Northampton, Mass.—Editor MOTOR AGE—Having had 3 years of experience with kerosene burners, I find some cannot use them while others seem to obtain very good results. I wish to say that I bought several gasoline burners in 2 months and had so much trouble with them that I finally bought a kerosene burner. While I ran it for 1,700 miles, it was not any too good. It would go out and clog up, so I got another one which cost $45. I was unable to get any steam with it. I finally ran on to a party telling me about a kerosene burner called the Barrett, so I got one and have used it for 3 years. It was not just right in some parts, but for heating I have never seen its equal, so I now have it fitted with a special very heavy coil which sits right over the small pilot. This coil is 4¼ feet long, all in one piece, and is fitted with special piping. It will not clog. This burner is very light and double feeding, with nozzles so fixed as to catch all the carbon. It is easily cleaned.

Digitized by Google

I know of a steam car in this city which is equipped with one and the nozzle has not had to be cleaned all summer. My experience was with gasoline. Formerly I got about 8 to 10 miles an hour, but now I get over 12 and on good running about 15. On a test on a fine state road I made 14 8-10 miles with three quarts with a car that had three empty seats, weighing in all 1,445 pounds. I used a 14-inch burner and one Mason engine. This burner I have started in 7 minutes; that is, with 150 pounds of steam. It burns quietly. Even the pilot cannot be heard while in the car. Others I have used and seen roar so they can be heard a long way off. One pilot that I tried roared so loudly I was afraid to use it. This pilot is under the bottom of the burner and is air tight as well as the burner itself. There is no back firing from it, and after over 1 year's use of it the tube and boiler is as clean as when put on. No soot at all comes from it. There is a car here in the city which would not make over 6 or 8 miles an hour with gasoline, but will now make easily 20 with kerosene and costs less than half to run it than it did with gasoline. Having read a good many articles on this kerosene burner, I tell my story, hoping it will help some out of gasoline troubles. If there is anything that they do not understand I will gladly answer them if they will take the trouble to write me.—J. HARRIS WIGHT.

The correspondent's figures of 6 or 8 miles an hour when using gasoline, and 20 miles when using kerosene, are rather extravagant or else show distinctly that there was a lack of knowledge in the handling of the gasoline burner. The particular gasoline burner in question possibly needed repair or cleaning.

PRIMES THE CYLINDERS

Pittsburg, Pa.—Editor MOTOR AGE—I have had the same trouble in starting a motor of which a correspondent of MOTOR AGE complained, and after vexatious trials tried priming the cylinders, using a small rubber bulb as an atomizer. Treated in this manner the motor was always ready to start on the first turn of the starting handle. Now in cold weather I resort to this method always and never have the least trouble. It takes a few moments, but it saves time in the end.—E. V. W.

HOT AND COLD RIVETS

Toledo, O.—Editor MOTOR AGE—I have read your article on riveting, but do not agree with you. I have been building frames for an automobile company in this town. When I first started to work for this company riveting was done by hand and put in cold; later on, pneumatic riveters were installed and the rivets put in hot. I found that a rivet put in cold by hand was not as solid as when it is put in hot. In taking a frame apart a rivet put in cold is easier to chop out than one put in hot, because a rivet put in cold is not pounded into the hole as solidly as a hot one. A rivet put in white hot is like a chilled casting when cold. The riveters that I ran were used for 5-16, 3-8 and 7-16-inch rivets. These machines would not mash a head on cold rivets, but when put in white hot the machine, running under 90 pounds pressure of air, made a perfect head. This applies only to rivets 5-16 inch in diameter and over; rivets under this size are better put in cold and by hand.—VICTOR H. CHRISTEN.

POWER COMPARISONS

Delaware, N. J.—Editor MOTOR AGE—Will you please advise me what horsepower a 5 by 5½-inch double gasoline engine will develop, a double cylinder motor with 6-inch bore and 4¾-inch stroke? I want to know which has the more power for automobile use?—John H. Hoyt.

Presuming that the motor is well made and well proportioned, the 5 by 5½-inch double cylinder should give 11 horsepower at 700 revolutions per minute, and the 6 by 4¾-inch motor, at the same speed, should give 13.3 horsepower.

NEW IDEAS PERTAINING TO THE AUTOMOBILE

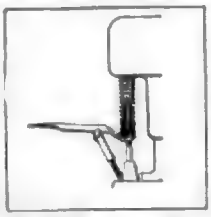
Selden's tubeless pneumatic tire is one of the few not using an air chamber and having the casing split and secured to the wheel rim similarly to mechanically secured pneumatic tires using the air tube. The tire has a thickened tread, part A, and carries a stepped lip E on one side, which is removable when removing the tire, and a hooked-shaped lip F on the other side, the hook partly surrounding the piece D resting on the wood rim B. When the flanges C are tightened in place by numerous cross bolts the curved edges of the lips E and F are forced together sufficiently to hold the air pressure with the proper inflation.

⁂ ⁂

Hill's method of removing cotter pins from valve stems, when removing the valves, is simplicity itself. One end of the lever fits beneath the cup, holding the bottom of the valve spring and the rod, acting as a fulcrum, rests in the angle of the push rod casing and the crankcase. By a downward movement of the outer end of the lever, the spring cap is raised, when the cotter pin can be taken out with ease and speed.

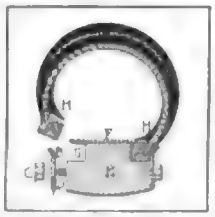
⁂ ⁂

The Lompereur anti-skid, a tire device which has already won continental fame, consists of a circle of metal shoes. Each shoe A lies crosswise over the tire tread and on the side adjacent to the tire is slightly concaved, so as to lie snugly against the tire when inflated. The outer surface of each shoe is flat in the central part, where it rests on the road, and is arched at the ends, where short links B unite the ends of the shoes. Within the arched ends of the links pass continuous crome leather strips O riveted to each of the shoes. The leather strips rest on the curve of the tire and serve in protecting the tire from wear by the ends of the shoes and also in holding the links in place, so that the entire anti-skid can be very easily handled when off the tire.



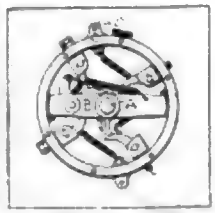
⁂ ⁂

The Toni single tube pneumatic tire, which is attachable by means of clincher-like lips, is somewhat of a novelty. The wheel rim has the corners next to the tire cut way, as shown at G, into which fits snugly the square lips A of the tire. For holding to the rim are side flanges B, retained through the medium of the cross bolts D in the rim, the nut C retaining the flanges. A circular plate F fits on top of the rim E and the lugs and has resting on the top of it the laps H which when the tire is inflated are held firmly on the plate F.



⁂ ⁂

The Drakner commutator, designed for non-trembler coils, is carried on the shaft A, to which the cross arm B carrying the pawl-like contact D is secured. The four stationary contacts are in the form of a pivoted pawl, held in position by a coil spring attached at one end to the casing and at the other to the body of the pawl. The rotating contact pawl D is also held in position by a longer coil spring. The action of the spring is such that contacts are certain at high speeds and by their use vibration is materially reduced, resulting in steadier and longer contacts. In timing the spark the casing is turned in the supporting ring, carried on the crankcase.



⁂ ⁂

The Hoffmann ball bearings for the road wheels of automobiles are designed on the compound principle, part of the balls being for radial support—that is, carrying the weight of the vehicle—and the others for taking up end thrust. The cone A has on its upper surface a raised central part between the bearings D D for separating these end thrust bearings, the opposite sides of these balls resting against the vertical side of the cups B, which form a race for the balls C for carrying the weight of the machine. A little pedestal can be noticed beneath the balls D D for keeping them in position. The adjustment of either set of balls is through a little screw resting against the outer surface of the cup B. A locknut is provided in the ordinary way, and a hub cap covers the end of the axle and locknut.

BRIEF BUSINESS ANNOUNCEMENTS

Findlay, O.—H. C. Kelley has sold his garage and agency to K. Zoll.

Minneapolis, Minn.—J. S. Spargo recently opened the Motor Car agency at 209 Fifth street, South Minneapolis.

Detroit, Mich.—The American Electro-Mobile Co. will not build its new factory until next spring, according to Secretary C. W. Beaumont.

Brunswick, Ga.—E. J. Olewine has rented the Levine building on Newcastle street, where he will carry on an automobile agency, in addition to his bicycle business.

Philadelphia, Pa.—An application has been made for the incorporation of the Hall Gas Engine Co., a corporation which proposes to engage in the manufacture of gas and oil engines.

Worcester, Mass.—The Automobile Dealers' Association of this city is considering the advisability of holding a 3 days' show in December or January. There are seven dealers at present in the association.

New York City—E. B. Gallaher, the American manager for the Richard-Brazier automobile, has announced the opening of an information bureau for automobilists in Paris. A suite of rooms has been engaged at 11 Rue d'Alger.

Lansing, Mich.—The Reo Motor Car Co. has appointed as local agents for 1906 Daniel J. Wurgis and Frank A. Wall. The local agency includes the counties of Ingham, Eaton, Ionia, Clinton, Shiawassee, and the northern half of Barry.

Lansing, Mich.—The Never Miss Spark Plug Co. has added a retail department of automobile supplies and promises to double its business next season. During the past season it claims to have sold 50,000 spark plugs and about 500,000 battery connections.

Detroit, Mich.—The C. H. Blomstrom Motor Co. is building an addition to its plant on Clark avenue, which, when completed, will increase the capacity of the plant about three times. The cost of the improvements is about $25,000, and the capacity will be increased to 1,500 machines a year.

Detroit, Mich.—A new addition is being built to the Cadillac company's factory at 1355 Cass avenue. It is entirely of cement and is being put up by the Concrete Steel & Tile Construction Co. It is probable that the building will be ready by December 1. The new factory is to be used for general manufacturing purposes and is to cost between $75,000 and $80,000.

Detroit, Mich.—The American Electro-Mobile Co., an eastern concern, is to locate here. It is a combination of small concerns. W. L. Woodrow is the president; Frank P. Ray, formerly associated with Edison, engineer, and C. W. Beaumont, secretary and treasurer. The exact location is as yet undecided. It will manufacture a new machine to be operated with an approved storage battery, which will give the machine a traveling radius of 125 miles without a recharge, it is claimed.

Portland, Ore.—Morgan & Wright has opened a branch at 86 Sixth street.

Pontiac, Mich.—The Welch Motor Co. has certified to an increase in the capital stock of from $100,000 to $250,000.

Chicago—Harry W. Cooper, formerly an inside man with Beckley, Ralston & Co., has been made city representative, calling on the retail trade.

St. Louis, Mo.—The Maxwell-Briscoe-Chase Co., western agent for the Maxwell car, is opening a branch at 3968 Olive street, under the direction of C. D. Harrington.

Chicago—The Royal Automobile Co., 144 Green street, has gone into the receiver's hands, Edwin C. Day, 1335 First National bank building, being the official appointed by the court.

Akron, Ohio—The Diamond Rubber Co. has increased its capital stock from $750,000 to $3,000,000. It is stated the company will shortly increase its capacity by the erection of a new building at its Akron plant.

Albany, N. Y.—A stock company has been formed with a capital stock of $50,000 for the purpose of building a garage. The location is at the corner of Pine and Chapel streets. The manager is to be C. Sutherland Ransom.

Concord, N. H.—Fred L. Johnson, 86 North Main street, runs a garage in the rear of the Eagle hotel. He has been well patronized during the past season by tourists to the White mountains. He has the agency for the Buick cars in New Hampshire.

St. Louis, Mo.—H. L. Hull of this city, is reported to be at the head of a syndicate after a concession to establish a plant in the City of Mexico for making all kinds of locomotive boilers, steam engines and automobiles. The company claims to have $1,000,000 back of it.

New York City—Gilsey Brothers have leased for a term of years for Madison Grant, as attorney, the four-story and basement garage at 215-217 West Forty-eighth street, to the Viqueot Co., which will use the property as a show room, repair shop, and garage for the Viqueot car.

Plainfield, N. J.—The Spicer Universal Joint Mfg. Co. will move its plant at the Potter works to the Spicer & Hubbard property at Madison avenue and West Third street. The capacity of the present place is much overtaxed. The company manufactures a dust and oil-proof universal joint.

Pittsburg, Pa.—Mrs. Mary C. Thaw has sold through the Commonwealth Real Estate Co., the vacant lot on the north side of Center avenue, for $15,500. The plot was bought by Dr. George Urling, of the Highland Automobile Co., and upon it the company will erect a two-story brick garage, at a cost of about $25,000. The company is now located at Baum and Beatty streets, and the present buildings will be sold when the new structure on Center avenue is completed.

Lynn, Mass.—Watson Coleman has been put in charge of the new White garage.

Boston, Mass.—The Grout Brothers have withdrawn their branch and in the future will dispose of their cars here through an agency.

Boston, Mass.—The Morrison-Tyler Co. is about to open its headquarters at 121 Massachusetts avenue, where it will show the Rainier and Maxwell cars, for which it is the New England agent.

Philadelphia, Pa.—E. C. Johnson is acting manager of the White branch, at 629-33 North Broad street, formerly occupied by the Banker Brothers Co. Johnson was formerly with the Quaker City Automobile Co.

Baltimore, Md.—The Auto Storage & Supply Co., of which James E. Norwood is president, has leased the property at 1416 Madison avenue, and will erect a garage at the rear. The structure will be two stories and 28 by 60 feet.

Cleveland, Ohio—The Brew & Hatcher Co. has changed its name to the Hatcher Auto Parts Co., Mr. Brew having retired from the firm. The company has recently improved its facilities for manufacturing automobile parts of all kinds.

Newark, N. J.—At the sheriff's sale of the business of George W. Condon, who ran a repair shop at 285 Halsey street, Michael J. Tansey, acting in the interest of the creditors, bid in the stock for $1,050. Patrick J. Nolan bought the interest in the business for $1.

New York City—Homer & Schultz have had their territory for the National enlarged. In addition to Greater New York and Long Island, it now includes Hudson and Bergen counties in New Jersey, Rockland and Westchester counties in New York, and Fairfield county, Conn.

Manchester, N. H.—The International Power Co. has taken over the Amoskeag Fire Engine Co. and will use the plant for the manufacture of automobile fire engines. D. A. Burt, the former manager of the La France Fire Engine Co., will be the manager of the fire engine department.

Cleveland, O.—The final organization of the Forest City Rubber Co. was completed at a meeting in the offices of Attorney George C. Wing. William E. Crofut was elected president and treasurer, and James C. Poore, vice president and secretary. Both of these men were formerly connected with the Ohio Rubber Co.

Fostoria, O.—The board of trade is endeavoring to secure new industries before the opening of the winter season. The largest of the propositions now before the board is an automobile factory, with a capitalization of $300,000, to get which it was necessary to subscribe $50,000 of the preferred stock. The amount has been raised and there is no doubt that the contract for the removal of the plant to this city will be signed before the end of the

Digitized by Google

week. The company contracts to build and sell 200 machines during the first year.

Hartford, Conn.—The Nicholas Auto Transit Co., of Nichols, has filed a certificate of organization.

East Moline, Ill.—The Moline Automobile Co. is building an additional building, 40 by 165 feet, necessitated by its increasing business.

New York City—Samuel P. Randolph has opened a temporary office for the Autocar Co., at 152 West Fifty-sixth street, with Jose M. Bellin as manager.

Dayton, O.—E. C. Coats, of the Peckham Carriage Co., has withdrawn from the firm and will open an automobile agency on South Main street.

Cleveland, O.—The name of the Automobile & Garage Co., of 404 Huron street, has been changed to the Standard Automobile Co., and will handle the Cadillac and Packard.

Philadelphia, Pa.—The force of the White branch has been considerably strengthened by the addition of A. E. Jones, formerly representing the Franklin at the Quaker City Automobile Co.

Peacock, N. H.—The A. H. Hoyt Co. has the agency for the Oldsmobile and Elmore cars. It has plying two buses between Franklin Falls and Tilton, N. H. One bus has cleared for its owner $15 per day during the past season.

Toledo, Ohio—The Commercial Motor Truck Co. has been incorporated with a capital stock of $20,000. The company has been in existence for some time and has been manufacturing a gasoline motor truck. The incorporation follows a reorganization of the affairs of the concern. The company's plant is located on St. Clair street.

Erie, Pa.—A new garage is being built by C. R. Dench. A dining room is to be connected with the garage.

Los Angeles, Cal.—The National Garage and Repair Co., with F. J. Richards as manager, has opened at 329-331 South Los Angeles street.

New York City—The Upton Machine Co., of 17 State street, with works at Beverley, Mass., will in future be known as the Beverley Mfg. Co.

Storeham, Mass.—The Phelps Motor Vehicle Co. is to be succeeded by the Courier Motor Co., which will occupy the old plant and double its facilities for turning out gasoline cars.

Boston, Mass.—The Radcliffe Motor Co. has secured the agency for the Frayer-Miller car, which, together with the Stoddard-Dayton, will comprise its line for the coming season.

Boston, Mass.—Harry Fosdick and Jewell Dowling are about to open their new garage on Stanhope street. They will handle the Fiat and Studebaker lines, and the National Fabrique motor cycle.

Oxford, Mich.—The Detroit-Oxford Automobile Works, located here, will move to Fostoria, O., this week. Lack of capital and the small size of the town is the cause assigned. The factory was started about a year ago.

Peoria, Ill.—The Illinois Automobile & Parts Co. is erecting a new garage, 40 by 90 feet, at the corner of Main and Globe streets, where the company will manufacture automobile timers, motors, etc., in addition to maintaining a garage. J. A. Holdsman, late of the Bartholomew company, is president and general manager.

Columbus, O.—The Paxson Motor Co., of Cleveland, has been incorporated with a capital stock of $10,000.

Cleveland, O.—The Auto Power & Appliance Co., of Cleveland, has filed a notice of increase of capital stock from $25,000 to $200,000.

Philadelphia, Pa.—F. W. Stockbridge, formerly in charge of the branch of the Reo company, has been succeeded by Daniel Cohan, formerly of New York.

Kingston, N. Y.—S. D. Coykendall is having erected a brick building, which will be used for the storing of automobiles. The building will be built on West Chestnut street.

Hartford, Conn.—Frank H. Harriman, motor manufacturer, has filed a voluntary petition in bankruptcy. Liabilities, $4,401.06; assets, $3,115.40. Of the assets, $2,000 represents 340 shares of the Harriman Motor Works.

Sodus, N. Y.—Lane & Parsons, of Hartford, Conn., have closed a deal here for the leasing of the plant of Tripp Brothers, which has been idle for a long time, and April 1 they will open a large tool manufacturing plant. They will also add special machinery for the repairing of automobiles.

Hammondsport, N. Y.—G. H. Curtiss' business has been taken over by the G. H. Curtiss Mfg. Co., with a capital of $40,000. Mr. Curtiss will be the president and manager, the product of the company consisting of engines, both double and single cylinder; complete motor cycles and side cars.

RECENT INCORPORATIONS AND CAPITAL INCREASES

Wilmington, Del.—The Universal Power & Promotion Co. has been incorporated with a capital stock of $100,000 to manufacture automobiles under patents held by C. A. A. Taylor and E. O. Brown, both inventors, of Wilmington.

Pontiac, Mich.—The Hess-Pontiac Spring & Axle Co. has been incorporated with a capital stock of $145,000 to succeed the Vehicle & Improvement Co. and the Pontiac Axle Co. The company will make a specialty of automobile springs.

Cleveland, O.—The Glenville Garage & Co. has been organized to handle automobiles and parts. Capital stock, $10,000.

New York—The Olborah Auto Co. has been incorporated with a capital stock of $3,000.

Albany, N. Y.—The W. J. Willard Co., to engage in the manufacture of automobiles, has been incorporated with a capital stock of $100,000.

Boston, Mass.—The Technical Automobile School of New England has been incorporated with a capital stock of $5,000.

New York City—The 35 per cent Automobile Supply Co. has been incorporated to deal in and manufacture automobile supplies. Capital stock, $40,000.

Troy, N. Y.—The Auto Exchange of Albany and the Troy Garage Co. have filed articles of incorporation with the county clerk, showing that the capital stock of $500 have in both cases been paid in.

Owego, N. Y.—The New Amsterdam Motor Co. has been incorporated with a capital stock of $75,000.

Brooklyn, N. Y.—The Prospect Construction Co. has been incorporated to maintain an automobile garage. Capital stock, $6,000.

Nyack, N. Y.—The Rockland Motor Co. has been incorporated with a capital stock of $5,000. It will sell automobiles and maintain a general garage business.

Detroit, Mich.—The Modern Motor & Machine Co. has been incorporated with a capital stock of $15,000.

Montreal, P. Q.—The Automobile Import Co. has been incorporated with a capital stock of $20,000, to manufacture all kinds of automobiles, vehicles, etc.

Newark, N. J.—The Motor Vehicle Co. has been incorporated with a capital stock of $5,000, to manufacture automobiles, vehicles, etc.

Trenton, N. J.—The Automobile Speedway Co. of New Jersey, of Jersey City, has been incorporated with a capital stock of $100,000.

Columbus, O.—The Auto Car Co. of Cincinnati has been incorporated with a capital stock of $25,000. The company will build a concrete garage at Eighth and Sycamore streets.

New Brunswick, N. J.—The Middlesex Motor Co. has been incorporated with a capital stock of $50,000. The company will construct automobile garages and also lease and build automobiles.

Cleveland, O.—The Glenville Garage & Machine Co., of Cleveland, has been incorporated with a capital stock of $5,000.

Chicago—Incorporation papers have been granted the Biddle-Murray Mfg. Co., which will manufacture automobiles. The capital stock is $10,000, the incorporators being Ralph M. Shaw, J. D. Black and Edward C. Maher.

Moline, Ill.—The Deere-Clark Motor Co. has been incorporated by C. E. Drury, R. S. Blakemore and W. E. Clark for the purpose of manufacturing motor cars; capital stock, $100,000.

Baltimore, Md.—The Sheddan Mfg. Co. has been incorporated. The company is to make air cushions and to deal in all kinds of vehicles, in addition to maintaining a garage. The capital stock is $15,000.

Ossining, N. Y.—Among recent incorporations is that of the Hutchinson Electric Horn Co., with a capital stock of $20,000.

Newark, N. J.—The Greene Motor Car Co., of Newark, has been incorporated with a capital stock of $100,000.

Omaha, Neb.—The Deright Automobile Co. has been incorporated with a capital stock of $50,000. The company has a new garage in course of construction at Nineteenth and Farnum streets.

Lansing, Mich.—The Motor Car Co., of Detroit, has been incorporated with a capital stock of $150,000.

Trenton, N. J.—The Summit Garage has been incorporated with a capital stock of $25,000, and will engage in the manufacture and renting of automobiles, motor vehicles and bicycles.

Albany, N. Y.—The Brewster Automobile Co. has been incorporated with a capital stock of $10,000.

Guthrie, Tex.—The Southwestern Transit Co. has been incorporated with a capital stock of $35,000 to operate an automobile line. The incorporators are E. R. Ames of Prague, and Shirley A. Bradish and Thomas J. Lowe of Guthrie.

Guthrie, Tex.—The Automobile Tire Repair Co., of Guthrie and Chicago, has been incorporated with $10,000 capital by W. F. Maloney, Robert A. Wells, Charles R. Tichenor and M. M. Chesrown, of Chicago, and G. V. Pattison and H. W. Pentecost, of Guthrie.

Quincy, Ill.—The Quincy Automobile Co. has been incorporated for $50,000 to manufacture automobiles and parts. J. W. Cassidy, H. Chatten and W. H. Govert are the incorporators.

Charlotte, Mich.—The Dolson Automobile Co. has been incorporated with a capital stock of $100,000.

Digitized by Google

SYRACUSE, N. Y., LIVERYMAN SEES TREND OF AFFAIRS AND PREPARES TO STAY IN BUSINESS

Takes on the Glide—The Holmes-Schmidt Motor Co., 1502 Michigan avenue, has taken the Chicago agency for the Glide.

Located in Erie—Jacob Roth is erecting a $70,000 garage at Erie, Pa. It will be a two-story affair in the center of the town, the building being of steel construction.

Whitney Promoted—R. A. Whitney, a general salesman for the Glide the past year, has been appointed sales manager in charge of the Glide agencies by the Bartholomew company.

Going to Paris—J. S. Josephs, manager of the Auto Import Co., New York, will sail on the 21st to attend the Paris show and see to the shipment of the entire Rochet-Schneider exhibit, which he has bought outright for display at the Madison Square garden show.

Gives Glad Hand—The Rhode Island Automobile Club on Thursday night last gave a farewell smoker to A. E. Hughes and W. J. Foss, who have secured the Philadelphia agency for the Cadillac and Pierce Arrow automobiles and have opened an establishment at the northeast corner of Broad and Race streets in the Quaker city.

Pope-Hartford Test—A tour which will test out the new Pope-Hartford four-cylinder car and which will also be a selling expedition was commenced on Sunday by Wilbur C. Walker, of the Pope company's Hartford office. Walker will drive the car to Springfield, Troy, Albany, Utica, Syracuse, Rochester, Buffalo, Cleveland, Erie, Pittsburg, Toledo, Indianapolis, Chicago and possibly to St. Louis. N. P. Bernard is chauffeur and accompanying Mr. Walker are F. L. Buckbee and W. H. Kellar, salesmen of the Pope company.

Gives Up Branch—The Pope Mfg. Co. has recently discontinued its branch at Providence, R. I., and disposed of its stock of cars and parts there to the Rhode Island Motor Car Co., which will have the agency for the Pope cars the coming season. The Pope building on Snow street will soon be vacated and the greater portion of the machinery and fittings shipped to Hartford. Secretary Wilbur C. Walker of the company, speaking of the changes, states that it is now the policy of the company to discontinue, rather than increase its branches throughout the country, as the demand is now almost greater than the supply, and the company has no difficulty in disposing of its allotments to its agencies.

Now Renault Secretary—H. B. Miller, formerly in charge of the sales department of Smith & Mabley, is now the secretary of the Renault American branch.

E. V. C. Co. at Show—By the arrangement of space at the New York show the Electric Vehicle Co. is to have three exhibits—gasoline cars in the main hall, electrics in the restaurant, and delivery wagons and trucks in the basement.

Plant Destroyed by Fire—The plant of the Central Mfg. Co., of Connersville, Ind., maker of buggy and automobile bodies, was totally destroyed by fire last week. The loss is estimated at $60,000, with $30,000 insurance. The factory employed 150 men.

Hungary Hungry for Cars—The trade in automobiles in Hungary, although little developed as yet, has lately made a distinct advance. The local industry is not yet in a position to compete against foreign importations, among which American cars are figuring in the import returns.

Spreading Out—The New Process Raw Hide Co., of Syracuse, N. Y., has just completed a two-story brick addition, which gives it 10,000 feet more floor space. It is also installing additional turret lathes, drills, grinders, spur gear cutters, bevel gear planers and other machinery. It is expected that this will increase the company's capacity 75 per cent.

Delayed by Strikers—Strikes in the building trades now promise delays in the new garages building in Hartford. S. A. Miner does not believe that he will get into his new quarters until April. The new addition to the E. V. Co.'s plant has been ready for 2 months, but the bridge workers' strike has prevented the erection of the roof, the girders for which are now on hand.

Franklin Agents—Planning for the 1906 campaign, the Franklin people have again closed with R. C. Hamlin to represent them in Southern California, Gus Boyer in San Francisco, A. R. Bangs in Boston, the Quaker City Automobile Co. in Philadelphia, Cook & Stoddard in Washington, D. C., and the Standard Automobile Co. at Pittsburg. The metropolitan district will be cared for by the Decauville Automobile Co. Sales Manager C. A. Benjamin is now in Chicago debating whether or not it would be advisable to open a branch or continue with an agency.

Page's Trip—Carl Page, manager of the New York branch of the White Sewing Machine Co., will sail for Europe on Saturday with his mother. After a tour of Italy and southern France he will visit the Paris show.

Hurlbert Enthusiastic—W. H. Hurlbert, manager of the New York branch of the Packard Motor Car Co., on the basis of present demand and orders, expects to dispose of fully half of the 1906 allotment by January 1. This wil be but a repetition of his experience with the Packards during the past season.

Now in Baseball—L. A. Mitchell, associate of Guy Vaughan in the 1000-mile record ride at the Empire track, companion of A. W. Church on the Glidden tour and salesman for some time in the employ of the Decauville Automobile Co., has resigned his position with the Decauville company to accept a position as secretary of the New York baseball team.

Hay Ford's Man—Thomas Hay, formerly of the Hayden Automobile Co., of Chicago, has been named as manager of the Ford branch in the windy city. C. C. Meade, temporarily in charge, has gone to the Pacific coast on a business trip. The Ford people will locate permanently at 1440 Michigan avenue as soon as the building which is to be built for them is completed.

Italians Busy—Reports from Milan, Italy, say the shipments to New York by one firm the past year, ended June 30, amounted to over $124,000. It is reported that this same firm expects to export more than double that amount to New York this year. Some of the Italian firms announce they have more orders than they can fill, orders being received only on condition that they be completed at some future time.

Department Store In It—Bacon, Chappell & Co., of Syracuse, N. Y., who conduct a department store, will enter the automobile business next season, and have arranged for the agency of the Rambler. They expect to secure some good location near the business section and conduct an up-to-date garage. The department will be managed by William Cranston, formerly with R. M. Cornwall & Co., in South Salina street. The Cornwall company will go out of the business at the close of the present season and devote its attention to the manufacture of gasoline engines.

Progressive Livery Man—John W. Cronin is a Syracuse, N. Y., liveryman who recognized the signs of the times and proved equal to the demands which progress made upon him. At the beginning of the 1905 season he erected a garage by the side of his livery building and has conducted both successfully. If anything the automobile business has encroached somewhat on the other branch, for Cronin this fall and winter will put into service two automobile hacks. Next season he expects to have a sightseeing vehicle and several automobiles for rental purposes. He took the agency for the Reo car, which he will continue next season. Cronin started in the livery business in a small way in 1878,

Digitized by Google

and from that time the business has increased steadily, until it is now the largest in Central New York.

Ollier Changes—L. J. Ollier, formerly with the Cadillac and later with Devlin & Co., is now in charge of the sales department for Ralph Temple, Chicago, who handles the Reo, Panhard and Premier.

Has Changed—F. S. Duesenberg announces he is no longer connected with the Iowa Auto & Supply Co., of Des Moines, Ia., having gone into business for himself at 915 Grand avenue under the name of the Duesenberg Automobile Co.

Old Line Suits—The Auto Shop of Paterson, N. J., has signed its old line for 1906. This includes Columbia gasoline and electrics, the Knox and White Steamer. President Andrew T. Fletcher may take on one more line which does not conflict with the other three.

Kelsey Moves—Cadwallader W. Kelsey, Philadelphia agent for the Maxwell car, left the Quaker city last week to assume his new duties at the Maxwell factory at Tarrytown-on-the-Hudson, N. Y., where he will be the general sales manager. He will be succeeded in Philadelphia by William P. David, well known throughout New England in connection with the Maxwell line of cars.

Kiser Bobs Up—Earl Kiser is expecting to break into the trade end of the game in Dayton, O., now that he has fully recovered from the Cleveland accident. The rosy-cheeked little driver is able to use his artificial leg without the use of a cane, and can drive an automobile in a clever manner. He will start in business as soon as he finds a location, taking with him John S. Johnson.

Signs Long Lease—C. B. Rice, New York agent for the Baker electrics, has signed a 10-year lease for a big building now nearing completion at Broadway and Seventy-seventh street, which he will use as an exclusive garage for electrics. It will have 35,000 square feet of floor space, sufficient for the storage of 300 machines. The present salesroom at Broadway and Fifty-ninth street will be continued for the exclusive exploitation of the Baker product.

Buy In—Mohler & De Gress have purchased the plant of F. A. Seitz at Long Island City, N. Y., and will enlarge the business.

Sixth Season—The Toledo Motor Car Co. will again handle Pope-Toledo cars next year, having handled them for the past five seasons.

Breaks in in Jersey—The Greene Motor Car Co., of Newark, N. J., has taken northern New Jersey for the Locomobile and the Smith & Mabley line of imported cars—the Mercedes, Panhard and Renault.

Renew With Henshaw—During the past week Harrington's Automobile Station, of Worcester, Mass., and C. K. Smith, New London, Conn., have renewed their contracts with C. S. Henshaw, the New England Thomas Flyer representative.

In a Merger—The American Motor & Cycle Co., of Battle Creek, Mich., is the result of a merger of the Currie Motor Cycle Co. and the Losey-O'Riley Co. The place will be located at 35 East Main street. C. G. Currie is president of the new company.

Stern Sells Out—Emil Stern, associated with Norris M. Mason in the American agency of the Leon Bollee cars, has sold out his interest to his partner, who will continue the business at 32 West Thirty-second street, New York. Mr. Stern will shortly return to France and again be associated with the Leon Bollee concern.

New in Chicago—The Kelley-Hunter Co., new in Chicago trade, has taken the Northern agency for Chicago and surrounding territory. The president of the company is W. M. Thompson, with Paul Kelley, of the firm of Kelley, Maus & Co., treasurer. The active members of the agency are Clinton Hunter, secretary and manager, and W. G. Tennant, vice-president. The latter has been connected with the Chicago branch of the Winton and later with the Haynes people. The new company is located on the second floor at 1449 Michigan avenue, but after February 1, when the McDuffe Automobile Co. moves out, it will occupy the entire building.

Fay Goes with Ford—Charles E. Fay has concluded a contract with the Ford Motor Car Co. whereby he is to assume the management of the Boston branch.

Unwin Connects—Harry Unwin, former manager of the Harrolds Motor Car Co., of New York, has taken the superintendency of the selling department of the metropolitan district branch of the White Sewing Machine Co. under Carl Page, manager.

Up a Notch—A prominent stove manufacturer confesses that the automobile industry in Detroit has passed the stovemakers in the Michigan city. For the year just ended the manufacturers of car wheels led with a total output worth $13,000,000, with the motor trade next with $11,000,000.

Argyll Salesroom—The British trade is proud of the new London depot for the Argyll cars, opened at 17 Newman street, Oxford street, W. In addition to the handsome display of cars and a repair shop, another dealer, Alfred Dunhill, has a branch establishment in the place for the purpose of retailing his motor clothing.

Packard Prompt—The Packard Motor Car Co. reports that in October it commenced the delivery of its 1906 Packard 24, both touring car and runabout, and that it expects to keep as closely to its shipping schedule as it did with model N, which scarcely varied a day throughout the season. The new model worked out so well that the Packard purchasing department was able to send out its orders 4 months ago.

Big Order Half Filled—More than half of the big order of the new electric broughams building for the New York Transportation Co. has been completed by the Electric Vehicle Co., of Hartford. The rig is fashioned somewhat after the English type of brougham, but is driven with twin motors and side chains and is fitted with solid tires. The resistance controller is mounted beneath a hood, readily accessible, and the battery is underslung.

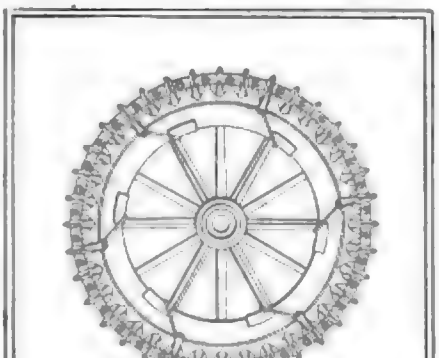
Current Automobile Patents

Combination Truck—No. 803,010, dated October 31; to Elmer P. Morris, East Orange, N. J.—The invention relates to a commercial truck, with power furnished by a gasoline engine. This engine furnishes the power for driving an electric generator and the generator in turn supplies current for electric motors on each of the front wheels. The front wheels, besides serving to propel the truck, are used for steering, the feature of the steering arrangement being that an electric motor does the work of turning the steering wheels. A vertical steering column with wheel is located in the front of the driver and on the bottom of the column is a sprocket connected by chain belt with the steering motor, the connection being such that a movement of a steering wheel to the right brings the electric steering motor into operation and turns the wheel in that direction, and an opposite movement of the hand wheel gives the opposite turn to the steering road wheels. The amount of turn given the road wheels is dependent on the amount of turn given the steering wheel, the speed of the electric motor being proportioned to the turn of the steering wheel. The same inventor has another patent, successively numbered, relating to the construction of the axles of his truck. The axle is a vertical framework of metal divided into three parts. Through the center of it pass the half axles carrying each of the road wheels, and on each half is a large spur gear to which the motors are connected.

Tire Cover—No. 803,326, dated October 31; to James M. Carpenter, Millersburg, O.—A novelty is presented in the device referred to in this patent, which is a cover for the tread of pneumatic tires for automobile wheels. The tread consists of metal links, pivoted together, each link having a concave under surface for resting on the tire tread and an upper surface of a ridge-like projections placed crosswise of the link and reaching across the tire tread. These projections are designed for overcoming slipping on muddy roads or in snow. Every seventh link has short arms on either side extending radially to the edge of the steel rim, where a clevis, which encircles the wheel rim and rests against one of the spokes, has its ends pivoted. The use of the clevis is not only to retain the tread in position but to prevent its slipping on the tire. No arrangements are provided for preventing its slipping on the tread when the wheels are reversing, but having it clamped to the spokes would serve for this.

Folding Foot Board—No. 802,995, dated October 31; to Harry A. Knox, of Springfield, Mass.—This invention is a foot board for use on the front seat of a runabout car and is so constructed that when the seat is not in use, the foot board swings upward and forms the front of the car body. This swinging movement is accomplished by having the foot board hinge at the bottom of the frame work of the car and a rigid lever bolted to the center of the foot board at either end. Connected with the lever is a link, attached to the body which is so connected as to give a toggle joint arrangement to the other parts.

Mixture Regulator—No. 803,289, dated October 31; to Thomas B. Jeffery, of Kenosha, Wis.—The device referred to relates to the supplying of mixture for a gasoline engine. A pipe leads from the carbureter to the inlet valve and in this pipe, intermediate of these parts, is an inlet valve for admitting outside air into the pipe. Both the gas inlet valve to the motor and the air in the valve are controlled by a ring beneath the steering wheel, the connection between the two valves and this ring being such that the air inlet valve opens as the gas inlet closes and a trip is furnished for disengaging the air inlet valve, permitting it to be closed without reversing the gas inlet valve movement.



CARPENTER'S TIRE COVER

Flat Inner Tube—No. 803,345, dated October 31; to Thomas B. Jeffery, of Kenosha, Wis.—The invention is a pneumatic tire in which the ordinary round inner tube is replaced by a flattened one, the construction of the tire casing giving it this shape. On the sides of the wheel rim are recesses in which the lips on the outer casing repose and on the tread part are three reinforcements to protect the tread and prevent side slipping. Over the outer face, or tread, of the wheel rim is a plate, held by screws, for preventing the wheel rim injuring the inner tube.

Combination Tire—No. 803,500, dated October 31; to Winnifred J. and James R. Mitchell, of Lyons, Mass.—The inventors have what can be called a combination tire, being a pneumatic tire protected by a circle of solid rubber. The tread of the wheel rim is grooved to receive the air chamber and on either sides of it are circular ring flanges bolted to the sides of the rim and having shoulders on the outer edges, on which rests an ordinary solid rubber tire. The air chamber is thus enclosed between the metal rims on either side and the rim and the solid tire, the latter being retained by bolts passing through the flange rings. The same inventors have another design of combination tire following similar lines of construction, except that a rubber ring encircles the air chamber and encircling and enclosing the ring is a grooved tread part, held to the ring flanges by cross bolts and, of course, nuts.

Single Tube Tire—No. 803,510, dated October 31; to William A. Sankey, of Sutton, England—The inventor has a single tube automobile tire which is slotted like the ordinary tire casing and has clincher style of lips for retaining it in position. As an aid to the tire lips, bolts pass through the rim radially, the heads, within the tire, resting on a broad circular band that rests on the rim and overlaps on the tire lips, thereby holding them and serving also to retain the air.

Fisk's Tire—No. 803,053, dated October 31; to Henry G. Fiske, of New York city—In his pneumatic tire, the air tube is of inverted U shape, and to render the tire practically puncture proof a thick felt tread is used. The entire casing is almost double as heavy as the ordinary casing and the tire rests between opposing flanges, which are aided in retaining it in position by a center wire, as used on buggy wheels. The air valve does not pass through the wheel rim but is located in the side and passes through on the flanges.

Tire Fastening—No. 802,702, dated October 24; to Thomas Midgley, of Columbus, O.—The invention relates to the fastening of a pneumatic tire to a rim, the tire having clincher rims but the rim of the wheel made flat with a metal ring with low radial flanges surrounding it. The tire does not rest firmly on the rim, but rather on two slightly crescent-shaped pieces, one under each tire lip. Between these pieces and the tire is a strip of leather or rubber, filling the spaces between the crescents and providing a floor for the tire. To hold the tire in place two endless rings are used, one on each side of the tire, each ring of wedge cross section so that the edge of the wedge can be forced between the low flanges on the wheel and the crescent pieces, thereby pushing the crescents closer together, forcing the leather strip up against the air tube. The larger ends of the wedge-shaped rings bear against the tire sides. The tighter the tire is inflated the greater will be the pressure on the side rings, and consequently the greater downward pressure on the crescent pieces, thus holding all parts rigidly in place.

Semi-Pneumatic Tire—No. 802,806, dated October 24; to Henry G. Fiske, of New York city—The tire described is not strictly a pneumatic, in that the air chamber is not more than half the size of the ordinary air tube, and the tire casing is double the ordinary thickness. The air tube resembles a figure 8, placed crosswise in the center of the casing with the space above and below it filled with cross layers of rubber and canvas to resist puncturing. The casing part, instead of being one or two thicknesses of rubber and canvas vulcanized together, is an outer tube of rubber with four or five smaller leather or canvas tubes within it. The tire is a single tube fastened to regular trough-shaped rims.

ROADSIDE TROUBLES

An Ounce of Prevention

Copyrighted by the American Motor League

By Chas. E. Duryea

WHEN THE VEHICLE STOPS—Coming events usually cast their shadows before, and the experienced man in most cases has warning of trouble before it happens. If he heeds this warning he remedies the difficulty and prevents the trouble. To the inexperienced man this is not possible, for he does not hear or feel the warning, because he has not learned what is right and what wrong, or if he is conscious of it he may not be able to locate it, so that in many cases his roadside troubles begin when the vehicle stops. If this happens when climbing a hill, do not withdraw the clutch until the brake is set. As the clutch is withdrawn make sure that the brake holds the vehicle. Withdrawing the clutch before applying the brake, or with a faulty brake, may result in running down hill backward. When the low or hill climbing gear is engaged, the clutch will hold the vehicle safely.

With the clutch released, apply the starting crank to see if the motor turns freely. If it does, go through the starting operation and see if it will start. If it does, the cause of stopping is not in the motor, and must be looked for elsewhere, unless the motor was actually overloaded and stopped because of sheer inability. If it does not start, see that the spark is all right, then that there is fuel, and neither too much nor too little. If it still refuses, the mechanical part, like the timing of the valves and the spark, should be examined. These, however, are not likely to be wrong without the trouble being apparent. If the motor is not free, it is either overheated or has a seized bearing, as explained in the paragraph on lubrication. If overheated it will usually loosen on cooling. Work oil freely on to the tight piston and examine the water circulation. Simple things sometimes cause trouble. A loose wire in the electric system, a loose joint in the fuel pipe, an empty gasoline tank, a stopped air vent therein—all cause roadside stops, and even experts look long and hard sometimes before locating the trouble.

Accidentally knocking off the switch, may, because so simple and unlooked for, cause a longer stop than a broken chain, which is found at once and repaired. Wires and similar connections should not be hidden, but should be kept in plain sight, as far as possible, where, by a single glance, one may see whether or not they are in proper condition. Each morning one should practice giving the vehicle a rapid inspection, covering all vital parts. Practice in making this inspection enables it to be made rapidly and thoroughly on the road, and thus assists in locating road troubles quickly.

Having determined that there is no fault with the motor, next move the vehicle. One should frequently do this, so as to know whether the vehicle runs easily or not. He will then know whether or not the stoppage was caused by some fault in the bearings, the brakes, the steering, or similar parts. A tight bearing may actually stop the vehicle and will quickly give the impression that one has a weak and faulty engine. A brake band rubbing will do likewise. Many an automobile user today is paying needlessly large gasoline bills, to say nothing of increased repairs, simply because his brakes continually drag. If the steering wheels are not parallel, the tires slip sidewise on the ground, which soon wears them flat and also adds considerably to the labor of the motor. Of course, if the difficulty is found in the vehicle it must be remedied. If neither in the motor or vehicle, next examine the transmission. A stripped gear, a sheared key, a broken clutch lever, or some similar cause may permit the motor to run and yet fail to drive the vehicle, but in this, as in other things, reasoning from cause to effect, with careful inspection, will locate the trouble, and having located it, in most cases there will be some temporary expedient by which it can be patched up sufficiently to permit progress.

Fix Before Leaving—Again, we repeat, a stitch in time saves nine, and roadside troubles can be largely avoided by attending to defects when they first show signs of existence. If the motor is working badly do not wait for starting troubles, but fix it before leaving it. If everything is in good order, starting troubles will seldom exist. At the risk of being thought tiresome, we repeat that the ignition should be carefully inspected. Many an expert looks for trouble everywhere else, assuming that the ignition is all right, when as a matter of fact, the ignition only is to blame. A spark may look large and yet fail to do its duty. Many a motor has been condemned unjustly because of faulty spark. Many a man has assumed, because he has just paid for a set of fresh batteries, that the spark must be all right. Batteries lose their strength easily. They sometimes become valueless standing on the shelves. A file or screw driver accidentally laid on top will in a few minutes ruins the life out of them. Many things of this kind can damage the spark. Therefore, above all things, make sure of the spark in starting trouble, and if trouble still continues, do not waste much time elsewhere until you have made doubly sure that the spark is right. With a magneto or dynamo there is no chance to run down over night, and the spark that gave satisfaction in the evening may with reasonable assurance be expected to do likewise in the morning.

Tool Kit—In trouble, one's best friend is the tool kit. Many things can be accomplished without tools, but tools are labor-saving devices of the most pronounced kind and every vehicle should be equipped with an outfit sufficient to adjust, or even tear down and assemble the complete vehicle. Some vehicles require special wrenches, whereas others are so designed that almost everything can be manipulated with common tools, such as the monkey wrench and screw driver. The user should know what tools his vehicle needs and provide accordingly. For unhandy nuts, end wrenches are advisable. One or more pairs of pliers, suitable for cutting and bending wire, and also for holding round as well as flat objects, are extremely handy. A cold chisel, a file, a punch for knocking out cotter pins or chain rivets and several sizes of iron wire should be carried. The size used on ordinary baled hay can be picked up at almost any stable and is very handy. Broom wire is also usually easy to find. This is worth remembering when there is something to be tied together. A gasoline squirt can, a supply of cylinder oil and a can of thinner oil, commonly termed engine oil, should always be at hand. It is also advisable to have a small can of graphite and one containing heavy grease. A tire pump will be included without doubt. If batteries are used an ammeter or voltmeter, or both, are decidedly valuable. For storage batteries a densimeter is sometimes needed, but this is seldom carried on the road. A similar device for testing gasoline is also a valuable addition to one's tool outfit. Some waste for cleaning purposes and with some vehicles a squirt gun for handling oil is advisable. A tire repair outfit ought to be a constant companion and this should include a ball of strong cord, 1-16 to 1-8 inches in diameter, with which a bursted tire may be wrapped in place. After wrapping this cord ought to be protected by wrapping it with tire tape, which keeps out the dirt and prevents the cord from wearing, while the cord furnishes the strength. There are short shoes provided for this purpose that can be laced in position on the outside of the tire, or a canvas strip may be placed around the air tube and the ends either laced together, or drawn out over the edges of the rim, where the inflation will generally hold them. This device will prevent the air tubes from being damaged, but is more trouble than the outer covering. A wrapping of tire tape must be provided in any event to avoid damage to the canvas and inner tube. The tool kit should also include any extra parts that may seem advisable to carry for the purpose of replacing those that are known to be likely to give trouble, as, for example, extra spark plugs, extra insulations, some insulated wire and light springs, such as valve springs, that may break without warning. The manufacturers of a vehicle or any user thereof will usually willingly advise on these points but every car driver must be his own mechanic for roadside troubles and repairs.

EDITOR'S NOTE — This is the sixteenth of a series of articles by Charles E. Duryea. These articles will be prepared for publication in book form and will be distributed by the American Motor League to its members during the coming year.

OFFICERS

ISAAC B. POTTER, President, Potter Building, New York.

CHARLES E. DURYEA, First Vice-Pres., Reading, Pa.

JOHN A. HAWKINS, Second Vice-President, Pittsburg, Pa.

FRANK A. EGAN, Secretary, 123 Nassau St., New York.

FREDERICK B. HILL, Treasurer, 23 Binford St., Boston.

National Headquarters Vanderbilt Building, New York

THIS LEAGUE
Is Now Collecting Route Information

covering all automobile routes in the important states and will publish road books for motor car users as fast as complete information is received. The A. M. L. is the only organization engaged in this work, and it invites the co-operation of all persons interested. For full information and membership blanks address American Motor League, Vanderbilt Building, New York City.

APPOINTMENT

Under the provisions of section 1 of article 1 of the by-laws, Dr. John A. Hawkins, of Pittsburg, has been appointed to fill the office of vice-president of the league in place of S. W. Merrihew, resigned. Mr. Merrihew was one of the founders of the organization, and it is to be regretted that his personal business is so exacting as to prevent his giving further attention to league work. Dr. Hawkins, the new vice-president, has displayed the greatest ability in the building up of the Pittsburg board of consuls, and the present activity of the league in western Pennsylvania is inspired by our Pittsburg members, among whom Dr. Hawkins is a zealous leader.—ISAAC B. POTTER, President.

STATE DIVISIONS

This week will conclude the announcement of districts for most of the remaining important states. Those hereafter to be announced will follow from week to week as conditions require. The time is now at hand when the active efforts of many members will be called upon to take up and carry forward the work, which has hitherto been attempted in a most inadequate way by the officers at national headquarters. Plans are being completed for the election of officers for the important state divisions and the detail work of organization will be committed to these officers as soon as they are chosen.

KANSAS DIVISION

District 1, counties of Brown, Doniphan and Atchison; district 2, counties of Jefferson, Leavenworth, Wyandotte, Johnson and Douglas; district 3, counties of Miami, Franklin, Linn and Anderson; district 4, counties of Bourbon, Allen, Neosho, Crawford, Cherokee and Labette; district 5, counties of Wilson, Montgomery, Chautauqua, Elk and Cowley; district 6, counties of Butler, Greenwood, Woodson, Coffee, Chase, Lyon and Osage; district 7, counties of Shawnee, Wabaunsee, Jackson, Pottawatomie, Geary, Morris and Dickinson; district 8, counties of Riley, Clay, Cloud, Republic, Washington, Marshall, Nemaha; district 9, counties of Jewell, Mitchell, Osborne, Smith, Rooks and Phillips; district 10, counties of Marion, McPherson, Rice, Ellsworth, Saline, Lincoln and Ottawa; district 11, counties of Harvey, Reno, Kingman, Sedgwick, Sumner and Harper; district 12, counties of Stafford, Pawnee, Hodgman, Ford, Edwards, Pratt, Kiowa, Clark, Comanche and Barber; district 13, counties of Barton, Rush, Ness, Trego, Ellis and Russell; district 14, counties of Graham, Norton, Decatur, Sheridan, Rawlins, Thomas, Cheyenne and Sheeman; district 15, counties of Gove, Logan, Wallace, Greeley, Wichita, Scott and Lane; district 16, counties of Finney, Gray, Meade, Seward, Haskell, Stevens, Grant, Kearney, Hamilton, Stanton and Morton.

COLORADO DIVISION

District 1, counties of Arapahoe, Douglas and Elbert; district 2, counties of Teller, Fremont, Custer, El Paso and Pueblo; district 3, counties of Weld, Logan, Sedgwick, Phillips, Morgan, Washington and Yuma; district 4, counties of Kit Carson, Cheyenne, Kiowa, Lincoln, Otero, Bent, Prowers and Baca; district 5, counties of Montrose, San Miguel, Ouray, Dolores, San Juan, Montezuma, La Plata, Hinsdale, Mineral, Archuleta, Conejos, Rio Grande, Costilla, Huerfano, Lasanimas; district 6, counties of Saguache, Gunnison, Chaffee, Park, Lake, Eagle, Summit, Garfield, Mesa, Delta and Pitkin; district 7, counties of Rio Blanco, Routt, Larimer, Grand, Boulder, Gilpin and Clear Creek.

ALABAMA DIVISION

District 1, counties of Mobile, Baldwin, Escambia, Covington, Conecuh, Monroe, Washington, Clarke, Choctaw, Marengo, Wilcox, Butler, Dallas and Autauga; district 2, counties of Geneva, Henry, Dale, Coffee, Crenshaw, Lowndes, Elmore, Montgomery, Pike, Bullock, Russell, Macon and Lee; district 3, counties of Sumpter, Greene, Pickens, Tuscaloosa, Hale, Perry, Bibb, Chilton, Shelby, Jefferson, Walker, Fayette and Lamar; district 4, counties of Coosa, Tallapoosa, Chambers, Randolph, Clay, Talladega, St. Clair, Calhoun, Cherokee, Etowah, Blount, DeKalb, Marshall, Cullman, Morgan, Madison, Jackson, Limestone, Lauderdale, Colbert, Lawrence, Franklin, Winston and Marion.

TENNESSEE DIVISION

District 1, counties of Crockett, Gibson, Dyer and Weakley; district 2, Fayette, Shelby, Tipton, Haywood and Lauderdale; district 3, Carroll, Humphreys, Benton and Henry; district 4, Hardeman, McNairy, Hardin, Chester, Decatur, Henderson and Madison; district 5, Dickson, Houston, Cheatham, Stewart and Montgomery; district 6, Hickman, Perry, Lewis, Wayne and Lawrence; district 7, Davidson, Robertson, Macon, Sumner, Wilson and Trousdale; district 8, Williamson, Maury, Marshall, Giles and Lincoln; district 9, Rutherford, Cannon, Bedford, Coffee, Moore and Franklin; district 10, Clay, Pickett, Overton, Jackson, Smith, Putnam, White, Van Buren, Warren, Morgan, DeKalb and Grundy; district 11, Cumberland, Loudon, Roane, Hamilton, James, Meigs, Rhea, McMinn, Bradley, Bledsoe, Sequatchie and Marion; district 12, counties of Campbell, Scott, Union, Claiborne and Anderson; district 13, counties of Jefferson, Sevier, Blount, Monroe and Polk; district 14, counties of Hancock, Grainger, Hamblen, Cocke, Unicoi, Carter, Johnson, Sullivan, Hawkins and Greene.

KENTUCKY DIVISION

District 1, counties of Fulton, Graves, Hickman, Carlisle, Ballard and McCracken; district 2, counties of Calloway, Marshall, Livingston, Trigg, Lyon, Caldwell and Crittenden; district 3, counties of Hopkins, Webster, McLean, Daviess, Henderson and Union; district 4, counties of Christian, Muhlenberg, Todd, Logan and Butler; district 5, counties of Ohio, Grayson, Hancock, Breckenridge, Mead and Hardin; district 6, counties of Simpson, Allen, Warren, Edmonson, Hart, Larue, Metcalfe, Barrey and Monroe; district 7, counties of Bullitt, Jefferson, Nelson, Spencer, Shelby, Oldham, Henry and Trimble; district 8, counties of Casey, Marion, Washington, Mercer, Boyle, Lincoln and Garrard; district 9, counties of Taylor, Green, Adair, Cumberland, Russell, Clinton and Wayne; district 10, counties of Pulaski, Laurel, Whitley, Knox, Clay and Bell; district 11, counties of Rockcastle, Jackson, Owsley, Lee, Estell, Madison, Lark, Montgomery, Powell and Wolfe; district 12, counties of Jessamine, Fayette, Woodford, Anderson, Franklin, Scott, Harrison, Nicholas and Bourbon; district 13, counties of Owen, Carroll, Gallatin, Boone, Grant, Pendleton, Campbell and Bracken; district 14, counties of Robertson, Mason, Fleming, Bath, Morgan, Menifee, Elliott, Rowan, Lewis, Greenup, Carter, Boyd and Lawrence; district 15, counties of Harlan, Leslie, Perry, Letcher, Knott, Floyd, Pike, Brethitt, Magoffin, Johnson and Martin.

CALIFORNIA DIVISION

District 1, counties of San Francisco and San Mateo; district 2, counties of Alameda and Contra Costa; district 3, counties of San Joaquin and Calaberas; district 4, counties of Santa Clara, Stanislaus, Tuolumne, Mariposa, Mono, Fresno, Merced, San Benito, Inyo and Madera; district 5, counties of Santa Cruz, Monterey, San Luis Obispo, Santa Barbara, Kern, Kings and Tulare; district 6, counties of Ventura, Los Angeles, San Bernardino, Riverside, Orange and San Diego.

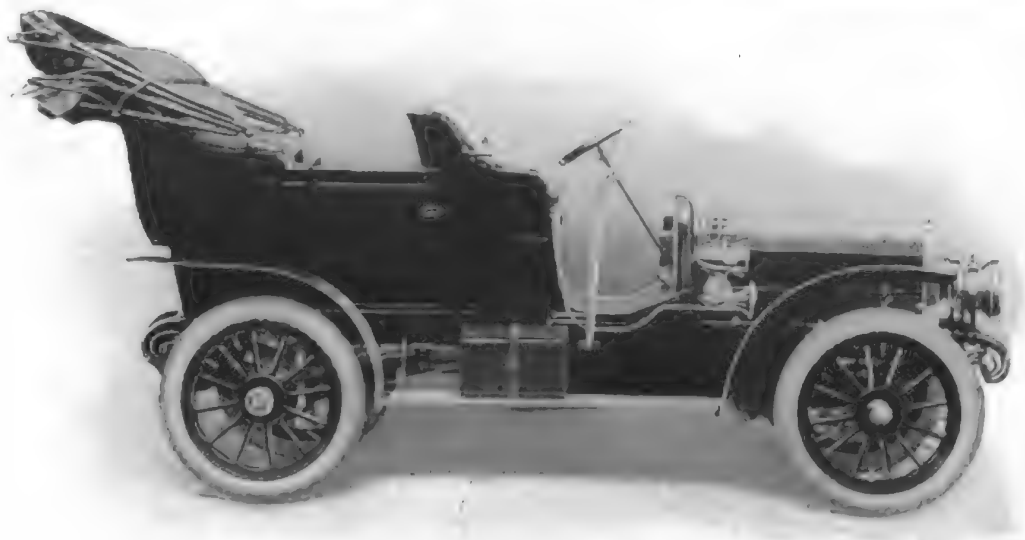
WINTON



Up-keep Reduced by Winton Model K Lubrication

Why lubricate the bearings of a motor car?

Because two metal parts rubbing together would soon be ruined by friction and wear.

How does lubrication prevent friction and wear?

Proper lubrication forces oil into the bearings so that a film of lubricant separates the moving parts. Hence these parts do not touch and cannot wear. But the oil does wear.

So you must choose whether you want a car that wears out its expensive steel and brass bearings, or one that wears out oil, which is much cheaper and which preserves the costly bearings.

If the oiling system is faulty, the damage is quite as much as if you had no lubrication at all. Because then both the bearings and the oil are worn by friction.

Economy of Up-Keep demands a perfect system of lubrication.

The Winton Model K has the best system of lubrication on earth.

Oil is fed in adjustable measured quantity to each bearing. Therefore there is no waste of oil. But instead, all the while each bearing gets all the oil it needs.

This oiler feeds only when the engine is in motion. That also prevents waste.

Oil is fed at regular intervals, so that the bearings are never flooded and never starved, but are always sufficiently fed.

But suppose all other oilers had these same points of merit—which they do not have. There are still other exclusive features that make Winton Model K lubrication infinitely the most positive, reliable and expense-saving.

First—There are no valves to clog and get out of order.

Second—Oil is not fed by gravity nor by air pressure, but by mechanical force. Clogged tubes can stop gravity-fed oil before it ever gets to the bearings. And air pressure can leak so that the oil stands idle in the tubes. But the Winton Model K lubricator exerts mechanical pressure so powerful that even in the most frigid weather lubricating oil cannot stop in the tubes or in the reservoir (on the dash), but must reach the bearings and there prevent friction and wear. This Winton Model K oiler positively shoots oil to the bearings with the force of a catapult and the accuracy of mathematics. That means money saved to you.

No excuse for buying a car that ruins its own bearings, when you can get the perfectly lubricated, expense-saving Winton Model K.

WINTON MODEL K—Four cylinder, vertical, water-cooled; 4¼-in. bore; 5-in. stroke. Individual clutch transmission. Winton Air Governor. Winton Twin Springs. Lubrication, Ignition and Carburation simple and positive. $2500 f. o. b. Cleveland.
"The typical American motor car."—Americanized Encyclopaedia Britannica.

750 MILES WITHOUT ADJUSTMENT.

Mr. A. L. Stark, Elyria, O., says:
"During the last three weeks I have run my Model K Winton 750 miles. The greater part of this distance was covered in a trip to Rochester, N. Y., and return. The entire 750 miles have been made without a single adjustment and entirely without tire trouble. I find the Model K has ample power to take all but the steepest hills on the high speed. It runs very quietly. I am more than pleased with the way the car handles, and it certainly is a beauty."

Rainier

30-35 H. P.

What is the automobile buyer going to do when he is strenuously told that each and every one of the 1906 cars is THE BEST CAR IN THE WORLD.

He is going to do a little investigating.

He is not going to be attracted nor distracted by the whirlwind of words with which one car after another comes before the public on paper.

When he gets down to business, he will find the RAINIER in the front rank of cars that have won renown and made fast friends by actual achievement. He will find that in every inch of metal and wood, in every working part, in every line, the Rainier as it will take the road in 1906 is the very embodiment of strength, compactness, lightness and beauty—now more than ever "The Pullman of Automobiles."

We want good Rainier agents in all unassigned territory. We can give them a car to sell that WILL sell, and that will make a new salesman of every purchaser. We stand back of the Rainier with the broadest and most liberal guarantee ever given.

Correspondence invited.

ENGINE.	30-35 H. P., 4 cylinders, water cooled.
IGNITION.	Simms-Bosch Magneto—make and break spark.
TRANSMISSION.	Sliding train. 3 speeds forward and one reverse.
REAR AXLE.	Bevel gear drive, clutch driven hub. Ball bearings.
FRONT AXLE.	I Beam section. Ball bearings.
FRAME.	Cold rolled pressed steel, aluminum under bonnet covering entire engine and transmission.
WHEEL BASE.	108 inches.
WHEELS.	Imperial whalebone, grade A 2d growth hickory.
TIRES.	Continental 34x4.
VALVES.	Mechanically operated, inlet and exhaust interchangeable.
CARBURETER.	Float feed, requiring no adjustment.
BRAKES.	Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
BODY.	Full aluminum, double side entrance.
EQUIPMENT.	Two head lights, 2 side lights, 1 rear light, 1 horn.

Price, $4,000

The 22-28 H. P. will be continued as heretofore, without any changes.

4 cylinders—98 inch wheel base—La Coste coil. French battery. Continental Tires. Aluminum side door body.

Price, $3,500

BOTH MODELS GUARANTEED FREE OF REPAIRS FOR ONE YEAR

The world's broadest and most liberal automobile guarantee.

Landaulet bodies for immediate delivery. Limousines for November and December delivery.

Type G Four-cylinder Light Touring Car

Air-cooled shaft drive. Sliding gear transmission. Three speeds and reverse. New and perfect disc clutch. Force-feed oiler on the dash. Four or five passengers. Side doors. 88-inch wheel base. 12 "Franklin horse-power." 1,500 pounds. 35 miles per hour. $1800, f. o. b. Factory.

Full head and tail-light equipment.

Franklins are the most economical of all motor cars. Franklin air-cooling is one of the things that make them so.

Franklins use less oil than many water-cooled cars; perhaps more than some; probably about the average. But if they used twice as much as the biggest they would still be the most economical of all motor cars.

They save on fuel and repairs. They save enormously on tires.

Any car uses from ten to twenty times more gasoline than oil; and the price of a good tire would supply oil for over ten thousand miles.

It isn't economy to save a nickel and waste a dollar. Economy is in saving the dollar; and still getting the results.

In the famous Long Island Economy Test an air-cooled Franklin won the trophy in competition with fifteen other cars—nearly all water-cooled.

The winning Franklin carried 4 people 190 miles on less than a gallon of oil, less than 10 gallons of fuel; and at a total expense of $3.22.

The only car that came near this economy record was another air-cooled Franklin.

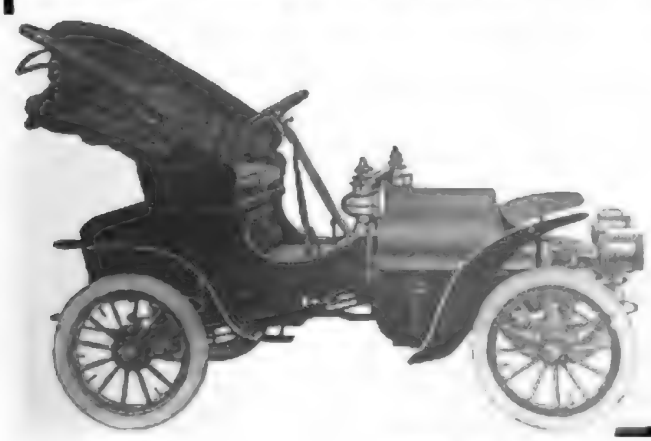
While, curious to tell, the one car which consumed precisely the same amount of oil and nearly twice as much fuel as the winner and required an expense of $5.28 to carry the same people the same distance—was made by the very manufacturers who are just now howling loudest against air-cooling economy.

People who live in glass houses should dress in the dark

4 Models for 1906

Send for the book

H. H. FRANKLIN MFG. CO., Syracuse, N. Y., *M. A. L. A. M.*



Type E. 4-Cylinder Runabout or Gentlemen's Roadster

Two passengers only. No tonneau can be attached. 12 "Franklin horse-power." Air-cooled engine. Wheel base 81½ inches—7½ more than last year. Roomier, more graceful; easier riding. Force-feed oilers on the dash. Change-lever inside the car and forward. Specially convenient when top is on. 1,100 pounds. One combination ironing which will accommodate canopy, cape or victoria top and glass front. 40 miles an hour. $2000, f. o. b. Factory.

Full head and tail-light equipment.

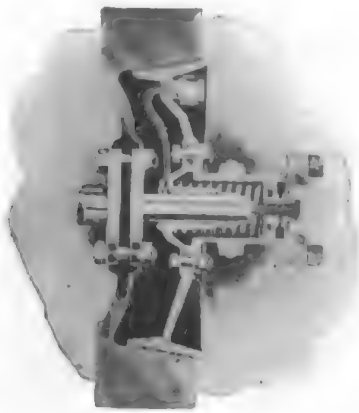
OLDSMOBILE

¶ Without going into minute details of construction of Model S (which we will gladly send you upon application), we will mention some of its features which stand out prominently, giving this machine its **marked individuality**

The Motor is of the four-cylinder, vertical, water-cooled type, developing 24 to 26 H. P. The cylinders are cast in pairs and are water-jacketed in such a manner that only the cylinders themselves are cooled, but the valves as well. All material used in the construction of the motor, as well as in every part of the machine, is carefully analyzed and tested, and each cylinder is thoroughly inspected. In common with the most up-to-date cars the motor may nearly always be started from the seat, thus doing away with the necessity of cranking. This is a very attractive feature.

The Crank Shaft is of special carbon steel and runs in long bearings. An oil pump in constant operation forces oil to all main bearings.



Cross Section of Clutch

The Transmission is of the sliding gear type, having three speeds forward and one reverse.

The Clutch is of the "dish pan", or cone type, fitted with leather surface, and a simple spring device which allows the load to increase gradually, thus doing away with any jerking in starting.

The Control is by single lever within easy reach of right hand. The whole transmission is enclosed in an oil-tight case and runs in oil bath.

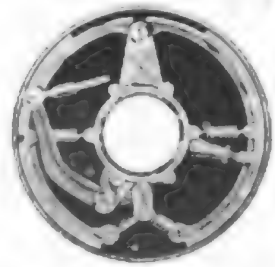
The Springs are of flexible, half elliptic type, giving exceedingly easy riding qualities. Length, 36 inches front, 48 inches rear.

The Ignition consists of four unit coils operated by dry cells, storage battery or magneto. The commutator is very accurate in its action and is instantly accessible—**accessibility of parts being a feature of this car.** The spark plugs are easily examined and connections quickly and positively made.

The Axles are fitted with Timken Roller Bearings throughout, and are made sufficiently heavy to withstand hard usage. **The rear axle is fitted with bevel gear drive, eliminating chain trouble.**

Oldsmobile Model S

The Wheels are 32 inch, equipped with 3½-inch pneumatic tires. Four-inch tires for unusual or extraordinary service can be had on special order.

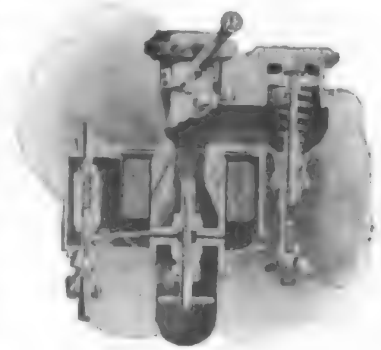


Cross Section of Rear Hub Brake

The Brakes. Each rear wheel is fitted with an effective toggle joint brake, which is absolutely positive in action, the large friction surface insuring a brake that brakes. Transmission brake is operated by foot lever.

The Steering Gear is of the "worm and nut" type, controlled by 16-inch wheel placed in very comfortable position. Spark and throttle control levers are located just below the wheel on right-hand side of the post. In addition to the regular throttle an accelerator pedal is provided, whereby speed may be momentarily increased.

The Carburetor is of the most efficient and best type. Particular attention has been given to this most important part of an automobile power equipment. Our new and improved carburetor, has several distinctive features; for instance, the gasoline nozzle instead of being placed in a mixing chamber by itself, runs up through the center of the float chamber. An auxiliary air inlet is also provided, which insures the maintenance of a perfect mixture. The result is a large decrease in fuel consumption and increased power.



Cross Section of Carburetor

The Water Circulation is by gear pump driven from crank shaft. Water is forced around water-jacket and out into the radiator mounted in front of car. Sufficient cooling surface has been provided, so that the temperature of the water is always kept well below the boiling point.

¶ Next week we will take up these and other distinguishing features of the Oldsmobile more in detail and show what they mean to you as a dealer or a buyer. Model "S" has a well-balanced, rangy exterior, distinctive and irresistably attractive. It has the equally well-balanced internal construction. It's the car that commands your attention on sight and holds your interest on demonstration. Orders are now being entered for these cars.

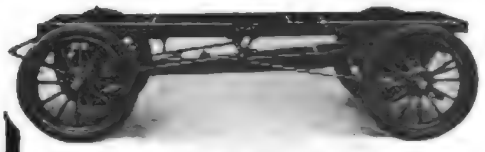
THE MARMON

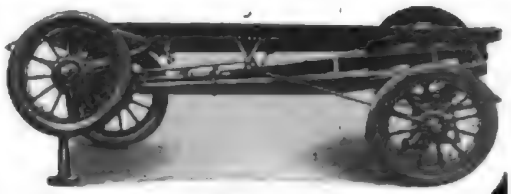
"A Mechanical Masterpiece"



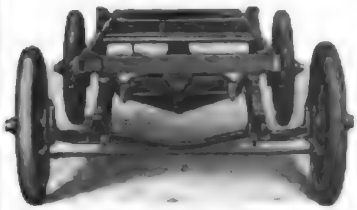
Side View—Normal Position.

No Jolts for Passengers

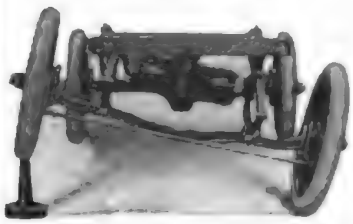
No Strains for Mechanism



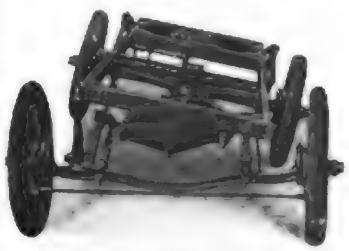
One Front Wheel and Opposite Rear Wheel Each Raised Over a Foot. Not a Strain Anywhere.



Front View—Normal Position.



Front Wheel Raised Over a Foot, Body Level.



Rear Wheel Raised Over a Foot, Lower Frame Level.

THESE pictures afford a clear view of the mechanical beauty of a car that is in all ways superb.

They show how easily the Marmon meets and overcomes the roughest road conditions, through its remarkable flexibility.

The first effect realized is the freedom from jolts and vibrations—a very luxury of motion over any and all roads, unknown in *any other car.*

More important still, no matter how rough the road, the running gear adjusts itself naturally to the ruts and bumps without subjecting the mechanism to binding or twisting strains. This is true of *no other car* regardless of price or prestige.

To determine how any other car would act under similar test, nail three legs of a chair securely to the floor and try to lift the remaining leg. Make some slight allowance in favor of the car because of its springs, and then charge against it the costly mechanism it carries and the great variety of roads over which it must travel, often at high speed. The entire mechanism is thus racked by twisting strains and ruinous friction in any such rigid construction, and not the least of the sufferers are the tires and the passengers.

The Marmon elasticity is supplemented by full elliptic springs but is primarily due to a patented exclusive feature.

Double Three-Point Suspension

Luxurious solid cast aluminum body on one frame, power plant on another frame, *each frame* suspended on three *pivotal* points. Raising or lowering one wheel does not affect the other wheels. No matter which wheels are raised, no matter how the two frames are tilted, the entire power plant and rear axle are *always* in perfect alignment. Straight and rigid shaft drive (without any sort of flexible couplings) delivers a greater percentage of power to the wheels than is possible in any other scheme of transmission.

The Marmon oiling system (fully patented) has no equal. Starting and stopping with the engine, a constant and uniform flow of oil is forced through the hollow crank shaft directly into all the main engine bearings, crank and piston pin bearings. Simple, unfailing, very economical; has no adjustments. Spur planetary transmission (clutches included) running in oil.

Four cylinder motor; perfectly air-cooled. Spark and throttle control on steering wheel.

The Marmon is stylish, strikingly handsome and very quiet. It is "A Mechanical Masterpiece" in whole and in every part, replete with distinctive features that appeal instantly and forcefully to all who seek a really superior car.

Side View—Front Wheel Raised Over a Foot.

Rides Like a Sail Boat

Side View—Rear Wheel Raised Over a Foot.

SUPPOSE you bought a car last winter at the Show, received it about a month later than it was promised—paid about $2,000 for it; spent $500 more or less on tires and repairs, and now find that the maker is going to stop making this car, or is going to cut the price $500 for next year—your car is now worth about $1,200, isn't it? and your summer's fun has cost you $500 plus $800 (depreciation), which is $1,300—which for six months use is over $200 a month—pretty steep, when you figure it up this way, isn't it?

Suppose you had bought a Stevens-Duryea at $2,500, spent $25 for tires and repairs (for that's all they have averaged)—It is not taken off the market at the end of the year, it is not cut in price for next year—you don't have to trade it in at a sacrifice of 40 per cent—(about a thousand dollars) in order to have an up-to-date car for next year.

Which car would you consider a better bargain?

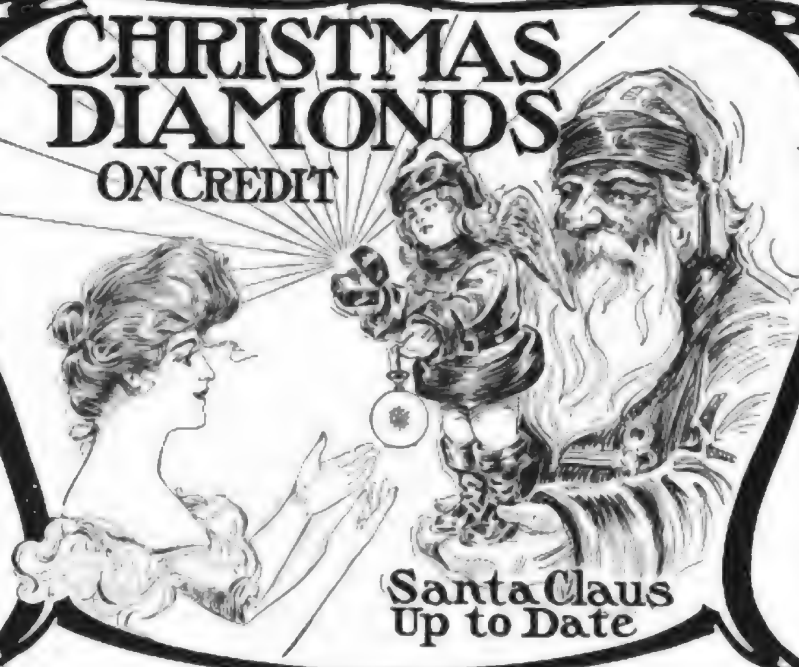
CHRISTMAS DIAMONDS ON CREDIT



Santa Claus Up to Date

Love Is the Real Santa Claus

It is our love for our dear ones that makes Christmas a truly Happy Season, and that brings to one and all the joys of a Christmas remembrance.

The Loftis System at Christmas Time

Is a great and Timely Convenience to thousands, as it enables persons in all circumstances to make beautiful and appropriate Christmas Gifts. Everyone at Christmas Time is anxious to give their loved ones handsome Christmas Presents, but it is not always convenient. THE LOFTIS SYSTEM of Credit MEANS CONVENIENCE. That is the only way in which it differs from a cash transaction. There is no delay, no security, no publicity. It simply means a matter of confidence and convenience to honorable people. Write Today for Our Handsome Christmas Catalogue.

You Are Welcome to Credit Whether you are a moderate salaried employee or a wealthy employer. The Loftis System makes any honest person's credit good by adjusting terms to meet their earnings or income. Do not think that you must give a cheap, ordinary present because you can only spare a few Dollars just now. With five or ten Dollars for a first payment you can give a beautiful Diamond which will last forever, enhance in value and continually bring pleasant thoughts of the giver's generosity.

Our Handsome Christmas Catalogue is resplendent with thousands of beautiful Jewelry suggestions for Xmas Gifts. Diamond Rings, Pins, Brooches and Earrings, Chatelaine Watches, Silverware, etc., for Wife, Sweetheart, Sister or Mother. Sparkling Diamond Studs, Scarf Pins and Cuff Buttons, Watches, Match Safes, Fobs, etc., for Husband, Father or Brother. With its aid you can select, in the privacy of your own home, suitable Gifts for all, both old and young. May we not have the pleasure of sending you a copy?

True Merit Wins! In competition with the entire world (both the United States and foreign countries) at the St. Louis World's Fair, our Goods, Prices, Methods and Terms won the Gold Medal, the highest award. No stronger endorsement of THE LOFTIS SYSTEM could be given.

This, together with the fact that we are the largest and oldest established Jewelry House in the United States, and that we refer you to any bank anywhere or any commercial agency as to our reliability and standing should interest you in our liberal offer to send you our Handsome Christmas Catalogue and to extend to you our most liberal terms as an aid to you in making Christmas a truly Happy season. Write today for Catalogue.

Do Your Christmas Shopping Now. Let us suggest that you do your Christmas Shopping now, conveniently and leisurely in the privacy of your own home. Select from our Handsome Catalogue the articles you desire and we will send them to you for examination and approval. If satisfactory retain them, paying one-fifth the cost and the balance in eight equal monthly payments. If not, return to us. We take all risks and pay all express charges. Now is the time to secure the choice selections and have ample time to inspect the goods. All orders filled promptly. Write Today for Our Christmas Catalogue.

There is no better investment than a Diamond. They have increased in value more than twenty per cent during the past twelve months and Diamond experts predict an even greater increase during the coming year. Write today for Our Christmas Catalogue.

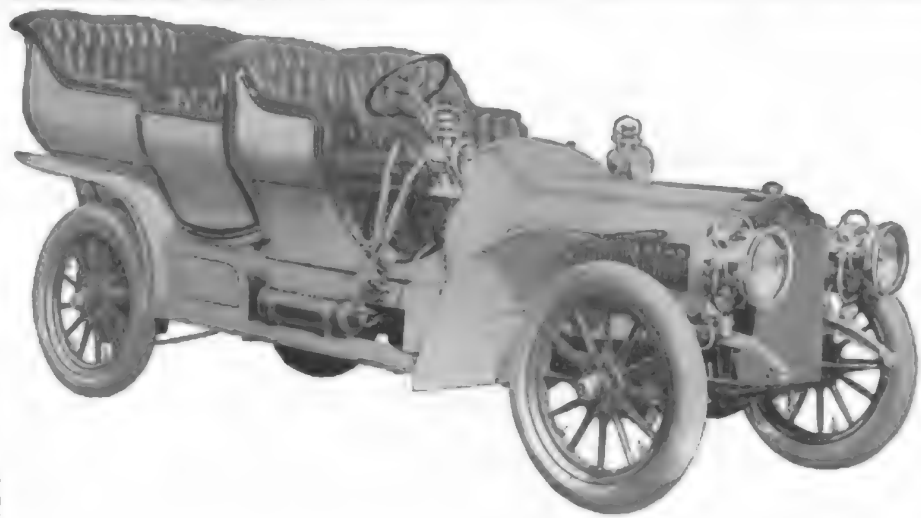
The New Thomas

Greatly Exceeds My Most Sanguine Expectations Experts Say It Is a Wonder



NO customer is so critical or hard to please as the manufacturer, who, regardless of cost, absolutely determines to do his utmost to build the best car in the world.

But, when an ordinary Stock Touring Car, without special preparation or intention, runs sixty miles an hour on the level, and climbs a 10 per cent grade on the high speed at forty miles per hour, within an hour after it first leaves the shops, it is something that not one car in a thousand will do.

Under favorable conditions we should do sixty-five miles an hour.

I am more pleased than ever with its speed, hill-climbing, quiet operations and mechanical superiority, and cordially urge disinterested automobile experts everywhere to rigidly investigate our claims, and compare our material, workmanship and design with the highest-priced cars in the world—we will win the verdict.

E. R. THOMAS.

Motor Age Circulation

Here is a testimonial from a firm which systematically checks all returns from advertising—one of the most convincing and valuable testimonials a publication ever received—read it

ROBERT INSTRUMENT CO., 56 Shelby Street.

MOTOR AGE, Chicago, Ill. Detroit, Mich., Nov. 2, 1905.

Gentlemen: Of all the publications relating to automobiling (and you will agree with us there are a few), we have shifted them thoroughly and from the entire "bunch" but four remain.

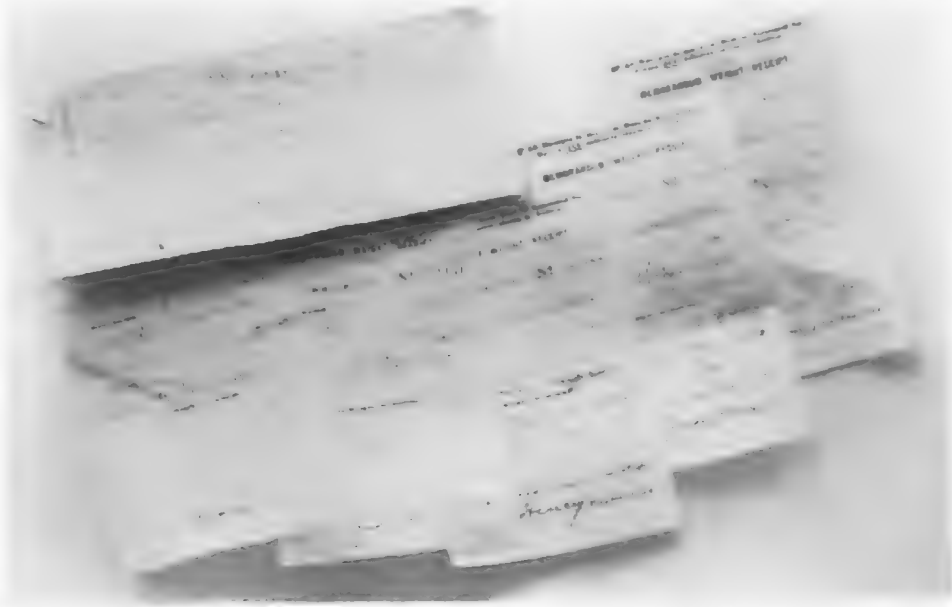
Of these four we have divided into two parts, "east" and "west." MOTOR AGE is west and the other three east.

The writer has practically "traced" every inquiry and order. The following form is made out weekly, and more often MOTOR AGE is first in amount of inquiries, orders and quantity.

The following is a copy of the last week, in which MOTOR AGE is again first:

	Inquiries.	Orders.	Quantity.		Inquiries.	Orders.	Quantity.
MOTOR AGE	24	15	32	HORSELESS AGE	12	9	14
CYCLE AND AUTO	16	11	21	AUTOMOBILE	9	8	19

Yours very truly, (Signed) ROBERT INSTRUMENT CO.
H. A. Abrahamson.



The above cut represents Post Office Receipts for 6,399 pounds net, of issue of October 26, 1905.

Each paper, including wrapper, weighed an average of 9½ ounces.		
6,399 pounds divided by 9½ ounces equals	10,777	papers
We also sold, non-returnable, to Western News Co. and news stands direct	674	"
Mailed under stamps to foreign addresses	90	"
Retained for office sales and distribution	350	"
Sold to Knight & Kelbourne for private circulation	600	"
Total for week of October 26	12,491	"
October 19, page 50, statement for October 5	12,239	papers
October 26, page 44, statement for October 12	12,868	"
November 2, page 48, statement for October 19	12,522	"
Statement above, for October 26	12,491	"
Average weekly edition for October issues, 12,530.	50,120	"

STATEMENTS PREVIOUSLY PUBLISHED

July—Average weekly circulation	11,755	Total	47,020
August—Average weekly circulation	12,468	"	62,393
September—Average weekly circulation	12,535	"	50,141
October—Average weekly circulation	12,530	"	50,120
Average for 4 months, 17 issues	12,334	"	209,674

We have in preparation a pamphlet containing proof of all statements previously published, with other information regarding circulation, together with copies of a few testimonials received by MOTOR AGE from advertisers and subscribers, which will be ready in the near future.

Having firmly established the fact that MOTOR AGE leads from the standpoint of circulation, we shall now cease the publication of these statements among our advertising pages, and render reports direct to interested parties each month.

We guarantee a Circulation of 12,000 Weekly

CADILLAC SALABILITY

Here's the 1905 Sales Record of one of the principal cities of the Central States
(POPULATION ABOUT 300,000)

	No. Lines Handled	Total Cars Sold
Dealer No. 1	Two	12
Dealer No. 2	Two	11
Dealer No. 3	Four	4
Dealer No. 4	Four	1
Dealer No. 5	Two	2
Dealer No. 6	One	6
Dealer No. 7	One	0
Dealer No. 8	One	4
Dealer No. 9	Two	0
Dealer No. 10	One	2
Dealer No. 11	Two	1

Total sales by above dealers 43 cars

THE CADILLAC DEALER SOLD 51 CADILLACS

Or about 15 per cent more Cadillacs than the sales of all the other dealers combined

There's a Reason For This and It's Not Hard to Guess It

We're Talking 1906 Business

CADILLAC MOTOR CAR CO., *Member Association Licensed Automobile Manufacturers.* **DETROIT, MICH.**

Will you write us about the

1906 Agency for the Wayne?

The Wayne Agency for 1906 is a good thing. The Wayne Cars were extensively advertised last year in all the leading magazines and trade papers. For 1906 we have made arrangements for a campaign of cooperation with our local agents which will mean practical assistance in selling Wayne Cars. We realize that to get good agents it is necessary for the agent to have a proposition on which he can make money, and the Wayne agency proposition is one which it will pay you to investigate.

The Wayne line for 1906 is comprised of cars that have proved their ability to stand hard usage by three years' road service.

We have not changed the Wayne principle of construction because nobody has yet been able to show us anything better tho' our cars contain all new improvements and are strictly up-to-date (no old models built over).

WRITE US AND FIND OUT WHAT WE HAVE TO OFFER, BEFORE YOU FORGET

DR. J. B. BOUCHER.
80 CHESTER CAR AVE.,
TELEPHONE CALL 1000.

Hartford, Conn., Oct. 23, 1906.

The Hartford Rubber Works Company,

Hartford, Conn.

Gentlemen:-

You may be interested to learn that the Hartford Dunlop tires fitted to my two cylinder Knox which I have driven all season, have thus far covered a little over 3500 miles. I have had no trouble with the exception of four punctures. I am much pleased with the tires both as to their wearing qualities and the ease with which they can be removed and replaced.

I do not enjoy punctures but must admit that they are robbed of half their horror since using the Dunlop.

Very respectfully yours,

J. B. Boucher M. D.

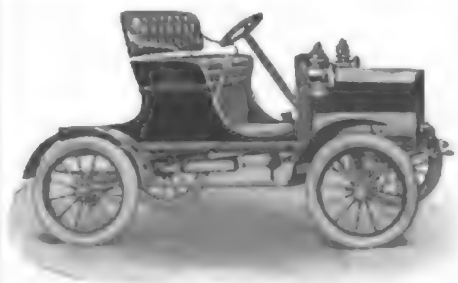
Just a Few Details

of our Models G and H which we could not mention in our announcement in Motor Age October 19 and 26: First a word about 2 cycle motors. In this construction all valves, cams, cam shafts and all gearings are entirely omitted as compared with 4 cycle motors. 75 per cent less working parts, 75 per cent **less** trouble. Our motor is as quiet as is possible to make a gasoline car. Both models, G and H, have 2 cycle, 2 cylinder vertical motors under hood in front. Beautiful body design, materials all of the very best, planetary transmission. **One lever controls all speeds and brake.** Model G lists at $650, Model H lists at $750.



Model "G" 10 h.p. Runabout

Change Tires—Thirty Seconds

Goodyear Universal Rim

SUPPOSING you were 25 miles from home, and your tire exploded. And you hadn't another with you. And when you stopped at the garage, the man said: "I'm sorry, but I haven't a single tire of that make."

Wouldn't it make you mad?

Of course it would, if you had an *ordinary* rim.

But if you had a Goodyear Universal Rim, you would smile and say: "Bring on any old tire, as long as it's a clincher, my rim will take it." And in less than three minutes you would be enjoying the scenery once more.

Because it *isn't* an all-day job to take off and put on a tire when your car has Goodyear Universal Rims. Just jack up the wheel and in 30 seconds the old tire is off, and in another 30 seconds the new tire, ANY kind, is on. You need no tools but the hands. And are "fixed up" and on the road while the man with *ordinary* rims is hunting for his crowbars and levers.

Figure 1

You see the flange comes right off on Goodyear Universal Rims like Fig. 1.

And then a 36-inch tire (for example) slides right on to the 26-inch rim like Fig. 2, as easy as you would put on your hat. On an ordinary rim you would have to pry that 26-inch tire over a 27-inch flange. You know what a profanity-inspiring job that is and it doesn't do the tire any good either.

Figure 2

Now this is all there is to taking off and putting on a tire when you have Goodyear Universal Rims. See how simple and easy it is.

The rim is made up of four parts, like Fig. 3.

Figure 3.

Nos. 1 and 3 are the removable flanges (rings) which can be adjusted to any clincher tire.

No. 2 is the base of the rim attached to the felloe of the wheel. It can be used without fitting on any standard wheel built for standard clincher rims.

No. 4 is the binding ring which holds the flanges in place.

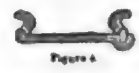

Figure 4

If you have decided to relieve yourself of all tire troubles and in consequence ride Goodyear Detachable Auto Tires, a section of the rim when put together, would be like Fig. 4.

Or, if you ride an ordinary clincher tire, the rim section would look like Fig. 5.

Figure 5.

The ring which holds the flanges in place is split at a point alongside the valve stem, like Fig. 6.

It can't be removed (and, of course, the tire can't come off) while the flange presses against it. This flange is kept tight against the ring by a plate which slips over the valve stem like Fig. 7.

Figure 6

When you wish to remove the tire, loosen the nut which holds the valve stem down, and push the stem up through the rim. This pushes up the plate and lets the flange ring slide inward like Fig. 8.

Then lift out the binding-ring, slip off the flange, and pull off the tire.

Time, 15 seconds. No tools but the hands.

Figure 7.

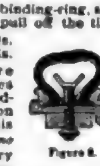

Figure 8.

Those who are weary of tire troubles are specifying Goodyear Auto Tires on Universal Rims. This equipment *costs no more* than the ordinary kind, and multiplies the pleasures of motoring many times.

Ask for our "Good News Book" and find out all the good points of the Goodyear Auto Tire and Universal Rim. It's of vital interest to the Manufacturer, Dealer or User who is satisfied with nothing but *the best*.

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

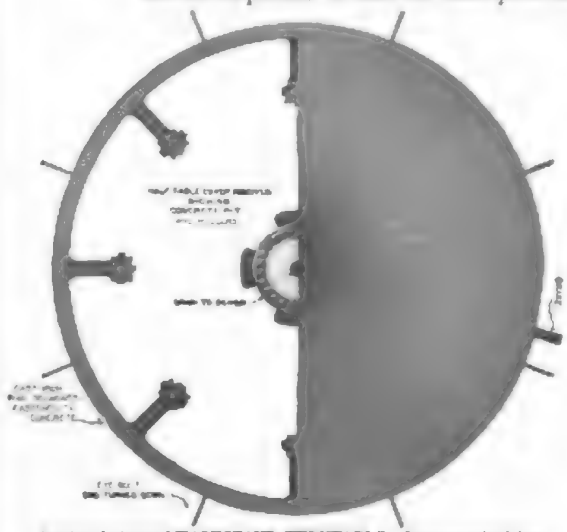
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.



Sectional views of WASHSTAND-TURNTABLE. Patent applied for.

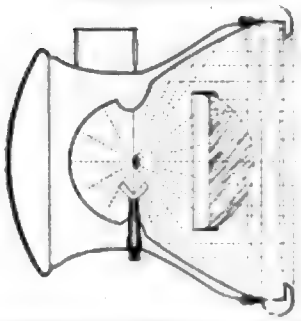
THE RE-INVENTION OF A RELIC

The Ancient



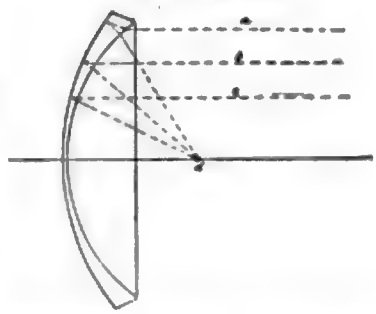
Abandoned by Rushmore ten years ago, patent expired.

FAILING IN THEIR EFFORTS TO IMITATE THE MODERN RUSHMORE SEARCHLIGHT, THE LANTERN MAKERS NOW TAKE UP THE ANCIENT DESIGN THAT RUSHMORE ABANDONED BEFORE AUTOMOBILES WERE KNOWN.

The best proof that the Rushmore Lens Mirror Searchlight has driven the lantern makers to the wall is the fact that they are now trying to create a demand for the old style metal reflector light fitted with a spherical cup and a little bull's-eye lens.

This "parabola-lens" reflector was patented and was manufactured by S. W. Rushmore over seventeen years ago. The patent has expired. Over a thousand large "parabola-lens" marine searchlights were sold by us, but we abandoned the design ten years ago when we perfected the aplanatic lens mirror, which is now the standard in all the navies of the world.

The Modern



Aplanatic Mirror, perfected by Rushmore ten years ago, now standard of the world.

We guarantee the 8-inch Rushmore searchlight with a three-eighths foot burner to give more light than the big twelve-inch "parabola-lens" light with its big three-quarter foot burner. It is an eight to one proposition. The Modern against the Ancient.

A brand new reflector shows up pretty well on the first night it is lighted, but after that the silver plating blackens and no amount of scrubbing can improve it.

The drowning man grasps at straws. The drowning lantern maker makes a last effort to float himself on the time honored and abandoned metal reflector.

GOODRICH TIRES

WITH THE BAILEY TREAD

"We wish to congratulate you because of the splendid way your Goodrich-Bailey Tires have given satisfaction and service to us and our customers. They not only wear longest with the least show of use, but seem to be free from weak spots, such as fabric breaks and rubber and fabric parting company on the Tread, *the latter seems to be a sure thing on some tires that we know of.*

We are looking to 1906 Goodrich and expect to be partial to them because we believe they deserve it, if their previous reputation is any criterion to go by."—*Ashville Cycle and Auto Company, Sept. 23, 1905.*

THE BAILEY "WON'T SLIP" TIRE. Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyright mark have been inspected and pronounced perfect. We guarantee our tires only on rims so branded.

A RECORD OF RECORDS

WE entered the Vanderbilt Cup Elimination Race for **only one** purpose.

We wanted to demonstrate that a **HAYNES Touring** Car could—**and would**—do in competition with racing monsters.

WE had been making what some people called extravagant claims for the **HAYNES**—and we wanted to prove them.

They **are** proven.

The **HAYNES** finished as neat a race as was ever witnessed and **won a place** entitling it to representation on the American Team.

The **HAYNES** will be **the** selling car of next season.

This record is conclusive evidence to the intending purchaser.

We want a few **good** agents.
Write **quick** for particulars.

Orders for this car are booked in the order of their receipt.

The Incomparable

WHITE

The Car for Service

ANNOUNCING BULLETIN No. 11

The most notable victory of the year scored by a stock car was the record trip of George A. Hensley in a White steamer from San Francisco to Los Angeles—a distance of 470 miles—in 21 hours and 12 minutes. This record superseded that of a 30 h. p. machine which had previously negotiated the distance in 24 hours and 56 minutes.

Three months have elapsed since Mr. Hensley's record drive and his record is still unapproached.

Digitized by Google

The "short" fracture shown above, while characteristic of poor oak, happens to show the fracture of poor hickory. The other fracture shows the quality of "Imperial" spokes.

Talks on Wheel Making No. 6

A bursted tire is robbed of its danger if the car is equipped with "Imperial" wheels.

When you see an unpainted Imperial wheel examine it closely and you will be impressed not only with the fine quality of its hickory, but with the strength of the spoke arch construction and the careful attention which has been given to every minor detail of the general fitting of the wheel, as, for example, the unusual insurance afforded against accidental splitting of the felloe.

Our success in wheel making is based upon the high development and application of the fundamental principles of the art—not upon geometrical novelties.

The excellence of "Imperial" wheels is based upon the perfection and refinement of orthodox methods.

Another PREMIER Triumph

At the races held at Indianapolis Saturday, Nov. 4th, the PREMIER 16 H. P. *regular stock car* set a new mark for cars of its power, making 100 miles in 135 minutes without stopping, thus breaking all records in its class. In making this run *less than four gallons of gasoline* were consumed, and the last 20 miles were the fastest of the hundred. There was a variation of only 5 seconds between the fastest and slowest miles.

This same car, without a particle of adjustment, participated in five races immediately succeeding this performance, winning three firsts, one second and one third against cars all of which were *much* higher powered and priced.

These performances demonstrate initial and continued good performance, speed, reliability and economy. No better evidence of superior merit can be adduced.

The Premier line for 1906, with its additions, offers highly attractive features. We would be glad to tell you about it if you will communicate with us.

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

THE OSCAR LEAR AUTOMOBILE CO.
Automobiles
Corner Fourth and Gay Streets

Columbus, Ohio, September 5, 1905.

The Steel Ball Co., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6-day endurance and economy run at Long Branch. In a run of 3,202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of all this we fully realize and its help in getting this record for our FRAYER-MILLER car. Yours truly,

THE OSCAR LEAR AUTOMOBILE CO.

THE STEEL BALL COMPANY
840 Austin Avenue

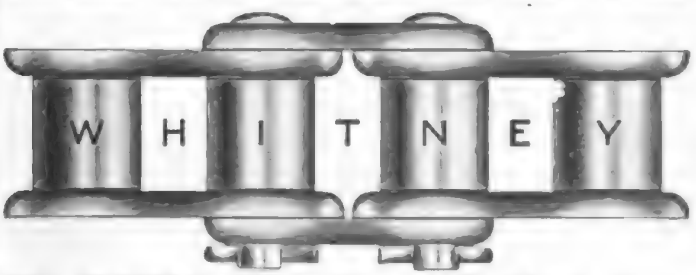
CARE OF MOTOR AGE, CHICAGO

1906 Model "WHITNEY" Detachable Roller Chain—Patented



THE WHITNEY MFG. CO., Hartford, Conn.

Investigate "Whitney" Standards for dimensions of Roller Chains. They have been adopted by most of the leading American Automobile Manufacturers and have been recognized by other chain manufacturers at home and abroad. If they are made universal six sizes of chain can eventually take the place of over thirty sizes used in the past.

Our new line of chains for 1906 Model Cars have been adopted by a large number of the leaders and they are making remarkable records for quiet running and efficiency.

If interested send for new catalog dated November, 1905.

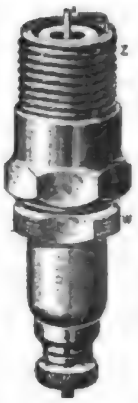
Free demonstrations on request at our agents.
Agents in all principal cities.

KNOX AUTOMOBILE CO., Springfield, Mass.

Largest and Oldest Manufacturers of Gasoline Commercial Cars
Member of A. L. A. M.



The long insulating surface
on the

"Soot-Proof" Plug

makes it impossible for the current to traverse a short circuiting deposit of soot in preference to jumping the spark-gap.

Since to do the former would involve overcoming a much higher resistance than applies in the latter case.

A constant

"Big Fat Spark"

Oil, Heat and Soot-Proof, non-short circuiting self-cleaning.

C. A. MEZGER
203 W. 80th St. ***NEW YORK***

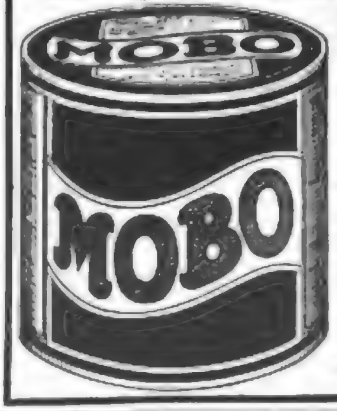
The Care *of the* Car

Washing the body of the machine, keeping the polished surface free from lubricator, road dust and gutter muck is just as essential to the life of an Automobile, as is the attention given the running gear.

Mobo, the new cleanser for Automobiles, will easily and quickly remove grease, dirt and grime and all traces of a hard run, without dulling or scratching the highly polished surface.

MOBO

is unlike common soap, as it positively contains no free alkali. Being a preservative as well as a cleanser, it prevents varnish or paint from peeling or cracking, and adds a fine gloss to the surface.



Mobo may be used with profit on leather goods, harness or woolen fabrics. Cannot harm the most sensitive skin, as it is a purely vegetable oil preparation and absolutely contains no free alkali. Put up in 2-lb. and 8-lb. cans; also in tubs, half barrels and barrels.

If your supply man does not keep *Mobo*, send us his name and address, and we will see your wants are supplied.

JOHN T. STANLEY
New York.

THE

Gray Autochime

PATENTED

Most Practical of Automobile Alarms

Is rapidly forging to the front in popular favor. It is blown from the exhaust, giving a deep, rich, musical tone pleasing to all ears, is operated by a foot pedal, and being small and compact takes up little space.

It is made of finely polished brass, has no soldered parts to melt or jar loose and is very durable.

Your horn cannot be stolen
If you use an Autochime

Why not order one TODAY?

THE

STANDARD AMERICAN COOLER

The Whitlock Cooler

Was used on the *Locomobile Racer that finished third in the Vanderbilt Cup Race.* It was never touched during the race. *It did its full* duty. It held its water and kept the engine cool.

THE ONLY CELLULAR COOLERS MADE IN AMERICA

that were used in the 1905 and 1906 Vanderbilt Cup Racers, also the 1906 Gordon Bennett Race.

Quality and efficiency only figure in an event of this importance. We make coolers of the **HIGHEST EFFICIENCY.** The leading makers of automobiles have recognized this fact by adopting

THE WHITLOCK COOLERS

continuously for the seasons of 1903, 1904, 1905 and 1906.

The Whitlock Coil Pipe Co.

Hartford ... Conn.

GARFORD TOURING CAR PARTS

The great problem of the hour for the automobile manufacturer is to develop the details of his engine. This study is so absorbing and important that the duty of producing axles and other parts has been left to other specialists.

Our specialty is the manufacture of parts for the very highest class of cars—parts that are as good as life insurance. We make:

REAR AXLE: Independent Shaft Drive, Ball or Plain Bearing, Weight Carried Entirely on Axle Tube

FRONT AXLE: I-Beam Section Nickel Steel Bed, Ball or Plain Bearing

CHANGE GEAR
STEERING GEAR
CLUTCH
DISTANCE ROD AND BRACKET
PROPELLER SHAFT
LEVERS FOR EMERGENCY-BRAKE AND CHANGE-GEAR

Parts of one size are suitable for cars weighing up to 2400 lbs. and of 30 h. p.

Parts of the other size are suitable for cars weighing up to 2800 lbs. and of 50 h. p.

Write for Circular No. 12.

The Expected Revolution Has Come

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should not buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the two cycle two cylinder Elmore engine. Understand—the two cycle two cylinder Elmore engine produces **two impulses every time the flywheel turns.** As you know, the two cylinder four cycle furnishes only one impulse every fourth time the flywheel turns. In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

THE ELMORE MFG. CO., 804 Amanda Street CLYDE, OHIO

Talkin' of the Cost of Up-Keep

THE ROYAL Tourist Cars are run by their owners at less repair expense than any other motor cars built. You simply do not have repairs Ask an owner of a Royal how much it costs him to maintain it. Then compare his figures with any other car, big or little, touring or runabout. Royal owners everywhere. Ask one.

Why is this? Every part is put together with proper care. Money is freely spent for best materials. That's why.

That is also the reason why we were able to roll our cars over in the Vanderbilt Trials and finish among the first.

THE AUTO-METER

on a car tells the speed of travel and the distance traveled. It is absolutely accurate.

"Built Like a Chronometer."

When you are whirling along, a glance at the Auto-Meter before you, tells you **exactly** how fast you are going if your pace be as slow as a fraction of a mile or as fast as 60 miles an hour.
When a trip is finished, the Auto-Meter tells **exactly** how many miles you have gone on that trip.
When the season is over the Auto-Meter tells **exactly** how many miles you have covered during the season.
All this is worth while. Is it not?
Get acquainted with the Auto-Meter. It will lead to lasting friendship.
Write for catalogue and pamphlet, "Indisputable Evidence." The latter gives the interesting experiences of many prominent automobile owners.

CREDIT

WHERE CREDIT IS DUE

(A Remarkable Letter—Read It)

Absolutely at my own expense and without solicitation, I insert this advertisement in MOTOR AGE so that all who care to be truthfully advised on the automobile tire question may purchase with the assurance of obtaining comfort and economy.

When I ordered my 1905 car at the Chicago Automobile Show, I specified Goodyear detachable 34x4½-inch tires.

My 1904 experience with another make proved so distressing, uncomfortable and unreliable, that I made a most careful study of the tire question at the New York and Chicago 1905 shows. I was at that time thoroughly satisfied that the mechanical principle of the Goodyear detachable rim was sound. I now know it to be.

My car with five passengers weighs very nearly 3,900 pounds. From June 1st to October 31st my car traveled 7,211 miles. I have six casings and, to start out with, had seven inner tubes. Two of these inner tubes I returned on October 15th just as I had received them from the Goodyear people, being convinced from my season's experience that I would have no use for them this year.

My repair expense for vulcanizing has thus far been less than $20.00.

My experience has been that of practically perfect comfort, a marvelous showing almost beyond comprehension, no doubt influenced by the following points of perfection.

I have found my Goodyear tires capable of being very easily removed and put on; absolutely water-tight when inflated; safely locked when inflated or deflated, no rim cutting if car is driven judiciously with deflated tires; positively no creeping; a quality of rubber that resists many a cut and puncture, which would puncture or burst other tires.

The above qualifications have invariably enabled me to feel safe when starting on a long journey, I go and return, trip after trip, without a stop, having made a dozen runs of 150 miles each day and several of from 175 to 185 miles from morning until night.

Made a round trip to Cleveland from Chicago after my tires had already run 5,000 miles, without even a puncture, although I voluntarily removed one casing before leaving Cleveland because of a cut in the outer fabric which had caused a sand blister.

Most of my motor friends know this story to be an absolute truth. None of them ever heard of my being in tire trouble. I have had a total of four punctures in the 7,211 miles, and in all this mileage I have only put the pump to the valve two or three times, except when I took off my tires for vulcanizing when needed which only occurred on a very few occasions, one tire at a time.

I feel confident that my six tires will carry me at least 5,000 miles more and I would not be surprised if some of my tires would be on the car at the end of next season, as I can really see no particular wear on them.

If anyone doubts the above statement, I should be glad to prove to him that I have given only absolute facts.

With such a showing as above stated, am I not warranted in spending a few dollars for this advertisement so that the merit of a good thing may be known to the thousands of automobilists who are putting in hard work on the tire difficulty?

ALFRED BERSBACH

The "Breech-Block" Plug

The Plug With a Handle

To take out your *watch* or open a *Breech-Block* requires just the same *time, same tools, same effort*, and *one twist* cleans the *entire* porcelain to the whiteness of snow.

To remove the porcelain only, loosen the clamping nut and it *drops* out of its holder, and the gaskets of copper *drop* with it. No digging!

It is *nickeled* inside and out. *Highly polished* and dust-proof. Sparks between *two adjustable* points and not between *one point* and the shell. Its points are *protected*.

Porcelains are *hand turned* and so perfectly glazed that soot cannot *stick* to them. Their *threads* are cut to perfection, and every particle of the idea of cheapness is left out of them. Can you think of a way to improve them regardless of cost?

THE HAM GOLD BLAST AUTO LAMPS

"THE LAMPS THAT LIGHT THE ROAD"

MR. MANUFACTURER:

Don't close your lamp contract for 1906 until you look over our line. We have no competition in light giving and burning qualities, and our lamps will surely interest you.

MR. DEALER:

Isn't it worth something to sell your customers lamps that will not only satisfy them, but will bring them back to tell you what a fine light they give, how steadily they burn in the strongest winds and over the roughest roads, and what a good fellow you are for selling them good lamps. They'll tell their friends about it, too.

MR. AUTOMOBILIST:

Are you discouraged with the oil lamp proposition? If you are, we know you haven't tried the

HAM COLD BLAST AUTO LAMPS

because they are a delight to the most critical. They are strongly built, handsome in appearance, give a powerful light, and are always reliable, as they are wind proof and will not jar out. Never smoke, consequently the interior is always bright and clear, and there is no odor.

AUTOMOBILE SCHOOL

CHICAGO SCHOOL OF MOTORING.

The original Automobile School in Chicago. One hundred and eighty graduates the past year, to whom we refer upon request.

Automobile owners, prospective buyers and young men wanting to become expert chauffeurs will save a great deal of money and a lot of worry by studying the mechanism, care and repair of gasoline automobiles in our shop, where all parts are open so you can see how they are made and how they operate. We give thorough and practical instruction. Competent chauffeurs supplied.

CHICAGO SCHOOL OF MOTORING,
264 Michigan Ave. Phone Har. 119.

FOR SALE OR TRADE—2 sections, 1,280 acres of good ranch land in Presidio county, Texas; will trade for automobiles. Alliance Motor Car Co., Alliance, Ohio.

WANTED—1905 two-cylinder runabout in exchange for Rambler Model E. Address F. P., care Motor Age.

FOR SALE—6 H. P. air cooled motor, $75; 10 H. P. water cooled motor, $85, new; 15 tube radiator, $10; hood, $12; McCanna 4 feed lubricator, new, $15; No. 10 Rose headlight, $12. Any of these parts sold separately. A. M. Symonds, 901 N. Fairfield Ave., Chicago, Ill.

FOR SALE—Automobile, $150. C. E. Shook, Waterloo, Iowa.

WANTED—Man thoroughly familiar with Stevens-Duryea cars to take entire charge of repair department. State experience, references, age, salary expected, etc. Address S. D., care Motor Age.

WANTED—A first class superintendent for an automobile accessory factory; must be thoroughly conversant with all high grade modern machine tools. Address, stating experience and salary expected, Manufacturer, care Motor Age.

FOR SALE—Autocar, four-cylinder, good order, equipped with cape top, gas lamps, odometer, etc.; price $1,650. W. T. K., 279 Washington St., New York City.

REWARD offered to any one locating a type 7 Searchmont touring car, factory number 181, green body, dark brown running gear. Address Stolen, care Motor Age.

WILL TRADE quarter section smooth land in western Kansas wheat belt for automobile. F. L. Martin, Hutchinson, Kan.

FOR SALE—Rambler Model E, good order, cheap. Address D. McC., care Motor Age.

THE LOGAN CONSTRUCTION CO.
CHILLICOTHE, OHIO

AUTOMOBILE DEALERS EVERYWHERE—We have a live proposition to offer dealers and agents in every town and city to handle our ready to deliver cape cart tops. Auto Top & Equipment Co., 1604 Broadway, New York City.

FOR SALE—A 1906 White Steamer, side entrance, never used and absolutely perfect; owner leaving for Europe soon. J. M. Shelley, Omaha, Neb.

WANTED—Cash buyer for 1905 Olds runabout, excellent condition. Write for particulars, Box 58, R. F. D. No. 2, Manchester, Iowa.

FOR SALE—Remodeled type eight Autocar. Four cylinder 20 h. p. Rutenber motor, Splitdorf dash coil and commutator, Shebler carbureter, McCord dash, automatic oiler, six lamps, baskets, storm covers and extra parts; tires all new, 32x3½; will carry five passengers anywhere; $1,250. 1406 Oxford St., Philadelphia.

WANTED—Auto in exchange for old plantation in Scott Co., Tenn.; clear title; no incumbrances. Address Box 531, St. Ansgar, Ia.

FOR SALE—Late '04 Packard, in fine condition, with $300 worth of extras; extension top, headlights, speedometer, odometer; $2,100 f. o. b. Kansas City; run 4,300 miles. N. T. Haynes, 3508 Central St., Kansas City, Mo.

FOR SALE—At a bargain, one 1905 White Steamer, complete with cape top, bampers, full lamp equipment, generator and lamps; been used little, practically new, in first class running shape; 3 extra cases, 2 extra inner tubes; full equipment cost about $2,800; will sell for $1,600 if taken at once. Will gladly demonstrate. Jacob Roth, Erie, Pa.

AGENTS WANTED—For our automobile and marine engines. Spark plugs, 50c and $1, direct to consumer. Coils, carbureters and all supplies at corresponding prices. Columbus Screw & Machine Co., Columbus, O.

FOR SALE—8-10 passenger wagonette; sample car 1905-6 Model; steam; price and description on application. Thompson Auto Co., Olneyville Sq., Providence, R. I.

FOR SALE—A 1905 Model "F" Knox touring car, with glass front, 32x4 tires; guaranteed to be in A1 condition; will sell cheap for cash. Address W. E. W., 219 South 6th St., Minneapolis, Minn.

FOR SALE—Marble Swift friction transmission, lever, joints, brake; new; bargain. 729, 164 Dearborn, Chicago.

FOR SALE—1905, 30-35 H. P. Locomobile; perfect condition; satisfactory demonstration; owner had also 1904 Locomobile; has ordered 1906 car; write us. Capen Motor Car Co., St. Louis, Mo.

SPARK-PLUGS—Large lot for sale at low figures. The best plug on the market. Standard or metric. Will job whole lot or sell in smaller quantities. Write for price, stating number wanted. Mechanical Plug Company, 3924 Olive St., St. Louis, Mo.

FOR SALE—One Olds runabout, one four cylinder, 20 H. P. gasoline car; eight steam cars, including runabouts and touring cars; also steam delivery wagons; all in first-class running order. Write for particulars if interested. K. A. Grout, Orange, Mass.

Wanted Names of Automobile Owners that would rather see their tires being pumped up than do the pumping. Our Tom Tire Pump fits on any Standard Machine and is worked by the motor, easily attached, well tested out, all enclosed and very satisfactory. Get acquainted with it. It is something that you will like. Agents wanted.

VOL. VIII NO. 20 CHICAGO, NOVEMBER 16, 1905 $2.00 Per Year

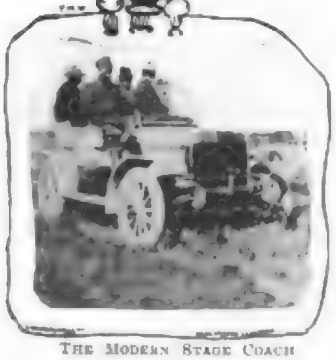
NEW MEXICO'S AUTOMOBILE STAGE COACH

A WESTERN SCENE—ROUND-UP OF A HERD OF HORSES

IF IT IS an ideal automobile ride the traveler wants, he will do well to take the trip offered by the Roswell Automobile Co. on its automobile stage from Roswell to Torrance, N. M. If it is scenery he wants, he will do well to stay at home, unless he will be satisfied with a typical picture of the plains, its inhabitants, both human and animal, and the pursuits of the people there encountered. But after making this trip, the traveler is impressed above and beyond all anticipations with automobiling in its ideal state, as exemplified on this run, and the absence of the natural scenery of a rugged country is forgotten on this trip.

Starting from Roswell, which is on the line of the Santa Fe railroad, at 10 o'clock in the morning, the cars of this company are soon on the main road that runs north for 21 miles to Eden Valley, which, more like a settlement than a village, is the only place on the entire run that has the semblance of a station or stopping place. There is a highway, or a wagon road, to Eden Valley, but the automobile company is not satisfied with the rutty track made by ordinary travel, and has constructed a road, thus not only avoiding the ruts of the wagon track, but making a clear right-of-way for its swift-moving cars. Out of Eden Valley the route takes directly to the northwest, and for 90 miles sends over a smooth trail across the plains, without a stream, ditch or even a stone to cause an interruption in the run, or in the scenery. Just before rounding into Torrance a few ranges of low, ragged looking foothills, covered with scrubby pines, are passed, and all during the journey, from Roswell to Torrance, the Capitan mountains are plainly visible, from 40 to 70 miles away; but the plains are so much in evidence that the distant mountains are barely remembered after the long ride is ended. In a word, the 111 miles from Roswell to Torrance might be described as consisting of fifty low, far-stretching hills, each one of which, when surmounted, discloses another identical in appearance to itself.

But there are some things of interest on this trip, outside of the superb automobiling it affords. The cattle industry of the southwest is shown in its various phases and the lazy but patient Mexican herder with his sheep is seen at intervals. Then there are



THE MODERN STAGE COACH

A STOP FOR REPAIRS

Digitized by Google

wild animals. On one trip recently the writer saw two herds of antelope, three lone wolves, a number of coyotes, a badger, white eagles, bald eagles and hawks, to say nothing of quail, plover, prairie chickens and prairie dogs innumerable. The antelope and wolves made the most interesting sights. Their interest in the flying automobile added to the opportunity of seeing them, for invariably they would stand for minutes in the same spot, sometimes not more than 100 yards away, and with wide-open eyes, watch the strange machine that had come to invade their territory. After passing all these scenes and riding over 111 miles of country, and stopping possibly a half-dozen times to replenish the water tank or adjust the machinery, the traveler reaches Torrance, and he has spent from 5 to 8 hours, according to circumstances. Whether he be an old automobilist or on his initial ride, they will be among the most pleasant hours of his life. But sometimes the circumstances are not as favorable as they might be. Sometimes there is a puncture, a blow-out, a hot-box, or a break in the machinery. That means

AN ANTELOPE IS NOT AN UNCOMMON SIGHT

a rest out on the open prairie of from 30 minutes to 3 hours, and if the start has been late, it may mean that the run will be completed after night, which will be too cold for comfort at fall seasons in that high altitude.

Organized 8 months ago, the Roswell Automobile Co. has had its three cars plying its one route for 7 months and in that time has satisfied itself that automobiling in the plains country of the southwest is far more pleasant and equally as much more profitable than the old-time stage coach. Officered by L. K. McGaffey president; R. E. Baughman secretary; E. A. Cahoon treasurer, and J. W. Stockard manager, the company has the best business men of Roswell at its back. Soon after the proposition was presented to the people, the necessary funds were forthcoming. In 1 month the machines were ordered and delivered and a track had been built over nature's roadbed to Torrance. The construction of the roadbed was a simple piece of work, made so by the ingenuity of Manager Stockard, who has safely surmounted every obstruction that has thus far come before the enterprise. At first he constructed a drag which consisted of two beams, fastened together at a distance apart equal to the gear of the automobile stage. These were armed with knives on their front ends and when this apparatus was dragged over the road, a track 8 inches wide for each wheel was cut out of the raw prairie. Later the drag was armed with a miniature snow plow on each of the beams and when the machine was dragged over the road again, it had cut out parallel tracks 30 inches wide that look like troughs in the face of the prairie. These troughs make the track for the automobile. While they cannot be seen sometimes 15 feet from the side of the machine, from the end of the car, or from the seats thereof, they can be followed for 1, 2, 5 and sometimes 9 miles, off across the plains and finally running up the hil that is invariably to be seen in the distance. For there is always a hill in every direction on the horizon on the plains of the southwest, and the traveler is apparently always in a low flat, bordered by low hills.

Generally speaking, the ground over which the Roswell-Torrance route passes is composed of gravel, sand and soft earth. Any one of these three materials makes a good road, or any of their compounds makes a better. But there are exceptions to the general rule in the shape of short stretches of gypsum, better known as gyp, and when a stretch of this mineral is found the road is bound to be a little rough. The gyp powders and blows away, leaving holes that give the motor car an unpleasant jolt. But far greater as a source of annoyance than any other thing on the route is the prairie dog. His villages are to be seen at intervals all along the route. In places the automobile track runs through one of his principal streets. He resents this intrusion and shows his displeasure by digging a house in the center of one of the tracks. That means that there will be a bump from 3 to 8 inches high right in the way of the car, and the machine must be slowed down to its minimum speed in passing the obstruction. All the dog holes can be filled

LOVERS' LANE, NEAR ROSWELL, N. M.

THE MAIN STREET OF ROSWELL, N. M., PRESENTS A BUSY APPEARANCE AT ALL TIMES

Digitized by Google

THE ROAD IS HIDDEN BY BUNCH GRASS

one day and there will be as many, or more, the next. Before long all the prairie dogs on the route will have to be poisoned.

The equipment of the Roswell Automobile Co. consists of three cars, a 1903 Winton and 1905 Winton and Cadillac. The Wintons each carry four passengers and the driver and the Cadillac carries three. The trips to Torrance are made three times each week, one machine making the round trip in 2 days. It is seldom that a machine runs light, and the fare is $10 each way—$20 for the round trip. Last week an inspector for the United States postoffice department took the Roswell-Torrance motor car trip for the purpose of seeing if the route is practical for carrying the mails. He was accompanied by Postmaster R. H. Kellahin, of Roswell, and the report of the postmaster is that it is practically assured that the mail contract will be awarded to the company. This will shorten the time of sending letters from Roswell to Albuquerque, Santa Fe and the other large towns of the territory at least 2 days. This will also add materially to the receipts of the company and will mean that two more cars will be added to the service and that trips will be made each way daily between the terminal points.

Several strong points have combined to make the motor stage between Roswell and Torrance a success. The natural condition of the country has made an almost perfect roadbed and the condition of the ground itself makes a magnificent track. Roswell is the largest town of the Pecos valley, the largest and most productive farming district of the entire southwest. It has one railroad, a branch of the Santa Fe, that runs from Kansas City southwest to Roswell. By a series of connections El Paso, Tex., may be reached on the south, and thus the main lines of the Santa Fe and Rock Island may be reached, and by these the town of Santa Fe, or Albuquerque, and the rest of the mountainous portion of the territory. By following the Santa Fe branch northeast from Roswell to Amarillo, Tex., then going to Trinidad, Col., on the Colorado Southern, and from Trinidad taking the Santa Fe, a traveler can finally reach the central portion of the territory by rail. He has then traveled 1,000 miles, gotten up at all hours of the night and consumed about 3 days of time. Railroad fare exceeding that of the motor stage is enlarged by hotel bills and Pullman fees. By the motor route Torrance can be reached in 6 to 8 hours and from there to the large towns is a short run via the Santa Fe Central, a little branch road independent of the larger systems of the territory. Since the starting of the stage, Torrance has become an important point on the map for traveling salesmen, travelers and politicians. That is "the place to take the automobile."

Thus the passenger business of the motor route is assured, and at good prices, too. When the mail contract is secured the route will be one of New Mexico's many gold mines. A freighting business is a later possibility, but is not yet discussed.

The receipts of the route are not net gain by any means, however. The hire of chauffeurs and the repairs on the machines are the greatest expense encountered. The repairs chiefly are put on the tires, which do not wear well in that country, for some reason. It is the experience of the company that 600 miles is a good run for a tire without a break. New tires are continually being put in use and this expense, together with the smaller breaks, makes quite an item in offsetting the net gains. The gasoline account is not as large as might be anticipated. Eleven or 12 gallons are consumed on each trip by the large Wintons and 8 or 9 will run the Cadillac.

After all has been said, the writer is impressed with the splendid opportunity the route affords for scorching. In the first 22 miles out of Roswell two small creeks are passed. They are soon to be bridged but even now they are crossed without difficulty. But after these two small streams are crossed there yet remains 90 miles of the route that is unbroken by steep hill, ditch or stone. In places where the track runs straight as a die for several miles the Wintons are put to a speed of 40 and 50 miles an hour, and it is then that the inexperienced passenger cries "Hold! Enough!" Those in the big cities of the east who are afraid to let out a notch or two on tempting stretches of boulevard can well imagine the sensations on this wild bit of road, with no policeman in sight to wave a warning finger and where a speed ordinance is unknown.

PUSH THE UNWIN CASE

Both Parties in Test of Constitutionality of New Jersey Law Hope For Early Decision

New York, Oct. 11—The Unwin test case, which is being pushed in New Jersey by the N. A. A. M., to determine the constitutionality of the license provision of the automobile law, is progressing rapidly. There is every chance that before the close of the year a decision will be handed down by the court of common pleas of Hudson county, to which an appeal was taken from the justice's court. Charles Thaddeus Terry, counsel for the N. A. A. M., and Assistant Attorney General Duffield, on behalf of the attorney general's office, have made their verbal arguments and will submit briefs. Each will reply to the other and then it will be up to the court to render a decision.

Thomas N. McCarter, the attorney general, himself an enthusiastic motorist, is much interested in having the question decided and has promised on his part to carry the case up to the court of errors and appeals and from there to the United States supreme court for a final decision, which shall be binding in all the states.

Professor Terry's foundation contentions that the law is unconstitutional are based on the following reasons: first, because it imposes a double tax on an automobile considered as personal property; second, because it imposes a tax upon the property of a non-resident; and, third, because it discriminates between different users of the highways.

In a talk with MOTOR AGE today Professor Terry stated his foundation contentions, as above quoted, and elaborated on them to a considerable extent.

"This tax," said he, "is not a license fee, for it taxes the car, and a license is never granted to anything but an individual. Since anyone may run the machine after a license has been granted to it, it is a misnomer to call it a license. Further than this, a license is never granted, except when the licensee is to make money from his license. It is, therefore, a tax and a double tax at that; for as each successive owner of the car must take out a new license, the car may be taxed fifty times. I prefer to reserve for my brief in reply to Mr. Duffield's any extended discussion of my contention that the law is unconstitutional because it imposes a tax on the property of a non-resident. As to the question of discrimination against the motor car, the courts have said repeatedly that there shall be no discrimination among members of the same class. An automobile can only be placed in a separate class on the theory that it is capable of greater speed and the motive power is not a horse or a man's muscle. Police power must be exercised within the limits of protection to the public and reasonable requirements to that end are demanded.

"If there is anything to this police power argument all there is to it is that a license is required for identification in case there be a crime committed. If the law said that no one should use the car except the owner such a law might come within the police power, but as it is a million men may use the car, so that identification is not assured.

"My opponent says that the automobile is a peculiar class of vehicle and that so long as all automobilists are brought under it, it is constitutional. The licensee may lend his car to his second cousin and all his second cousin's friends and so may not know who has used it. If the law had said the car could only be used by the owner or his agent, then it might be different, but it does not. In all the cases quoted by my opponent—known as the inn and ferry cases—the licenses were taken out for a profit making business.

"This taxing of a non-resident's property, as comprehended by the present law, is not upheld by any court. It is ridiculous that a man should have to take out a license from each of eight or ten states for a journey through them. The courts have universally held that no line of property in a state temporarily or brought into the state for purposes of transit can be taxed."

TOO BUSY TO MAKE CARS

Toledo, O., Nov. 13—The Consolidated Mfg. Co., which has been manufacturing the Yale automobile under the name of the Kirk Mfg. Co., has decided to discontinue that branch of the business. Negotiations with a number of concerns are now pending for the continuation of the manufacture of the new Yale touring car, and it is expected that a deal will be closed within a short time. The Consolidated concern was formed 3 years ago, and took over the business of a number of Toledo's important manufacturing businesses, among them being the Yale and Snell bicycle plants, the Kirk automobile plant and other lines. The company will continue to manufacture the Yale and Snell bicycles, Yale-California motor cycles, drop forgings, brazed tubing, sheet metal, stove trimmings, fittings of various kinds, etc. As the company asserts it is doing a mammoth business in all these lines, which now require more attention than heretofore, and inasmuch as the automobile department could not be given the attention it needed, and as it was the last to be added to the long list of departments of the big plant, the Consolidated people have decided to leave the field of automobile making altogether.

HOPE FOR DECISION SOON

New York, Nov. 14—Those who are interested in the outcome of the Selden patent suit may expect a decision from the lower court within the next couple of months. As the case now stands there are but two more witnesses in rebuttal to be examined by the plaintiff's lawyers. The examination will take about 6 weeks, when the court will take the case under advisement. It is expected that the court will render a decision within a few weeks after the case is closed. Those interested in the suit profess to believe that a favorable decision will be rendered and that there is little likelihood of an appeal being taken. On the other hand, those in the know say the case will go to the United State supreme court before a final decision is reached and the case brought to a close.

MOVES IN WINDY CITY

Several Agencies Switch and New Branches Are Opened On Chicago's Automobile Row

Chicago, Nov. 13—The Chicago automobile row is undergoing its annual changes rather early for next season. A change has been made in the Maxwell representation, the Holmes-Schmidt people taking it on with the Glide and Welch.

It was announced late last week that the Pardee-Ullman Co. had signed a contract with Sales Manager Benjamin to handle the Franklin, which was formerly represented by Ralph Temple, who now has almost a complete new line. The Pardee-Ullman concern will continue to handle the Packard, the Franklin filling in the vacancy left when the White company decided to open a branch in Chicago.

One more new deal was announced Tuesday, when Ralph Temple took over the agency for the National, formerly handled by the Hayden Automobile Co. This gives Temple four strings to his bow—the Panhard, which he imports direct from France; the Reo, the Premier and National.

Another new manager to report was none other than Webb Jay, who has so far recovered from the injuries received in the Buffalo accident, when he ran into the fence during a race, as to be able to assume the management of the new White branch which has been opened in this city. Jay will at once set to work looking for a location.

The Bennett-Bird Co., formerly representing the Premier and Cleveland, has materially altered its plans, having closed to represent the Corbin and the Dolson. This leaves the Cleveland without a footing, but several are now bidding for the agency, it is reported. The Bennett-Bird Co. plans to enlarge for the coming season and expects to move some place in the same block where it can get 50 feet frontage. The Buick agency, at 1412 Michigan avenue, in charge of W. J. Meade and next door to Bennett-Bird, is also thinking of moving, although having nothing definite in sight so far.

This moving end of the game is particularly prominent just now, and in consequence the block from Fourteenth to Fifteenth streets on Michigan avenue resemble a series of fortifications. The old Hankins mansion, at 1440-2, on which the old gambler is reported to have spent $135,000, is being dismantled and on the same site will go up a modern two-story building which will be occupied by the Ford branch, in charge of Thomas Hay. A few doors north another old building is being torn down and in its place will be the big structure to be occupied by the Excelsior Supply Co., which intends getting on the row. At 1424 the workmen are busy on the place where C. A. Coey will hold forth with the Thomas in a building which Coey aims to be second to none in the automobile game when it is completed. On the other side of the street the building activity is confined to the new structure to be occupied by the McDuffee Automobile Co. soon after the first of the year. It will occupy three numbers, 1501-3-5.

Digitized by Google

The McDuffee company has also opened a branch in Milwaukee, which is in charge of W. F. Discher. H. C. Tillotson and H. G. Moore, the latter formerly with the Rambler people, will be associated with McDuffee here and will sell the Stoddard-Dayton and the Royal. As soon as McDuffee moves out his old store will be occupied by the Kelley-Hunter Co., which is now on the second floor. This latter concern is new in the game and represents the Northern line in this section.

One other is also talking move—the Greer Automobile Co. It says it needs larger quarters and may change locations about May 1, although it is more possible that it will stay where it is and open a garage on Indiana avenue, from which it will run its renting business. Just what line Greer will carry is not yet definitely known. He is thinking of changing, but will probably keep the Michigan line, which will also include a commercial rig the coming year.

J. H. Toole, who has heretofore represented only the Orient buckboard at 433 Wabash avenue, has signed to also carry the full Orient line at the same place. The Autocar agency has not been changed and Geyler &Levy will continue to push the sale in a retail way in this section.

Several changes have taken place in the managership of branches and the personnel of the various staffs. A. J. Banta has assumed charge of the Locomobile branch, while Thomas Hay is running the Ford place. L. J. Ollier has become sales manager for Ralph Temple, and Fred Brand has succeeded Jack Fry at the Apperson place. The Pardee-Ullman Co. has added J. Baylies to its staff to look after Franklin interests, while Van Alstyne is in charge of the branch just opened by the St. Louis makers at 1229 Michigan avenue.

M. J. Budlong, president of the Electric Vehicle Co., came on to Chicago last Monday for the purpose of installing as manager of the Chicago branch of the company W. H. Durphy to succeed Frank J. Fanning. Durphy only recently allied himself with the Columbia people, having formerly managed the Boston branch of the Decauville company.

A fire in the building occupied by the Acme and Ford branches and Dan B. Southard stirred up the row last Thursday. The fire at one time threatened to be dangerous, but it was eventually put out with bdt slight damage.

PAGE BANQUETED

New York, Nov. 11—Carl H. Page, manager of the White Sewing Machine Co.'s branch in this city, accompanied by his mother, sailed for Europe today for a vacation of 6 weeks. He will be met on the other side by Walter White and the trio will make a tour of Italy, Southern France and the Mediterranean, in addition to attending the Paris Salon. By way of an au revoir Conrad N. Pitcher gave Mr. Page a surprise dinner in the yacht room of the Hotel Astor last evening, at which twenty-four guests sat down. There were music, songs and speeches between courses. Windsor T. White paid a high tribute to the guest of honor personally and as a business man.

TRIP ONE-THIRD OVER

Percy Megargel Reaches Portland, Ore., After Strenuous Trip in the Reo Mountaineer

Portland, Ore., Nov. 10—The hardest part of the trip of the Reo Mountaineer on its trip west across the continent was completed when it rolled into town here Thursday night. It had been a strenuous journey, not anything remarkable from a record standpoint, for that was not the object when we left New York August 19, but it has demonstrated thoroughly the possibilities of the automobile and has resulted in the gathering of piles of useful road data for the American Motor League. Our adventures have been many and varied, but we have pulled through all of them and feel none the worse for our experience. If anything it has paid us in the way of rugged health. We shall rest here a few days before picking up the thread of our journey.

Under the shadows of Mount Hood, the highest peak of the Cascade range, with 60 miles of villainous roads to traverse before entering Portland, the Reo Mountaineer pulled into Wapinitia late Sunday after having spent 24 hours in the Indian country. Saturday night Fassett and myself spread our blankets in the hayloft of an Indian's farm near Warm Springs, in the Indian reservation of that name. Incidentally we cooked our breakfast, dinner and supper in Indian country and lucky were we to have provided ourselves with grub, for nothing could we get in the eating line from the Indians.

The hills we have encountered the past week are far steeper than anything I have ever tackled in all my 17,000 miles touring by automobile and Saturday I struck for the first time a hill that the Reo refused to mount with its 1,100 pounds of live and dead baggage. The little Yankee gradometer said 40 per cent and then refused to register further, yet the car struggled gallantly toward the top until we struck a lot of loose stones, then she quit. It was a trail that we had been informed was impassable and had not been used for years, yet it was a choice of taking the grade or fording a 3-foot-deep creek and incidentally running several hundred yards up stream.

While the Mountaineer ran a quarter of a mile up the aforementioned hill in a few minutes, it took us nearly 2 hours to get it down, for we did not dare to dig out the sprags, which were buried deep down into the roadbed, fearing to lose our car. As a last resort we hauled out our cable and made it fast to a boulder weighing some 500 pounds and with this dragging after it the car was slowly backed down to the creek at the bottom, which we forded next morning in safety without even experiencing spark trouble.

Huge stones, stumps—standing in many cases 18 inches from the ground—fallen logs and deep washouts had to be weathered repeatedly Sunday and our log book shows a mileage for the entire day of only 30 miles. This 30 miles was all hills and it was either a case of run on low speed toward the summit of some high mountain or with switch shut off and all brakes set dash down toward the bottom, not knowing what minute would be our last. On one of these wild dashes we ran into a pile of stones in the middle of the roadbed upon rounding a turn and our muffler was carried away. The usual quiet Reo now resembles Dan Wurgis' famous Reo Bird, its exhaust being audible for a half a mile or even further. In fact, the reports from the double-opposed motors were so loud Sunday afternoon that Fassett fired three times at a coyote before the animal heard the report of the gun and turned to run away, he being so amazed at the sound of the motor that he stood looking at the automobile less than 100 yards distant. No, Fassett didn't hit him.

At Madras, Ore., we found the automobile sheds of the Auto Transportation Co., which operate several cars between Madras, Prineville and Bend. Here we were able to secure gasoline at a nominal figure and also get some valuable information on the roads from Donald Ray, the company's superintendent, a young college man who is making his mark in the west. The Reo Mountaineer is the first automobile that ever tackled the road through the Warm Springs agency. We were informed by several that it was impossible for an automobile with 8 inches clearance to negotiate the roads through the agency, but after coming across the Rocky and Blue mountains we did not consider anything impossible, nor did we find it so, although we had to use great caution in dodging the high rocks.

The top price was paid for gasoline at Burns, Ore., where we paid $12 for 15 gallons. We had to have it and the merchant knew it and soaked us accordingly, although I have since been informed that he charges everyone that same price. From here we will go south to Los Angeles and then follow the Santa Fe route across Arizona and New Mexico if such a thing is possible.—PERCY F. MEGARGEL.

A. L. A. M. ENGINEERS MEET

Hartford, Conn., Nov. 13—The engineers of the mechanical branch of the Association of Licensed Automobile Manufacturers met on Thursday in Hartford where a conference on metallurgy was in progress in the laboratory of Henry Souther, who is in charge of this branch of the service supplied to the mechanical branch. A visit to the factories of the Pope Mfg. Co., where Pope-Hartford automobiles are made, and the Electric Vehicle Co. was a part of the day's program. The principal business of the day was a discussion as to steel and the movement for a higher quality of steel was general. The quality of steel that has been furnished to American manufacturers has contained too high a percentage of both sulphur and phosphorus, both of which are negative quantities to be avoided. The amount of carbon, manganese, silicon and nickel, too, play important parts and Mr. Souther has been giving much of his attention to the refinements of steels which will have the greatest efficiency. The question of steel naturally led to discussions of crankshafts, wheel pivots, axles and gear house shafting.

FLEXIBLE MOTORS

WHEN a British motor car manufacturer drove a new six-cylinder car 50 miles on high gear, the British motoring public was set to wondering and discussing the feat, for such it really was, considering the condition of the roads and other unfavorable things. Now the discussion has been so prolonged as to raise the question whether it is not possible to practically do away with change speed gears entirely and depend almost wholly upon the flexibility of the motor for speed governing of the car upon the highways.

It is pointed out that many manufacturers making cars fitted with four speed changes have suddenly taken to advertising the fact that they have motors of great flexibility, indicating that their own cars are capable of being driven long distances without change of gear from the high, and the fact that these concerns have so advertised their wares is pointed out as meaning that they can make flexible motors even of the four-cylinder pattern and that at no distant date the cars may be minus the three and four speed change gears if flexibility of motor is further developed.

This is the argument in favor of six and eight-cylinder motors, but at least one American maker has persistently clung to the manufacture of a car with four cylinders to the motor and with but two changes of speeds in the gear box.

To do away with the multiplicity of speed change gears would doubtless eliminate much complicated mechanism so far as the speed change portion of the transmission is concerned, but at the same time it would add complications if six and eight-cylinder motors were to come into general use in a desire to obtain flexibility of power. If it is possible for one maker to design a motor with such flexibility as to do away with all save two speed change gears, it is possible for others to do likewise; and this must be the result in time.

It must, however, be remembered that there is a difference in English and American roads, and while a motor car might be driven for 500 miles without change of gear in England, it would be almost impossible to find 500 miles of roads in America that would permit of such a feat, unless boulevards were depended upon for such a test. Still, the one American make bobs up at all stages of the argument.

It can safely be argued it is not often that great difficulty is encountered in the matter of cylinders, and that there would be little more trouble with six than with four; that it is as easy to take care of a half dozen connecting rods and pistons and commutator parts as two-thirds that number, and that when one cylinder happened out of commission there would be a sufficient number left to do the work on ordinary occasions.

The little controversy which is interesting both English motorists and makers will reach this country before another season passes, and it is safe to say the number of American makers putting out six-cylinder motors, while small today, will be increased at least several fold. Furthermore, it is not beyond an impossibility that ere a very few years have passed the whole transmission scheme will have been so altered as to do away with speed changes entirely, particularly on cars which are of sufficient size to permit them being fitted with motors having not to exceed four cylinders, with which most of the large cars are fitted today. It is a subject which will withstand study and experiment for the next few years.

SMALL CARS ABROAD

THERE appears to be a tendency on the part of the motor car manufacturers in continental Europe to appreciate the fact that the buying public does not consist entirely of those people who desire or who can afford to purchase multiple cylinder cars of high power. This is shown by the fact that at the forthcoming Paris salon there will be shown, according to reports, a large number of small and popular priced cars, including runabouts and light touring cars such as have been in vogue in America for 3 or 4 years and which proved the beginning of the motor car industry in this country.

Small cars have been made in European countries but not to any extended degree, the demand having been so great for large cars that manufacturers naturally were disinclined to dabble in the making of cheaper and smaller vehicles when they had all they could do to supply the demand for those of larger size and of greater price. Some weeks ago it was thought possible there would be an immense number of popular priced cars exhibited at the forthcoming show in Paris. At the present writing this enthusiasm, which possibly only existed on paper, has dwindled to some extent, but it is evident that some of the makers of the most prominent cars on the market today are anticipating the desire of the middle class to purchase machines and enjoy country life in automobiles, the same as those of the wealthier class are enabled to do.

It is announced that such concerns as Renault and Peugeot have designed and are making small cars which will be exhibited at the show and which will be constructed in large quantities with a view to supplying a big demand for the middle classes on the continent. Small cars have been extremely popular in England, where good roads abound, and they would prove likewise popular in France if sold for a reasonable price. It is true there have been small cars made on French soil, but they have not been of the class desired and have usually been noisy affairs at best. They have in no manner compared with the small English cars or the small cars manufactured in this country, so far as price and running qualities are concerned. They may have been better from a mechanical point of view, but it is not always the mechanically perfect machine that proves the most popular and does the most work.

In America the tendency at present is rather to get away from the small car, which is shown by the fact that the makers here are today building larger cars and more powerful motors than at any time since automobiles were first put into use in this country. The small car, however, is by no means obsolete and probably never will be. There is a field abroad for small cars and the field is growing.

The American roads are partially responsible for the change of feeling among those who might be satisfied with light powered cars if they could do the work at all times and in all conditions, but the man who desires to go where he pleases and when he pleases must naturally have sufficient power to take him over America's frightful highways. It is different in the case of the Englishman or the Frenchman, for in both France and England there are few roads over which a very light powered car cannot be run at a satisfactory speed.

The fact that the French makers are turning their attention toward the construction of smaller cars would indicate that the general masses of people are yet to be interested in the automobile; that those who have so far taken it up have been those who are inclined to accept anything that is new, chiefly from the standpoint of the faddist. This is not so much indicated in this country as abroad, for in this country there have been machines on the market at any and all prices and the prospective purchaser had but to indicate his limit in order to be possessed of a car.

The foreign prospective purchaser with a small amount of money at hand was not so fortunate if he desired to be loyal and purchase a home made machine. He was compelled to buy a high priced, heavily-powered car or go without, for the supply of small cars was by no means equal to the demand for them.

The movement on the part of French makers to begin the manufacture of small cars is wholesome in the extreme and speaks for the motor car trade a long term of prosperity in the immediate future.

Many a man can thank election day for giving him his first ride in an automobile.

It is strange that no manufacturer has so far thought to equip his new models with some sort of music-producing apparatus.

Some street car companies are seriously thinking of compelling each passenger to take a dose of anti-freezing compound as he or she hands a nickel to the conductor.

If motoring keeps on increasing its popularity with the people and if only some one can be found to look after the stray cats, dogs and canary birds the Humane Society can go out of business. The horses won't need it.

If Percy Megargel doesn't learn anything about automobiles on his transcontinental trip he ought to return home with a pretty generous fund of knowledge on cow punchers, bronchos, coyotes, snakes, bad roads and other disagreeable things.

The British motorist is pestered by police traps, the same as the motorists in New England, Chicago, and other parts of the United States, but so far advices have told nothing of the Englishmen bumping the bumps, so they do not know what it is to touch high spots.

Is is estimated that in another 6 weeks all the testimony in the Selden patent suit against Ford and others will have been introduced; then the court will take the case under advisement and will render a decision—within several months. There is of course a possibility that the case will go to a higher court, and this will drag it along for another period of years. In the meantime the public will go on buying automobiles, and will take a chance on the outcome of the patent litigation.

With Kaiser Wilhelm adding automobiles to his stable as fast as the royal treasury will stand the strain, with President Loubet of France and King Alfonso of Spain becoming such pals through their love for the motor car, with the Prince of Wales touring through India and with the rest of the royal bunch showing such a fondness for motoring, our own Theodore R. must find it rather lonesome being left out in the cold with nothing to do besides criticising the football rules and wondering if Teddy, Jr., will make the varsity eleven at Harvard.

Nobody will deny that the A. L. A. M. is gaining ground—it has taken in one new member of late.

Sticking to the cab may be loyalty for the horse on the part of the jehu, but it is like other forms of loyalty, rather hard on the pocketbook.

It may be 40 miles from Schenectady to Troy, as the old song has it, but it is even a longer stretch from the Vanderbilt cup race to the Ormond meet in the estimation of those enthusiasts who like to talk racing.

Chicago is figuring on extending its boulevard system, which may, after all, be of no avail to the automobilist, inasmuch as by the time the work is completed the automobile will have given way to the airship.

One of the troubles that will crop up at the 1906 shows is that the prospective purchaser will find so many "best" automobiles and so many devices with which to fit his rig he will not be able to make a choice and will suffer from cold feet.

Olympia show in London will have 300 exhibitors; great interest being taken in Paris event, demand for space being more than promoters can care for.

Counsel on both sides pushing Unwin case, which is being pressed to test constitutionality of license provision of New Jersey's automobile law.

Consolidated Mfg. Co., of Toledo, abandons manufacture of Yale automobiles because of growth of other branches of its business.

Many changes recorded in Chicago, several leading agencies being transferred, new branches opened and managers changed.

Percy Megargel and Reo Mountaineer arrive safely in Portland, Ore., completing one-third of double transcontinental journey.

Chairman Morrell, of the A. A. A. racing board, given banquet and told what a good fellow he really is.

Sicily cuts into touring game and offers $10,000 and gold shield for touring event for 1906.

New Yorkers fight against embargo prohibiting gasoline cars being driven on steamship docks.

Reports show that England has turned out 13,200 cars and 15,000 motor cycles in last year.

Decision in lower courts in Selden patent suits expected within next couple of months.

Factory to be started in Chicago for manufacture of 1,000 Maxwell cars for 1906.

Ford Motor Co. announces four-cylinder runabout for to list at $400 to $500.

American Automobile Association creates a route and maps committee.

Senator Morgan has let 3 consecutive weeks slip by without discovering a beach suitable for racing purposes.

These late season attacks on motorists on the part of the police can be accounted for on the ground that a cold winter is upon us and coal will soon be needed.

With Sicily offering $10,000 in cash for a touring event it is about time for the Amateur Athletic Union to butt in and endeavor to draw the amateur line in motoring.

The fellow who thinks that by making a carbureter to use kerosene he will put the Standard Oil Co. out of business will find himself mistaken, for John D. will simply do a little regulating that will offset any that may be done by outsiders.

An English motorist has just given a cyclist 5 hours' start in 100 miles and beaten him. Some people can remember 10 years ago when the cyclist could make the motorist look like two dimes, a nickel and five pennies in a race of this kind.

Such utterances as those credited to the Rev. Father P. J. McDonnell, the Chicago priest who advocated before the west park board that "a man would be justified in killing the criminal autoist who would crush out his life" are either anarchistic ravings or intended for advertising.

New York voters certainly demonstrated that all this talking good roads agitators have been keeping up for all these years did not go in one ear and out the other. Fifty millions of dollars judiciously spent on the highways of the empire state ought to give the good motorists a touch of the hereafter.

Last week in Chicago a runaway horse dashed through State street, the crowded retail center of the city, knocking people right and left and colliding with other vehicles. There was no number on the horse or on the wagon, and the police were unable to locate the horse, the driver or the owner. This seems a pretty good opportunity for the automobilists to demand that all vehicles be numbered. Here is a chance for John Farson to start something, now that he is again the presiding officer in the local automobile club.

Google

J. BULL HAS DONE WELL

Report Shows That 13,000 Motor Cars Have Been Manufactured in Great Britain This Year

Washington, D. C., Nov. 11—Some interesting facts concerning the automobile industry in England are just to hand, from which it is learned that a study of the figures relating to the motor car industry shows that the principal works and factories in England have during the past season had their capacities taxed to the utmost; their output has been immense; good prices have been realized, and yet they have not been able to fill the demands of the consumer. From careful inquiries it is estimated that the production this year up to the end of September was nearly 13,200 cars of all grades and sizes, together with about 15,000 motor cycles. Taking the average selling price at the factory as $1,000 per car and $150 per motor cycle, this means that during the 9 months the turnover of the works has been $13,200,000 in cars and $2,250,000 in motor cycles, together over $15,000,000. The total trade, taking middlemen's profits into consideration, must be well over $20,000,000, and this has been achieved in an industry which has yet to see its first decade.

France's automobile press has described Great Britain as a much more valuable market for their manufacturers than the French market itself. During the first 9 months of 1905 there were imported 4,761 motor cars, valued at approximately $10,323,250, and 1,395 motor cycles, valued in round numbers at $208,000—that is to say, Great Britain has only been able to make some 70 per cent of its requirements. In addition there were imported about $3,250,000 worth of parts, so that the total import trade has reached the large amount of approximately $13,781,250, showing that altogether about $33,750,000 worth of automobiles and motor cycles has changed hands in the British market during these few months.

The average price of the imported car was $1,900 in 1904 and $2,165 in 1905. The great advance is in the quality of the product. The British output is largely made up of the smaller and cheaper cars, and it is doubtful whether corresponding figures on the same basis would show an average retail selling price of more than $1,250—$1,500. This means that the foreigner has secured the cream of the trade. Of course, many cars worth double and treble this average are British-made throughout, but the car for the man of moderate means has been the aim of British makers, and the great number turned out must infallibly bring down the average realized price. The light car, as it is termed, has not had so much attention paid to it on the continent, makers' efforts having been concentrated on the larger and more profitable sizes, and it is practically certain that if it were not for the American small-car imports the average import car value would be even much larger than it now stands. The trade is expanding and it would seem that it will continue to expand, and that before long the manufacturer of the small car will occupy just as important a position in the motoring world as his big brother. The profits to be had making the higher powered cars have been tempting, it is true, but on the other hand the masses have to be looked after, and if the cry for a machine within reach of the middle classes is loud enough, which it promises to be, the trade will have to pay heed to it. The coming shows will give a line on this feeling in the United Kingdom, for many new small-car models are promised for these exhibitions. They will also be featured at the Paris salon.

SICILIAN TOURING EVENT

Paris, Nov. 2—Ten thousand dollars in cash and a valuable gold shield, together with the promise of minor works of art, is not a bad start in the automobile world for the small Mediterranean island of Sicily. Chevalier Florio set the ball rolling by offering a Florio targa, or gold shield, for competition in a great touring event to be held on the island at the end of the Wellington boot during next April. M. Figari, another Italian sportsman, immediately came forward with a little gift of $6,000 in cash, which generous act so moved the chevalier that he added to it a sum of $4,000. This $10,000 and gold shield are ready to be won. As first prize there will be $5,000 for the owner of the car and $1,000 for the driver; $1,600 will go to the owner of the second and $400 to the chauffeur; the third car will gain $800 for the owner and $200 for the driver, and fourth and fifth prizes will be $600 and $400, respectively. Regulations have not yet been drawn up, but the event will consist of a tour round the island over varying roads from level and straight to hilly and winding, for two classes of vehicles. The one will be for touring cars, the chassis of which is sold at less than $3,000 and which does not weigh more than 2,200 pounds, and the other for chassis selling from $3,000 to $4,000 and weighing 2,860 pounds. Two passengers will be carried in each car. The start will be made by the drawing of lots. Special precaution will be taken to keep out freak automobiles, and five cars from each construction will be allowed. In addition speed tests over a splendid 3-mile course and a hill-climb over a 5-mile rise will be put on the program for next April.

AUSTIN QUITS WOLSELEY

London, Nov. 4—Henry Austin, who was practically the founder of the Wolseley Motor Car Co. and designer of the Wolseley cars up to a few months ago, has left the Wolseley company and has acquired a factory near Birmingham, from which he proposes to market the Austin car in two types—15-20 horsepower and 25-30 horsepower—thus following the line of others who have had wide experience in the game, by leaving the smaller car to others. There is no doubt that Austin was the first man in British automobilism to produce a car reliable in its construction and moderate in its price. Its engine design was against it of late years, but its reliability was always undoubted. That design, it is said, will not be continued in the Austin, but current design will be adopted by Austin.

SEASON IN SYRACUSE

Dealers and Manufacturers Report Satisfactory Business, All Things Considered

Syracuse, N. Y., Nov. 10—Local automobile dealers and manufacturers are well pleased with the season of 1905, which is now practically over so far as the sale of new cars is concerned. In view of the fact that when the season should have been well under way it was cold and wet until late in the spring, the dealers have had a remarkable trade. The one feature of the business that has been watched carefully is the development of the commercial car, for the dealers believe that along this line in the future will be a great development and that when once the business houses wake up to the situation they will come into the fold. As far as the number of commercial cars sold in this vicinity last summer is concerned, dealers have nothing to pat themselves on the shoulders about, They claim, however, that they have succeeded in awakening the interest of the business men so that several of them have ordered trucks to be delivered early next spring. Six or eight commercial wagons are now in use in this city and are giving the best of satisfaction. The dealers hope to have forty or fifty next year. Probably twenty doctors are now regularly using their machines in their practice and are well satisfied. This is another field in which the automobile men hope to push out next year.

The Amos-Pierce Co. has the largest garage in the city, using the whole building formerly occupied by the J. S. Leggett Co., which is now located in Seneca Falls. C. L. Amos says the season has been excellent, most of his sales being of large touring cars. This firm handles all of the Pope machines, the Oldsmobile and several other well known makes.

"We have had little small-car business this year," said Mr. Amos, "but trade in large cars has proved to be better than we hoped for when we saw how late the season started in. We have several commercial trucks ordered for next spring and shall push the business in that direction as much as possible. The electric business is also growing to be an important factor. During the year we sold an electric patrol to the police department and it has given the best of satisfaction. It was made by the Electric Vehicle Co. of Hartford, Conn.

The Amos-Pierce Co. during the summer did a large business in renting cars, charging from $3 to $5 an hour. On the whole the livery business was profitable.

The Syracuse Motor Car Co., at 118 South State street, is an outgrowth of the business established by W. H. Bissell, who is now manager of the company which has been incorporated. This concern sells the Cadillac and Winton and has a complete repair department, including all the big machines necessary to do any kind of work that is required. This company did all of its business after May 1 and during May and June had the best results, selling a large number

Digitized by Google

of Cadillacs. The company will handle the same lines next year with the addition of a machine to sell for $1,200 to $1,400, for which there is a large demand.

John W. Cronin, who runs the largest horse livery stable in the city, came into the fold this summer and built a garage adjoining his livery stable, taking the agency for the Reo car. Mr. Cronin, although a great lover of horse flesh, made up his mind that he better get into the automobile game as the time would come when his horses would have to take a back seat. He has been joked far and wide for running both a garage and a horse livery, but he stands up well under the pressure.

The R. M. Cornwall Co., which for several years has been in the automobile business, will at the close of this season retire and devote its time to the manufacture of gasoline engines for boats and for farm purposes. The concern is now closing out a considerable stock of automobiles and will have an auction at the close of the season.

William Burns of 612 East Jefferson street, at the beginning of the season erected a garage where a person could store his automobile and take care of it himself, the only charge being for storage. This proved to be a good thing for persons with a small pocketbook and plenty of time, and he had no trouble filling the place. Next year Mr. Burns expects to run an automobile livery and will start in with two machines for rental.

PITTSBURG MAKING NEW ROW

Pittsburg, Pa., Nov. 13—Pittsburg automobile dealers are getting ready for the biggest campaign in their history next year. This is evidenced in two ways. One is the new feature in their business of making a hard campaign on fall and winter sales. This fall the early arrivals of some of the 1906 models have been prolific of much business, and the dealers are already getting in line with advertising that shows that they mean to make a hard pull for steady sales all winter, and the prospects for the success of such a movement are excellent. The other indication of unusual effort among the local firms is found in the way they are spreading out. Two more new garages were arranged for last week. The Hiland Automobile Co., which was organized only a year ago and which handles the Autocar, last week bought a site 100 by 150 feet on Center avenue near the clubhouse, east end, for $15,000 and has commissioned an architect to prepare plans for a two-story brick garage to cost $25,000. The company now has a two-story brick garage on a leased site at Beatty and Baum streets and will sell both the building and the lease as soon as its new building is completed. The structure will be 80 by 125 feet and will be provided with all the latest machinery for repair and vulcanizing work, electric charging, etc. In addition to the Autocar the Hiland company will handle the Buick and the Peerless the coming season.

L. G. Martin, the Oakland automobile dealer, also secured a site for a new garage last week, getting a long lease on a lot in Forbes street near Boquet street.

LOOK FOR A BIG SHOW

Britons Await Opening of Doors of Olymphia Hall—Three Hundred Exhibitors Take Space

London, Nov. 4—Everyone connected with the fourth international motor exhibition of the Society of Motor Manufacturers and Traders, which opens at Olympia hall on the 17th feels that this will be the most brilliant show held in the United Kingdom. It has been demonstrated that the makers are not afraid of showing their new models before the Paris salon and this fact, coupled with King Edward consenting to be a patron of the affair for the first time, promises to make it a success even before the doors are opened. There will be 300 exhibitors at Olympia, fifty-two more than last year, and of this number fifty-one will represent foreign makers. About 135 of the 300 will be car makers, and of this 135 thirty-five of them will exhibit commercial rigs. Thirty-five motor boat makers have space and the remainder will be made up of tire, wheel and accessory makers.

While it is yet 2 weeks from show time some of the exhibitors have let out a few facts about what they propose to have. Through Charles Jarrott & Letts will be shown a modified model of the Oldsmobile runabout, as well as a two-cylinder chassis and vertical engine. S. F. Edge will have a 40-horsepower Napier chassis, a 40-horsepower six-cylinder Napier fitted with a Pullman limousine, a second Pullman limousine with side entrance special fitted tourist body, cape hood and wind screen and an 18-horsepower Napier landaulet on C springs. C. S. Rolls & Co. will feature the Rolls-Royce car that finished second in the tourist trophy race. James & Brown will have nine cars and three patent appliances in the motor car section and also five commercial vehicles. Among the motor cars will be a 20-horsepower four-cylinder touring machine with roi des Belges side entrance body and a 14-16-horsepower four-cylinder double landaulet de luxe for four persons inside and two outside. Among the commercial rigs will be a 14-16-horsepower four-cylinder van built for Gamage, an ambulance van, a 5-ton 25-30-horsepower four-cylinder chassis suitable for an omnibus, a 9-11-horsepower two-cylinder light van and a 20-horsepower tower van. Charron, Girardot & Voigt, makers of the French C. G. V. car, announce they will show identically the same cars at Olympia as they will at the Paris salon. The Lacre Motor Car Co. has in mind exhibiting its new 24-horsepower Albion car for a feature and also several commercial vehicles.

RUSH FOR FRENCH SPACE

Paris, Nov. 5—Complaints are heard on all sides of the difficulty in securing suitable space in which to make a respectable display at the approaching automobile show in the Paris salon, which opens its doors December 8. It seems as if everyone wanted the best there is to be had and in consequence of this rush for space the promoters of the show are puzzled what to do with all the applications. Even the big fellows are kicking because they are unable to get all they ask for and in the main hall it has been found necessary to fix a minimum area, while outside of this mammoth room it is almost next to impossible to get any respectable amount of room in which to display the 1906 product. But it is going to be a great show, a show that will surpass anything of the past not alone in the machines exhibited, but in decorations as well.

It is conceded that the show will lack in anything sensational in the way of striking novelties, but it will be an exhibition which will be noted for the individuality displayed. The makers seem determined to cut away from the single pattern habit and are working out details of their own instead of making it another Mercedes year, such as was the case 3 winters ago. It was thought some little time back that the small cars would be crowded into the background, but recent developments show this report to be ill-founded, for there is every reason to believe that the runabout and the light touring car will be decidedly prominent in the big French exhibit. Several of the big bugs, like Renault and Peugeot, have been boosting the game of the small car so that it seems probable that the leading makers will turn out something reliable in the way of the cheaper cars. The success of the Baby Peugeot in England has so encouraged the Peugeot people that they have gone extensively into the manufacture of the light cars.

The expected invasion of American makers to inspect the leading factories of France is received with surprise on the part of the manufacturers here who so carefully guard their trade secrets. If the Yankees do break into the holy of holies and get a chance to see the inside workings of our factories it will be surprising. As one critic puts it, "the French trade would be much happier to see Americans who come over as buyers."

PANHARD FLOTATION EXPECTED

London, Nov. 4—The flotation of Panhard & Levassor for $12,500,000 is freely talked about as an event that may be in the financial papers any morning. It is a big sum, but so great is the Panhard reputation and so substantial have been the profits earned in the Panhard factories, that it is said that the capital has been all underwritten by very sound speculators. If the Panhard flotation goes off without a hitch—one never knows in these things what to credit—there is no doubt that a few more will follow in the spring. Investors seem to be openhearted in springtime and it would not surprise shrewd judges here if S. F. Edge and Daimlers were the first two English firms to appeal to the British public for increased capital. For most part of 10 years the British motor industry has lain under the investors' bane, but the swing of the pendulum has reached the turn.

Some weeks ago Daimler, of Coventry, after languishing for years for lack of capital, by showing undoubted signs of greatly increased vitality and the possession of a finely designed and constructed car, secured enough to get on a solid footing.

GIVE HIM GLAD HAND

Leading Motorists Banquet Chairman R. L. Morrell and Hand Out a Full Line of Jolly

New York, Nov. 9—Thirty men prominent in the trade, racing and journalistic contingents of automobiledom bade Robert Lee Morrell, chairman of the racing board, to the banquet hall of the Waldorf-Astoria tonight, dined and wined him sumptuously, told him what a good fellow he was and how much he had done for America in his successful promotion of the Vanderbilt race, and gave him a lasting souvenir of their friendship and appreciation in the shape of a really magnificent piece of bronze statuary by Carpeaux entitled and symbolizing "La Dance." It was an idea of the resourceful Schwarzkopf, which met with a ready and generous response from all approached. Schwarzy acted as toastmaster until he had paid the opening compliments to the guest of the evening and introduced the one who had been delegated to make the presentation. Then he resigned the leadership of the postprandial gabfest to Batchelder, who, assisted by Wagner as starter and Al Reeves as timekeeper, saw that everyone present got rid of a little speech limited to 3 minutes. By the time the thirty orators had relieved their minds Morrell must have gotten a pretty fair idea that his friends thought him all right and decidedly IT as a racing board chairman and Vanderbilt race promoter. If he didn't either he was very modest or the eloquence of the speakers was unequal to the occasion. The hit of the occasion was the following song to the tune of "Tammany," composed and sung by C. H. Gillette with orchestral accompaniment, all hands joining heartily in the chorus.

All of you have read, I guess, that most great men were small;
Napoleon and Schwarzkopf were neither very tall;
But we've another here with us who runs our racing game,
He's little, but oh, my, oh, my, he gets there just the same.

Bob Morrell, Bob Morrell,
Ran the race to beat the band,
Finest seen in any land.
Bob Morrell, Bob Morrell,
You're a rare one,
Mister Chairman,
Bob Morrell.

Bob Morrell, he is the man that ran the auto race,
Jumping sparks, but didn't he cut out an awful pace;
Maybe he didn't have Long Island farmers on the run
To see the way he jollied them was the greatest kind of fun.

Chorus, etc.

Here's thanks to you, our Bob Morrell, for all the work you did,
And for you on the job next year we all now make a bid;
There's no one else that we can find who could do half so well,
So here's a toast to next year's race and Chairman Bob Morrell.

Chorus, etc.

Among those present were Winthrop E. Scarritt, A. L. Riker, Robert Graves, C. E. Massenet, A. de Magnan, E. R. Hollander, Windsor T. White, Thomas Hilliard, G. M. McWilliams, E. D. Winans, Alfred Reeves, E. E. Schwarzkopf, F. J. Wagner, S. W. Merrihew, H. M. Swetland, Peter Fogarty, Carl Page, F. E. Spooner, and S. A. Miles.

W. K. Vanderbilt, Jr., and Foxhall P. Keene, who were included among the subscribers to the testimonial, sent regrets, accompanied by flattering encomiums of Mr. Morrell.

During the evening it was announced that the A. A. A. directors had passed resolutions indorsing Chairman Morrell's administration, and that Governor Higgins had appointed Mr. Morrell state commissioner for the Jamestown exposition. Both announcements elicited cheers.

ECONOMY AWARDS CONFIRMED

New York, Nov. 13—Although the contest committee of the New York Motor Club will not complete the figures showing the results of the recent 6-day economy test until toward the end of the week it has progressed far enough in the compilation to announce the prize winners. The awards made conform to the statement of results published in the MOTOR AGE. The three chief prizes went to the Reo bus—the National trophy with tire charges eliminated, with an average of $2.93 per passenger; the W. J. P. Moore trophy, tire charges included, with an average cost per passenger per mile of 4.29 mills; and the W. J. Morgan trophy for the lowest gasoline consumption, with an average of $1.60 per passenger for the 682 miles. Having won general trophies the bus was not given a gold medal in its price class.

The Alden L. McMurtry ignition prize went to the Reo runabout, which had no ignition troubles whatever. This car also won the gold medal in the two classes up to $1,500, with an average per passenger of $3.38. In the price class the Compound driven by F. C. Carter took the silver medal for second with an average of $3.72 per passenger.

In the classes from $1,500 to $3,500 the four-cylinder Marmion took a silver medal for second with an average of $4.58. The Reo bus was first, but, as stated above, was barred from receiving a gold medal, having won a general prize.

The Oldsmobile runabout, the Wayne and the Compound driven by C. F. Hatch were awarded certificates for covering the entire distance.

EAGLE ROCK CLIMB SURE

New York, Nov. 14—It now seems assured that the annual Eagle Rock hill climb on Thanksgiving day, formerly promoted by the Automobile Club of New Jersey, will take place as usual this year. With the change of residence of C. H. Gillette, who had managed the former climbs, to Hartford, the Automobile Club of New Jersey abandoned the promotion of the event. This morning, however, a wire was received from Senator Morgan instructing his secretary to see that the New Jersey Automobile and Motor Club, of Newark, N. J., secured at once permission from the West Orange authorities for the climb and stating that he would leave Daytona on Thursday evening to arrange the preliminaries for the event which has proved so popular among motoring sportsmen.

FIGHT FOR A FOOTING

New Yorkers Discovers There Is Embargo Against Admission of Gasoline Trucks to Piers

New York, Nov. 14—Through an investigation set on foot by Alden L. McMurtry and Secretary Lamberti, of the New York Motor Co., which represents the Atlas gasoline trucks in this city, it has come to light that there is a very considerable embargo against the admission of gasoline trucks to the steamship piers. Replies to twenty-five letters sent out to steamship companies by Secretary Lamberti show that ten refuse to admit them to their docks, five allow them on their piers, and ten refuse a reply until they have consulted with their lawyers and insurance agents.

The American, Old Dominion, White Star, Red Star, Leyland, Atlantic Transport, Clyde, Southern Pacific and Maine steamship lines bar them. The Merchants, Quebec, American and Asiatic, Merchants and Miners, and United States and Australia companies admit them.

The commissioner of docks and ferries writes that his department "has no objection to the receipt and delivery of merchandise on the piers along the water front by gasoline motor trucks."

A New York fire exchange representative writes that there is no rule of the exchange that directly forbids the presence of gasoline motor trucks on piers and wharves.

A leading insurance lawyer is quoted as saying: "We are of the opinion that the use of motor trucks is now so common that we think that the standard policy with the usual 'work and material' clause affords protection to the owners of the piers."

There are eight makes of gasoline trucks and delivery wagons in use in this city—Atlas, Cadillac, Knox, Packard, Wheeling, Daimler, Oldsmobile and Maxwell. It is expected that they will join in the campaign of inquiry and education inaugurated by the New York Motor Car Co.

Mr. McMurtry in discussing the embargo said: "It is an injustice not only to the manufacturers of gasoline commercial wagons, but also the users of such vehicles to discriminate against their employment in the receipt and delivery of merchandise on the docks.

"The use of commercial motor wagons is rapidly increasing, and eight different makes of gasoline trucks are finding ready sale in this city. One of the big express companies recently purchased five such wagons for city use and orders are being given for delivery wagons and trucks by wholesale houses, department stores and other large business organizations. The inconvenience to these of having their wagons excluded from some wharves and not from others can easily be imagined.

"The excuse that there is danger of fire from gasoline vehicles is not upheld by facts. The danger is so slight and remote as not to be worth consideration. The commissioner of docks and ferries, leading insurance lawyers and officials of the fire exchange have all given opinions favor-

Digitized by Google

able to the use of gasoline wagons on the piers. Under the circumstances it seems like the worst kind of injustice for ten or a dozen of the big steamship companies to rule gasoline trucks from their wharves.

"I do not believe that such action on their parts is due to any settled opposition to commercial motor vehicles. When they understand how the matter is viewed by insurance authorities I believe they will all throw their wharves open to motor wagons. A campaign of enlightenment will be carried on until this end has been attained."

The objection to the admission of gasoline to the piers had its parallel a year ago in the rule compelling automobiles to empty their gasoline tanks before going on ferry boats. A vigorous fight was made against the unreasonableness of the rule, wherein the danger theory was exploded, which finally resulted in the repeal of the ordinance. It is expected that the present campaign will be successful in the end. With the considerable extent of the use of gasoline trucks already and its rapid growth it would seem that discrimination in the sending of freight would soon bring the objecting companies to their senses.

PASS UP DIXON DEAL

Chicago, Nov. 13—The rumor that a branch factory which will turn out 1,000 Maxwell cars in 1906 will be established in Chicago has been confirmed by A. F. Chase, of the Maxwell-Briscoe-Chase Co., which will handle the output in the central west. Just where the factory will be located Mr. Chase is not ready to divulge, but the deal will be closed in the near future and the plant put in operation at once, as the place he has in mind is ready-made, as it were, the building being already up. It had at first been planned to establish the factory at Dixon, Ill., but this deal fell through.

"For 1906 the Maxwell people have planned to turn out 3,500 cars," said Mr. Chase, who is in Chicago at the present time, it being his intention to make this his permanent home, although he also has business ventures in Minneapolis and St. Louis to look after.

AFTER HOLCOMB'S RECORD

Chicago, Nov. 15—Weather and road conditions permitting, Clovis Bertrand expects to start between midnight and daylight Thursday in a 45-horsepower Clement-Bayard in an attempt to beat the Chicago-New York record of 58 hours 35 minutes made by Bert Holcomb and Lawrence Duffie in October of last year. Though Bertrand has in mind driving the entire distance himself, he will have eight pilots, for the most part well known to automobilists and all well acquainted with every foot of the journey, which is 1,108 miles by odometer and 1,066 miles by the map. A. G. Schmidt, who with Jerome Ellis in an Apperson made the former record of 72 hours 45 minutes, will be his pilot to Toledo. Charles Schmidt, of Gray Wolf fame, will be his guide from Cleveland to Buffalo. Then other pilots will take charge.

FORD PLANS ARE OUT

Four-Cylinder Runabout to Sell at $400 to $500 Announced by Detroit Manufacturer

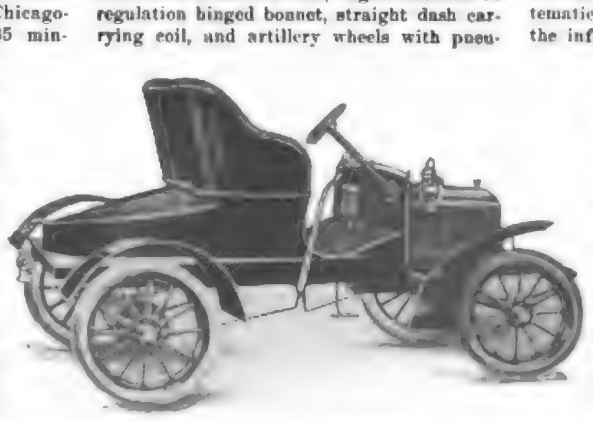
Detroit, Mich., Nov. 15—One of the sensations of the coming automobile season, if not the one, will be the new 15-horsepower four-cylinder Ford runabout that will sell for the low figure of not over $500. The announcement of this little car coming from the hands of Henry Ford, has been awaited for several weeks and has been talked of for months—in fact, ever since it first leaked out in this city that the Ford Motor Co. was working on such a machine. The feature of the runabout is four vertical cylinders mounted beneath a forward bonnet and connected through a planetary gear set and propeller shaft to the rear axle. Good riding qualities are insured by the use of a 78-inch wheel base, 28 by 2½-inch pneumatic tires and half elliptic springs in front with full ellipties in rear.

The little machine weighs but 700 pounds and is carried on ball bearings in the front wheels, with an entire equipment of rollers in the rear axle, with the exception of the end thrust balls.

Each cylinder has a bore of 3⅝ inches and a 3¼-inch stroke, and has the usual water jackets connected with a cooling radiator and tank forming the front of the bonnet, and giving a very touring-car air to the little machine. The mixture is exploded within the cylinders by an electric system consisting of two sets of dry cells for alternative use, a commutator, coil and spark plugs, with all steering wheel control features the same as in big cars. A mechanical oiler distributes the oil to all motor parts, splash within the crankcase oiling other parts.

Three brakes are used—a pair of internal expansion ones on the rear hubs for regular use and applied by lever, and an emergency band on the driving shaft, the latter applied by foot pressure.

As might be expected, the body is not a diminutive toy product or buckboard combination, but a genuine full fledged runabout from radiator to tail light, comprising all luxuries such as individual seats, with heavy upholstering, rear platform with semi-elliptical covered carrying compartment, large fenders in front and rear, engine enclosed in regulation hinged bonnet, straight dash carrying coil, and artillery wheels with pneumatic tires. The body work is regularly finished in maroon, and a full equipment of two side oil lamps, a tail lamp and horn is included, and the use of an inclined steering column connected with Ford reduction gear is one of the points found in this little product.



Ford Four-Cylinder Runabout

Of the other Ford products for the coming season, the six-cylinder 40-horsepower touring car can be considered the leader, combining as it does such Ford features as direct shaft drive construction, ignition by magneto, water cooling system, 114-inch wheel base and all other big car features. The other car, a horizontal two-cylinder machine, known as model F, has accommodations for five people.

WANT RACE FOR FIATS

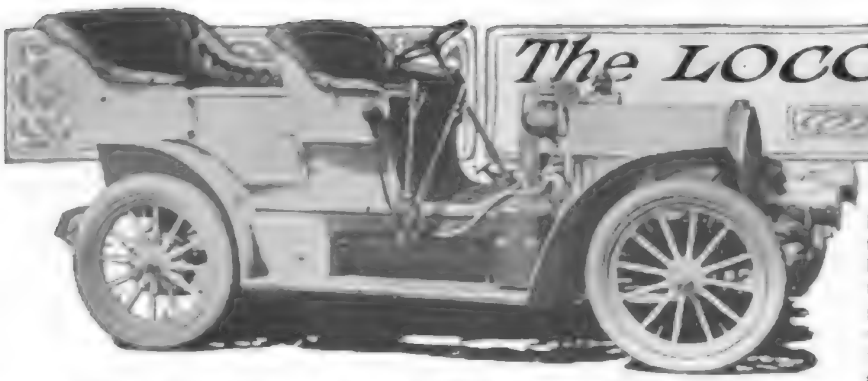
New York, Nov. 13—Senator Morgan is now in Florida. Incidentally he is to arrange for an automobile exhibit, which he is to promote as a part of the pure food exposition at Jacksonville January 4-18. The main object of his trip, of course, has to do with the preliminaries for the southern circuit of automobile and motor boat races. Entry blanks for the Ormond-Daytonia meet will be out this week. The Minneapolis trophy, of $3,000 value, has been allotted to the 100-mile championship, for which W. K. Vanderbilt, Jr., gave a cup last year.

Hollander & Tangeman are eager for a special race between three of the Fiats and three of the Mercedes cars, which competed in the Vanderbilt race. This has given rise to a suggestion that there be added to the program a special race of the approximate distance of the Long Island circuit, to which only the cars that competed in the Vanderbilt race shall be eligible. It is argued that a renewal of the great road race on the beach would be interesting, not only as a second meeting of the cars, but as showing the comparative speed of a road and beach course.

CREATES NEW COMMITTEE

New York, Nov. 9—The board of directors of the American Automobile Association at regular monthly meeting today decided upon the creation of a routes and maps committee, the chairman of which will be Asa Goddard, ex-president of the Worcester Automobile Club. This committee will be considered a subdivision of the national touring committee, and a systematic plan for perfecting and revising the information concerning the main routes of motor travel, with official hotel and garage appointments, will be put into operation immediately. Mr. Goddard will tour in various parts of the country, and the first routes to be arranged will be in New England territory. It is the intention of the A. A. A. to perfect its touring bureau so that when the 1906 season begins it will be prepared to supply members with all kinds of definite information. The Philadelphia Automobile Association, the Red Devil Automobile Club of St. Louis and the Indianapolis Automobile Racing Association were admitted to active membership.

Digitized by Google



The LOCOMOBILE for 1906

TWO models will be manufactured by the Locomobile Co. of America, of Bridgeport, Conn., for the 1906 trade, one a 15-20-horsepower, side entrance car with normal accommodation for four passengers and the other a 30-35-horsepower touring car with accommodation for five. The former machine has a regular four-cylinder motor with 3¾-inch bore and 4½-inch stroke and in the large machine the measurements are 4½ by 5½ inches. The lighter machine is intended for purchasers desiring a light car with medium passenger service and the other model for those wanting the largest style of touring machine.

In both models make-and-break ignition, with current furnished by a gear-driven magnet, is used. A few changes in the valve caps and mechanical igniters are found, but the general lines of the motors remain the same as this year. The clutch and gear box remain unaltered, but internal emergency brakes have been added.

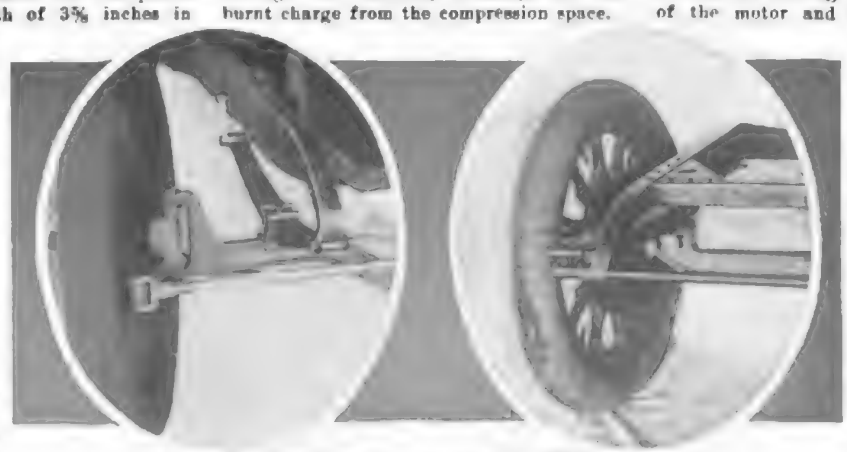
Changes in the running gear are not numerous, though all parts have been materially strengthened. The front axle is a drop forging of I-section with integral spring seatings on either side of a central drop, and the axle ends are drop forgings drawn out and hand welded in place. The rear axle is also made in I-section and is dropped between the spring seatings, the semi-elliptic springs in the rear being thrown outside of the frame so the latter can be hung low and have sufficient room for vibrations, because of the drop in the axle. Similar construction, to that used this season, is found in making the brake drums on the rear wheels and the drive sprockets integral and bolting them to alternate spokes in the road wheels. The pressed steel fame is made with side pieces tapering from a depth of 3⅝ inches in the center to either ends. At the front and rear are cross tie pieces and two others are required for carrying the gear box, the motor lugs resting directly on the frame side pieces dispensing with sub pieces. All the parts are held together by gusset plates. The wheels revolve on plain bearings, with lubrication provided for by the axle stubs being in the form of grease boxes and carrying enough lubricant for many miles. The smaller model has a 93-inch wheel base and carries 32 by 4-inch tires and on the larger machines are 34 by 4½-inch tires and 106-inch wheel base. In each model an aluminum apron encloses the under side of the chassis and protects all of the mechanism from mud and dirt.

The motor used in each model is formed with four cylinders cast in pairs, each having inlet valves disposed in integral valve ports on the right side and exhausts in similar ports on the left, two camshafts being used, one for the exhausts and the inlet shaft serving to operate the ignition devices as well as the inlet valves. Both shafts are driven by enclosed gears at the forward end. The top part of the crankcase is a bronze casting carrying the three bearings of the crankshaft, the aluminum base serving only as an oil pan, being divided between the pairs of cylinders to insure splash for all crank throws. As on the present cars all valves are made interchangeable, but the method of removal is now by bronze screw caps in the tops of the ports, serving for covering the openings, through which the valves may be taken out, instead of caps held by yoke and lock nut as used this season. Copper covered asbestos gaskets are used below the bronze caps. A novelty is added in the fitting of drip cocks in the cylinder walls to facilitate draining the motor in cold weather. Although no change is made in the valves or the actuation thereof, they are timed differently so that the admission valve begins to open before the exhaust is closed, both valves being for a short time open together, the object of this timing being that a current is set up through the exhaust, cleaning out the burnt charge from the compression space.

The crankshaft, a special drop forging, has its bearings ground and hardened and the pistons are made with a slight taper, being 1-10,000 inch smaller in diameter at the top than the bottom to allow for the greater expansion at that end. They are made with four compression rings above the wristpin, each being split diagonally and ground. Steel of I-section forms the connecting rods, which are provided with steel bushings at the piston end and bronze bushings at the crank pins. The wristpins are made hollow.

Motor lubrication is by a specially made mechanical oiler driven from the rear end of the exhaust camshaft. Three feeds are used, one to each of the crankcase compartments and the third to the gear housing enclosing the gears for the governor, inlet camshaft, magneto and pump. Within the crankcase splash is looked up to to care for the cylinder walls and all bearings, there being oil grooves on the pistons for distributing the oil over the cylinder walls. Over all bearings are oil receptacles, which are filled from the splash. In the lower part of the cylinders are oil grooves also filled from the splash when the piston is at the top of the stroke and when the bottom of the stroke is reached the piston pins come opposite the grooves, so that the oil flows into the piston pins. Each crankshaft bushing has angularly cut grooves for running the oil throughout the bearing.

Only a few detailed changes are noted in the cooling system, the most important being the rearrangement of the pipes to and from the cylinders, the water now leaving the pump, entering the top of the jackets between the exhaust valves and, instead of flowing into the top part of the jackets, flows through stand pipes within them, exiting from these pipes in the bottom of the jackets. The exits from the jackets are in the tops, directly in the center, from which the water flows to the top of a Whitlock radiator. On the front of the motor is a rotary fan, belt driven from the pump shaft. The bracket for the fan bearing is carried on the front of the motor and has a separate oiler.



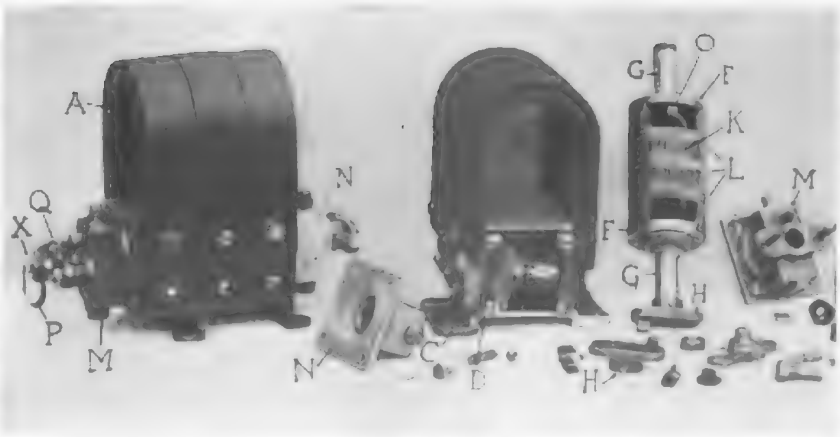
FRONT AND REAR AXLE CONSTRUCTION ON 1906 LOCOMOBILES

One of the most noteworthy features of both Locomobile models for the coming season is the use of low tension ignition with current supplied by a magneto manufactured by the Locomobile company after the design of Mr. A. L. Riker. The simplicity of make-and-break ignition is one of its merits, the entire ignition scheme comprising a gear driven magneto, a single wire to the plugs and make-and-

Digitized by Google

break devices within the cylinders driven from the inlet camshaft, the use of coils, batteries and commutators and high tension wiring being eliminated.

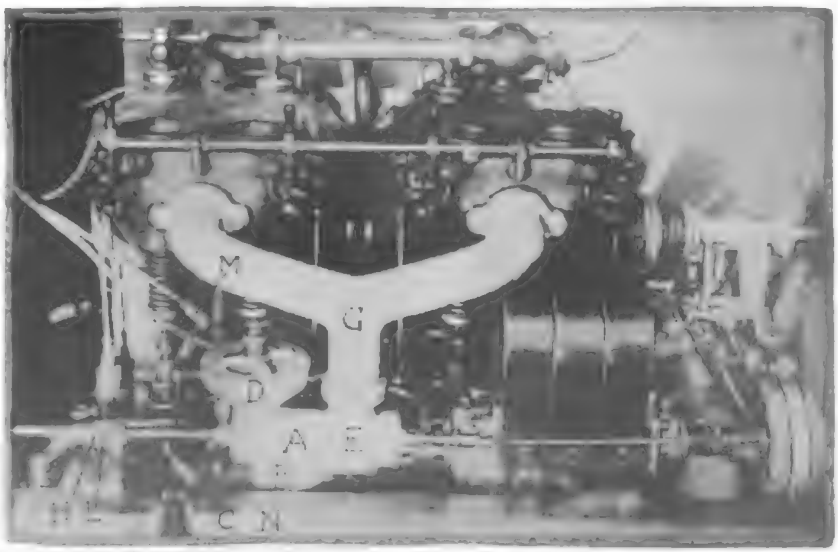
In examining the Locomobile system the magneto naturally comes first. In constructing this machine care has been taken to prevent the disturbing of the armature winding by centrifugal force and also to guard against short circuiting by the accumulation of grease around the winding. The making of all parts with ground joints, thereby rendering the device water tight, is an important fact. The magneto consists of three specially made permanent magnets A, to which are bolted the two pole pieces D, the entire device resting on the base C, by which it is held to the engine crankcase by four vertical dowel pins and one bolt and from which it can be removed by loosening one cotter pin, a nut and a lock nut. Enclosing the three magnets are the hoods B. Between the pole pieces D revolves the armature, the core of which is shown in position at E, but a view of the complete armature is shown just to the right of this, in which K shows the wire winding around the coil and L the three retaining bands to keep the wire in place when the armature is revolving. The end plates F are held to the core by sweated screws and carry the bearings G, which work in the end boxes M and N, the latter not only furnishing long bearings and good lubricating facilities but also when in place, as shown in the assembled view, protecting the armature. Proper insulation of the wire used in the armature winding is essential and in this regard the maker has used a double covering of silk and several coats of shellac. The armature is further insulated by the use of micanite cloth underneath the pole pieces and sheet mica underneath the three sets of binding wires. The armature is driven from a separate gear and the connection between the armature and the gear is through the double clutch pieces H, one pinned to the end of the armature shaft and the other to the gear shaft, so that the magneto can be lifted vertically out of place, the clutches slipping easily in and out of position. Current is taken from the armature through the bent U-shaped spring P, the outer end of which presses against a steel pin X, passing through the center of the shaft, being properly insulated and connected at its inner end with the armature winding. The other end of the winding is grounded through the wire O. From the spring P the current is taken from the terminal Q by wire to the switch on the dash in the large car and thence to the bus bar on the cylinder by another wire, but in the smaller model the wire connects direct with the bus bar. On the bus bar are



LOCOMOBILE MAGNETO AND ITS VARIOUS PARTS

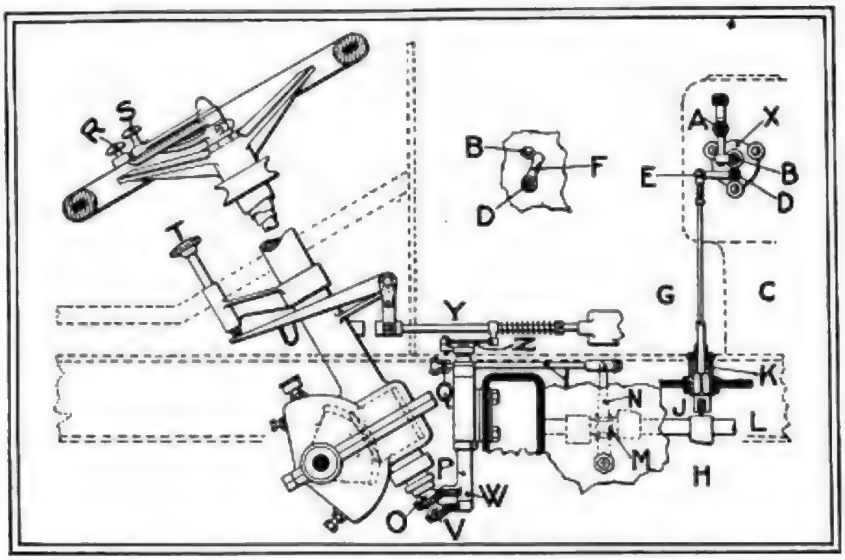
knife-edge switches for cutting out any one cylinder when needed. In the larger model a battery is used for starting the motor, the current being turned on by the dash switch, but in the smaller car the motor is started by cranking, the magneto furnishing sufficient current. In the new machines the bus bar is slightly raised to make the igniters more accessible and is held in place by the split brackets so it can be quickly taken off. When revolving at 150 to 200 turns per minute 30 volts without load is given and 20 with load, and at 900 revolutions per minute this is 75 volts without load and 65 with load

The Locomobile carbureter for the coming season has as its leading feature a balanced throttle and automatic auxiliary air inlet valve. The housing consists of three leading parts, all of which are made from bronze—the float chamber C, within which is a spun copper float for regulating the flow of gasoline into the bottom of the chamber; the vertical cylindrical part B, in which is the spraying nozzle and above this the horizontal cylindrical part A, which carries the balanced throttle and has on its rear end the aluminum supplementary air valve D, the adjustment of which is effected through the nut above the spring surrounding the stem of the valve, increasing the spring tension, causing the valve to open only with greater motor suction and loosening the nut giving the opposite result. This valve comes into use for speeds greater than 15 miles per hour when running on high speed. A simple Y piping G connects with the cylinders. Air enters through the bottom of the cylindrical part B and passing up and around the spraying nozzle, enters the chamber A, and passes towards the front of it until the expansion E is reached. At this point is the rear end of the sliding throttle sleeve or drum and as the drum, which is closed at the front end and open at the rear, is pulled toward the front by the governor rod F or pushed to the front by means of the throttle lever on the steering wheel or the accelerator through the rod H, the mixture passes out and up the pipes G. In the rear end of the drum are V notches which are never closed when the drum is in its closed position, thus permitting of some mixture passing to the motor, acting as they do, like a bypass and preventing the motor from shutting down. By having the chamber A expanded at E, immediately outside of the sliding throttle, the motor suction draws gasses out on all sides of the throttle instead of at one side, so the throttle will not bind in the chamber as it would if the suction was all on the one side. The rod to which the throttle is attached consists of two parts, one H and the other F, both abutting within the part E of the chamber. The part F is connected to the governor through the arm K, so that when the governor acts the rod is free to



INLET SIDE LOCOMOBILE MOTOR, SHOWING CARBURETER AND MAGNETO

Digitized by Google



CONTROLLING MEDIUMS AND CONNECTIONS ON THE LOCOMOBILE

move, not being hampered by any connections with the steering column or the accelerator and jerky action is thereby eliminated. The rod H runs direct to the accelerator pedal, a downward movement of the pedal forcing the rod to the front and carrying the throttle that way. The rod is also connected with the throttle lever on the steering wheel through the arm L, connected with a sliding block on the rod H, the sliding block acting against the coil spring surrounding the rod, so that through the medium of the spring the throttle can be moved to the front. Should a further movement be necessary the accelerator is brought into use. A priming device is installed by means of which priming can be accomplished from the seat, the rod M from the dash carrying a bell crank, the horizontal part of which is directly above the priming cock N in the top of the float chamber.

The gasoline is carried in a 17-gallon tank, which fills practically all of the space beneath the driver's seat. The governor of the ball type is carried within the drive gear on the front end of the exhaust camshaft. Coil springs ordinarily hold the weights together, but when separated by centrifugal force they act on a sleeve connected by yoke with the arm K. The governor is enclosed within an aluminum gear housing.

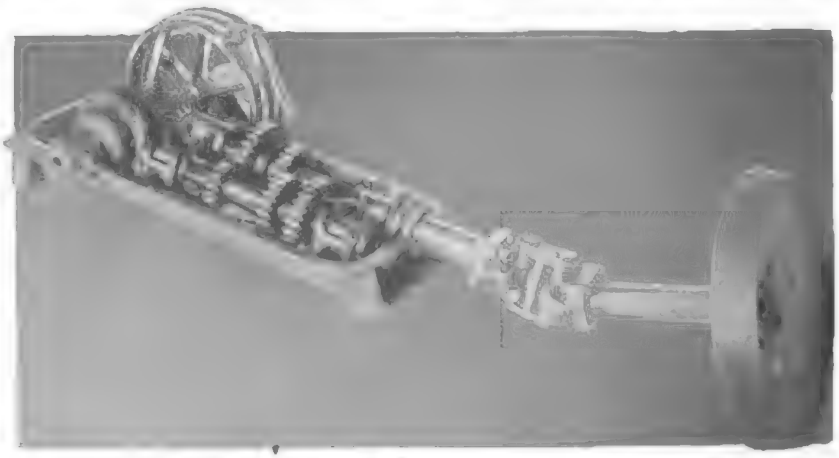
Producing the spark within the cylinders calls for a hammer-and-anvil mechanism, as shown in the line illustration. Current comes through the bus bar A and the knife-edge switch to the bolt-like electrode B, held in the casing X, which has a ground fit with the cylinder casting and is retained by three screws. The moving electrode D is a bolt with an integral arm F within the cylinder, resting against the inner end of B, and outside of the cylinder has the horizontal arm E, the outer end of which rests on the top of the push rod G. This rod G at its lower end carries the small steel roller J, always held against the spiral cam H by the coil spring K. A feature of the camshaft L is that it carries eight cams made integral with it, four of the cams being for opening the inlet valves and the other four for the make-and-break device. The arm F normally rests some distance from the end of B within the cylinder, but when the cam H raises the rod G the arm is raised and later F is drawn from the electrode B, the current tending to bridge the gap passes in the form of a hot spark. Both electrodes are fitted with iridium points, this metal offering the greatest resistance to the effect of the electric arc produced when the spark occurs. Timing of the spark is accomplished by the spiral cams H, the whole camshaft being slidable by means of the collar M, the yoke N coupled with the rod I, which is in turn connected with the spark lever R on the steering wheel through the bevel gear O on the bottom of the tube carrying the spark lever, the bevel gear in turn meshing with another bevel on the tubing P, the top of which carries the arm Q connecting with the rod I. By this connection the entire inlet camshaft can be moved to the front or rear and the timing of the spark altered without affecting the opening or closing of the inlet valves, the inlet cams being made extra long to permit of the sliding. The camshaft at its forward end has a sliding fit in its driving gear.

In this illustration the interconnecting of the throttle lever S, on the steering column and the accelerator pedal T is shown. The lever S connects with the rod Y to the throttle through a tube within the steering column and bevel gears V and W at the base of the column. The latter bevel gear is on the bottom of a vertical tube, to the top of which is attached the arm Z, uniting it with the throttle rod Y. By this arrangement the control of the spark and throttle is as simple as in the ordinary jump spark machine.

In the transmission of power from the crankshaft a flexible connection is provided by the leather faced cone clutch working within a coned flywheel secured to the crankshaft flange by six bolts. The clutch face in the larger car is 2½ inches wide, slightly wider than this year, and the introduction of a double universal joint between clutch and the gear box is novel. This double joint insures correct alignment and greatly facilitates removal of the clutch without dismounting either the motor or gear box. The clutch is engaged by a pair of helical springs on studs fastened to a disk plate within the clutch, the plate forming a part of the thrust bearing of the motor shaft.

There are no changes or improvements in the gear box in either models, three forward speeds with direct drive on the top speed still being used. As heretofore, the differential is carried in the rear part of the gear box. The gear box consists of three parts—a manganese bronze central part for carrying all of the bearings, as well as the entire case, by arms resting on the frame pieces, and an aluminum top and bottom, the latter acting as an oil pan and the former being a gear covering.

In the gear box the main and countershafts are of steel, running in long bronze bearings. The main shaft is squared and carries the sliding unit, consisting of a pair of gears. For direct drive internal teeth on the front of the first sliding gear lock with the gear on the rear end of the clutch shaft, the countershaft running idly. The other forward speeds are through countershaft gears and the reverse idler is in the rear end of the case. Bearings for both main and countershafts are in cross partitions of the case, the case proper forming an enclosed chamber around the ends of either shafts, making the dust and oil-tight features of it more prominent. All



LOCOMOBILE SPEED CHANGE GEAR AND CLUTCH SHOWING DOUBLE UNIVERSAL JOINT

Digitized by Google

THE 30-35-HORSEPOWER LOCOMOBILE FOR 1906

speeds are gained through one lever, speeds from the reverse to direct drive being obtained in respective forward positions of the lever.

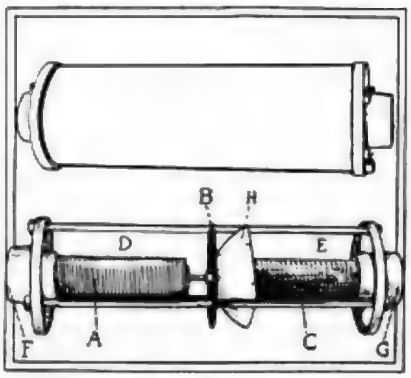
Final drive in both models is by double side chains, the sprockets on the differential countershafts being small and enclosed in metal casings connected with the rear fenders and the running board. The divided counter shaft carries the differential in the rear part of the gear box and has bearings in each side of the gear case as well as others carried by the side pieces of the main frame. Rear wheel sprockets are made very large, standard roller chains are fitted, and shut rods, with turnbuckles used for chain adjustments.

On the differential countershaft and outside of the gear box is the running brake, which is a broad-rimmed wheel 10 inches in diameter and 3½ inches wide, surrounded by a metal band, double acting in its engagement. The metal lining in the band is riveted on in segments, with the object of furnishing a better braking surface. The rear hub emergency brakes are of the internal expansion type working within drums 11 inches in diameter and 1½ inches wide. The expanding shoes are two semi-circular cast iron pieces, pivoted on top to an arm on the radius rod hub and at the lower ends connected by lever link mechanism. Coil springs joining the two expanding shoes hold them off the drums when not applied and a stop rod screwed into the carrier hub rests against the inside of the shoes so that the coil springs do not draw them too far from the drum. Application of these brakes is through lever connected with the brake expanding lever by steel cable and compensating mechanism.

Both machines are fitted with double side entrance bodies, the smaller machine having a hollow dash. Bonnets are of the hinged style, the radiator forming the front end. Large flaring fenders, running side boards, heavy upholstering and the usual style of finish are other body features.

THE PACKARD RUNABOUT

One of the raciest looking runabouts that has been brought out for some time is the Packard, built by the Packard Motor Car Co., of Detroit, Mich., and fashioned in most details after the Packard "24," the company's touring car for the coming season, but differing in body details. The wheel base of the runabout model is 108 inches and the motor is placed further back, so that the radiator is in rear of the front axle. The hood extends as much to the rear as in many of the racing machines. Individual seats are carried a little in front of the back axle and in rear of them is a tool box and rumble seat. By having the front fenders sloping from the front of the bonnet to the

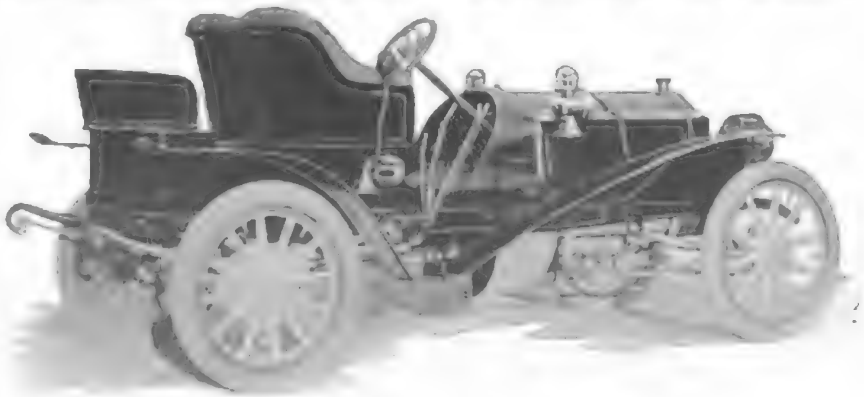


CHAMPION MFG. CO.'S MUFFLER

side steps and using short ones for the rear wheels a decided novelty is introduced. On either side of the round topped dash is a heavy, rounded projecting flange, protecting all mechanisms carried on the dash. The upholstering is in water-grained leather over curled hair and the finish in Richelieu blue, with black mouldings and cream yellow stripings. The running gear is cream yellow with blue stripings. The mechanical features, such as the motor, carbureter, ignition, cooling systems, clutch, transmission, lubrication, control and crankcase, axles, wheels, brakes and other features are identical with those in the touring car. The steering column is inclined at an angle of 37 degrees and has a worm and segment gear. The steering knuckles are carried on imported ball bearings. The framework of the chassis is built on the same general principles as in the touring car, only with the measurements altered. Cold riveting is used throughout and the flanges on the side pieces are extended top and bottom at each cross member junction. Thirty-four by 3½-inch tire are used in front and 34 by 4-inch in the rear. Such control features as lever for emergency brakes, two change speed levers, and spark and throttle on the steering wheel are used as operating pedals.

NEW MUFFLER DESIGN

Champion mufflers, made by the Champion Mfg. Co., of Newark, N. J., are unique in several respects and the maker in designing them has been led by the assumption that the exhaust from the motor should have as full and free an opening into the expanding chamber as possible in order to keep every possible portion of the heat away from the exhaust valves. Each muffler consists of a cylindrical chamber divided into two parts by the baffle plate B, located centrally between the ends. Into the part D the exhaust enters through the connection F. When entering the gases do not come direct into the part D but enter through the flat coil spring A, which is closed at its inner end. The coils of the spring rest so closely upon one another as to make the spring practically a closed tube, with the gases entering at one end. The force of the exhaust gases causes the spring to extend, drawing the coils slightly from one another and leaving spaces between them, through which the exhaust is sprayed, as it were, into the chamber. As soon as the pressure of the exhaust is less than the tension of the spring the coils come together and form a positively closed pipe between the motor and the muffler. The gases after passing from the spring-like tube and expanding pass through the baffle plate B and the saucer-shaped disk H, into the chamber E, through the center of which is the perforated tube C connecting with the outside air. The perforations in this tube are small and arranged symmetrically, providing easy exit to the outer air. The mufflers are made in sizes from 10 to 14 inches in length and 3 to 4½ inches in diameter.



PACKARD CAR FITTED AS A RUNABOUT, WITH RUMBLE SEAT

Digitized by Google

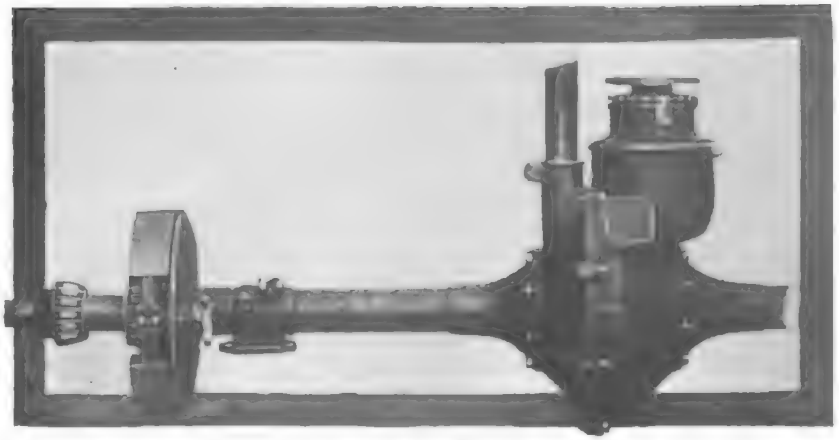
The Royal Tourist

metal float for regulating the flow of gasoline from the fuel tank. The mixing chamber is a horizontal tubing with the spraying nozzle in the center, cold air entering at the front end. At the rear of the chamber is a supplementary spring-controlled air valve. By water jacketing the entire mixing chamber, condensation of mixture in cold weather is prevented. Throttle control is through a quadrant lever on the top of the steering column, near which is a spark advance lever.

Within the gear box several innovations over present construction are met, among which can be noted the suspending of the case from the top half, there being four integral arms for this purpose, each resting on the subframe pieces. Aluminum is used throughout in the case. Another new feature is the carrying of the reverse idler L on a separate shaft in the top part of the case, the shaft being very long compared with bearings, so that it can be shifted in the latter, being in mesh only when in use. A spring throws it out of mesh. Hess-Bright ball bearings, so generally introduced on many of next year's cars, are used in every bearing on the main shaft A and the countershaft B. These bearings are packed in oil and for gear lubrication is an oil bath. The gears are made with very wide face and hardened, and instead of being keyed or pinned to the shafts, are bolted to integral flanges in the case of the larger ones. Direct drive is used on the high speed and on the other two forward speeds and the reverse, drive is to the countershaft and then returned to the main shaft. Changes in speed are given by a lever at the right of the seat, the lever working in a quadrant. Within the flywheel is a spring-engaged cone clutch filled with a leather bearing, beneath which is a series of flat metal springs to ease engagement.

Within the gearcase the main shaft A of squared section carries the sliding unit composed of the two gears E and D, between them being the collar to which the yoke is attached for shifting, the shifting rod passing through the opening S in the top of the case. For direct drive the shifting unit is moved ahead, so that the dental face teeth in the front side of gear D mesh with similar teeth on the back face of gear C; so the shaft A and the clutch shaft, part of which is shown, are united, giving a direct drive along the shaft A, with the countershaft B and its gears revolving idly. For slow speed ahead gears E and H are meshed, for second speed gears D and G, and for the reverse gear E is put in mesh with the reverse gear L, which is at the same time put into mesh with the small gear K on the countershaft.

Transmission from the gearcase is by universal-jointed propeller shaft to the bevel differential in the center of the rear axle. This axle is of the floating type as used this year, the two drive shafts from the differential bevels to the road wheels, carrying none of the weight of the car, which comes entirely on the axle casing. In this way the axle drive shafts can be drawn out by removing the hub caps, which act as clutches, connecting the drive shafts with the road wheels. Long roller bearings are a feature of this axle construction, they being used on either side of the differential as well on the end bearings of the drive shafts and also in the road wheels.



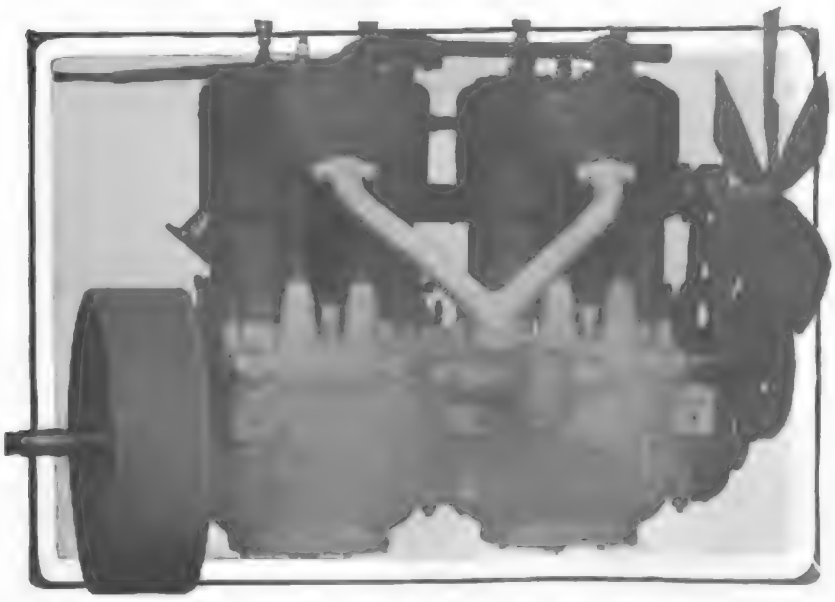
Brake Drum, Differential Housing and Covering for Royal Floating Axle

The differential housing, as can be noticed in the view of the rear axle is made in two parts, being split vertically in line with the bevel gear, and the two halves securely bolted together, with each half in turn bolted to large flanges on the inner ends of the sleeves on the axle tubings. This construction gives sufficient strength for all road jars, relieving to the drive shafts of these entirely. In one half of the differential casing is a seating for the torsion rod which parallels the propeller shaft, as the other half is expanded at the front side so as to encase the bevel on the end of the propeller shaft.

Brake control rests with an internal brake on the drive shaft at the rear of the gear box, it being connected with a pedal for application and interconnected with the clutch releasing it when applied. Emergency internal expansion brakes work within steel drums on the rear hubs. The expanding shoes are cast iron, with a brass facing for contact with the drums. These brakes also are interconnected with the clutch, removing the latter when applied. Cam action expands the shoes, forcing them upon the drums. A feature of the regular brake is the introduction of a pawl that permits the clutch to be engaged with the brake still applied, thus allowing the car to be started on an incline without any danger of running backwards.

A change in the steering gear is made by using a worm and sector gear instead of the rack and pinion type, as used this season. The worm is on the bottom of the steering column and together with the sector is enclosed in an oil tight and dust proof case. The muffler is of standard construction.

The round-topped radiator and arched hood, together with a similarly shaped hollow dash, so conspicuous on this year's Royal tourists, are retained for the coming season, but the other body lines slightly altered, as necessitated by a longer wheel base. The side entrances are wide and provision is made for carrying tools and light baggage. Individual front seats, very heavy upholstery and finish in any standard colors are points noted in connection with it. The body is roomy throughout and has good baggage space.



Intake Side of the 1906 Royal Four-Cylinder Motor

Digitized by Google

The Oldsmobile

MODEL S, a vertical automobile announced by the Olds Motor Works, of Lansing, Mich., for the 1906 market, is conspicuous in that it is the first machine brought out by this pioneer concern with this type of motor carried beneath a forward bonnet. The Olds company has previously adhered to the horizontal motor for pleasure vehicles, but the announcement of a vertical-cylindered machine does not come as a surprise, as the company has for some time been testing out this model. Its coming has been awaited with no little interest by the motor car fraternity. The machine follows standard lines throughout, having as its leading features a cone clutch, sliding gear transmission and shaft drive, with large five-passenger, double side entrance body with hollow dash.

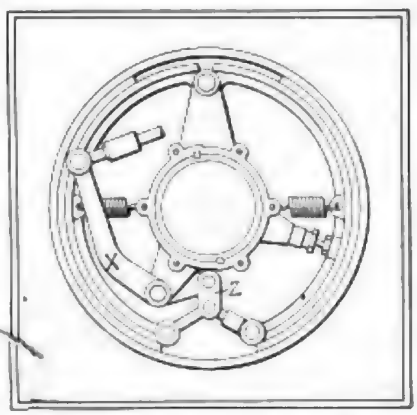
Both the motor and gear box are suspended on a sub-frame carried on cross pieces of the main frame, each part having integral lugs for the purpose. Side pieces of the main frame are made from pressed steel in channel sections and taper from the center to the front and rear, where they terminate in drop forged spring hangers, to which are attached the semi-elliptic springs, the front springs being bolted at their forward end direct to the spring hanger and at the rear shackled beneath the frame pieces. The rear springs are 40-inch semi-elliptics, offset from the frame and shackled at the back end to very long curved spring hangers, a bit of construction giving a racy appearance. Beneath the motor is a metal mud apron, part of which is riveted between the main and sub-frame pieces, acting thereby as a brace to the frame. Other portions of the apron are removable, so as to facilitate examining of the motor.

Thirty-two by 3½-inch tires are used on the front and rear wheels. The front axle is a standard tubing, slightly dropped in the center between the spring seatings, and carries the Elliott type of steering knuckles. It is a 2-inch tubing with ¼-inch wall. The steering connections are furnished with large bearings, each equipped with a T-handled grease cup and protected by a leather dust cap. The rear axle is of the divided type, the drive shafts enclosed within a heavy axle casing, and uniting at their inner ends with the bevels in the differential. Timken roller bearings are used in the wheels, as well as in the rear axle bearings. The wheel base is 106 inches, the weight 2,200 pounds and the tread 55 inches, but treads of 52 or 58 inches will be supplied on order.

The motor has the cylinders cast in pairs, with the water jackets, valve ports and cylinder heads made in a single casting. The valves are carried in ports on the left side, the inlets and exhausts being on the same side, requiring only one camshaft for actuation. By placing the inlets at the adjacent sides of the cylinders forming each pair a single piping suffices to carry mixture to each pair, but a separate exhaust pipe connects from each cylinder with the exhaust pipe to the muffler. The crankcase is an aluminum casting, made in two parts, the top receiving the cylinder castings and carrying the three bearings of the crankshaft, so that the bottom of the case can be readily removed, leaving all parts of the motor properly mounted and not even disturbing alignment.

The crankshaft throws are set at 180 degrees, the two centers constituting a pair, as do the outer throws. The bearings of the shaft, as well as those in the lower ends of the connecting rods, are heavily bronzed with a lining of babbitt, each being grooved for the distribution of oil.

The cylinders have a bore of 4½ inches and a stroke of 4¾ inches, the rated power of 24-26 being given at 1,000 revolutions per minute. The pistons are made from cast iron, ground on the wearing surface, and to further insure proper fitting are run in with belt. On the top part and above the wristpin are the usual compression rings, ground to fit, and on the lower part are oil grooves. Connecting rods made of drop forgings are attached at the lower end to the crankshaft in the usual capping style and on the upper end have a bearing in the large wristpin that is pinned in place in one of the piston journals.



OLDSMOBILE INTERNAL EXPANDING BRAKE

The intake and exhaust valves are located in the bottom of the ports and open upwards by push rods from the camshaft within the top part of the crankshaft. The valves are made with the stems and heads separate, but securely fitted together, the top part made from metal tending to resist pitting to a great extent. Valve springs have the usual attachments to the valve stems and the push rods work in long guides in the top part of the crankcase. The removal of the valves is simplified by having caps fitted in the opening in the top of the ports directly above the valves, the caps simply having to be unscrewed before drawing out the valves.

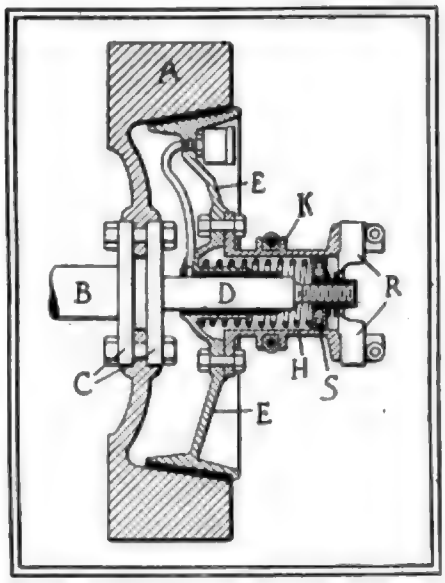
The igniting current is supplied by either dry cells of storage battery, with the coil on the dash and the commutator on the rear of the motor. The latter is carried on the top of a vertical shaft, gear driven from a motor shafting and supplied with special lubricating devices. The spark plugs are placed vertically in the center of the cylinder heads, placing them practically in the center of the combustion chamber. A four unit coil is used.

Motor cooling is accomplished by a water radiating system and fan immediately in rear of the radiator. The latter is of Olds construction and consists of a series of flat tubes connected with a combination water tank. From the radiator water is drawn by a gear driven pump carried on the crankcase and delivered separately to each pair of cylinders and later leaves them from the top parts and returns to the top of the radiator. The cooling space in the radiator is such that the circulating water is always kept below the boiling point.

Oil is delivered to each of the crankshaft bearings from a separate lead from a positive oiler and the lubricant after running through these bearings forms a bath in the bottom of the case, from which it is splashed, filling rings in the pistons and also oil receptacles over each of the other motor bearings. The camshaft depends on the splash for filling the oil cups above its bearings and the cams are lubricated directly from the splash.

In the float feed carbureter air enters the base of the mixing chamber through the opening A, mixture passes to the motor through the exit B, controlled by the throttle K, and for high motor speed additional air is drawn in through the auxiliary valve C, normally held shut by the coil spring

Digitized by Google



CONE CLUTCH ON FOUR-CYLINDER OLDSMOBILE

surrounding its stem. One feature is the cylindrical float G, with the spraying nozzle in the center, the needle valve H within the nozzle, being adjustable from the bottom. Gasoline enters the float chamber through the passage D, controlled by the needle valve E, the valve not closing the passage when the chamber is empty, but on gasoline entering the float rises, allowing the end of the lever F beneath the float to rise and the weight of the needle valve E forcing the other end down, closing the inlet opening. The adjustment of the supplementary air valve can be varied by the thumb screw on the bottom of the valve stem.

The mixing chamber construction is featured by restricting the air passage considerably surrounding the top of the spraying nozzle, giving the passage an inverted con shape and thereby focusing the inrushing gases near the tip of nozzle, insuring a good mixture. Gasoline from the float chamber enters the nozzle through two oppositely placed horizontal passages, either of which, however, is of sufficient capacity to furnish enough fuel for all motor speeds.

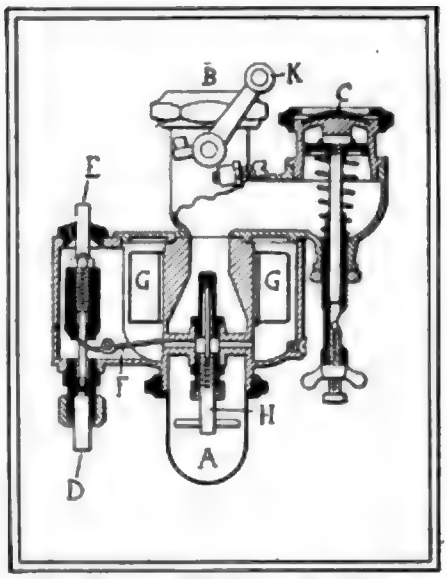
The working of the lever F connecting the float and needle valve E is made possible by having the weight of the float greater than that of the valve, or if not greater having a lack of weight more than compensated for by different lengths of arms on the lever, so that as the float settles its weight will be sufficient to force that end of the lever F down and raise the opposite end, opening the valve E at the same time and admitting more gasoline from the fuel tank, thus maintaining a constant float level at all times.

Transmission of power from the motor is through a friction clutch of standard design. The flywheel A is bolted to the flange C on the crankshaft B, being retained between that flange on the crankshaft end and a similar one on the continuation part D, which forms a bearing for the clutch. The clutch proper consists of a cone shaped disk E, which has its bearing on the continuation D of the crankshaft and is bolted to the sleeve part H, which carries a collar K for the attachment of the shifting yoke connected with the clutch pedal. The casing H terminates in the jaws R, to which the shaft running to the gear box is coupled, and within it is a separate chamber for the clutch spring and a race for carrying the end thrust bearing S. A separate oil cup is supplied for providing lubricant for the clutch hub.

The gear box is carried on the subframe and is an aluminum casting with top inspection caps. The main and countershaft bearings are carried between the top and lower parts of the case. All gears used are made from carbon steel, tempered and hardened, and have very wide faces. Three speeds and one reverse are obtained, the changing of speed being on the selective principle, one lever giving all the speeds. The final propeller shaft is universally jointed and the differential in the rear axle has the usual end thrust bearings.

Three brakes are used, one on the propeller shaft in the rear of the gear box for ordinary use and pedal applied, and two internal expanding ones within the rear wheel hubs for emergencies only. In the latter the expanding shoes are carried on a regular brake hanger at the upper ends and at the lower end are connected by toggle joint with cable to the emergency lever, the bell crank X, when pulled by the cable, forces the link Z and two short arms down, a movement which causes a rubbing of the shoes on the drum. From the hub of the brake hanger coil springs connect with each of the shoes to keep the latter off the drums when not in use.

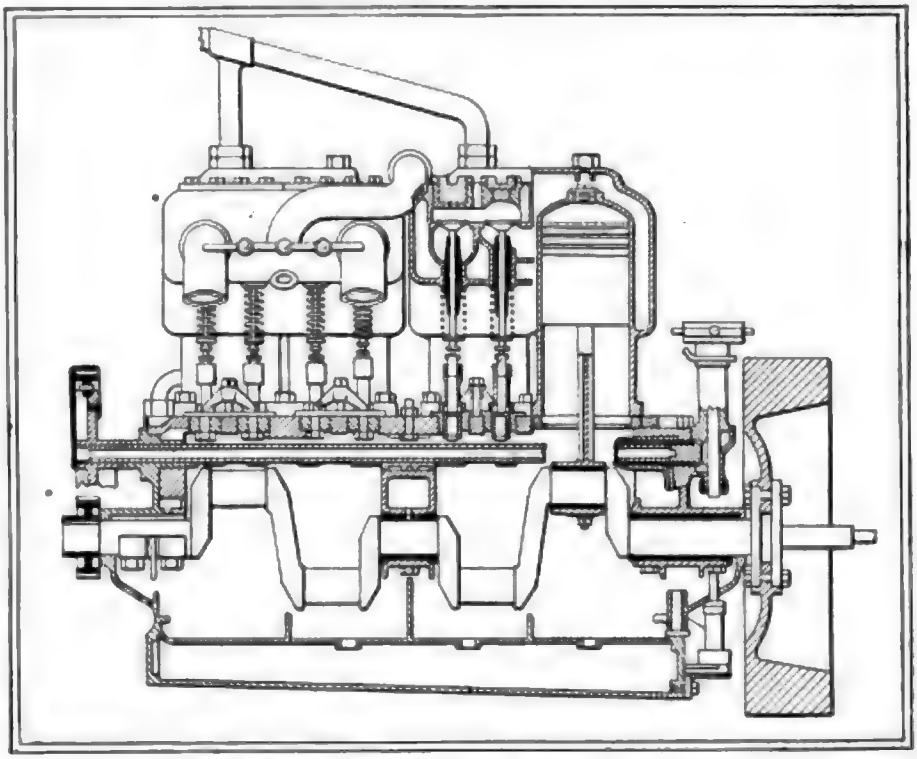
Steering is through a worm and nut gear on the bottom of a well inclined column, the horizontal shaft at the base of the column having a bearing in the side piece of the frame and the rod connecting with the tieshaft between the knuckles being outside of the frame piece. The nut in the gear has a large wearing surface well



CROSS SECTION OLDSMOBILE CARBURETER

babbitted that it may be readily replaced at any time. On the top of the steering wheel are the spark and the throttle levers and the other controlling parts are conveniently grouped about the operator.

The body lines of this model are featured by a hollow metal dash, affording good covering for the coil and other parts, sloping backs to the front and rear seats and a decided forward curve from the end of the frame piece beneath the rear seat. The tonneau entrances are wide and have rear swinging doors; the upholstering is heavy and the radiator is of the plain type. Large flaring front fenders with small rear ones, connected by running board, are other points in the body lines. The body throughout can be described as roomy and well proportioned in every detail, and the finish is in keeping with that of all large touring machines.



SIDE SECTION OF THE OLDSMOBILE FOUR-CYLINDER MOTOR

NEBRASKANS USE MOTOR CARS IN HUNTING EXCURSIONS

After Convention—Efforts are being made by the citizens of Hornellsville, N. Y., to secure the next annual convention of the New York and Chicago Good Roads Association.

Herkomer Conditions—For the 1906 tour for the Herkomer trophy the Automobile Club of Germany intends using a longer route, passing over some Bavarian and Austrian territory and finishing at Munich. It will probably be held in June.

Royalty Goes Hunting—President Loubet of France and King Alfonso of Spain became quite chummy on the recent visit to the republic of the young monarch. Both enjoy hunting and President Loubet often went out with Alfonso for a day with the guns, traveling in an automobile to the hunting grounds.

Vermont Officials—H. W. Hall, of Burlington, has been elected president of the Vermont Automobile Association, with J. M. Boutwell, of Montpelier, first vice-president; J. B. Manley, of Brattleboro, second vice-president, and John W. Gordon, of Barre, secretary and treasurer. The membership is now 103.

Enterprise—The De Forest Wireless Telegraph Co., of Kansas City, Mo., has equipped an automobile with a complete wireless telegraph outfit and the car will be held in readiness for calls from newspapers in case of railroad wrecks or other accidents near Kansas City. Similar cars are now in use in Chicago, Detroit and St. Louis and other cities.

Tours in Racing Car—Foxhall Keene has demonstrated that it is possible to use a racing car for touring purposes, having used his 120-horsepower Mercedes, which he drove in the Vanderbilt, to travel from New York to Philadelphia in less than 3 hours actual traveling time. He continued from Philadelphia to Baltimore and Washington.

Club Going South—The Minneapolis Automobile Club has arranged a southern trip which will take in the Ormond beach meet. A special train will be engaged to leave January 22, stopping 2 days on the return trip so the members can take in the Chicago Automobile Show. Asa Paine, vice-president of the club, is also president of the East Coast Automobile Association, hence the great enthusiasm shown by the Gophers over the trip to Florida.

Jacksonville Statistics—Jacksonville, Fla., according to the city recorder, boasts 166 registered automobiles of thirty-eight different makes, of which number 151 are of the gasoline type, seven steam and eight electrics. Runnbouts number 130. The large observation car owned by W. E. Sebree has been shipped there from New York and will be used for sight-seeing tours this winter.

Signs at Last—The Automobile Club of Syracuse has received the first danger signs, which will be widely distributed in the vicinity of Syracuse for the benefit of touring automobilists. The signs are of sheet steel and enamel and bear the words: "Danger—Erected by the Automobile Club of Syracuse." The routes toward Rochester, Utica, Watertown and other cities will receive special attention, as they are the most traveled.

Cycle vs. Car—C. W. Brown, in a 6-horsepower Rover, gave C. H. Larette, on a pedal-propelled bicycle, 5 hours' start in 100 miles over a course from Finchley to Swaffham, England, and beat him, catching the cyclist just as he was getting to Swaffham church. The car maintained 20 miles an hour, once being delayed by a leaky radiator. It was horse and horse, though, for the cyclist was forced to take shelter because of a storm.

Now for Good Roads—The good roads amendment to the constitution authorizing the New York legislature to spend $50,000,000 on the roads of the country was passed by a large majority. In the rural districts of Onondaga county there were 4,192 votes for the amendment and only 985 against it. In Syracuse the vote was: For, 3,700; against, 721. This means much to Onondaga county, which has been in the rear as regards good roads improvement. Prior to the adoption by the supervisors of what is known as the county highway map, petitions for the improvement of about 100 miles of road had been received by the state engineer. The map which was adopted asked for the improvement of 200 miles more, making a total of 320 miles. The amount of money appropriated by the legislature was sufficient to improve only a small portion of this. Of the original 100 miles petitioned for, only 11 miles has been constructed, the work being stopped owing to the exhaustion of the appropriation. Plans are ready for the letting of contracts for 37 miles more as soon as more money is in sight.

Farson is Chief—John Farson was last week elected to the presidency of the Chicago Automobile Club, with Allan S. Ray first vice-president; B. H. Marshall, second vice-president; Sidney S. Gorham, secretary; T. J. Hyman, treasurer, and Ira M. Cobe, N. H. Van Sicklen, Robert Terrant, Jr., F. C. Donald, Jerome A. Ellis and Charles E. Gregory directors. It is Mr. Farson's purpose to work for a new home and a building committee has been named.

Up to Snuff—As the result of a good roads convention being held at Mansfield, O., last week, a resolution was adopted which called for the construction of a mile of sample road by the construction gang of the National Good Roads Association. A permanent organization was effected. Among the speakers for the occasion were Martin Dodge of Washington City and William Bradburn, consulting engineer for the national organization.

Objects to Title—Good naturedly, John T. Landis, of Nashville, Tenn., objects to being called a "reputed millionaire," as he was styled by MOTOR AGE in a recent account of a tour by Mr. Landis from Nashville to New York. "While I enjoy the reputation of being able to take care of myself, I have never before been reputed to be a millionaire, nor do I court such distinction—at least unless fairly earned," writes Mr. Landis from Boston.

Soaks the Chauffeur—According to cable advices, Alois Bauerfield, at one time chauffeur for General Porter, former American ambassador to France, has been sentenced by a French court to 1 month in prison, $100 fine and ordered to pay $3,000 damages for running down and killing a carter named Urbain. The court held the former ambassador responsible in law for his servant's action, although General Porter was not in the car at the time.

Something Doing in Nice—Egged on by the success of the Monaco meeting while its hands were tied by stringent regulations, the Automobile Club of Nice is hustling to raise funds for a big motoring festival next year that will excel anything ever pulled off in Italy. The mile track on the promenade des Anglais is being put into condition for mile and kilometer tests next March and April and a pot of money has been raised to put Monaco in the shade.

Climbs the Balkans—Europe's Percy Megargel, R. L. Jefferson, has, mail advices state, climbed the first range of the Balkan mountains. This gives Jefferson the honor of being the first to cross the Balkans in a motor car. Jefferson's experiences have been out of the ordinary for the reason that no wheeled vehicles are used in the mountains, so that the road in some places are merely trails, with hardly room enough in the passes for a car to navigate. There being no bridges, Jefferson was often forced to drive

Digitized by Google

his car in the streams for a ways before finding a place to climb the opposite banks. Last reports had the tourist on the last stages of his journey to Turkey, he having crossed the Turkish frontier.

Bars Searchlight—England has ruled that a searchlight, or a light that is capable of being used as a searchlight, and is therefore not a fixed light, is not allowed by the law to be carried or used on a motor car.

Rah-Rah Boys Use Cars—The streets outside Franklin field, Philadelphia, during the progress of the football game between Pennsylvania and Harvard, last Saturday afternoon, presented the appearance of a huge open-air garage. For blocks in every direction the motor cars of various vintage and size were lined up along the curb, many of them having been driven by their owners from Boston, New York, Washington and other cities to the scene of the great contest.

Bay State Dope—Statistics gathered by the Massachusetts highway commission show that from May 20 to October 19, 654 convictions were secured for scorching and that $6,457 was paid in fines by the motorists using the roads of the state. These figures are questioned, however, it being claimed that there are no returns from a number of leading cities. In the list Hingham leads with 100 convictions and $1,040 collected in fines. Boston had twenty-two convictions for which $280 was paid by the scorchers.

Massachusetts' Strength—According to the returns received by the Massachusetts state highway commission, on October 15 11,546 automobiles, 1,495 motor cycles and 270 manufacturers and dealers had been registered in the state. The number of licenses issued to what might be called amateur drivers was 10,993, while 4,776 professional tickets were taken out by chauffeurs. Since the commission assumed jurisdiction over automobiles in 1903, $59,351.50 has been turned over to the commonwealth in fees.

Use Motor Car for Hunting—The automobile now serves as a medium of transportation for hunting parties, as an immense amount of territory may be covered in a day. Messrs. Walton and Packwood, of Springfield, Neb., which is 45 miles from Lincoln, recently took a number of friends for a hunting trip of several days. They covered many miles of territory in a search for good shooting. They were enabled to carry along any amount of shooting necessities and report the motor car the modern means of transportation for the hunter.

Handy on Election Day—On election day in Philadelphia every automobile that could be hired or borrowed was in use by the Republican and City parties in getting out the vote. The Broad street garages received all the way from $25 to $50 per car, according to size. Many an invalid had his first automobile ride on that day, and the veteran workers, who were familiar with the old cab and coupe method of getting out the stay-at-homes were enthusiastic over the speed and comfort of the latter-day scheme. Many private owners who were interested in the success of the battle against the boodlers loaned their cars and chauffeurs to the cause, and the splendid victory of the reformers owes no little of its completeness to the motor car. During the long campaign the big Seeing Philadelphia cars were in nightly use by the City party as speakers' stands, while a score or more of touring cars carried the large corps of spell-binders from ward to ward where meetings were in progress.

Kaiser Motor Mad—Germans are wondering if Kaiser Wilhelm will soon abolish the title of master of horse and make that official master of the automobiles, so enthusiastic has the emperor become over motoring. William has just bought seven new cars, bringing his total up to thirteen—more than any other crowned head in Europe possesses. He changes cars as often as he does his uniforms and when he goes for an outing through the streets of Berlin he is preceded by a pilot car in which there is a trumpeter, while three or four other cars follow the one flaunting the royal eagles. It is even said that the emperor is thinking seriously of disposing of his horses, which now have nothing to do but eat their heads off in their stalls.

Florida Show—Directors of the forthcoming January 4 to 18 pure food industrial exposition show at Jacksonville, Fla., propose to include in the display of goods the latest automobile models. The directors have set aside one end of the building right in the center of Jacksonville, opposite the big Windsor hotel. Senator Morgan, who is now in the south, will learn how many feet the exposition people will set aside for the automobile exhibit and will also try and arrange with the transportation companies for a reduction in freight on the prospective exhibits. He will then go on to the Ormond-Daytona beach to meet the tournament committee, which will have charge of the local arrangements for the fourth annual meet. One of the things that will have to be done will be the erection of 20 miles of double line wire to take the place of the present more or less destroyed wire, which has been used for timing the races with the electric clocks the past two tournaments held on the ocean beach.

Saves a Neck—Attempts to lynch Jim Walker, a negro, accused of attacking Mrs. Moore, an Atlanta, Ga., woman, were frustrated by an automobile. The mob had a rope about the negro's neck when Sheriff Nelms came upon the scene, dashing into the crowd in an automobile. He persuaded the mob to let the law take its course and, putting the prisoner into the car, hiked him off to jail. Moore, husband of the woman, assisted the sheriff in his pleading with the crowd, for which he was promised that he could spring the trap when the negro was strung up.

Hill-Climb Out West—Motorists in Riverside, Los Angeles and Pasadena are showing great interest in the proposed hill-climb up the Box Springs grade, scheduled for Thanksgiving day. It is 5 miles of crooked, turning grade, 1,000 feet from the foot to the crest of the range. The steepest part of the grade covers only about 2¼ miles of the total distance, but the rise of 800 feet in this distance is said to be strenuous for any car. Theodore Crossley in a 16-horsepower Wayne has climbed the 2¼ miles in 5 minutes 30 seconds, and Walter Collinge, in a 16-horsepower Reo, has done the full 5 miles in 9 minutes 30 seconds.

Greely Cautious—Contrary to expectations, General Greely, chief signal officer of the United States army, failed to make extended mention of the subject of automobiles as applied to the work of the signal corps in his annual report, recently submitted to the secretary of war. He dismissed the subject with the following brief statement: "Although automobilism is as yet unsuitable for general transportation in the field, yet its utility and advisability for self-propelled vehicles for military purposes has been amply demonstrated. Auto-propelled vehicles have been purchased by this department for experimental uses as parts of telegraphic trains."

YOUTHFUL SPANISH KING TAKES FRENCH PRESIDENT FOR AUTOMOBILE RIDE

The Realm of the Commercial Car

The CROWN Delivery Wagon

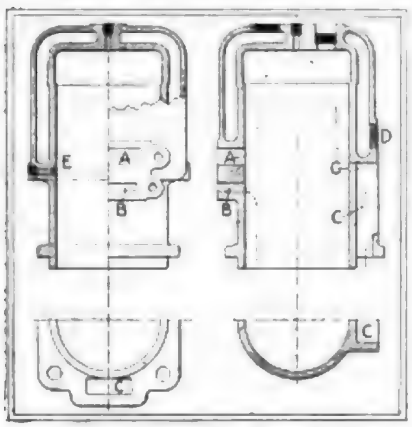
HAVING a vertical two-cylinder two-cycle water-cooled motor placed cross-wise beneath the seat, with drive from the end of the crank-shaft to a planetary gear box mounted on a cross shaft midway of the front and rear wheels of the car and single chain drive to the rear axle, may be considered the leading features of the Crown delivery wagon, manufactured by the Detroit Auto Vehicle Co., of Detroit, Mich. The wagon was placed on the market during the early summer months, previous to which time it had undergone a continued and severe testing period with the object of determining the reliability of the two-cycle proposition for commercial uses. With a brake horsepower of 14 at a crank-shaft speed of 750 revolutions per minute, and weighing 1,100 pounds, and having a load carrying capacity of 1,500 pounds, the machine should be adaptable for many lines of city work, such as deliveries for department stores, furnishing houses, groceries, florists and many of the innumerable lines of city delivery that call for a speed as high as 25 miles an hour.

Standard lines are followed in the frame construction, the 2 by 2½-inch angle side pieces with a ¼-inch wall being straight throughout, with a length of 96 inches and a width of 34 inches. In tieing the side pieces together, angle pieces are used, one at the front, one at the rear, two beneath the driver's seat for carrying the motor, and one back of this, with a center brace to the engine cross piece for carrying the transmission gear box. Gusset plates are used at every junction of frame pieces and hot riveting throughout has been used. Four full elliptic springs, 30 inches long, resting on the usual style of axle seating and pivoted at the top to rods with a dropped part for carrying the frame, give a low center of gravity, the pivoting of the springs on top and the use of radius rods removing driving strain and leaving the springs to carry the load. Both front and rear axles are of Weston-Mott design and straight throughout their length. The front road wheels revolve on double races of Hyatt roller bearings, the spindles having a diameter of 1⅝ inches, the same as the drive shafts in the rear axle. The casing enclosing the latter is heavy, with strong spiders on each side of the differential, and truss rods from the ends of the spider arms to the spring seatings, the spiders being so placed as not to lessen the clearance of the vehicle. The strut rods connect with the frame side pieces slightly back of the bearings of the gear box and are adjusted by turnbuckles in the center. The road wheels have a diameter of 30 inches and carry solid rubber tires. The wheel base is 78 inches and the tread standard.

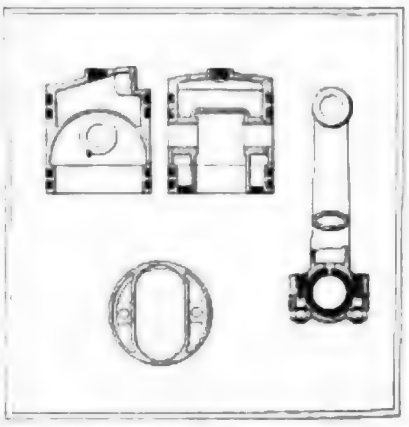
The general disposition of the motor, carbureter, lubricator, radiator and muffler can be seen in the top view of the chassis, the crankcase taking its support on frame cross pieces through the medium of four integral lugs, each bolted to the frame pieces. The bore and stroke are 4½ inches. Like most two-cycle motors the crankcase is used for a pressure chamber for the mixture before it enters the cylinders. In order to obtain as high compression as possible the case is reduced in internal capacity—and is made compression tight—by having enlargement for the two throws of the crankshaft to work in and by reduction of the case between the cylinders, instead of making the base compression space larger, as is usual in most two-cycle motors.

In the sectional views of the cylinders the method of taking the mixture into the crankcase and conducting it to the explosion chamber in the cylinders and later exhausting the spent gases can be studied. The exhaust openings, A, are on the back side of the cylinders and just below are the openings, B, through the cylinder walls for conducting the mixture from the carbureter to the crankcase. The intakes from the crankcase to the cylinders are on the opposite sides and are shown at C, the arrows indicating the mixture flow. Referring to the top view of the chassis the pipes G connect with the exhaust openings and the muffler and the pipes H extend from the carbureter in front of the motor to the intake openings directly beneath the exhaust ports, where the mixture passes into the crankcase. From the case it enters the cylinders through a channel, part of the covering for which can be seen at K in the chassis view or the entire plate shown at K in the view of the front side of the motor. The exhaust ports have an area ¾ by 3 inches, the intake to the crankcase ⅜ by 2½ inches, and the intake to the cylinder from the crankcase slightly less. The bottom of the exhaust port is on a level with the center of the intake port, while the intake to the crankcase from the carbureter is ½ inch lower than the latter.

In reducing the size of the crankcase to obtain high compression the construction of the pistons is varied considerably, it being well understood that where hollow pistons with an outer measurement of 4½ by 4½ inches are used there is at least 32 cubic inches of space within them. To reduce this the maker of the Crown has introduced an arched partition immediately above the wrist pins, an opening for the removal of the core from the space above being in the piston head and plugged. To further reduce the interior capacity of the pistons, side core spaces are used beneath the wrist pins, sufficient room being left between for the connecting rod to work. These two compartments are of half oval shape. The deflecting plate is placed so that the inrushing gas is



FRONT SIDE SECTIONS OF CROWN CYLINDERS



CROWN PISTONS AND CONNECTING ROD

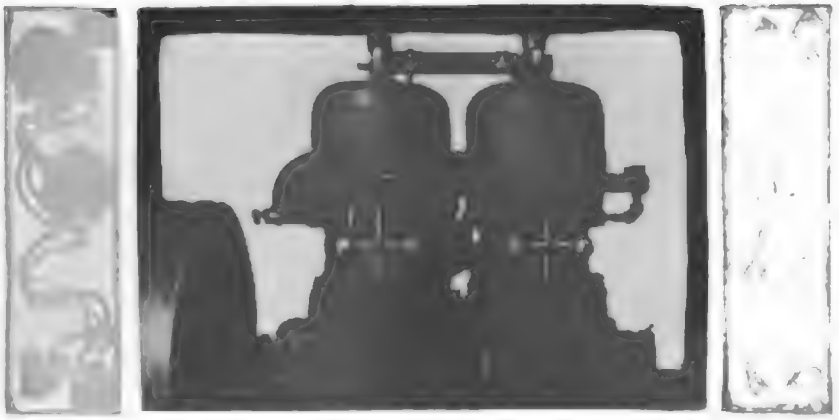
Digitized by Google

directed to the top of the explosion chamber while the exhaust gas is being withdrawn at the opposite side of the cylinder. The wrist pin is made with a diameter of 1 inch and is pinned to the connecting rod, thus having two bearings in the pistons adjacent to the cylinders, so that lubrication is facilitated. The connecting rods are hollow bronze castings made heavy and being large to increase crankcase compression. At the crankpin end is a babbitt bearing, split horizontally, the cap being retained in position by a pair of screws with locknuts and cotter pins. The crank shaft is a drop forging with throws set at 180 degrees. The shaft revolves on three bearings, each having a diameter of 1½ inches and each being furnished with an integral flange 3-32 inch wide and 3-32 inch high so as to retain crankcase compression.

Cooling is accomplished by a water current entering the waterjackets at the front at openings D and pipings D. The exit is through the top of each cylinder by pipes connecting with the top of a horizontal tube radiator of the fin type. Circulation is maintained by a pump on the end of the crankshaft, a separate water tank being eliminated. The radiator is placed well beneath the dash, being protected by the ends of the springs and the vehicle frame.

Jump spark ignition is used, the plugs being placed directly in the cylinder heads with current furnished either by battery or dry cells and distributed by a commutator carried on the right end of the crankshaft. On the motor are individual oil cups for supplying the cylinders and bearings.

The planetary transmission does not offer an innovation in its construction or method of giving different speeds. It is carried on a three bearing shaft, the two end bearings being carried on the main frame side pieces and the center bearing in a special piece uniting two ... pieces of the frame. The shaft has bearings with a diameter of 1¼ inches and works in babbitted journals fitted with individual oilers. On top speed the drive is direct, in that no gears are rotating on their axes within the case, a cone serving to lock all. The slow speed ahead and the reverse are gained by friction bands on the outside of the case drums. The bands are fibre lined,



FRONT VIEW OF CROWN TWO-CYCLE MOTOR

1½ inches wide, with a 9¼-inch diameter. Beside the gear drum is a fourteen-tooth drive sprocket, a forty-eight-tooth sprocket on the rear axle connected with it by roller chain. High and slow speeds are gained through a lever inside of the seat at the driver's right and a pedal furnishes the reverse. Two internal shoe brakes are on the rear hubs, the parts being bronze shoes working within cast steel drums, with an evener rod between the brake pedal and the brakes.

Typical delivery body lines are followed, the rear carrying space of 54 inches long, 42 inches wide and 52 inches high, being protected by a water-proof canopy with wire sides and drop curtains. All operating devices are inside the body.

POOR ROADS TO BLAME

A. J. Gill, who built the first and only complete automobile constructed in Oregon, has sold his interest in the A. J. Gill Co., of Portland, Ore., and connected himself with the H. L. Keats Auto Co. He has charge of the gasoline engine department, retailing Oldsmobile engines and establishing agencies throughout Oregon, Washington and Idaho.

"Building automobiles in Oregon did not pay," he said. "The large, twelve-passenger machine I designed and built for the Deschutes Irrigation Co. for operation on an 80-mile oiled road between Shanike and Bend was constructed at an actual loss to the builders. The machine has also proved a loss to the irrigation company, although it is in good running order, has run 2,000 miles to date, and is in all respects suitable to interurban traffic on any properly constructed road. The machine is now out of commission, the irrigation company having failed to provide a proper roadway on which to operate it."

The automobile referred to is the powerful twelve-passenger machine described in an issue of MOTOR AGE last year, when the Gill company completed it. A trial trip was made on the desert between Shanike and Bend in central Oregon. The plan of the irrigation company was to build a dirt road and oil it, and operate the machine for transportation of passengers from the railroad terminus at Shanike to the town of Bend, 80 miles inland, in the heart of the Deschutes irrigation district. The roadway made by the company proved a failure. The sand was so deep that at many places the automobile was stalled, and it was impracticable to put enough oil on the roadway to make it hard. The machine, after repeated trials, was placed in storage.

PACKARDS FOR HONDURAS

The Packard truck that made its debut early last spring has had a strenuous life ever since, being introduced to practically every phase of transportation common to big cities. Now it is to be shipped to other lands, the equatorial regions being the latest place selected for testing its ability. Three of the regular 1½-ton trucks have recently been shipped by the Packard Motor Car Co. to Central America. The trucks left the factory last week consigned by way of San Francisco and boat to the New York and Honduras Rosario Mining Co. at San Lorenzo, which is on the Pacific coast of Honduras. These trucks are to be used for the transportation of gold and silver concentrates from the mines near Tegucigalpa, the capital of Honduras, to San Lorenzo, a distance of 90 miles, and on the return trip will carry miscellaneous freight for use at the mines. The government of Honduras has spent during the last 5 years over $1,000,000 in improving the road between Tegucigalpa and San Lorenzo, so that it is in good shape and contains no grades greater than 10 per cent. Transportation is at present accomplished by

SYNNESTVEDT 5-TON ELECTRIC TRUCK SOLD TO ST. LOUIS CONCERN

pack-mule and the New York & Honduras Rosario Mining Co. figures that each truck will replace seventy-two mules. This may seem preposterous at first, but the following data shows how such is accomplished. The average load for a mule is 250 pounds. This is carried in two sacks of 125 pounds each, slung across the back. Six days is the average time occupied by the mule train to travel the 90 miles, depending, of course, upon the weather and conditions of the road. The normal capacity of the motor truck is 3,000 pounds, and it will travel the 90 miles in 9 to 10 hours, or 1 day.

A system of gasoline supply for trucks has been evolved by Mr. Jeffs of the mining company. Gasoline is taken to Honduras in drums, each drum containing 100 gallons. These drums will be distributed at regular distances along the road, in batteries of five drums each, buried in the sand, so as to reduce to a minimum the chances for accident. The five drums of each battery will be connected with one pump, with lock valve. In this way the company hopes to have no trouble whatever in keeping a supply of fuel at hand at all times. The cost of gasoline in Honduras is 20 cents per gallon, no greater than is charged in many parts of the United States. It might be interesting to note that the gold and silver concentrates which the trucks will carry will be shipped to New York, and smelted and refined in the larger refineries of the east.

The trucks have bodies similar to the standard style turned out by the Packard Motor Car Co.

CARRIES 5-TON LOADS

The Synnestvedt Machine Co., of Pittsburg, Pa., builder of electric commercial machines, has during the past summer added to its line of electric trucks a huge 5-ton one, which weighs approximately 5 tons. One of these trucks has recently been sold to the Simmons Hardware Co., of St. Louis, Mo., and before being shipped made a few demonstration runs for the Commercial Automobile Co., of Chicago, its western sales agency. The illustration shows the truck loaded with forty-four heavy trunks used by Marshall Field & Co., the trunks being filled with merchandise to be transported from the retail headquarters at State and Randolph streets to the main distributing center on Cottage Grove avenue for the south side of the city. The weight of the load was slightly over 6½ tons and the truck made the run of 3 miles to the south side at a speed of 6 miles an hour.

The truck is of the side stake variety, made with strong parts. Current for the electric motor is furnished from a forty-cell battery carried on dropped pieces of the main frame. The battery is made up of ten trays of four cells each, the trays being separately removable and weighing approximately 300 pounds each, giving the total battery a weight not exceeding 3,000 pounds. One Synnestvedt four-pole motor supplies power for the rear wheels. The motor is relieved of all pounding and jarring of the road wheels by being carried on heavy coil springs from a cross piece on the truck frame. It is maintained in a fixed position from the rear axle by heavy frame-like strut rods pivoted at the motor, the rods being made so that adjustmnets of the drive chains can be made. The motor has four forward and two reverse speeds. It has practically eight armature windings, two for each pole. On the slow speed the eight windings are connected in series, for second speed the two windings in each pole are united in parallel and the four poles joined in series, for third speed the two poles are joined in parallel, with the other two in series, and on top speed all windings are united in parallel. The controller is horizontally placed beneath the seat and is worked by a short lever at the right of the seat. The motor when under load on level street draws from 75 amperes of current upwards and the voltage ranges from 80 when recharged to 68, the latter being the minimum reading for carrying loads with a medium amperage.

The running gear is provided with a very heavy frame of H-section on which rests the carrying platform. The rear axle is a solid piece of square section 3 inches to the side and the front axle is a sold shafting with a diameter of 2½ inches. Yoke steering knuckles work within heavy jaws pinned to the ends of the front axle. Front and rear wheels are 36 inches in diameter, are shod with 7-inch Firestone tires and run on Moffat roller bearings, the motor also running on these bearings. The spring suspension is a platform scheme in front and rear, the rear platform being attached to the frame at the front ends of the side springs and to the center of the rear cross piece, the cross part of the front platform connecting the rear ends of the front side parts, rests against a cross piece of the frame. The wheel base is 10 feet. Steering is through a column on the bottom of which is a small pinion meshing with an internal toothed quadrant that connects with the tie rod.

THREE PACKARD TRUCKS SHIPPED TO CENTRAL AMERICA FOR USE IN MINING WORK

Digitized by Google

BUSINESS BRIEFS

Tiffin, O.—Landis Eberhart is contemplating opening a garage here in the near future.

Detroit, Mich.—The New Way Motor Co. is now located in its new factory on Sheridan street.

Madison, Wis.—The Mason-Kipp Mfg. Co. has changed its name to the Madison-Kipp Mfg. Co. and has recently enlarged its plant.

Milwaukee, Wis.—Referee Maxwell has appointed Paul E. Muller trustee of the Western Auto Supply Co., with a bond of $3,000.

Bellefontaine, O.—Officials of the Zent Automobile Co. have expressed a preference to moving the plant to Columbus instead of to Lancaster, as was originally intended.

Boston, Mass.—The Butler Motor Car Co., at 998 Bolyston street, will handle this year in addition to the Cleveland car and the Pierce-Racine, the Rapid commercial truck.

Lansing, Mich.—Charles M. Barber, for the past year instructor in history and economics in the Lansing high school, has resigned and will go to Mexico as agent for the Reo.

Providence, R. I.—The Autocar agency, which has been in the hands of the Thomas & Lowe Machinery Co. for the past 2 years, will be controlled by A. S. Hitchcock and G. H. Brown.

New York City—Horace S. Ely & Co. have leased to the Panhard & Levassor Co. for John T. Finn the new four-story garage at the northwest corner of Sixty-second street and Broadway.

Newark, N. J.—Articles of association have been filed for the Turbine Locomotive & Car Co., with an office at 81 Orange street. The concern will manufacture all kinds of motor vehicles for use on land and water.

Cleveland, O.—The Hatcher Automobile Parts Co., which recently succeeded the Brow & Hatcher Co., has fitted up a factory on the Superior street viaduct, where it will produce all kinds of automobile parts to order.

Pittsburg, Pa.—The Central Automobile Co., lately organized by Edward G. Mooney and Edward Seeley, has secured the agency for Pittsburg and vicinity of the Reo car. The Central garage is nearly completed at 5991 Center avenue, East End.

Danville, Ill.—J. S. Chambers & Son have sold their store on Walnut street for a consideration of $16,000. Chambers retires from active business and Earl, who has been in partnership with him, will conduct a garage in the north portion of the town.

Detroit, Mich.—The Michigan Motor Co., of Grand Rapids, has been incorporated with a capital stock of $150,000, and will hereafter conduct its business in Detroit. The company manufactures gasoline engines, motors, propeller wheels, clutches and accessories, boats, launches, etc. The business of the Michigan Motor Co. of Grand Rapids has been taken over at a valuation of $75,000.

Detroit, Mich.—The woodworking plant of J. Beaudette & Co has gone into the manufacture of automobile seats.

Austin, Tex.—S. B. Radkey has opened a garage for the storage and repair of automobiles at 123-129 West Fifth street.

Buffalo, N. Y.—William R. Densmore, formerly with the Packard company, of Detroit, has joined forces with the Centaur company.

Harrison, N. J.—B. G. Koether, formerly purchasing agent of the Hyatt Roller Bearing Co., has left the purchasing department to become assistant sales agent and manager of the company.

Decatur, Ill.—George Johnston and Frank Ruhl, of Clinton, have purchased the good will and machinery of the Keller-Needham Automobile Co. and will continue the business.

Davenport, Ia.—Orey Jansen has purchased the stock and good will of the Davenport Automobile Co. The new management will open a garage at Fifth and Perry streets which will accommodate sixty cars. It handles the Pope-Toledo and Northern.

New London, Wis.—It is believed the town will secure an automobile factory, C. M. Jelieff, a real estate man, having had a proposition from a Michigan manufacturer who is seeking a location. The proposed plant would occupy 12 acres of ground and employ 200 men.

NEW INCORPORATIONS

Boston, Mass.—The Foss-Hughes Motor Car Co. has been incorporated with a capital stock of $5,000. The company will deal in motors, automobiles, etc.

Trenton, N. J.—The Automobile Speedway Co. has been incorporated with a capital stock of $100,000 to construct, maintain and operate speedways for the racing of automobiles. The incorporators are Atlantic City, Jersey City and Baltimore parties.

Pontiac, Mich.—The Welch Motor Car Co. has filed a notice of increase of capital stock from $100,000 to $250,000.

Brooklyn, N. Y.—The Prospect Realty Co. has been incorporated with a capital stock of $6,000 to maintain a garage for motor vehicles.

Atlantic City, N. J.—The Atlantic Automobile and Machine Works has been incorporated with a capital stock of $50,000. It will engage in the manufacture of automobiles and will also conduct a garage.

Frankfort, Ind.—The Automobile Vending Co. has been incorporated with a capital stock of $10,000.

Oswego, N. Y.—The New Amsterdam Motor Co. has been incorporated with a capital stock of $75,000. The company will manufacture motors, engines, batteries, etc.

New York City—The Automobile Realty Co. has been incorporated to engage in the manufacture of automobiles. Capital stock, $6,000.

Union, N. J.—The Union Automobile Co. has been incorporated with a capital stock of $10,000.

New York City—Articles of incorporation have been issued at Albany to the Adams Vehicle Co. Capital stock, $5,000.

Malden, Mass.—The United Auto Supply Co. has been incorporated with a capital stock of $40,000.

New York City—The Auto Auction Association of America has been incorporated with a capital stock of $5,000. The company will deal in automobiles.

Augusta, Me.—The Hamilton Automobile Co. has been incorporated to deal in machinery. Capital stock, $50,000.

LaCrosse, Wis.—The Auto Rapid Transit Co. has been incorporated with a capital stock of $25,000.

BUILDING CHANGES

Flint, Mich.—Ground has been broken for the new factory of the Buick Motor Co. in Oak Park division.

Danville, Ill.—A New York firm, it is reported, is to build a garage with a storing capacity of 300 cars. Estimated cost of the building is about $500,000.

Detroit, Mich.—The Hayes Mfg. Co. will soon move into its new plant, where it will manufacture hoods, dashes, mud guards, tanks and sheet metal specialties.

New York City—Architect J. H. Morgan has filed plans for the four-story garage which the Long Island Realty Co. will build at 1869 Broadway. The cost is placed at $150,000.

Buffalo, N. Y.—John J. Albright is to build a garage and greenhouse on his premises at 130 West Ferry street. The garage is to be built of stone and brick and will cost about $12,300.

Newark, N. J.—Stengel & Rothschild, of Kossuth and Main streets, are contemplating extensive additions to their plant. They are engaged in the manufacture of automobile and carriage leather. The improvements will probably be completed by January 1.

Pontiac, Mich.—The Pontiac Body Co. has made extensive repairs to its factory and has remodeled its power plant. It has also leased the building of the Co-Operative Canning Co. adjoining and will devote itself exclusively to the manufacture of automobile bodies.

Lansing, Mich.—The Auto Body Co. has broken ground for an addition that will double the present capacity. The addition will be of brick and two stories high in the rear of the present plant. Besides the new building for manufacturing purposes, a new steam plant will be built.

Boston, Mass.—Salesrooms for the Ranier and Maxwell automobiles have been opened at 121 Massachusetts avenue, corner of Boylston street, under the management of A. E. Morrison. A garage is in course of construction on Ipswich street, and will be run in connection with the establishment.

Racine, Wis.—An addition to the Mitchell factory is under construction. The new building is to be 207 feet long by 60 feet wide. This is expected to give the plant a capacity of eighteen cars a week. After next year, it is announced, the manufacture of Mitchell motor cycles will be discontinued.

Newark, N. J.—Temporarily the Greene Motor Car Co., recently incorporated with $100,000 capital, is located at 776 Broad street. Contracts have been let, however, for a large garage at 88-90 Washington street and extending through to 9 Bleecker street, which will give room for from sixty to eighty cars. The new company will represent the Locomobile, Mercedes, Panhard, Renault and Oldsmobile in northern New Jersey. R. A. Greene is president, W. L. Clark vice-president, E. A. Greene treasurer and W. C. Overman secretary of the company.

ROADSIDE TROUBLES

An Ounce of Prevention

Copyrighted by the American Motor League

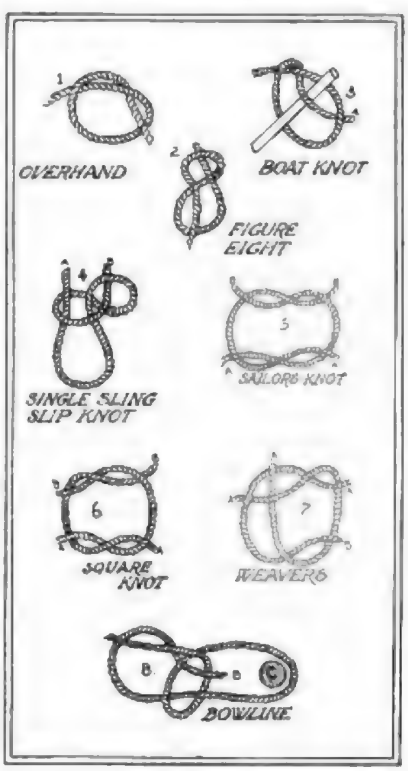
By Chas. E. Duryea

TOWING—It sometimes happens that a vehicle is incapacitated and must be towed. This subject, therefore, becomes of importance, whether it is one's own vehicle that is the cause of the trouble, or whether it is a neighbor that is stranded. If the fault is in the motor or transmission, the vehicle can usually be towed without difficulty. If of the chain variety, the chain should be removed, which will permit the vehicle to run freely. If of shaft drive, with trouble in the motor, disconnecting the clutch or gears will serve to let the vehicle run freely. If, however, the trouble is in the transmission, it may be necessary to disconnect the propeller shaft at the universal joints, which will, of course, free the axle. Most vehicles have brakes which are independent of the chain or propeller shaft, so that these disconnections will not interfere with the proper use of the brake. This is of considerable importance, for if the towed vehicle cannot be stopped it may run into the vehicle ahead or do other damage.

If the disabled vehicle is of light weight, and the other of the front-seat variety, the front passengers may push the disabled vehicle by sitting on the footboard of the uninjured car, with feet against the rear of the disabled rig. This procedure saves hunting for a rope and has been used successfully in many instances. It permits the driver of the uninjured vehicle to keep his eye on the situation better than if towing. It is sometimes possible to tie the front end of a rail against the rear of the disabled vehicle with a bit of light string, in the absence of anything better, and then rest the rear end of the rail against a solid portion of the uninjured vehicle, with one man holding it in place. In this way one vehicle will push the other much as a locomotive pushes a car on a parallel track by means of a stake, as is commonly done in switchyards.

If a suitable rope is at hand, or even a stout wire or chain, the common method is to hitch the uninjured vehicle in front with a space of 10 feet or more intervening. This space gives the man who guides the rear vehicle some freedom in the matter of steering and also some time in which to apply the brake in case the forward vehicle stops suddenly. Most vehicles nowadays have spring ends or spring supports projecting both front and rear and it is quite common to attach the rope to these. This has two objections. The pull is on one side and the rope is quite near to one front wheel. If the forward vehicle suddenly slacks, the rope may go under the wheel and wind up with a great probability of doing damage to the towed machine.

If the running gear itself—that is, the wheels and axles—is damaged, the problem is a little more severe. If a wheel is broken, sometimes a wheel that can be used may be borrowed nearby, but if not, it is usually possible to support that corner of the vehicle by placing a rail under the axle as far to the outside as possible and supporting one end of the rail somewhere on the body or framework, while the other drags on the ground. The step is usually a convenient point of support and can be varied in height by blocking, either under the end of the rail that rests over the step or under the axle where it rests on the rail, or, in extreme instances, by both. Sometimes a short bar can be lashed across the floor of the vehicle, with one end projecting, on which the rail may be supported. The same procedure applies whether the wheel is a front one or a rear one, the only difference being the direction in which the vehicle must be towed after the rail is applied, for it is quite evident that the end of the rail on the ground must project at the rear, in which case this plan, if used to replace a broken front wheel, requires that the vehicle be towed rear wheels first. It will usually be found that it can be steered satisfactorily with the remaining front wheel. Sometimes the broken end may be supported by a wheelbarrow. If both wheels are broken, two rails can be used, as described, but in this event it is usually better to lash a single rail at its front end to the rear of a truck or farm wagon and support the center of the broken end of the vehicle on this, which permits it to be towed easily and safely. Instances are known where a light sulky has been thus used to support the front end of an automobile and where the car furnishes its own power while the sulky by means of its shafts permitted the steering. If one of the rear axle bearings is seized, it is quite evident that removing the chain so as to permit free turning of the balance gear will permit the other rear wheel to revolve freely. It is even possible with one-half of the rear axle fixed, as by seizing, to drive the vehicle by means of the other rear wheel, to which the balance gear transmits all the power at double speed.

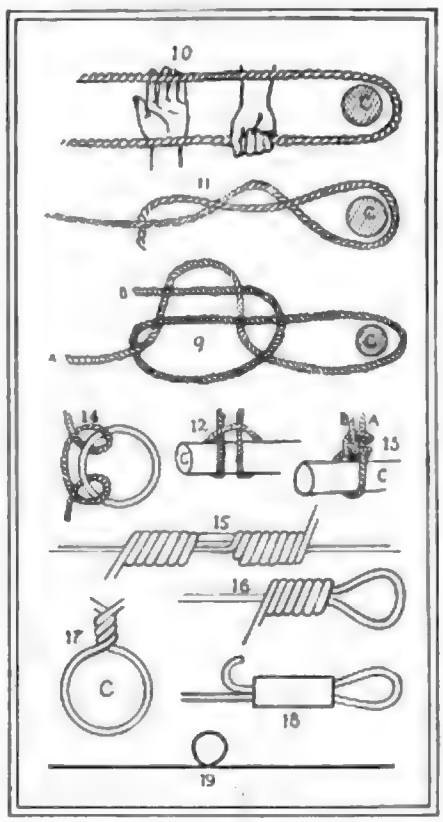


Knots—There are many occasions when one must be able to tie a knot, but there are many people who cannot tie the proper knot for the occasion and who find great difficulty in doing some of the things just described simply because of this fact and not because of any lack of material or great difficulty in the operation. There are many kinds of knots known to those who have occasion to use them constantly, but there are a few which meet the most ordinary needs and which should be known by everyone, for they are just as essential as any other part of a common education. The underlying thought in a successful knot is to bring those portions of the rope in contact with each other that have a tendency to move in opposite directions and in this way cause the friction between the two portions to prevent movement. The simplest and most common form of knot is the overhand, figure 1, in which the rope is formed into a loop or circle with the end passed over and then under the body and up through the loop. There may or may not be something within the loop. If not, this knot will draw down upon itself and form an enlargement in the rope suitable for a handhold or an abutment useful for many purposes. A neck halter for horses is formed by such a knot tightly drawn in the end of a rope and another loosely drawn at suitable distance from the end, through which the end knot is inserted after the rope is placed around the horse's neck. Pulling on this halter will tighten the loose knot, but it will not shorten the loop or choke the horse. In other words, it forms a useful loop for many purposes and is so simple to tie that no one need forget it. It corresponds to the slip knot shown in figure 4, except that the solid knot is in the end A and B would represent the main body of the rope. This overhand knot in its closed form pulls down so tightly that it cannot be

Digitized by Google

readily untied. To secure easy manipulation the figure 8 knot is advised instead for many uses, as in figure 2. A modification of the overhand, although almost identical, is the boat knot, figure 3. This can be tied in the body of the rope, for it depends upon the stick, toggle or post to which it is applied for its holding ability and not upon the fact that the end passes through the loop, as does the overhand. The slip knot shown in figure 4 is identical in construction with the boat knot and also with the halter mentioned, but is usually tied at the end of the rope and by using the end, although many prefer to tie it even at the end of a rope, as the boat knot it tied. As shown, it consists simply of an overhand knot tied around the main body A of the rope. It is sometimes secured against coming untied by tying a closed overhand knot in the remaining end B of the rope after the slip knot is completed and as close to the slip knot as possible. Since this overhand knot cannot pass through the slip knot, without previous loosening, it effectually prevents accidental untying. The slip knot is susceptible of a slight modification, due to a different formation of the overhand knot; that is, instead of forming the overhand knot by carrying the end over and then under, if formed by carrying it under and then over the projecting end will not be parallel but will lie across the main body of the rope. This knot tends to slip and untie itself and it not reliable. If used it should always be protected by tying a closed overhand in the end of the rope so that its yielding will be stopped before it comes untied. Note that the slip knot, like the boat knot, if properly constructed, is untied by slipping the main loop out of the overhand loop when the stick or post is removed. The modified slip knot mentioned will not do this. In figure 5 is shown the sailor's knot, and in figure 6 the square knot. These are both in reality double overhand knots. They are the knots commonly used in tying one's shoe or tying a package; and for these purposes the ends are usually doubled for form bows, which are untied by pulling. This construction is so well known and so apparent that it is not shown. In these knots the only difference is that the ends in the sailor's knot project across their respective rope bodies, whereas in the square knot the ends project parallel to the bodies. This latter arrangeemnt secures more fully the conditions required by a true knot, viz., that adjacent portions, if slipping, must move in opposite directions and the square knot is therefore the better knot, for it will hold with less danger of coming untied and is substantially as easy to untie when required. A modification of these knots is the weaver's knot, figure 7, in which one portion is identical with the same portion in figures 5 and 6, but the end of the other portion passes under and across its body and over both parts of the opposite body, as will readily be seen. This knot also can be tied with a bow, which both adds to its efficiency and is readily untied. A is the body of the rope, B the end and C the post.

What a knot is depends both upon its construction and upon the way in which it is constructed, or, in other words, upon its relation to the body and end of the rope. The weaver's knot is simply another form of the bowline knot shown in figure 8. This latter knot is of the non-slipping variety and is the one most commonly used where it is desired to encircle something without slipping and diminishing the loop. It serves the same purpose as the halter knot, but since it must be tied afresh each time, it is not suitable for a halter. It is easily tied by forming a small kink in the body of the rope through which the end is passed downward, then up over the body, then downward and up through the kink parallel to itself but projecting so that the pull comes in opposite direction, as in figure 8. This description is given because it makes the shape of the knot more plain than the usual method of tying. As usually tied it is begun as an overhand, followed by a pull on the end, which



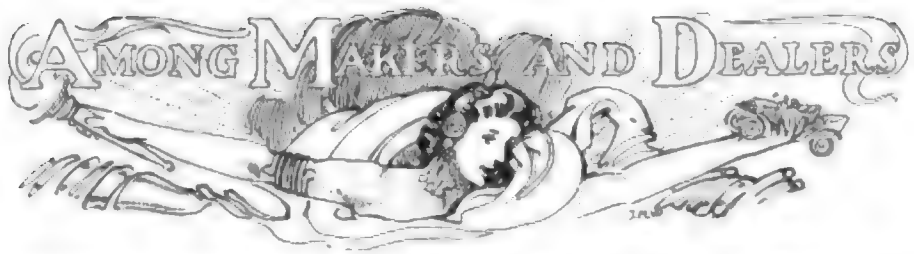
throws a kink in the body, with the end projecting straight through the kink, after which it is completed as above described. A few trials will make this description plain and comparison will show the resemblance to the weaver's knot, which it becomes if the loop around C is cut.

A knot serving the same purpose as the bowline but somewhat quicker to tie and possessing the advantage that it may be tied with a partial strain on the body of the rope, is shown in figure 9. The writer has never seen this knot described and believes its advantages entitle it to a description here. The construction is shown in figures 10 and 11 quite clearly. After encircling the object C the end is brought parallel to the body, each passing over the wrist of the hand that grasps the other, as in figure 10. The hands are then withdrawn, bringing the rope in the position shown in figure 11. The end is then passed over both and up through the loop from below, as shown in figure 9. When drawn tight it will not slip and is readily untied. These knots will meet all common requirements and should be practiced until thoroughly familiar, for when needed their service may be of great importance. A pleasant evening, particularly with the children, can sometimes be spent practicing their quick construction. Figures 12 and 13 show two forms hardly worthy of being termed knots and generally called hitches. These are sometimes used in connection with a knot. For instance, a loop either of the slip knot or of the non-slipping variety if doubled back on itself produces the hitch shown in figure 12. This is easily loosened and yet will grip so as to not readily slip along the part to which it is attached, and it is absolutely prevented from slipping if it is placed so that a projecting point, like a knot on a log, comes between the ropes. In figure 14 is shown a ring attached in the middle of the rope. This is particularly advantageous in certain places, such as anchoring a boat to a rope stretched over the water. The ring can be attached anywhere by forming a loop in the rope, which is pushed through the ring and then spread out and doubled back on itself, so as to pass the ring through the loop. In figure 13 is shown a simple form of single hitch frequently used instead of a slip knot.

Splices—While splicing usually refers to ropes, it is offered here in connection with wires. If the wire is quite flexible, it may be tied as is a rope, but this is not the ordinary nor best method. The common lineman's splice is formed by placing the wires closely together, parallel, with ends projecting in opposite directions. They are then seized with the pliers, so that the ends project 25 or 50 wire diameters. The ends are then turned into a plane at right angles to the main wires, after which they are wound around the main wire as closely as possible. Sometimes this joint will slip the distance represented by the width of the pliers, but usually it will not do so. A loop is formed in the end of the wire by the same process after the wire has been doubled back on itself, as shown in figure 16. When used for wrapping purposes the ends of the wire are simply crossed, seized with the pliers and pulled taut by being twisted, as in figure 17. If the wire is exceedingly stiff, like piano wire, the parallel ends should be wrapped with much finer wire and the entire joint filled with soft solder. A loop in stiff wire is formed by wrapping and soldering or by pushing a small tube over the body, then pushing the end through it and bending a hook to prevent the end pulling out, as in figure 18. Wire-cutting pliers should be a part of the tool equipment, but if not, the wire can usually be quickly broken by nicking it slightly with a file and then bending it at the nick a few times. Exceedingly fine wire, such as is used for tying tags, can usually be broken by kinking it shortly, as in figure 19, followed by a quick jerk, which causes it to break at the kink.

EDITOR'S NOTE—This is the eighteenth of a series of articles by Charles E. Duryea. These articles will be prepared for publication in book form and will be distributed by the American Motor League to its members during the coming year.

Digitized by Google



Orders Pipes—Joseph S. Heller, of New York, has returned from Belgium, whither he went 5 weeks ago to arrange for 1906 importations of Pipe cars.

On the Spot—Thomas A. Egan and F. G. Grinnell, of Narragansett Pier, R. I., will establish a garage in connection with the Clarendon hotel, at Sea Breeze, Fla., on the famous Ormond-Daytona beach course.

Exit the Horse—The Pope Motor Car Co., of Toledo, O., has decided to get rid of all its horses, which have been used for trucking and teaming purposes. A week ago last Saturday a Waverley gasoline truck was installed, and in a short time a Pope-Hartford motor truck will be in, when the last horse will go.

Olive Goes Home—Harry L. Olive, who has been traveling in the interest of the Yale automobile for the Consolidated Mfg. Co., of Toledo, O., has resigned and has returned to Los Angeles, Cal., where he will again push the sale of the Peerless automobile, this machine having been handled for some time by Pawley & Olive.

To Handle Berkshires—Douglass Andrews & Co., of New York, have contracted for the entire 1906 output of the Berkshires and established their headquarters at 1623 Broadway, with C. S. Tate as manager. Agencies have already been closed for Brooklyn, Pittsburg, Chicago and Boston. The 1906 models are expected to be ready December 1. These cars are of the 4-cylinder vertical type and are made in 16, 25 and 40 horsepower models.

Moline Deal—Preliminaries for the establishment of the Deere-Clark Motor Co., of Moline, Ill., have been completed and a license to incorporate has been issued to the firm. The capital stock is $100,000, and the incorporators are C. F. Drury, R. S. Blackmore and W. E. Clark. The organization of this company has been in progress for some time and practically the entire capital stock has been subscribed by Moline people. The plant will be situated on First street, East Moline, and plans are already under way for the construction of a building.

Show on Wheels—Plans for a transcontinental automobile show train, to carry the product of the leading manufacturers of the country have been announced by G. A. Wahlgreen, of Denver, Colo., publisher of Motor Field and director of the Pike's peak hill climb, to be held in Colorado next fall. The transcontinental automobile show train will be made up of fifteen or more baggage cars, and according to the promoter will tour the principal cities of America, taking the place of the minor automobile shows which are generally held each year. It is planned to make the trip in September or October of next year. The train will not interfere with the two big shows held annually at Chicago and New York, but is planned by Wahlgreen to take the place of all of the other shows.

Has Swell Place—The Palace Automobile and Machine Co. has opened one of the most pretentious garages in the Harlem district at 208 West 124th street, New York.

New Wayne Men—William B. Young, well known as a bicycle trainer, and Franklin H. Bowen, formerly of the Ford Motor Co.'s metropolitan branch, have been added by A. L. Kull to the selling force of the Wayne Automobile Co. of New York.

Acme Deal Closed—Frank A. Devlin, representing a Chicago and New York syndicate, has closed the deal for the Acme plant at Reading, Pa., the price, it is said, being $250,000. He announces it is his plan to increase the output to 600 cars. Irving D. Lengel will remain as superintendent.

A. L. A. M. Not In It—C. A. Wardle, who was in Chicago this week, denies that the A. L. A. M. is in the least interested in the Inter-State Automobile Clearing Association, of which he is one of the prime movers. Nor is it the intention, he states, to handle any but licensed cars, as it is contemplated that any make of car may be handled in the scheme to bring buyers and sellers of second-hand cars together.

Hub Change—A new company has been formed to handle the Oldsmobile in Boston. The Adams-Sutton Motor Co., which has secured the agency, is composed of W. O. Adams, formerly foreign sales manager of the Olds Motor works, and David Sutton, formerly with the Canadian Bridge Co. At present the company is showing the new models in temporary quarters at 43 Stanhope street, but as soon as the Motor Mart is completed it will have quarters in the building.

Four in Wayne Line—The Wayne line for 1906 is to embrace four distinct models, including two sizes of four-cylinder cars. The model F for next season's market is a four-cylinder motor, with the cylinders cast in pairs. The cylinder dimensions are 5½ by 5 inches, the motor developing 50 horsepower. The speed change gear will give three speeds forward. Hess-Bright bearings will be used all through; a floating rear axle, I beam front axle of nickel steel, 114-inch wheel base and 34 by 4½-inch tires are other features. The model K will also be a four-cylinder car, with 35-horsepower motor, the cylinders also cast in pairs, the dimensions being 4¾ by 3 inches. The transmission and axles on this car will be the same as those on the model F. The runabout will have a double opposed motor 4½ by 4 inches under the hood, and will give 14 horsepower. This car will have shaft drive and sliding gear transmission, with tires 28 by 3 inches. The touring car has an opposed motor 5½ by 5 inches under the body, developing 20 horsepower. The transmission will be through a planetary gear and the tires will be 30 by 3½ inches.

New in Boston—Simeon H. Baker, who has been connected with the Rambler for the past 4 years in Boston, has severed his connection with the Thomas B. Jeffery Co. and has formed a company to be known as the Baker-Cormerais Motor Car Co., to handle the Premier.

Heath in Jail—Howard T. Heath, who claimed he was an automobile manufacturer, has been taken from Chicago to Elgin, Ill., and jailed on two charges of obtaining money under false pretences. John Overst and George F. Volsch claim to have paid him $700 for stock in an imaginary automobile factory.

Pittsburg Wants Show—An automobile show is again being talked of in Pittsburg and it is the apparent desire that such an affair will be held as soon after Thanksgiving as possible. Would-be buyers are more anxious than ever for the show because there are so many new agencies in Pittsburg this fall and so many changes in the old ones that they want a fair chance to look over and have explained to them carefully the merits of the different machines before buying. Negotiations are now pending for the renting of a big building down town and if sufficient support in the way of space and advertising is received from the dealers the affair will be pulled off very soon, it is said.

Winton Plant Working—The Winton factory at Cleveland reports it is now making shipments of four or five cars every day and agents all over the country are being supplied with samples as fast as possible. Charles B. Shanks will be home from his exhibition tour of the country some time within the next couple of weeks and then the output of 2,500 machines will be pushed in earnest. Alexander Winton and Harold Anderson, chief engineer of the Winton company, left last Tuesday for Europe where they will attend the London and Paris shows. Reports that the Winton company will engage in the manufacture of motor boats or that it is identified with the Cleveland Motor Boat Co. is emphatically denied by officials of the Winton company.

Big Fiat Deals—Three announcements of more than ordinary importance are made by Hollander & Tangeman, of New York, importers of the Fiat—the lease of a big garage on upper Broadway, the conclusion of a big importing contract and the incorporation of their business under a new title. They have leased for 10 years the five-story building at the northwest corner of Fifty-sixth street and Broadway, adjoining Smith & Mabley's. During the recent visit of the directors of the Italian company to the Vanderbilt race a contract was signed for the exclusive Fiat agency for 10 years, embracing an order for 1,500 cars to be delivered within that time. They also bought the Fiat patents right outright for this country and Canada, which they claim will enable them to exclude all Fiat cars not purchased direct from them. With the beginning of the new year a

Digitized by Google

stock company will be formed to take over the present business with the title of the Hol-Tan Co.

Reo Transfer—Daniel Cohen, of the New York office of the Reo Motor Car Co., has been transferred to Philadelphia, where he will act as manager of the branch there.

Baltimore, Md.—The Automobile Outing Co., of which J. Q. A. Smith is secretary and treasurer and Richard Keating president, has secured the agency for Baltimore and several counties in Maryland for the full line of Columbia electric and gasoline cars. The company is now establishing itself in a large garage and show room.

Gabriel Doings—The Gabriel Horn Mfg. Co., of Cleveland, O., having secured letters patent for this country on the Gabriel horn, announces that it will institute a vigorous campaign against all infringers. The W. F. Peckham Motor Syndicate, of London, has been granted the agency for Great Britain.

Ford's Cleveland Branch—Euclid avenue, Cleveland, will have another addition to its colony next spring in the shape of a northern Ohio branch for the Ford Motor Car Co., whose line was formerly handled by T. C. Whitcomb. The new establishment will be located at Euclid and Perry streets and will be in charge of Harry Cunningham, who has gained considerable fame on the track. M. J. Roseboro will represent the branch on the road.

Moocrs Looking Around—L. P. Moocrs, formerly designer for the Peerless company, has been in Cleveland the past 10 days looking up material. He is preparing to go into the manufacture of automobiles on his own account. He will probably locate in the east and has not fully decided upon the size of machine he will build. He has been abroad for the past 4 months studying French and German features and he has a number of new ideas which he will embody in the new Moocrs car.

Succeeds Old Firm—The Motor Car Supply Co., of Cleveland, was incorporated last week by W. B. Drown, Erwin G. Guthery, L. H. Drown, E. C. Lessner and A. R. Graves. The company succeeds the State Automobile & Supply Co., which has an establishment in the Pythian Temple building. The company will handle Pittsfield spark coils, a line of four-cylinder engines built to its order, and supplies and material of all kinds; it will also handle motor boats built by the Cleveland Motor Boat Co., a new concern.

Energine Energy—The product known as Energine which has gained considerable prominence throughout the country as a substitute for gasoline, will in the future be manufactured by the Energine Refining Co., a new concern with $500,000 capital stock which has succeeded the Energine company, a smaller concern. The new company is headed by the same people—F. B. Maney, R. P. Beardsley and others of Cleveland. Considerable outside capital has been interested. Heretofore the company's plant in this city has had a capacity of about 100 barrels per day. A new refinery having a capacity of 700 barrels per day is under erection. In addition to the numerous distributing stations in this country, the company has arranged for distributing agencies in London, Paris, Christchurch, N. Z., Johannesburg, South Africa, and Buenos Ayres, South America.

Dispute It—Crydus & Co., of New York, dispute the claim of Emil Stern to the right to place a Leon Bollee agency in this country, as was stated he has done in the appointment of Morris M. Mason.

Making Anti-Freeze Mixture—R. R. Owen, of Cleveland, has organized the Owen Chemical Co., which will push No-More-Auto-Freeze, a preparation whose name bespeaks its character. Mr. Owen has been using the preparation for several years. He bought the formula and has made up 100,000 gallons.

Royal Progress—The Royal Motor Car Co. has completed its new factory building, adjoining the old plant in Cleveland and is preparing to move in. The building is made of concrete block and is two stories high and 50 by 175 feet. The company is installing a large amount of modern machinery and it announces it will produce about double the number of cars that it did last year. Practically all work will be done in its own plant.

Few Reo Changes—The announcement of the Reo Motor Car Co., of Lansing, Mich., for 1906 states that the five-passenger touring car will weigh 1,600 pounds, will have pressed steel frame, half elliptic front and full elliptic rear springs, tubular axles, 30 by 3½-inch tires, a 4¾ by 6-inch opposed motor giving 16 horsepower, Olds carbureter, planetary gear transmission, single chain drive, and a 90-inch wheel base.

New Scheme—A new and original method of introducing its product in places where it has hitherto been unknown has just been inaugurated by the Maxwell-Briscoe Motor Car Co. The company will send a number of its salesmen in touring cars through sections of various eastern states, each carrying along a complete moving picture outfit. Arrangements will be made to give a moving picture exhibition in a public place of the towns visited. The views will include racing and touring incidents, including the performance of the Maxwell car on its trip up Mount Washington. The first of these missionaries to start was P. B. Blisdale, who started over a route which includes many of the towns in northern New Jersey.

Feased by Rents—Automobile firms in Pittsburg are finding out that they have a hard obstacle to overcome in the matter of excessively high rents. This fact alone has kept at least two concerns from locating downtown this fall and is holding up the plans of another newly formed company which desires to do a large storage business for business men during the day when they are at their offices. Downtown lots are worth from $2,000 to $20,000 a front foot according to their location and the business area is so congested in Pittsburg that every square foot of space is very valuable. An amount of room necessary for a garage, even if it be a small one, costs a sum altogether out of proportion to the possible revenues to be derived from storage. Nature has apparently ordained that the automobile business of Pittsburg must be conducted several miles from the business center and the dozens of business men who come in their cars in the morning must put up with the inconvenience as best they may.

Orders Chassis—John T. Rainier, president of the Rainier company, of New York, has just returned from a flying trip to Cleveland, whose object was to arrange for 100 Rainier 30-35 horsepower chassis, to be added to the 1906 output. The Morristown Garage Co. has been given the agency for middle New Jersey and T. S. Morse, of Lenox, Mass., the Berkshire district.

Briscoe Enlargement—The Briscoe Mfg. Co. has recently acquired the plant of the Wheeler Mfg. Co., of Detroit, which is moving into its new factory. This plant adjoins the Detroit factory of the Briscoe company and contains some 15,000 square feet of floor space. While its eastern trade has been handled by the new plant of the company at Newark, N. J., the industry as a whole has so expanded than an enlargement of the Detroit plant was deemed necessary.

Dealers Bothered—Proprietors of garages in Stanton court, Washington, D. C., of which there are several, are having their own troubles just now, as certain parties in the neighborhood are filing injunction suits against them with a view to stopping certain alleged noises. The latest suit was filed against the Haynes Automobile Co., of which H. A. Rhine is manager. The usual grounds, alleged noises and foul odors, form the basis of the complaint. No action in any of the cases has yet been taken.

New Firms In Cleveland—The retail business in Cleveland is being augmented by a number of newcomers of late and it looks as though next spring would find a considerable overstock of dealers. The following are some of them: The Paxson Motor Car Co., capital stock $10,000; formed by C. D. Paxson, Robert Dash, C. B. Solders, Otto Leisy and A. D. Paxson; the Standard Automobile Co., capital stock $10,000, formed by T. H. Hogsett, G. M. McAlleman, George H. Kelley, George H. Smith and F. B. Williams; the Motor Car Supply Co., capital stock $10,000, formed by W. B. Drown, E. C. Lessner, L. H. Drown and A. R. Graves, and the Ohio Garage & Repair Co., capital stock $10,000, formed by G. W. Hale, J. O. Lundy, H. D. Merrick, I. D. Hogg and E. F. Gibbons.

Buys In—The Standard Automobile Co., of Cleveland, has succeeded the Automobile Garage & Repair Co., for the past 2 years a leading retail concern, and agent in northern Ohio for the Packard, Cadillac and Autocar lines. The new company has a capital stock of $100,000 and the officers are Warren C. Anderson president, George S. Waite secretary and general manager, and John Rauch treasurer. The company's establishment at 404 Huron street, is one of the largest garages in the country. Formerly half of the building, which is four stories high, 80 by 200 feet, was occupied by Price Brothers Carriage Co., agent for the Baker electric line, but from now on the new company will have the whole of the large building, Price Brothers being on the point of moving into a new establishment it has secured just next door at 408 Huron street.

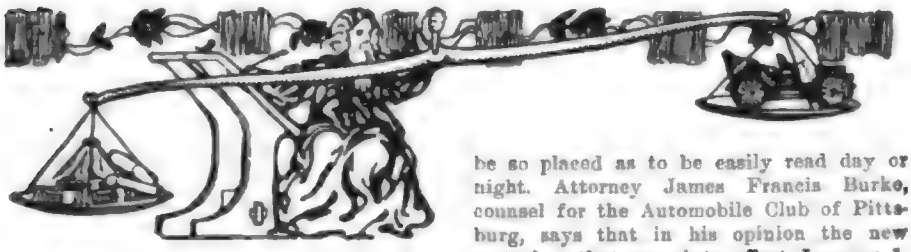
LEGAL LIGHTS AND SIDE LIGHTS



NEW QUAKER DECISION

Pittsburg car owners and dealers are alike jubilant over the decision of Attorney General Hamilton L. Carson, handed down at Harrisburg last week, making void all city ordinances regarding the speed and running of automobiles. It will be remembered that the Pittsburg motorists have been fighting with the city authorities on this point for months and the decision of the state official is a victory for them. The text of the decision is to the effect that the last law passed repeals all former state measures and makes the act of 1905 apply not only to automobiles, but to motor bicycles and delivery cars, none of which can be operated after January 1 without a license from the state highway department. An important feature of the new act is that its enforcement will come under the direct supervision of the state highway department and the details under the state automobile bureau, of which H. M. Cutshall will be in charge. Instead of having the license issued by the county prothonotaries as heretofore they will be granted by the state highway department. Two tags will be supplied with every license, one for the front and one for the rear of the machine and they must be so placed as to be easily read day or night. Attorney James Francis Burke, counsel for the Automobile Club of Pittsburg, says that in his opinion the new state law that goes into effect January 1, 1906, will do away entirely with all preceding city ordinances. Such legislation hereafter cannot impose on the automobilists a double burden of taxation, which was the contention of the Pittsburg motorists in the late controversies. In all ways the new state law is likely to be much more satisfactory and motorists are looking forward eagerly to the first of the year when the state highway department will open an office in Pittsburg and bring the licensing of automobile vehicles of all kinds under an orderly management.

The attorney general's decision was made in response to the highway department's request for an opinion, made it plain the new automobile law which goes into effect in the Keystone state next New Year's day repeals all former legislation upon the subject. Some motor cyclists have been claiming that the law will not apply to them, but Attorney General Carson comes out flat-footed and says that it does, and that all operators of the two-wheelers will be compelled to secure a license from the state highway department and carry two tags, just the same as an automobile. Some of the motor cyclists are wondering whether the clause of the new law which requires the rear tag to be illuminated at night applies to them also. In view of Mr. Carson's opinion it would seem that it does. That the carrying of a light so close to the gasoline tank spells danger for a motor cyclist every one admits, and an effort will be made to explain to the attorney general the advisability of placing such a construction upon the new law as will allow the two-wheelers to carry their illuminated number on the front or to so interpret the law on this point as to let the motor-cyclists out entirely. Mr. Carson also made it plain that on and after the first of next year any machine carrying other than Pennsylvania tags while traversing the roads of the Keystone state will bring its operator into conflict with the authorities; all such foreign tags must be removed from a car when it enters the state. No arrangements have yet been made whereby automobilists can secure licenses in their own towns and cities; as the law reads now, all licenses must be obtained from the state highway department, whose only office is located in Harrisburg, the state capital.

WORKHOUSE FOR SCORCHERS

Delegate Frank Hussey, of the twenty-second ward, has introduced in the house of delegates at St. Louis a bill making the offense of exceeding the speed limit with an automobile punishable by from 5 to 10 days in the workhouse. No alternative of a fine is permitted. The measure also provides that not only the chauffeur, but also the person under whose orders he is acting, shall be punished. The present speed limit of 8 miles in the streets and 6 miles in the parks is not changed. Delegates Coale and Smythe, the only automobile owners in the house, voted to lay the bill on the table, but their motion was defeated.

THE READERS' CLEARING HOUSE

ANTI-FREEZING SOLUTION

Chicago, Ill.—Editor MOTOR AGE—I have a four-cylinder motor, with Whitlock radiator, and wish to make a non-freezing solution of glycerine and water. Nearly every one of whom I have inquired seems to have a different proportion. Will a solution of 2 gallons of water and 2 gallons of glycerine be about right, and what would result if more glycerine were used.—CHARLES E. BARTLEY.

Ordinarily 25 per cent of glycerine is sufficient for most climates. Tests have proven that glycerine will freeze as follows: Ten per cent of glycerine in water at 30 degrees Fahrenheit, 20 per cent at 27 degrees, 30 per cent at 21 degrees and 40 per cent at 0. Glycerine and water appear to be frozen when, in fact, they are not; but appear to be in a spongy state. They do not freeze because of the insulation of the molecules. The jelly-like consistency disappears when the mixture has become warm from the heat of the motor.

Calcium chloride is more commonly used for an anti-freezing solution. It is cheaper than glycerine and the tendency is to absorb moisture. Three pounds of chemically pure calcium chloride should be dissolved in 1 gallon of warm water. This will suffice for temperature down to zero. For 20 degrees below zero use 4 pounds to each gallon of water, and for 40 degrees below 5 pounds should be used for each gallon of water. Calcium chloride will not attack any of the metal parts except solder. If a handful of unslacked lime is added to the mixture and dissolved, and the mixture strained before it is put into the radiator, the solder will not be injured.

Glycerine sells for about $2.50 per gallon, whereas calcium chloride is advertised by Chicago wholesale drug houses about as follows: In drums of 700 pounds, 75 cents per hundred; 100-pound drums, 2 cents per pound; 50-pound drums, 3 cents per pound; 25-pound cans, 5 cents per pound; 3 and 6-pound bottles, 8 cents per pound. Supply houses sell 10 pounds for $1 or 25 pounds for $2.

CAUSE FOR NOISES

El Dorado, Kan.—Editor MOTOR AGE—Will you please tell me through the Readers' Clearing House what causes the following noises: Whenever my car starts down an incline and gains a little momentum of its own there immediately starts a loud clapping or pounding sound, which continues until the bottom of the hill is reached. I cannot locate it. This same noise is noticeable when the clutch is disconnected and the spark retarded in order to cut down the speed of the motor. It seems loudest when the engine runs free. While the car is standing, with the motor running slowly, if the throttle is opened a little just before starting the car, and the motor picks up a little speed, there is a sort of a popping sound just after each explosion. The cylinder oil cup feeds nearly 15 drops per minute, so it can hardly be a dry piston, although it does seem to come from the cylinder. This noise is hardly noticeable when first starting, but after running 8 or 10 miles it becomes louder and can easily be heard from the operator's seat. I run my car nearly 35 miles every day.—FRANK JEROME.

In running on a decline with the clutch engaged and engine throttled, the momentum of the car exceeds the speed of the motor and when an explosion takes place the speed of the engine is increased enough to take up the back lash or lost motion caused by the momentum of the car gaining on the motor, hence the clapping sound. If the noise continues when the clutch is disengaged and spark is low, it is undoubtedly a loose connecting rod bearing.

The connecting rod caps should be frequently examined to see how the bearings are wearing. Often a cotter pin is sheared off, and a nut works loose, resulting in a loose bearing.

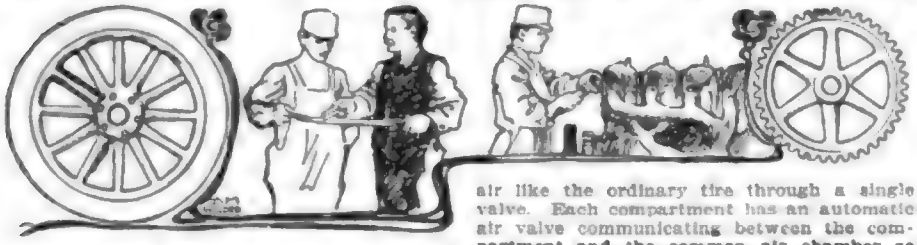
Current Automobile Patents

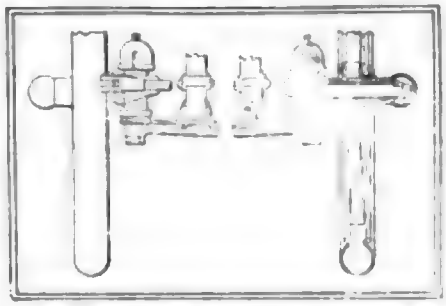


Transmission Gear—No. 803,845, dated November 7; to Charles E. Neal, New York city—The transmission gear referred to gives two forward speeds and a reverse and has practically no gear box as used in most cars. Within the case on the rear axle is a differential with a double-beveled gear A having two gear faces to give different speeds. Opposing this gear is another single gear B for the reverse drive. Between these gears and sliding on the drive shaft C are two bevels of different size. By a double shifting device consisting of D, for sliding the bevels on the drive shaft, and E for sliding the gears A and B to right or left, different speeds are gained. The smaller gear on the drive shaft can be meshed with the larger bevel of A for slow speed, with B for reversing. Fast speed is gained by meshing the larger bevel on shaft C with the smaller one on gear A.

Lubricated Clutch—No. 804,104, dated November 7; to Albert DeDion and George Bouton, Puteaux, France—The automobile clutch described is of the single-disk type; two disks, A and B, being connected with the crank shaft D. Another disk C between them is connected with clutch shaft E. The feature of the device is the method of lubricating, there being little blocks of graphite or graphite carbon inserted in receptacles in the faces of the disks A and B so that the graphite bears against both sides of the disk C. By this method the disks are lubricated and work in a dust-tight compartment, the object of the lubrication being ease of engaging and disengaging and the prevention of heating of the disks. The clutch described is engaged and disengaged through the use of a coil spring and lever arms engaging in the collar on the hub enclosing the spring, all end thrust owing to the spring being taken up by ball bearings.

Divided Air Tubes—No. 804,088, dated November 7; to Manley H. Blakeslee, Buffalo, N. Y.—Conspicuous in the automobile tire referred to is the dividing of the air chamber into ten separate compartments, these being arranged end to end, forming a circle within the outer casing as does the ordinary inner tube. These separate air compartments are enclosed within an air chamber supplied with air like the ordinary tire through a single valve. Each compartment has an automatic air valve communicating between the compartment and the common air chamber so that to inflate the compartments the air is pumped into the common chamber. It in turn passes through the automatic valves into the separate compartments. The object of the construction is that should one of the compartments become punctured the usefulness of the tire is not affected.

Steering Knuckles—No. 803,606, dated November 7; to Fred A. Law, Hartford, Conn.—The steering knuckles referred to in this device differ materially from the ordinary knuckles by having the vertical pivot which carries the spindle for the road wheel attached at its lower end to the axle of the machine, it being different in this regard from either the Le Moine or Elliott type of knuckles. The spindle works in a plain bearing at the bottom and has ball bearings on top encased in a separate cage, making them oil and dust tight. The tie rod is connected to the inner side of the hub of the vertical spindle.



Law's Steering Knuckle

Armor Plated Tire—No. 803,989, dated November 7; to Clarington W. Caterson, Franklin Forks, Pa.—The tire referred to is an ordinary pneumatic having a flexible plate of armor placed within the casing part. This armor consists of a tread portion made like a flat strip. Attached to either side of this are curved side parts corresponding with the curve of the side of the tire. These parts are in reality hinged sheets being hinged in order to not interfere with the resiliency of the tire and yet afford ample protection for it.

Compound Engine—No. 803,823, dated November 7; to Edward T. Pollard, London, England—The compound gasoline engine described, is of the three-cylinder style with the two end cylinders explosion ones and the middle one an expansion cylinder. In the heads of the two explosion cylinders are exhaust valves that open every other revolution and in the expansion cylinder is an exhaust that opens every revolution. In the explosion cylinders are ports uncovered at the end of the out stroke. Passageways connect from these ports to the rear of the expansion cylinder. Non-return valves are placed in these passages.

Armored Tire—No. 803,659, dated November 7; to Arthur S. Allen, Brookline, Mass.—The tire described is secured to clincher rims and has the common air tube. The outer cover is reinforced by three layers of wire gauze embedded between the rubber layers, constituting the casing. The gauze layers are placed so that the wire strands constituting them do not run in the same direction as any two of the layers, thus binding and supporting the tire casing equally in all directions.

Belt Transmission—No. 803,810, dated November 7; to George A. Cutter, Nashua, N. H.—The belt transmission device described comprises a main shaft and a counter shaft, with the former provided with a pulley, the diameter of which can be varied at will by being constructed of two opposing cones with a movable band between the cones for the belt to travel upon. On the counter shaft is a similar pulley and between the main and counter shafts is an arrangement for sliding one of the cones on either pulley so as to increase or decrease the pulley diameter. A heavy leather belt passes over the pulleys.

Pipe Wrench—No. 803,641, dated November 7; to Emmerson Thompson, Cambridge, and Thomas A. Brown, Toronto, Ont.—The wrench described is an ordinary monkey wrench but which has a separate attachment furnished enabling the wrench to be used on pipes. This attachment is a triangularly shaped piece with one face straight and serrated and the opposite one slightly curved and serrated. When being used, it is placed between the pipe and the outer jaw of the wrench, the curved serrated side being next to the jaw and the straight serrated against the pipe.

Anti-shock Device—No. 12,399, dated November 7; to Jules M. M. Truffault, Paris, France.—The device described is the Trauffault-Hartford anti-shock, which is designed to be placed between the frame of an automobile and the bottom of the spring, or carried on the axle, the object of the device being to make the action of the spring more uniform and to prevent bouncing when traveling at fast speed over rough surfaces. The device consists of two disks, one attached by a rigid arm to the vehicle frame and the other to the running gear, either by way of the spring or axle. One of the disks is a pan-shaped piece and the other a plain one, fitting within the former. Between them is a friction washer. The disks are held together by a bolt passing through them, the bolt being rigid to one and having a slotted connection with the other.

Mechanical Lubricator—No. 804,033, dated November 7; to Johannes T. Pederson, New York city—The mechanical lubricator described is intended especially for automobile use and is a combination of pressure and gravity feed, the former to be used when the engine is running and the latter in supplying oil before the motor starts, or in case of the pressure feed becoming deranged. Changing from pressure to gravity feed is accomplished by simply turning a button on the top of the oiler case.

Traction Engine—No. 803,361, dated October 31; to Robert Reed, of Logansport, Ind.—The inventor has a traction engine propelled by a four-cylinder gasoline motor carried in front. The crank shaft is constructed to transmit the speed to several propeller shafts, being connected to each through a variety of clutches. Means are furnished for operating each of the clutches and communicating different speeds to the rear driving wheels.

American Motor League

OFFICERS

ISAAC B. POTTER, President. Potter Building, New York.

CHARLES E. DURYEA. First Vice-Pres., Reading, Pa.

JOHN A. HAWKINS, Second Vice-President, Pittsburg, Pa.

FRANK A. EGAN, Secretary, 132 Nassau St., New York.

FREDERICK B. HILL, Treasurer, 32 Bedford St., Boston.

National Headquarters Vanderbilt Building, New York

THIS LEAGUE
Is Now Collecting Route Information

covering all automobile routes in the important states and will publish road books for motor car users as fast as complete information is received. The A. M. L. is the only organization engaged in this work, and it invites the co-operation of all persons interested. For full information and membership blanks address American Motor League, Vanderbilt Building, New York City.

NEW CONSULS

The following named members have been appointed local consuls in their separate localities: T. J. O'Neill, Hanover, Pa.; Elmer E. Hauer, Lebanon, Pa.; James Harvey App, Chicago, Ill.; Charles F. Keene, Toledo, Ohio; Frederick Komp, Rutherford, N. J.; Silas Edgerworth, Springfield, Mass.; Charles M. Connughty, Buffalo, N. Y.; O. Gaston Maxwell, Watervliet, N. Y.; Forney Roberts, Washington, D. C.

TEXAS DIVISION

District 1, counties of Bowie, Cass, Marion, Harrison, Red River, Morris, Titus, Franklin, Upshur, Smith, Wood, Henderson, Van Zandt, Kaufman, Hunt, Hopkins, Lamar, Fannin, Grayson, Collin, Dallas, Cooke, Montague, Denton, Wise, Tarrint, Rockwall and Parker; district 2, counties of Panola, Rusk, Nagogooches, Shelby, San Augistine, Cherokee, Anderson, Houston, Trinity, Madison, San Jacinto, Liberty, Chambers, Jefferson, Orange, Hardin, Jasper, Newton, Polk, Tyler, Sabine and Angelina; district 3, counties of Erath, Hood, Somerville, Johnson, Ellis, Navarro, Hill, Bosque, Hamilton, Corvell, Lampasas, Lennan, Limestone, Freestone, Leon, Robertson, Falls, Bell, Burnet, Williamson, Milam, Burelson, Lee, Travis, Blanco, Hays, Comal, Guadalupe, Caldwell and Bastrop; district 4, counties of Brazos, Grimes, Walker, Montgomery, Washington, Harrison, Austin, Waller, Colorado, Fayette, Gonzales, DeWitt, Victoria, Calhoun, Jackson, Metagorda, Brazoria, Galveston and Lavaca; district 5, counties of Valverde, Edwards, Kerr, Kendall, Bandera, Kinney, Uvalve, Medina, Bexar, Wilson, Atascosa, Karnes, Goliad, Refugo, San Patricio, Aransas, Bee, Nueces, Live, Atacosta, Frio, Zacalla, Dimmit, LaSalle, Mullen, Live Oak, Duvol, Encenial, Webb, Zapata, Starr, Hidalgo and Cameron; district 6, counties of Gillespie, Llano, San Saba, Mills, Comanche, Eastland, Stephens, Palo Pinto, Jack, Clay, Wichita, Archer, Young, Wilbarger, Baylor, Throckmorton, Shackelford, Callahan, Coleman, Brown, McCulloch, Mason, Kimble, Menard, Concho, Runnels, Taylor, Jones, Haskell, Knox, Foard, Hardeman, Lipscomb, Hemphill, Wheeler, Collingsworth, Childress, Hall, Donnely, Gray, Roberts, Ochiltree, Hansford, Hutchison, Carson, Armstrong, Briscoe, Swisher, Randall, Potter, Moore, Sherman, Dallam, Hartley, Oldham, Deafsmith, Parmer, Castro, Bailey, Lamb, Hale, Floyd, Motley, Cottle, King, Dickins, Crosby, Lubbock, Hockley, Cochran, Yoakum, Terry, Lynn, Garza, Kent, Stonewall, Gaines, Dawson, Borden, Scurry, Fisher, Jones, Nolan, Mitchell, Howard, Martin, Andrews, Winkler, Ector, Midland, Glasscock, Sterling, Coke, Tom Green, Irion, Upton, Crane, Ward, Pecos, Crockett, Schleicher and Sutton.

VOLUNTEERS WANTED

The A. M. L. was formed to promote the interest of all motor car users, or rather to enable them by means of an organized body to promote their own interests. Through the league they must ascertain, protect and defend their own rights; by banding together they may prevent the enactment of bad and oppressive laws, but this can be done in no other way. They may provide themselves with printed routes, maps and guide books by which touring may be made easy and agreeable, but this must be done either at considerable expense out of each individual pocket book or by a community of effort and at smaller expense through a large organization. They may work to improve the roads and to erect guide boards and danger signs, but they cannot do this successfully unless they work together.

There is only one league of motor car users in America. There is only one organization which invites all automobilists into its ranks and places all upon an equal footing; there is only one that gives to each member the right to vote and to be represented in the affairs of the national and state bodies. It is the American Motor League. The league is now forming state divisions in the important states. Within the last 4 weeks twenty-five states have been divided into districts having approximately the same population and each containing a number of automobilists and members of the A. M. L. Each of these districts will be called upon to send representatives to the state boards of officers and all states will send delegates to the national assembly. By the national assembly the officers of the national body are elected, the constitution and by-laws made and amended and the work of the league directed at national headquarters.

Twenty-five state divisions will make a splendid beginning. A state division has charge of league affairs within the state. Each state division having 100 or more members elects a chief consul, a vice consul and a secretary-treasurer.

But how are these bodies maintained? Whence comes the revenue and how are the expenses paid? Article 3 of the American Motor League constitution, section 5, provides as follows:

"Section 5. The secretary shall retain from the annual dues and from all renewal fees an amount equal to at least one-third of said dues and fees. The balance of the sum so received shall be divided and disposed of as follows: One-half of said balance shall be returned quarterly to the state divisions of the states from which the dues and fees shall have been received, and the remaining one-half shall be divided pro-rata among the local boards of consuls and league clubs in the cities and towns of said state, according to the number of league members upon the several rolls of said boards and clubs as shown by the last approved quarterly report. All sums so remitted shall be used by state divisions, local boards and league clubs for the exclusive purposes of league work, and must be accounted for in periodical reports sent to the secretary of the league. No state division, local board of consuls or league club shall partake in any division of league dues which shall have been received from members within the state prior to the formation of such state division or local body."

By this arrangement the money is fairly divided; the national, state and local bodies each receiving one-third of the membership dues. The league thus puts money into the club treasury and takes nothing out. Most users of motor cars do not and will not become club members; yet it is clear that the best league work is to be done by the clubs, and it is equally clear that all motorists, whether club members or not, should contribute to the cost of this work. As these league dues are but nominal—$2 a year for each member—it is important that a large number of members be enrolled, for in no other way can a good working income be assured. The number is increasing in all directions, but the best increase comes from the work of members in their home towns. The league wants volunteers; men who believe in this work and will preach it to others.

LEAGUE CLUBS

Any automobile club may become an A. M. L. club and participate in the distribution of league funds. The benefits thus to be enjoyed will be enlarged with the growth of the organization; but in no case is the club required to take money from its treasury to pay league dues, that being done by each member who receives due notice from national headquarters. One-third of all these dues goes back into the general fund to be divided among the league clubs. In the same manner one-third of the dues paid by non-club members within the state is added to the fund.

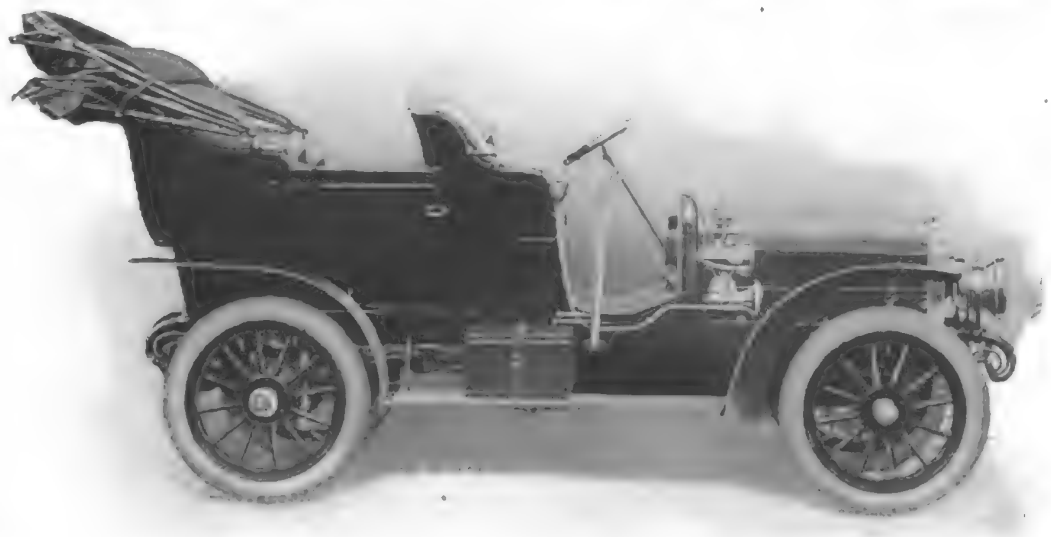
WINTON



UPKEEP SAVED BY ACCESSIBILITY

A passenger locomotive is thoroughly inspected and tested **every day.**

It runs 100 miles and is taken into the round house and "tuned up" before it is permitted to take another trip.

And yet the locomotive runs over level steel rails, stops only at designated stations, and pulls practically the same load day after day. It has **no** bad roads to cover, **no** rocky hills to climb, **no** series of quick and unexpected stops to make, and **no** heavy pulls on one run and light pulls on the next.

But the motor car is compelled to suffer all these abuses, and, by some owners, is never inspected until **something** goes wrong.

For two reasons:

1. Some cars are so **complicated** that the owner **doesn't know how** to inspect and "nurse" his car, taking the little precautions that guard against "going wrong."

2. Most cars are so built that the owner **cannot inspect working parts without tearing down the car.** No wonder he **hates** to go over the engine and transmission to see that everything is right. The owner can't be blamed for not wanting to **spend half his time** tinkering, and tearing down, and building up, meanwhile covering himself with **grease and dirt and perspiration.** But he has only himself to criticize if he buys **that kind of car.**

The new Winton MODEL K is so **free from complications** that any intelligent person can use and care for it without having to hire a chauffeur. And its working parts are absolutely **the most accessible** in the world.

No Winton owner considers it a hardship to inspect working parts. So **easily** are these reached that to keep a MODEL K in perfect condition is a **pleasure.** Simply turn a handwheel and either engine or transmission is **instantly laid bare.**

Not even necessary to remove one's cuffs, for the Winton MODEL K combines immediate accessibility with **thorough cleanliness.**

REMEMBER THIS: Many an **expensive repair bill** can be **saved** by "a stitch in time."

That "stitch in time" is merely the **occasional inspection** of working parts.

No automobile on the market has working parts that can be inspected with such **ease, rapidity and cleanliness** as the new Winton MODEL K.

"The typical American motor car," says the Americanized Encyclopædia Britannica.

The Get-At-Able Winton Model K.—Four-cylinder, vertical, water-cooled. 4½ inch bore. 5 inch stroke. Non-breakable, individual clutch transmission. That perfect Winton Air Governor. Winton Twin Springs, comfort givers and money savers. Lubrication, Ignition and Carburization systems perfected to the minute. $2500 f. o. b. Cleveland.

BEN FRANKLIN

The great Ben Franklin—drawing lightning from the clouds—identified the world's sources of power; and added to its available energy.

FRANKLIN

"Franklin horse-power" is a new expression and a necessary one. We use it to protect ourselves and the public.

Every automobile buyer ought to know that "Franklin horse-power" is an absolutely different standard from ordinary horse-power. It means more and **does** more—a great deal more.

Twelve "Franklin horse-power" does what would require 20 of other horse-power to do. Twenty "Franklin horse-power" equals 30 of any other. Thirty "Franklin horse-power" equals 45 or more of the average American sort.

This is so because the Franklin engine—bore for bore—delivers more power to the rear wheels than any other automobile motor; and because this power is given full effect by the entire Franklin design and construction.

A bigger charge is admitted to the combustion chamber because of the low temperature produced by the Franklin auxiliary exhaust.

The explosion is consequently **stronger;** and its force is highly concentrated by the small interior surface of the Franklin motor.

The auxiliary exhaust—a port valve at the bottom of the stroke opens before the main exhaust operates; completely **relieving back pressure** and maintaining the temperature combustion chamber at the temperature of highest efficiency.

The immensely large exterior air-cooled **surface** radiates the remaining unused heat with great rapidity.

The **cylinders** are cast to a special analysis of peculiarly **tough, close-grained** iron and are of **uniform** thickness and perfectly seasoned and ground.

There is no such waste of energy in an ordinary motor. No such dissipation of force within the engine as occurs with a large interior surface; no leakage of compression from porous metal or imperfectly fitting pistons. No such extremes of temperature with the consequent ill effects.

The Franklin motor needs no "warming up" to its work. It cannot freeze. It never overheats.

It begins making power from the word "go"; makes it all the time; and delivers it to the rear wheels.

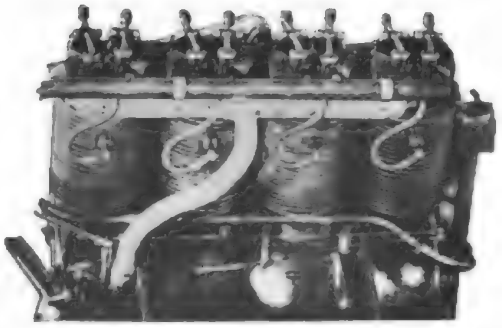
The simple, correct design, the strong, flexible, light-weight construction of Franklin cars, carry into full effect the high power-delivery of the motor; and transform it into a finished ability from twenty to fifty per cent greater than that of any other motor in any other car.

THE MOTOR CAR

Digitized by Google

FRANKLIN MOTOR

Franklin motor-cars—by unexampled refinements of engineering and construction—utilize energy to a degree unequaled in any other cars.



HORSE-POWER

Rated power is an entirely different thing from actual power.

Rating is merely a calculation of what an engine of given size **ought** to do.

Power is what it really does. And that depends upon many things besides its size.

"Franklin horse-power" is what the Franklin engine actually does.

Nearly all the leading American manufacturers, except ourselves, in order to meet the demand for power, are this year building larger and heavier cars, with larger engines and increased horse-power rating.

These ratings (35, 40, 45 and even 50) are honest, but they are decidedly misleading.

Many motorists have been greatly disappointed and they will continue to be disappointed in the performance of their cars, so long as horse-power is graded by figures rather than by ability.

You can to a certain extent get increased power by increasing an engine's size and weight. But this means also increasing the size and weight of the whole car. This cuts down what the power will do and adds to the expense of doing it.

We prefer to keep down the weight and the mere rating of our engines, while we increase their actual power and the actual efficiency of our cars by refined engineering and light, strong, flexible construction.

We thus insure greater comfort, safety and real ability at less expense.

Franklin cars are roomy and capacious. They have no water-cooling complications, weight or trouble. Their wood sills and perfect springs make them easy riding and safe when driven at speed on rough roads.

They are economical of oil, fuel, repairs and particularly, tires.

They not only do more than any other cars of their price; but they do it for far less operating and maintenance cost.

It was a 10 "Franklin horse-power" car that two years ago cut down the record between San Francisco and New York from 61 to 33 days.

No other car has touched this record since, though several of higher rating tried it.

In the famous Long Island two-day Economy contest a 10 "Franklin horse-power" car, carrying four people, won the trophy over ten other cars, all of higher rating —up to 20, 30 and 40 horse-power.

In racing, hill-climbing, touring—no matter what the test is,

Franklins do more dollar for dollar than any other cars.

Rating or ability: which do you want?

A heavy car with a heavy engine to drag it and heavy expense to keep it going,

Or a strong, light-built, powerful car—with every ounce of its energy put into action, doing the same work—and more, on a lower rating for less cost?

If you want to be sure of it, try it at a Franklin dealer's.

You cannot hear the sands of time dropping into space,
Nor the quiet POPE-TOLEDO pass at a mile a minute pace.

More Power **More Room** **More Strength**
More Speed **More Style** **Less Weight**

Our 1906 Type XII, 35-40 Horse Power

"Quiet mile a minute Pope-Toledo." The latest and greatest achievement of the world's largest Automobile plant.

MOTOR consists of four individual twin-head cylinders, 4-cycle copper-jacketed, developing under brake test 43-44 H. P. All gears encased. The VERY REMARKABLE RESULT of securing ONE H. P. FOR EVERY TEN AND EIGHT-TENTHS POUNDS OF WEIGHT HAS BEEN ATTAINED, and this, too, without in any sense sacrificing the strength or wearing parts.

CONTROL is simple, flexible and positive. The car can be driven on HIGH SPEED BEHIND A TEAM WALKING, or up to its MAXIMUM SPEED, simply by the use of throttle and spark, both located on the steering wheel.

TRANSMISSION is of the sliding gear type, having three speeds forward and reverse. Ball bearings at all important points.

BODY DESIGN entirely new and of distinctive appearance.

ORDER NOW FOR EARLY DELIVERY.

In the meantime we have for **IMMEDIATE DELIVERY**

Price, $3,500

Our New Type X, Four Cylinder, 20 H. P. Car

one of the most efficient cars on the market. It is specially designed to meet the demand for a light, wieldy car of great power, which can be easily controlled

TYPE X. $2800

Digitized by Google

About this time every year you begin to see little news items like the following in the "For Sale" columns:

> FOR SALE—1905 Model ———— car, delivered last May; used only six months, run about 3,000 miles. Just been thoroughly overhauled; three new tires on car; 3 extra tires (re-covered), 6 extra inner tubes. Cost $3,000, price $1,800. Only reason for selling is that I have ordered one of their next year's models.

Now, there is quite a bit of information not printed in so many words in this ad, but which can still be picked out by Mr. Keen Buyer if he's a mind to. So let's analyze and see what more we can learn.

First. The car has cost the owner $1,200 (the difference between what he paid for it and what he **thinks** he can get for it) in the short space of **six months**, for the single item of **Depreciation.** This is an average of **$200 a month.**

Second. He has had to buy six extra tires and six inner tubes, which at $50 per tire and $10 per tube totals some $360—an average of $60 per month.

Third. The car needed a "thorough overhauling" after only six months' use. This overhauling probably cost $200 (mainly because everything was so inaccessible). This is an average of $35 per month, in addition to the bills for current repairs which came in every 30 days and which averaged, say, $25 (and that's letting some men off **easy**).

Fourth. Excluding gasoline and other supplies, and not allowing anything for a chauffeur's salary, the above items work out to $200 plus $60 plus $35 plus $25, which is over $320 a month—which for 500 miles service per month works out to **nearly 65 cents a mile.** Startling, isn't it?

After getting this far, Mr. Keen Buyer decides that a car that needs a thorough overhauling after only six months' service of 3,000 miles isn't what might be termed a **durable** car.

He decides that six tires and six inner tubes for 3,000 miles is much too many. (The ad doesn't state how many more were too far gone to be re-covered and were thrown away, but we'll let that go.)

And it strikes him that $200 a month is entirely too much to charge off for depreciation; that **if the maker didn't bring out a new model every year,** a man might use his car more than one short six months without having to sacrifice it in order to avoid the stigma that attaches itself to the owner of an "out-of-date" car. Then he could save about $150 of this $200. He further figures that while tires are expensive, and repairs too, **yet both are insignificant expenses when compared to this Depreciation item.**

Now when Mr. Keen Buyer learns that the Stevens-Duryea Stanhope is being built for **its fifth year** without change in its looks, power or price, he is interested. When he learns that the same policy is being carried out with the four-cylinder Stevens-Duryea, he is apt to sit up and take notice. If he writes for further information he will learn that the Stevens-Duryea is so built that the "thorough overhauling" every six months isn't part of its routine. And he will also learn that the **average tire bills on 300 of these cars sold up to September 1 have been less than 45 cents per car per month.** When he learns that **less than one in five** of the Stevens-Duryea owners are employing chauffeurs, when he looks in the "For Sale" columns and fails to find any four-cylinder (and mighty few two-cylinder) Stevens-Duryea cars for sale, although some 350 of the latter are in use, when he makes a trip around to the various agents in his city and finds that none of them have a four-cylinder Stevens-Duryea for sale second-hand, showing that they have not been able to get any Stevens-Duryea owner to like their cars enough better to "trade"—well, we've got to stop, but just one word more: Get our printed matter and find out why the Stevens-Duryea seems to have hit it off so well with the owners.

Oldsmobile Model S

¶ Following our more general announcement of last week, we have set forth in detail the leading features of our Four-cylinder Touring Car.

¶ In general appearance this car is strictly up-to-date. The front axle has been placed well forward under the radiator, giving a wheel base of 106 inches. The standard tread is 55 inches; but either 52-inch or 58-inch tread will be furnished to order. The general design of the car is such that the tendency is slip on short turns running is very small. Weight of car 2,000 pounds.

Price $2250.

Front section of the Oldsmobile Four-cylinder Touring Car

Motor.—The car is equipped with a four-cylinder vertical motor, cylinders 4½ inches bore by 5 inches stroke, developing 24 horsepower at 1,000 revolutions per minute. The cylinders are cast in pairs, and each is provided with two valves, the inlet valve and cage are made from the best grade of cast iron and the exhaust valve and cage from semi-steel. The valves are 2 inches in diameter and are interchangeable.

Ignition.—The ignition is by jump spark, current supplied by a splash magneto. The top of the magneto is enclosed, and no liquid is allowed to enter the case. The magneto is driven by a silent chain from the crankshaft. The timer is of the automatic type, and is driven by a silent chain from the magneto shaft. The spark coil is mounted by means of screws and secured to a post system. The coil is of the vibrating type, and is provided with a switch for cutting out the spark when desired. The spark plugs are of the Champion type, and are interchangeable.

Transmission.—The transmission is of the selective type, and is provided with three speeds forward and reverse. The gears are of nickel steel, and are cut from the solid blank. The shafts are of nickel steel, and are mounted in ball bearings. The transmission case is of aluminum, and is provided with a removable cover for convenience in inspecting the bearings of the shafts.

OLDSMOBILE

Frame: A pressed steel frame of channel section is ed. In addition to the main frame, a sub-frame is pro- led which supports the motor and radiator. A portion the dust pan which runs under the car is riveted between outside and inside members, and gives a pronounced icing effect. A portion of the dust pan is removable, so it the motor may be very easily examined, yet at the same ne it is firmly fastened when in place and absolutely pre- nts the dust, mud and water from reaching the working rts of the mechanism. Both engine and transmission are gned upon the sub-frame, and all working parts may be noved without disturbing the hanging of the crank, or nsmission cases.

Transmission: The transmission is of the sliding gear pe, having three speeds forward and one reverse. All gears are made of special high carbon steel, tempered l hardened. **The control is of the selective type, all anges being made with one lever.**

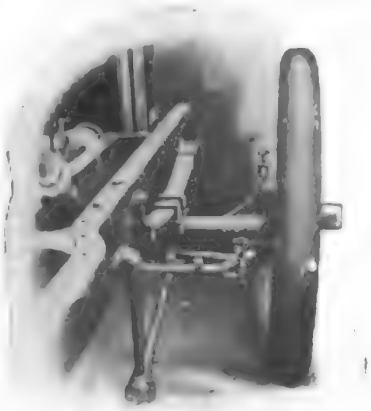
The clutch is of the "dish pan" or cone type, and is ovided with a simple spring device whereby the load may thrown on the motor gradually, thus doing away with y jerking motion when starting. The clutch may be own out by foot lever, and also by emergency brake er.

Control: Steering is accomplished through a worm and t mechanism. The nut has a large wearing surface so obitted that same may be easily replaced at any time. e spark and throttle levers are placed upon the steering t, and just beneath and at the right-hand side of a 16- h oval-rim steering wheel, An accellerator pedal is also anged in such a way that it may be used with ease when s desired to instantly increase the speed for a short erval.

Brake: There are two brakes; one, operated by a pedal trol, acting on the cardon shaft, just back of the trans- sion case; the other, operated by a hand lever, which ts up" the emergency toggle joint brake upon the rear eels. Application of this latter brake throws out clutch, connecting transmission from motor.

Axles: The front axle is of our own special design, is built of 2-inch tubing, having a ¼-inch wall. The ering connections have special large bearings, all these rings being equipped with "T" handled grease cups, protected by leather dust caps. The steering connec- ns and gear links are adjustable so that the wheels may easily lined up at any time. Axle is dropped in center protect the fly wheel and other parts beneath the car. The rear axle is equipped with Timken roller bearings throughout.

Drive: Bevel-gear drive is used, having a ratio of 3 to 1. Ratio of 3½ to 1 or 4 to 1 will be furnished on special order. We do not recommend any lower than 3½ to 1.



Showing the Steering Mechanism

Springs: Large, half-elliptical springs made of the best stock obtainable are used, the front being 36 inches long, and rear 48 inches.

Miscellaneous: The wheels have ten spokes in front, and 12 in the rear, and are equipped with 32-inch by 3½-inch tires. Four-inch tires for extraordinary service can be had on special order. Running board and mud guard irons, instead of being riveted on are drawn into taper sockets upon side members of frame and are easily remov- able. The lamp brackets are adjustable for different sizes of lamps; dash and tail light brackets are supplied. Lug- gage rack is equipped at rear on special order. A tubular horn, two acetylene head lights, generator and two oil lamps are furnished with each car. A box carried on running board contains storage and dry cells, tools and compartment for waste and small repairs.

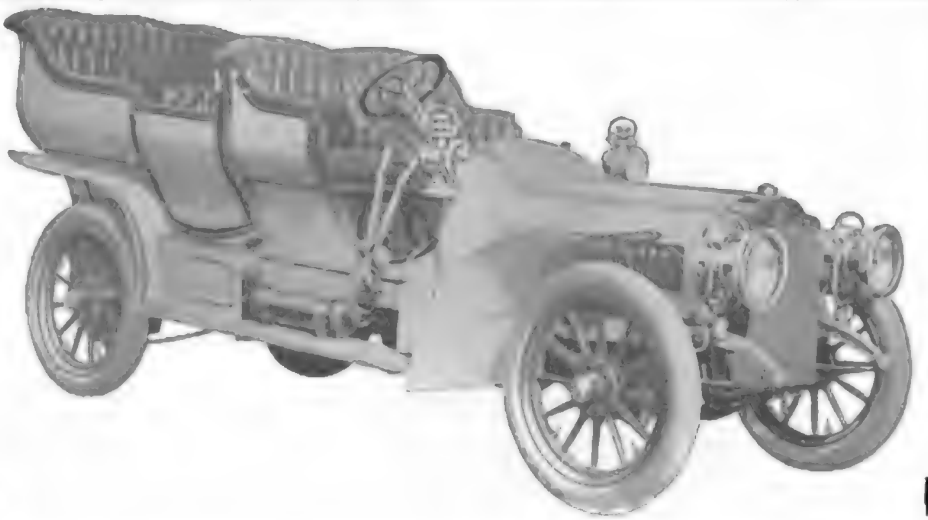
The New Thomas

Greatly Exceeds My Most Sanguine Expectations Experts Say It Is a Wonder



NO customer is so critical or hard to please as the manufacturer, who, regardless of cost, absolutely determines to do his utmost to build the best car in the world.

But, when an ordinary Stock Touring Car, without special preparation or intention, runs sixty miles an hour on the level, and climbs a 10 per cent grade on the high speed at forty miles per hour, within an hour after it first leaves the shops, it is something that not one car in a thousand will do.

Under favorable conditions we should do sixty-five miles an hour.

I am more pleased than ever with its speed, hill-climbing, quiet operations and mechanical superiority, and cordially urge disinterested automobile experts everywhere to rigidly investigate our claims, and compare our material, workmanship and design with the highest-priced cars in the world—we will win the verdict.

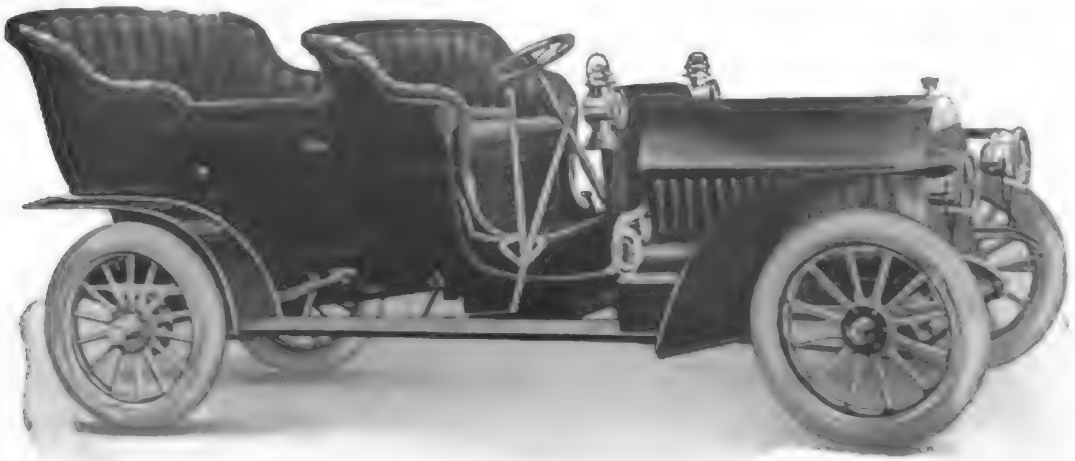
Wayne

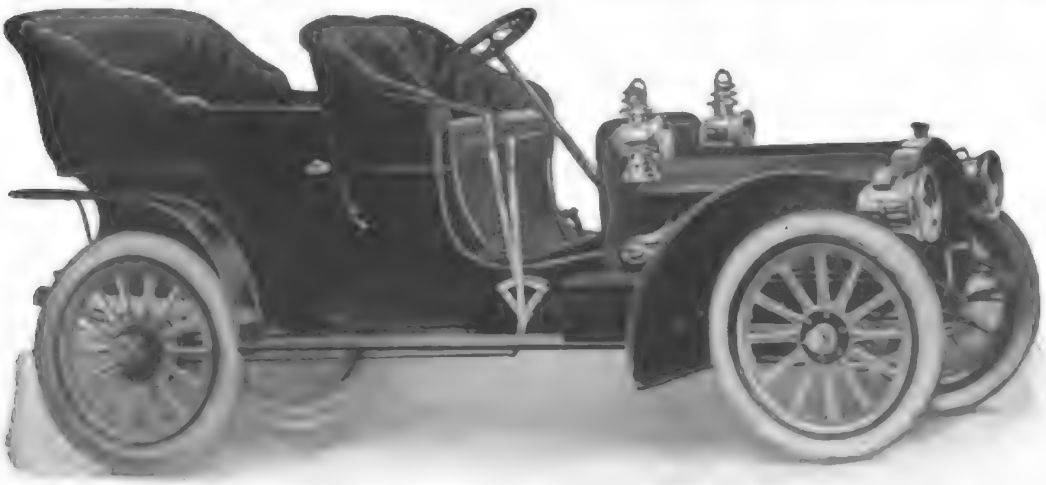
An Introduction to the Wayne Cars of 1906

The appreciation accorded our cars last year warrants us in greatly increasing our capacity and in placing before the automobile trade improved types of Wayne cars. The four models we now present are the result of mature experience. They are not new and untried experiments. Each car is a distinct type of Wayne design and construction and each model has been built with a view to supplying the varied demand for high grade machines. In the Wayne cars of 1906 the automobilist will be sure to find a car suited to his needs.



Wayne Model F $3500

MOTOR, 4 cylinder vertical, cylinders 5½ x 5 cast in pairs. Cylinders and pistons ground. Engine develops by brake test 50 H. P. Water Cooled. IGNITION, jump spark with quad coil and storage battery. TRANSMISSION, sliding gear with three speeds forward and reverse. Hess-Bright ball bearings throughout. REAR AXLE, shaft drive floating type. FRONT AXLE, I beam drop forged, one piece, nickel steel. WHEEL BASE, 114 inches. TIRES, 34 x 4½. EQUIPMENT, includes all necessary tools of the best quality, 2 side lamps, 2 acetylene head lights with generator, tail lamp and tube horn.



Wayne Model K $2500

MOTOR, 4 cylinder vertical, cylinders 4¼ x 5 cast in pairs and water cooled. Engine develops by brake test 35 H.P. Cylinders and pistons ground. IGNITION, same as Model F. TRANSMISSION and axles some type as Model F. TIRES, 32 x 4. EQUIPMENT, same as Model F.

Wayne

Wayne Model H
$6500
Ten Passenger Roadster

Motor—Four cylinder, vertical, cast en bloc, 4½ inch bore, 5 inch stroke, 381 cubic inches piston displacement. Cylinders—Cast en bloc. Valves—Mechanically operated, all on one side. Ignition—Dual, Bosch high tension magneto and storage battery. Carburetor—Kingston. Cooling—Water, pump circulation. Lubrication—Splash. Transmission—Selective sliding gear, three speeds forward and reverse. Clutch—Multiple disc. Drive—Shaft. Rear Axle—Full floating. Steering Gear—Worm and sector. Brakes—Two internal expanding on rear wheels, one external contracting on drum attached to transmission. Wheels—Artillery. Equipment—Top, windshield, speedometer, electric lights, electric horn, tools and tire carrier. Wheelbase—130 inches. Tires—34 x 4 inches.

The strong features as well as the extreme simplicity and accessibility of the engineering construction. The comfort and luxurious appointments of the body are in keeping with the high class of automobile it has to show.

Wayne Model C
$1285

WAYNE—Eighty special six-cylinder touring car, with wheelbase 124 inches. Engine is large, under the double opera seat, developing 60 horsepower. Motor—Six cylinder, vertical, cast en bloc, 4 inch bore, 5 inch stroke, 452 cubic inches piston displacement. Cylinders—Cast en bloc. Valves—Mechanically operated, all on one side. Ignition—Dual, Bosch high tension magneto and storage battery. Carburetor—Kingston. Cooling—Water, pump circulation. Lubrication—Splash. Transmission—Selective sliding gear, three speeds forward and reverse. Clutch—Multiple disc. Drive—Shaft. Rear Axle—Full floating. Steering Gear—Worm and sector. Brakes—Two internal expanding on rear wheels, one external contracting on drum attached to transmission. Wheels—Artillery. Equipment—Top, windshield, speedometer, electric lights, electric horn, tools and tire carrier. Wheelbase—124 inches. Tires—34 x 4 inches.

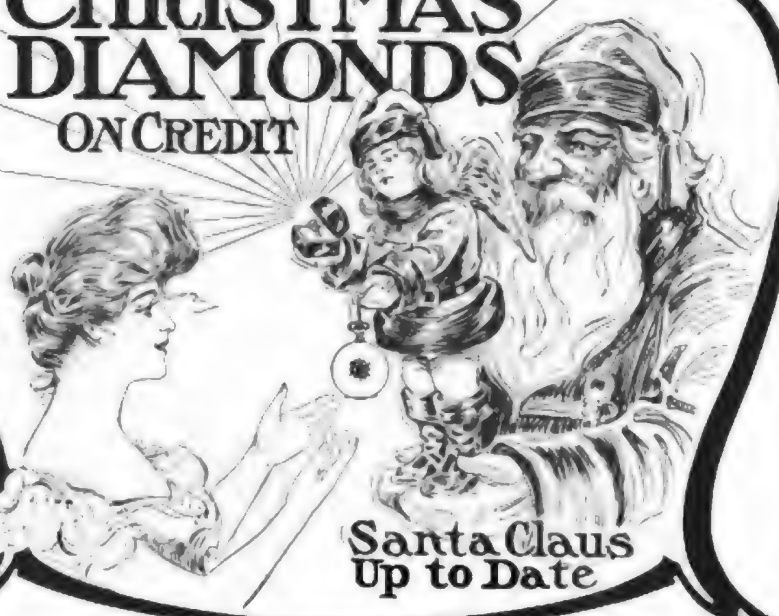
CHRISTMAS DIAMONDS ON CREDIT



Santa Claus Up to Date

Love Is the Real Santa Claus

It is our love for our dear ones that makes Christmas a truly Happy Season, and that brings to one and all the joys of a Christmas remembrance.

The Loftis System at Christmas Time

Is a great and Timely Convenience to thousands, as it enables persons in all circumstances to make beautiful and appropriate Christmas Gifts. Everyone at Christmas Time is anxious to give their loved ones handsome Christmas Presents, but it is not always convenient. THE LOFTIS SYSTEM of Credit MEANS CONVENIENCE. That is the only way in which it differs from a cash transaction. There is no delay, no security, no publicity. It simply means a matter of confidence and convenience to honorable people. Write Today for Our Handsome Christmas Catalogue.

You Are Welcome to Credit whether you are a moderate salaried employee or a wealthy employer. The Loftis System makes any honest person's credit good by adjusting terms to meet their earnings or income. Do not think that you must give a cheap, ordinary present because you can only spare a few Dollars just now. With five or ten Dollars for a first payment you can give a beautiful Diamond which will last forever, enhance in value and continually bring pleasant thoughts of the giver's generosity.

Our Handsome Christmas Catalogue is resplendent with thousands of beautiful Jewelry suggestions for Xmas Gifts. Diamond Rings, Pins, Brooches and Earrings, Chatelaine Watches, Silverware, etc., for Wife, Sweetheart, Sister or Mother. Sparkling Diamond Studs, Scarf Pins and Cuff Buttons, Watches, Match Safes, Fobs, etc., for Husband, Father or Brother. With its aid you can select, in the privacy of your own home, suitable Gifts for all, both old and young. May we not have the pleasure of sending you a copy?

True Merit Wins! In competition with the entire world (both the United States and foreign countries) at the St. Louis World's Fair, our Goods, Prices, Methods and Terms won the Gold Medal, the highest award. No stronger endorsement of THE LOFTIS SYSTEM could be given.

This, together with the fact that we are the largest and oldest established Jewelry House in the United States, and that we refer you to any bank anywhere or any commercial agency as to our reliability and standing should interest you in our liberal offer to send you our Handsome Christmas Catalogue and to extend to you our most liberal terms as an aid to you in making Christmas a truly Happy season. Write today for Catalogue.

Do Your Christmas Shopping Now. Let us suggest that you do your Christmas Shopping now, conveniently and leisurely in the privacy of your own home. Select from our Handsome Catalogue the articles you desire and we will send them to you for examination and approval. If satisfactory retain them, paying one-fifth the cost and the balance in eight equal monthly payments. If not, return to us. We take all risks and pay all express charges. Now is the time to secure the choice selections and have ample time to inspect the goods. All orders filled promptly. Write Today for Our Christmas Catalogue.

There is no better investment than a Diamond. They have increased in value more than twenty per cent during the past twelve months and Diamond experts predict an even greater increase during the coming year. Write today for Our Christmas Catalogue.

The New Model 1906

Rainier

30-35 H. P.

What is the automobile buyer going to do when he is strenuously told that each and every one of the 1906 cars is THE BEST CAR IN THE WORLD.

He is going to do a little investigating.

He is not going to be attracted nor distracted by the whirlwind of words with which one car after another comes before the public on paper.

When he gets down to business, he will find the RAINIER in the front rank of cars that have won renown and made fast friends by actual achievement. He will find that in every inch of metal and wood, in every working part, in every line, the Rainier as it will take the road in 1906 is the very embodiment of strength, compactness, lightness and beauty—now more than ever "The Pullman of Automobiles."

We want good Rainier agents in all unassigned territory. We can give them a car to sell that WILL sell, and that will make a new salesman of every purchaser. We stand back of the Rainier with the broadest and most liberal guarantee ever given.

Correspondence invited.

ENGINE.	30-35 H. P., 4 cylinders, water cooled.	**TIRES.**	Continental 34x4.
IGNITION.	Sims-Bosch Magneto make and break spark	**VALVES.**	Mechanically operated, inlet and exhaust interchangeable.
TRANSMISSION.	Sliding train. 3 speeds forward and one reverse.	**CARBURETER.**	Float feed, requiring no adjustment.
REAR AXLE.	Bevel gear drive, clutch driven hub. Ball bearings.	**BRAKES.**	Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
FRONT AXLE.	I Beam section. Ball bearings.		
FRAME.	Cold rolled pressed steel, aluminum under bonnet covering entire engine and transmission.	**BODY.**	Full aluminum, double side entrance.

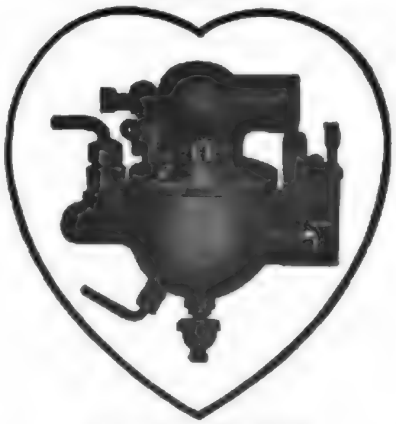
THE HEART



OF THE AUTOMOBILE

The Schebler Carbureter

STANDARD OF THE WORLD

Eighty-two automobile and marine engine builders in the United States and Canada have adopted the Schebler. All the carbureter manufacturers in America cannot show this record.

Seven sizes from ½" to 3".

Schebler carbureter with balance throttle to be used with a governor.

Schebler two-cycle engine carbureters.

Schebler Special for Cadillacs.

Oldsmobile carbureters.

Ford two-cylinder carbureters.

Autocar Runabout carbureters.

Franklin Automobile carbureters.

Standard sizes for all other motors.

Special fittings for attaching the Schebler to above cars.

Congratulations

From a dealer in a rough-road country on the service obtained from

GOODRICH TIRES

WITH THE BAILEY TREAD

"We wish to congratulate you because of the splendid way your Goodrich-Bailey Tires have given satisfaction and service to us and our customers. They not only wear longest with the least show of use, but seem to be free from weak spots, such as fabric breaks and rubber and fabric parting company on the Tread, *the latter seems to be a sure thing on some tires that we know of.*

We are looking to 1906 Goodrich and expect to be partial to them because we believe they deserve it, if their previous reputation is any criterion to go by."—*Ashville Cycle and Auto Company, Sept. 23, 1905.*

THE BAILEY "WON'T SLIP" TIRE Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyright mark have been inspected and pronounced perfect. We guarantee our tires only on rims so branded.

CADILLAC UTILITY

The single-cylinder Cadillac
will climb any hill that any automobile will climb.

The single-cylinder Cadillac
will travel as fast as anybody ought to ride.

The single-cylinder Cadillac
will travel any road that any automobile will travel.

The single-cylinder Cadillac
Costs less to operate
Costs less to maintain
Requires less attention
than any automobile we know of.

Because so many people know these, and some other things, probably accounts for the fact that more Cadillacs were sold during 1905 than any two other makes combined and won for them the unquestioned distinction of

Why Goodyear Detachable Auto Tires Won't Rim Cut

WHEN an Auto Tire gets rim-cut, it's time to feel for your pocketbook and ask yourself, "What tire shall I get *next* time?"

For a rim-cut tire is pretty near its finish.

Fig. 1

And the chances are ten to one that if you are forced to ride around the block on an ordinary tire with ordinary rims your tire will be rim-cut before you get there. Because ordinary rims are just like a dull jack-knife. Now if you wished to cut a strap with that dull knife, and the strap was held like Fig. 1 you couldn't do it, because your strength would not be great enough. But if you take the strap like Fig. 2, with a little sawing you can cut it.

Fig. 2

Fig. 3

That's exactly the way the ordinary rim cuts the ordinary tire. When the tire is inflated, like Fig. 3, even the tremendous weight of the car is not sufficient to cause the rim to cut the tire.

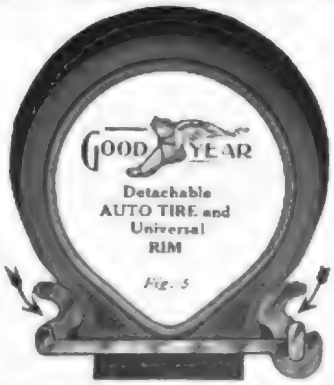

Fig. 5

But just as soon as it gets flat, like Fig. 4, then the rim begins to cut it, just as the knife did the strap in Fig. 2.

Now look at the picture of the Goodyear Auto Tire on the Goodyear Universal Rim (Fig. 5.) The portion of the rim against which the tire rests forms the arc of a large circle. That rim can no more cut the tire than you could have cut the strap by using the handle of the knife instead of the blade.

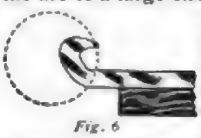

Fig. 6

Notice the edge of the ordinary rim used with ordinary tires (made into a circle), in Fig. 6, and compare with the Goodyear Universal Rim, used with Goodyear Auto Tires (Fig. 7.) Then you can see more clearly what we mean.

Fig. 7

We (and others) have ridden the Goodyear Auto Tire on Universal Rims *absolutely flat* for **25 miles** on rough roads without the least injury to the tire. We have the evidence if you would like to see it.

This is only one reason why wise riders are specifying Goodyear Auto Tires on Universal Rims for their new cars. Our "Good News Book" gives ALL the reasons. It is intensely interesting to Manufacturers, Dealers and Riders seeking relief from tire troubles.

LOOKING AHEAD

Thousands of owners prefer Imported **CONTINENTAL TIRES** because they are stronger, faster and will last longer than any other tire made, but usually ask the manufacturer to fit it with Imported **CONTINENTAL TIRES** too near to the time of delivery. Because the car is already fitted with some make of American tire, a manufacturer usually states that it would be a delay of from two to three weeks to make the change. To insure your getting them, **specify Imported**

CONTINENTAL TIRES

at the time the order is placed. In that way you are **sure of getting what you specify.** We carry a large stock at all our branches in the principal cities in the United States. Notify us at the time you place your order and we will see to it that no delays occur on our side.

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

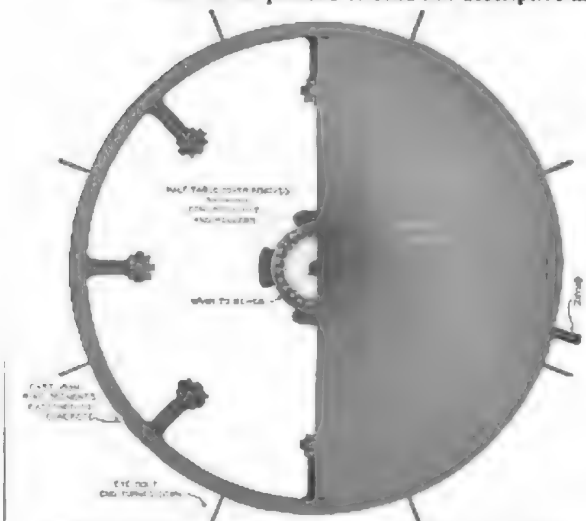
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

It moves easily, is practically indestructible and is absolutely fire-proof.

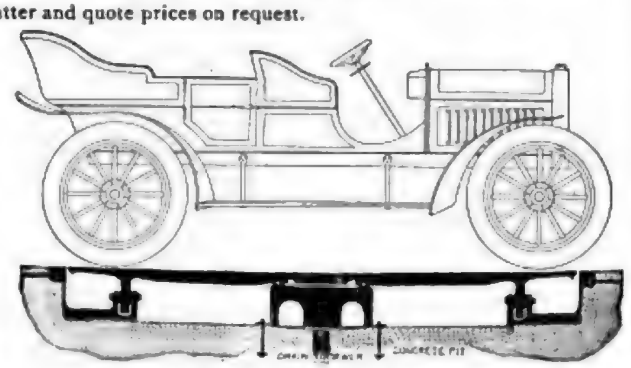
It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.



Sectional views of WASHSTAND-TURNTABLE. Patent applied for.



LINK-BELT Machinery Co.

CHICAGO

Michelin

Tires of the Very Highest Grade

Michelin Tires carry more guaranteed weight per wheel than any other pneumatic tire made in the world.

In Vanderbilt Cup Race the Michelin Tires were the only stock tires that did not require attention from start to finish — a record which is entirely exclusive from all other makes represented.

THE HARTFORD DUNLOP TIRE

OFFICE OF
DR. J. B. BOUCHER,
88 CHARTER OAK AVE.
TELEPHONE CALL 1864.

Hartford, Conn., Oct. 23, 1905.

The Hartford Rubber Works Company,

Hartford, Conn.

Gentlemen:-

You may be interested to learn that the Hartford Dunlop tires fitted to my two cylinder Knox which I have driven all season, have thus far covered a little over 3500 miles. I have had no trouble with the exception of four punctures. I am much pleased with the tires both as to their wearing qualities and the ease with which they can be removed and replaced.

I do not enjoy punctures but must admit that they are robbed of half their horror since using the Dunlop.

Very respectfully yours,

J. B. Boucher M.D.

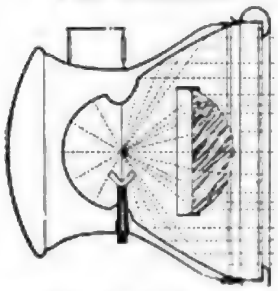
THE RE-INVENTION OF A RELIC

The Ancient



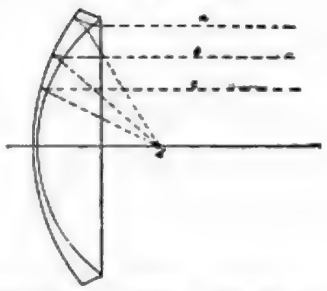
Abandoned by Rushmore ten years ago, patent expired.

FAILING IN THEIR EFFORTS TO IMITATE THE MODERN RUSHMORE SEARCHLIGHT, THE LANTERN MAKERS NOW TAKE UP THE ANCIENT DESIGN THAT RUSHMORE ABANDONED BEFORE AUTOMOBILES WERE KNOWN.

The best proof that the Rushmore Lens Mirror Searchlight has driven the lantern makers to the wall is the fact that they are now trying to create demand for the old style metal reflector light fitted with a spherical cup and a little bulls-eye lens.

This "parabola-lens" reflector was patented and was manufactured by S. W. Rushmore over seventeen years ago. The patent has expired. Over a thousand large "parabola-lens" marine searchlights were sold by us, but we abandoned the design ten years ago when we perfected the aplanatic lens mirror, which is now the standard in all the navies of the world.

The Modern



Aplanatic Mirror, perfected by Rushmore ten years ago, now standard of the world.

We guarantee the 8-inch Rushmore searchlight with a three-eighths foot burner to give more light than the big twelve-inch "parabola-lens" light with its big three-quarter foot burner. It is an eight to one proposition. The Modern against the Ancient.

A brand new reflector shows up pretty well on the first night it is lighted, but after that the silver plating blackens and no amount of scrubbing can improve it.

The drowning man grasps at straws. The drowning lantern maker makes a last effort to float himself on the time honored and abandoned metal reflector.

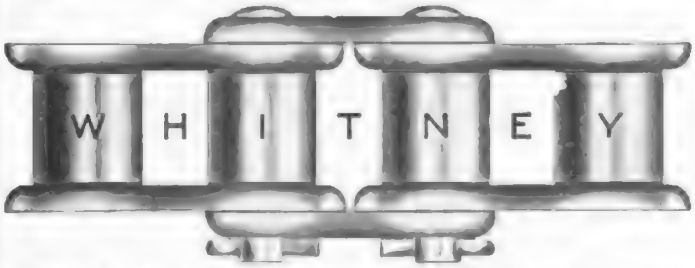
1906 Model "WHITNEY" Detachable Roller Chain—Patented



THE WHITNEY MFG. CO., Hartford, Conn.

Investigate "Whitney" Standards for dimensions of Roller Chains. They have been adopted by most of the leading American Automobile Manufacturers and have been recognized by other chain manufacturers at home and abroad. If they are made universal six sizes of chain can eventually take the place of over thirty sizes used in the past.

Our new line of chains for 1906 Model Cars have been adopted by a large number of the leaders and they are making remarkable records for quiet running and efficiency.

If interested send for new catalog dated November, 1905.

WESTERN TOOL WORKS

Galesburg, Ill.

The Expected Revolution Has Come

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should not buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the two cycle two cylinder Elmore engine. Understand—the two cycle two cylinder Elmore engine produces two impulses every time the flywheel turns. As you know, the two cylinder four cycle furnishes only one impulse every fourth time the flywheel turns. In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

THE ELMORE MFG. CO., 804 Amanda Street CLYDE, OHIO

MOLINE

1906

MODEL "A" 30-35 Horse Power. $2500.00

Four-cylinder, water-cooled motor. Interesting features—110-inch wheel base, 34-inch wheels with 4-inch tires, pressed steel frame, three speed sliding gear transmission, mechanical oiler, and large roomy body of handsome design.

MODEL "C" 18-20 Horse Power. $1750.00

Practically the same construction as above, except on a smaller scale. Four-cylinder vertical water-cooled motor, 100-inch wheel base, 32-inch wheels with 3 1-2 inch tires, neat new design of double side entrance body.

MODEL "G" 16 Horse Power. $1000.00

Double opposed motor under the body, plenty of radiation, lots of bearing area, new design of wate rpump, mechanical oiler, 86-inch wheel base, running boards at side, and detachable side entrance tonneau body.

Advance circular ready for distribution

Moline Automobile Co.

Why Premier Cars

Appeal to All Classes

To the Professional Man—because of its simplicity.

To the Business Man—because of its readiness to go at all times.

To the Repair Man—because of its perfect accessibility to working parts.

To All Men—because of its low cost of fuel and maintenance.

We have much data from drivers on this latter point; for instance, one writes us: "The total cost of my running this season—5,000 recorded miles—is only a trifle over one cent per mile for the car, or 1-5 to ¼ cents per mile per passenger; total for repairs, fuel, etc., excepting tires."

These are points to remember when purchasing a car.

The Air Cooled Season never ends.

Side Entrance $1,500. Runabout $1,250

Our new [1906] Doctor's Special $1,425

Light Truck $1,400

"SOOT-PROOF" WINS

Five Prizes Were Awarded to the Cars Using "Soot-Proof" Plugs

The "McMurtry" Prize for the car having the least ignition trouble was awarded to a Reo using "Soot-Proof" Plugs. These cars covered a distance of 700 miles during the National Economy Test of the New York Motor Club, October 30 to November 4, 1905.

These cars had absolutely no spark plug troubles, and the original plugs were used throughout the entire run. Thus again has the "Soot-Proof" Plug demonstrated its superiority, reliability and economy.

Claims vs. Reasons

The easiest things to make about an automobile are claims—claims for durability, simplicity, comfort—you know the list. Reasons for these things will be found in abundance in even the most cursory study of

THE MARMON

"A Mechanical Masterpiece"

The picture furnishes a hint of its mechanical distinctiveness. Even in such rough-road tests as this, the mechanism is maintained in alignment, free from binding and twisting strains. This flexibility, this natural freedom from strain and undue friction, furnishes a reason for length of life and highest efficiency for the mechanism and a very luxury of motion over rough roads that is unknown and unknowable in any other car. This is due to the patented Marmon feature

Double Three-Point Suspension

Luxurious cast aluminum body in one frame, power plant on another frame, each frame suspended on three pivotal points. Eliminates the ruinous strain inevitable in all other cars. Means fewer parts, simpler parts and less wear on all parts, tires included. Four cylinders, air-cooled. A strictly high-grade proposition for the agent in touch with high-class trade.

Full description in Booklet L. Get posted on the one modern car.

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

THE OSCAR LEAR AUTOMOBILE CO.
Automobiles
Corner Fourth and Gay Streets

Columbus, Ohio, September 5, 1905.

The Steel Ball Co., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6-day endurance and economy run at Long Branch. In a run of 3,202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of all this we fully realize and its help in getting this record for our FRAYER-MILLER car. Yours truly,

THE OSCAR LEAR AUTOMOBILE CO.

THE HAM GOLD BLAST AUTO LAMPS

"THE LAMPS THAT LIGHT THE ROAD"

MR. MANUFACTURER:

Don't close your lamp contract for 1906 until you look over our line. We have no competition in light giving and burning qualities, and our lamps will surely interest you.

MR. DEALER:

Isn't it worth something to sell your customers lamps that will not only satisfy them, but will bring them back to tell you what a fine light they give, how steadily they burn in the strongest winds and over the roughest roads, and what a good fellow you are for selling them good lamps. They'll tell their friends about it, too.

MR. AUTOMOBILIST:

Are you discouraged with the oil lamp proposition? If you are, we know you haven't tried the

HAM COLD BLAST AUTO LAMPS

because they are a delight to the most critical. They are strongly built, handsome in appearance, give a powerful light and are always reliable, as they are wind proof and will not jar out. Never smoke, consequently the interior is always bright and clear, and there is no odor.

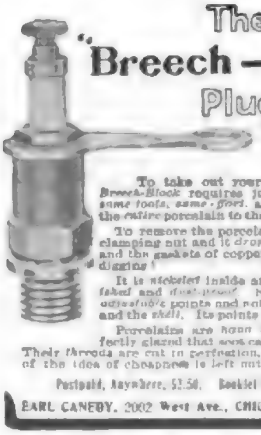
The "Breech-Block" Plug



The Plug With a Handle

To take out your watch or open a *Breech-Block* requires just the *same time, same tools, same effort*, and *our metal* cleans the *entire* porcelain to the whiteness of snow.

To remove the porcelain only, loosen the clamping nut and it *drops out* of its holder, and the gaskets of copper drop with it. No digging!

It is *nickeled* inside and out. *Highly polished* and *dust-proof*. Sparks between *two adjustable* points and not between *one* point and the *shell*. Its points are *protected*.

Porcelains are *hand turned* and so perfectly glazed that soot cannot stick to them. Their threads are cut to perfection, and every particle of the idea of cheapness is left out of them.

Battery Connections free with 2 Plugs. Full guaranteed. Write today. The longer you wait the more good spark plug enjoyment do you "Miss." See the point?

Never-Miss Spark Plug Co., Lansing, Michigan

There was a time when a regular and reliable ignition was a problem. This problem is solved today by the **HERZ TIMER**. We have made and sold over 70,000 of these instruments last year, to the most prominent manufacturers in this country, as well as in Europe, and are making now four distinctly new models for four of the leading manufacturers in America. The reason for this success: It's Tool Steel vs. Tool Steel, best Sheffield grade obtainable; **Sticking Vibrators** absolutely impossible; running packed with grease; built like a watch, tool maker's work throughout. We make 18 models and fit any make of motor. State make of your motor when ordering.

1905 Model B Pope-Hartford, used but little; in A1 condition; $450. J., care MOTOR AGE.

THE manager of foreign department of a prominent automobile factory is about to resign from his position on account of the firm having changed its foreign policy, and is prepared to negotiate for a new connection in the same or similar line.

This gentleman is recognized as one of the best authorities on export business in general and has all the qualifications of experience, foreign languages, energy, tact and influential connections abroad to guarantee his success.

To an enterprising automobile factory he would bring a specially valuable asset in the shape of his ability to give it an immediate footing in the foreign field with a list of about 1,000 trade correspondents and without the expense of preliminary work of organization and experiment.

Aside from the recommendations of his present employers he can furnish the best references and documentary proof of his abilities and past success. Address S. K., care MOTOR AGE.

1906 White, Model F; run 700 miles; perfect condition; no suitable winter storage. A. B. C., care MOTOR AGE.

When Your Motor No Longer

Handles the load, don't buy a new machine, but send motor to us. We know how to fit pistons and thoroughly overhaul motors. McCadden Machine Works, St. Cloud, Minn.

WANTED—A second-hand cylinder for Searchmont 1903 engine. Must be in good condition. State price. R. L. B., care MOTOR AGE.

FOR SALE—Detachable motor bicycle outfits at fall prices. Send for literature. Shaw Mfg. Co., Galesburg, Kan.

AUTOMOBILE BARGAINS

Through a business deal we obtained a few standard $1,400 side entrance touring cars, 30 H. P. double opposed engine, and $750 runabouts, made by one of the oldest automobile makers in the country. ALL NEW GOODS. Shipments made direct from factory. Full description on application. The opportunity of a lifetime. Write today, making best cash offer. Having already made our profit on these cars, we can afford to let them go at a sacrifice. Best cash offer takes first machine, next best second, etc., until closed out regardless of cost. No trades. Skinner & Skinner, 4134 Indiana Ave., Chicago.

1906 Olds, Model R; curve dash; blue and yellow; used but little. M., care MOTOR AGE.

MOTOR AGE

VOL. VIII NO. 21 CHICAGO, NOVEMBER 23, 1905 $2.00 Per Year

A YANKEE JAUNT FROM PARIS TO NICE

WITH the weather man doing his best to bring on winter before the one day of the year when King Turkey reigns supreme, there is not much left for the motorist with touring ndencies well developed who is forced to stay in northern climes t to sink into the luxurious depths of the big leather chair in e smoking room of the club and with others of his kind dig up miniscences of the past summer and anticipate the joys that await n 6 months from now. If the motorist is of the other sex there left to her the diary to which she can turn and read extracts to r less favored sisters in the sewing circle or at the mother's meetgs. Probably no one will get more enjoyment out of such fanning es as Mr. and Mrs. Walden W. Shaw of Chicago, who spent the st half of the year of 1905 in Europe, driving where fancy willed d drinking in the beauties of France, Italy, Spain and England m the soft seats of a big 24-35-horsepower Panhard, at the wheel which sat Mr. Shaw, who works on the theory that if there is ng to be any road mishaps he prefers to have the control of car himself. However, a chauffeur—an American—accomied the party, and very useful he proved to be, looking er the car and keeping it in the pink of condition, which is of the essentials of perfect touring, according to experts.

To the stay-at-homes who forced to do their sightng through the eyes of ers, this jaunt seems alst ideal. The Shaws made ris their rendezvous and er completing all prepaions for their trip in the y French metropolis, arded the big car and d to the south of nce to Nice, which they de their headquarters d from which point they de their excursions into dy and Spain. Little ss Shaw and her nurse re left in the villa in ce while the grown-ups nt on their sight-seeing ps through the historic ntries surrounding them. this way it was almost e being at home with rope at one's own door.

A member of the Automobile Club of Nice, Mr. aw took the precaution fore leaving Paris to tify himself with a French license. After he had passed through this ordeal he no longer wondered why the French have the reputation for having the best drivers in the world and why such high speed is permitted in that country. The reason was apparent—no one received the O. K. on his motoring passport until he had thoroughly convinced the authorities that he knew his car and was fully competent to be trusted on the magnificent highways of Europe. The first step necessary in this ordeal was to apply for a license to the minister of mines, stating the power of the car, when built, the speed it was capable of developing, the number of teeth on the sprocket and many more questions of similar character, so that the authorities had all the data at their command. In due course of time Mr. Shaw was visited by an expert sent by the minister of mines, who took the American out on the road in order that he might demonstrate his ability. For 15 miles Mr. Shaw was on the rack. Up hill and down dale the big car went, quick stops being made occasionally, while he was also asked to demonstrate the command he had over his car on the hills. After this came a wait of a week and then the license, which was the open sesame to the joys of motoring outside Paris. On the card was pasted a photograph of Mr. Shaw and armed with this documentary evidence of his ability to handle an automobile, he had not the slightest difficulty with the authorities in other cities. The one license was enough for all Europe, although nearly every country has a law similar to France's.

COMING OUT OF THE SHORT TUNNEL NEAR AUXERRE, FRANCE.

As might be expected by the severe examination, every driver Mr. Shaw met on the road knew his business. It was a safe bet that the man you were approaching was going to stay on his side of the road and the strain one runs across in this country, where it is necessary to do a certain amount of mind reading and guess what the other fellow is going to do, was done away with—all that the tourist had to do was to pay attention to his own steering.

Fully equipped in the way of license and supplies and with the

Digitized by Google

big Panhard in trim for the trip, the Shaws left Paris January 18 for a run down to Nice. It was a cold day, but the sun was out and the sky of cerulean hue. Paris was left by way of the port de Choisey and outside the gates a stop was made to lay in the stock of gasoline, which is much cheaper outside the walls of the big city than inside. Choisy le Roi was the first town reached, then came Villeneuve, where the Seine was crossed. Outside Villeneuve the Americans got their first experience with pave—pronounced pauvay—a road made of square blocks of stone, each about a foot square, that have been there for hundreds of years. The pave looked a good deal worse than it is in reality, and it was not long before they were rewarded by reaching the magnificent macadam roads they had heard so much about. They found them fully up to expectations—just like glass, well graded and drained by ditches, while on each side of the highway were double rows of tall, beautiful trees, which in places met above their heads, forming arches of verdure for many miles.

From Villeneuve to Melun, a distance of about 15 miles, they found the road perfectly straight, without a suspicion of a turn. At Melun the Alonet river, which empties into the Seine, was crossed, the road passing through Sivry, La Chatelet and Valence en Brie, finally reaching Montereau, where the Seine and Yonne rivers were crossed and the southern bank of the Yonne followed to Port sur Yonne, where the river was again crossed and the northern bank taken to Seus. Here the road was perfection, outside of the fact that there were some sharp curves. Following the twistings and turns, the tourists had spread out before their American eyes a grand panorama of country, the hills and valleys checkerboarded off in little patches representing the different crops, each laid out with a park-like regularity that added to the enjoyment of the scene. Another river was crossed at Seus—the Vanne, which empties into the Yonne. Then the road passed through Villeneuve sur Yonne to Joigny, where the tourists decided to take the lower course through Auxerre and Avallon to Dijon instead of going north through Tonnerre. They found the southern route more hilly, but were rewarded by grand scenery. The road from Joigny to Auxerre made one turn which ran a distance of some 15 miles, and Auxerre reached at 5 o'clock. As it was almost dark then, it was decided to make the stop for the night at this point. The party put up at the Grand Hotel de la Fontaine, where, they were told, Napoleon once slept. The distance covered during the day was 105 miles.

The second day's trip was from Auxerre to Beanne, a distance of a trifle over 106 miles. The Americans were away to an early start, 7:15 o'clock finding them on the road, which almost immediately took them into the mountains, their first experience being a passage through a tunnel. At Avallon they asked a woman in a donkey cart the way and were misdirected, making the complete circuit of a mountain and again bringing up at Avallon before discovering their mistake. This made a difference of 25 miles, but finally the national highway was picked up again and followed to Precy. On the way they ran into a severe snow storm in the mountains, so that the shelter of a snug brasserie or cafe—where the food was nothing to brag about, the tourists finally taking the remains of the meal and feeding it to the dogs—was enjoyed. Then the trip was resumed, Dijon being reached about 4 o'clock in the afternoon. Not satisfied here, the Shaws determined to push on to Beanne. They found it like a Peary excursion to the north pole, the roads being covered with 3 inches of snow. But a passage through the beautiful land had been ploughed, so the going was not bad. The last 10 miles or so before reaching their destination were made in darkness, so that the big acetylene lamps were brought into use, throwing beams of light 200 yards ahead, making travel comparatively easy. The hotel at Beanne was small but comfortable and here the tourists had their first experience with candles, gas not being available. The distance for the day was 131 miles, which put them 211 miles from Paris.

Leaving Beanne early the next morning the tourists found that the snow of the night before had been first converted into slush, then frozen, so that it was difficult work to keep the Panhard in the path. Passing through Chagny, Chalons was reached and here a stop was made to lay in more gasoline and oil. From here the banks of the Soane were followed over a rolling road until Tourims was reached. Here they passed a Fiat carrying two men, with the results that there were several lively brushes along the broad highway. Through Villefranche and Limonest they went, the Panhard some ways ahead, until finally when the Shaws stopped to take a picture of a perfect road, shaded on either side by magnificent trees, the Fiat passed and was seen no more, Lyons being its destination.

It was a beautiful bit of scenery along here, the mountains on both sides being covered with snow. If it had not been for the melting of the snow in the low country and on the road, it would have been impossible to have made the time the Americans did. About here they started a steady climb over the mountains for Lyons, a distance of about 6 miles, the road winding around the cliffs, with an abrupt descent into Lyons, which was made with the engine disconnected and the big car coasting along as easily as a boy sliding down hill on a bob sled, and with not much more noise.

After an hour's stop in Lyons, the journey was resumed, the Marseilles road being followed. This took them up the mountains again in order to reach the Rhone valley. All the way to Vienne it was hilly, with deep snow on the hills and with the valleys green with verdure.

Ideal touring conditions were discovered from Vienne to Valence, the roads being about 50 feet wide and paved with macadam. Here was found the carniveau, which is a ditch about 18 inches deep and about 6 feet wide, with sloping sides, paved with stone, a relic of the middle ages, and intended to keep the spring torrents from the mountains on the side of the road from washing out the highway. There is no danger if one takes them slowly. About 200 yards on each side of the road is a T. C. F. danger sign, put up as a warning for these ditches. Racing with trains and following the Rhone, the Shaws still found time to admire the ruins of old castles on the hill tops. Darkness overtook them at Tain and the lights were called into play, with the result that Valence was reached at 5:45 p. m., where the tourists put up at Hotel de la Croix d'or for the night. They had traveled 180 miles that day and were 391 miles from Paris, with two more days' journey ahead of them before reaching Nice.

The next stage of the journey was far from being as pleasant as the preceding ones. It was cold, the wind was sharp and penetrating and there was a white frost over everything. But the Chicagoans were game and pushed on, reaching Montelimar and then following the valley of the Rhone.

Old Roman Aqueduct at Frejus
Historic Ruins Along French Highway

Digitized by Google

At Orange they ran across a historic old Roman arch which was promptly cameraed, then the Chicagoans drove to Avignon, where is located the palace of the pope. They went through the palace, cathedral and the beautiful gardens on the high hill. The next town on the route was Aix en Provence, which was reached about 3:30 p. m. through the valley of the Durance. At this point they took to the mountains again, Brignoles being their stop for the night. One hundred and forty-nine miles were covered that day, leaving the party 540 miles from Paris and 80 miles from Nice.

Not much of a trip was left for the last day. At Frejus a stop was made to secure photographs of the aqueducts and the old Roman arena. Here the tourists crossed the Estrelle pass between Frejus and Cannes, then hurried along through Cannes, Antibes and finally Nice was reached at 11:30. On the promenade des Anglais was a sight that gladdened the mother's heart and in a jiffy little Miss Shaw, cart and nurse were picked up and bundled into the car, which whirled the reunited family to its villa on the Place Angliecane, which was made their headquarters while they were in this part of the country and from which started those jolly little excursions into Italy and Spain.

"Our plan of making Nice our headquarters and from that point taking little jaunts into Spain and Italy was as near perfection as a touring automobilist could well desire," said Mr. Shaw. "In that way we always had a comfortable home to return to and the trips did not tire us the way they would if we had simply wandered around. We had some trouble locating in Nice, though, for it was hard to find a villa that had modern conveniences. Finally we hit on a snug little villa on the Place Angliecane, built by an Englishman, and boasting one of the very few bath rooms in the city. We arrived in Nice in time to take in the carnival, and a grand sight it was, I assure you.

Cathedral Located at Sens, France

One of the Roads Running Out of Nice

"On some of our little rambles we saw some of the finest bits of old architecture in Europe. For instance, at Nimes we ran across the Maison Carré, which was built by the Romans before Christ. It has never been renovated and is undoubtedly the finest bit of Roman workmanship remaining. Then there are the old Roman baths with the bottomless springs. Just outside of Nimes is one of the real curiosities of the trip—Aignes Mortes, a walled town which, in the old days, must have been a regular Gibraltar. Surrounding the town is one huge swamp, which would effectually shut off the enemy. Of course, there has to be some way to get into the place, and that is provided for by a beautiful road, which runs through the swamp in a straight line. But the builders of the fortress were wise enough to make the place safe and some distance before you get to Aignes Mortes you find a huge tower dumped down across the road, effectually barring off approach if the defenders of the town so willed it, for the swamp acts as a barricade in any other direction.

"One of our favorite runs was from Nice to Monte Carlo. It is an easy little trip, taking just about as long to make as it does to run out home from down town. We'd do it in about 25 minutes and along the road to the resort you experience the true joys of fast driving on magnificent highways. Every man you met knew his business, leaving you free to look out for your own car. You can readily appreciate how much this lifts off your mind. The road is smooth and the curves can be taken at top speed without danger.

"All through our tours of Europe we had few mishaps. Only once can I remember that we even got a scare. That was in England and was occasioned by the rules of the road there, which require the driver to keep to the left. This law may sound queer in this country, where we are all used to staying on the right side, but I daresay our way looks just as funny to John Bull. This left-hand style has been handed down for centuries. It seems that it originated with the rule requiring the owner to have his name painted on the right side of his rig, so that in case of accident his identity could be readily learned by the people on the sidewalks. So, all the time I was running from Folkestone to London I kept saying 'left' to myself so I would not forget the change of style of driving.

"The roads twist and turn along this route and are very narrow, but I had been progressing fine. Then we struck one long, sweeping curve, one so big you couldn't see the people coming from the other way. I was bowling along some at that, and just as I struck the crest of the curve I saw another car coming about as fast as I was, and I became a bit mixed right here and just missed hitting it by not more than a foot. That certainly did impress the left idea on my mind and I guess I will never forget it as long as I motor.

"Driving through Italy in the southern part of the country we struck roads far different from those up near France. The highways there are repaired by simply dumping loose rocks into the ruts and letting the traffic wear them down. You can imagine how this works. There's always two deep ruts far worse than any of our street car lines in this country and once you got into them it was hard swinging out again to pass anyone. This often led to vexing experiences with the country people who take things so easy. We'd come across a vehicle traveling to town with the carter fast asleep, so that often we had to cut down the speed to a snail's pace and follow until the driver happened to awake. He knows how to take it easy, too, for his cart is equipped with a swinging bed, much on the same style as these swings on porches of country homes here—four chains running down, one from each corner of the wagon and holding a platform upon which the driver stretches himself for a snooze. The horse knows the way and even if he doesn't the deep ruts hold him to his course, so all his owner has to do is to start the animal and then go to sleep.

"In Italy we did not follow the routine by keeping to the coast line, as many of the other tourists do, but cut up into the country into the lake districts, thus enjoying trips that are denied to most motorists who travel through Italy. The roads there were, most of them, built by Caesar and he built them for keeps. As a rule they run as straight as an arrow and such a thing as a mountain does not cause any deviation in the route—the road either runs through the mountain or else goes around it.

"In Italy they sell gasoline by the pound and one place it cost me $18 for about 25 gallons. It is not hard to get, though, for motoring is so universal that nearly every hotel and shop has a supply on hand.

"That long trip made America look pretty good to us when we struck New York and at the present time I am well satisfied to stay at home, although I have been thinking strongly of joining a party of friends for a winter in Jamaica."

BIG ENGLISH SHOWS IN FULL BLAST

Olympia and Stanley Exhibitions Opened—French Makers Much in Evidence—Some of the New Things in Construction On the Other Side of Atlantic

London, Nov. 17—Special cablegram—According to schedule England's two shows opened today—the big affair promoted by the Society of Motor Manufacturers and Traders in Olympia hall, and the other exhibition in Agriculture hall. Of course more interest centered in the former, for the Stanley show does not pretend to enter into competition with Olympia, its exhibits being confined mostly to motor bicycles and tri-cars, which are barred at Olympia. The Stanley also has a fair number of car exhibits, but these are restricted, as in former years. Sir Albert K. Rollit, M. P., officiated at the Stanley opening.

The fourth annual show of the Society of Motor Manufacturers and Traders opened this morning in Olympia hall under the patronage of King Edward and the prince of Wales; thus in a way stealing a march on the Paris salon and showing the French that there are others, to use an Americanism. The show closes November 25. It was a brilliant opening, the huge buildings being magnificently decorated and every inch of space filled by the very latest things in motor construction. There were 300 exhibitors ready for the crowd when the doors swung open, of which fifty-one represent foreign makers. One hundred firms are showing cars, thirty-five have commercial vehicles, twenty-six have motor boats, while the rest is made up of people who make bodies, tires, accessories and machinery. It was a most representative show and had fifty-two more exhibitors than last year's affair. The annex is a small show in itself, 10,000 feet of additional space being secured by removing a number of pillars and building a new roof on the building.

For the first time an English show has the cream of the French makers exhibiting their new cars a full month ahead of the Paris salon. While it is clearly apparent that the people from across the channel are not showing every new thing they have up their sleeves, still the strong support they are giving Olympia is a victory for John Bull and will no doubt be a strong argument for the English show opening this early from now on.

Even at this hour the show is most complete, despite the handicap English manufacturers have been placed under by the short time in which they had to get up their 1906 models. There was an extremely short space, from the manufacturers' viewpoint, between this show and the last one and few expected to see so many completed new models as there were on the stands when the building was thrown open this morning. Of course, there are quite a number of incomplete exhibits, but that was to be expected, but on the whole the show is a credit to the promoters as well as to the exhibitors who have as yet hardly recovered from the retail selling season.

As one walks through the vast buildings the new wrinkles for 1906 are most noticeable. Probably what impresses the observer most is that the designers have gone in more for comfort than in previous years, that there has been a general increase in horsepower, that ball bearings have come into greater popularity, that there has been a radical departure in the abandonment of the engine under the hood on the part of some, that more firms are using shaft transmission and final gear drive and that there has been an increase in the size of the wheels.

London, Nov. 11—The British motor trade is too busy even to talk. The reason is that Olympia opens in 4 working days from now, and, as usual, everything has been driven so late that quite a number of exhibitors don't know what they will or will not have on view. The building has been in the hands of the Society of Motor Manufacturers and Traders since November 1, but the raised dais, upon which all exhibits are staged, had to be laid down, so that it was November 6 before the earliest exhibitors could obtain entrance, and even yet one can only see a chaos of properties and scenic effects half disclosed. But cars will begin to arrive on Monday and then, in the words of the poet, we shan't be long. Hitherto the society has simply thrown open its doors about midday and let the show open itself, but it is felt that the importance of the industry and its claims should have some more public recognition. Accordingly the promoters are endeavoring to obtain the presence of the prime minister at a formal function and if this is achieved the customary public ceremony will be enacted and the exhibition, which is under the patronage of the king and the prince of Wales, blessed and toasted and all that.

Body design has evidently been given much careful thought this year, for it is noticeable that the comfort of the passengers has been looked after. In the line of covered carriages there is a double landaulett, with inside capacity for four passengers. This type has been taken up by the British firm of Argyll and by the French firms of Mors. C springs, too, are played up prominently by S. F. Edge, representing the British industry, and by Charron, Girardot & Voight, from the other side. Considerable favorable comment is heard on all sides for the Napier springs, which are declared to be most luxurious. They combine the three-point suspension of the transverse spring with the S spring and leather braces of the old barouche.

STEERING CONNECTIONS OF THE CROSSLEY

Most striking is the abandonment of the bonnet in front and the placing of the engine under the driver's seat. This, however, is found only in covered carriages, particularly in the new Napier landaulet and a town brougham brought out by the Mors company. Critics who have inspected this innovation are inclined to think that this movement will gradually extend itself to other types, although it is thought it will be a long time before the engine will be moved from in front of the high-powered touring cars.

None seems to be able to get away from the high power fever. Even the conservative ones who start out by declaring they intend catering only to the big demand for small, light cars inevitably drift into the manufacture of something big. Striking instances of this are found in the case of the Albion Motor Co., which is making a 24-horsepower car, while the American Oldsmobile is another example. The latter, hitherto prominent for its runabout, has for 1906 a four-cylinder 20-horsepower car and also a two-cylinder 12-horsepower rig. Legros & Knowles, who have heretofore confined themselves to the small car, are in line with 25-30-horsepower and 35-40-horsepower machines, and the Duryea has advanced from 12-15 to 15-18.

One of the points upon which a very large amount of alteration and innovation is observable is the clutch. The leather faced cone type is, generally speaking, relegated to the cheap car; the laminated, or disc, type is found in the largest and most costly cars in which professional pride has not operated to prevent progress. The laminated clutch, after a year's debate and test, has won all along the line. Its expensiveness is its only principal drawback. It adds considerably to the cost of a small car for it must be made really well or left alone. There are at the moment only two leading clutches of this kind in use—the Hele-Shaw and the Bradley. The Hele-Shaw is the older and more popular, but the Bradley is quite as good and has a more positive disengagement. This in the Hele-Shaw is secured by small flat springs arranged between the discs. In the Bradley it is secured by a series of stop pins

Digitized by Google

penetrating all but the particular disc each governs, three pins being provided for each plate. It is a difficult operation to describe clearly, but briefly the action of each set of three pins is to push its particular plate out of engagement when the clutch pedal is pushed down. The Argyll, Arrol-Johnston, Clement-Talbot, Dennis, Gladiator, Beloze, Albion, Armstrong-Whitworth and Bell Bros. use them.

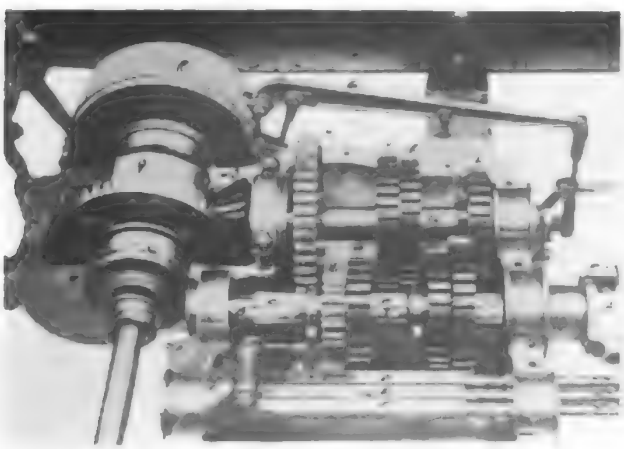
On the de Dietrich and a few others of similar type it is apparent that a lesson has been learned from the horizontal engine, for here spectators will find both sets of valves on the same side of the engine, which works all the valves on a single camshaft. Ball bearings are more prominent than ever, principally in connection with the bearings of the gear shafts. The Dennis people fit balls also to the worm pinion, as well as to the axle and front hubs. The Royal Enfield has ball bearings fitted to a live axle in the new model of its touring car. The Argyll folk are fitting their gear bearings with rollers. While each faction is claiming superiority, it is evident that there is a tendency to substitute sliding for rolling friction.

Shaft final transmission and gear drive, too, are prominent on the new models, the most prominent convert being the C. G. V. There is also a tendency to use larger wheels as well as tires. In regard to the latter, it seems to be the general opinion that it has been clearly demonstrated that one of the chief causes of excessive tire wear has been the use of tires too small for the weight they are called on to carry. Therefore, the Albion with 5-inch tires on all its four wheels will be one of the sensations of the show. Thirty-four-inch wheels will be seen on all sides in marked contrast to the early style, when few cars had anything over 30 inches.

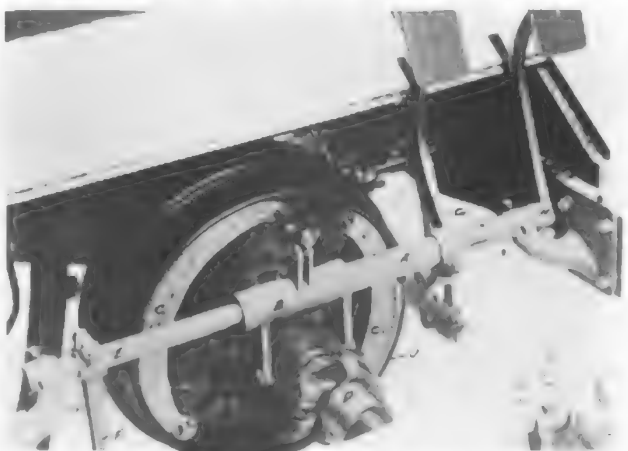
The introduction of the side entrance tonneau has been the means of permitting the placing of luggage racks in the rear, something that could not be put on with the rear entrance. This idea, however, is not new, although several cars now have the entrance from the side. It is also noticeable that long wheel bases are not generally admired, although a necessity when the side entrance is fitted. Narrow roads and sharp turns have taught their lesson and many find it impractical to use a car with a long wheel base, finding that a shorter one is much easier to handle on the average country road.

THE CROSSLEY BRAKE

Few cars seem better constructed than the Crossley. The leading features of the Crossley are pressed steel frame cross-tied and reinforced at main angles, extra long hangers carrying extra long springs, thus giving a long body without unduly lengthening the wheel base. Mercedes practice is very pronounced in some features. The radiator and bonnet, the system of steering wheel control and the speed gears and change systems are all on Mercedes lines. But there are many purely Crossley features which are sure to be imitated for their excellence. The engine on both 22-28 and 40-horsepower models is four cylindered, with cylinders cast in pairs and valve pockets on opposite sides, both being mechanically operated. Low tension magneto is the system adopted, with vertical ignition rods made adjustable so that the ignition in each cylinder can be most accurately timed. Double springs are fitted to each ignition plate and bottom tappet lever arms are fitted with pillars to admit any fitting of springs. By adopting adjustable valve roller spindles the clearance between spindles and induction valve is reduced to a minimum, thus maintaining the valve open over the greatest period. In common with most other leading European designs ball bearings have been introduced into the gear box, steering gear, clutch and road wheels. The adoption of the Mercedes type of double gear-shafts has of course necessitated the adoption of the gate style of change speed lever quadrant. Unlike the new Mercedes, however, there is no through drive. The type of flexible joint between gear box and clutch is worth inspecting, as also are the connections between the steering pillar and the steering wheels. The after end of the steering rod is a distinct improvement on the usual ball joint and the whole front carriage, with its block fan to eject from the bonnet the dust drawn through the radiator, and steering connections, ball bearing throughout even to the rod connecting the steering arms, is really well thought out. In the Crossley clutch the flywheel rim is made with a wide flange J forming a female clutch member, the male part consisting of a pair of expanding shoes C and C1 pivoted at their upper ends and with the lower ends attached to a perforated metal framework carried on the hub clutch. This frame work carries a pair of levers, expanded by a cone on the clutch shaft. When the clutch is engaged the expansion of the shoes takes place at the lower part of their faces, metal plates being embedded in the shoe faces, providing a removable friction surface. A coil spring K removes the shoes from the female part in disengaging. The clutch pedal G is fastened to the sleeve A, on which are two depending arms for moving the cone on the shaft. Within the sleeve A is the brake racking shaft E, carrying at one end the pedal H and at the opposite one the arm F, connecting by cable with the brake band. The shaft D with universal joint connects with the gear box. Following 1906 tendencies this box is made with four forward speeds and has the differential gear housed in a separate chamber at the rear end. Gear changes are made on the Mercedes gate system, three shifting units being employed. Ball bearings have been fitted in all of the main and countershaft bearings, as well as on both sides of the differential and to absorb end thrust. The main shaft B connects with the clutch at its forward end A and has the two sliding units, K1-L1 and H1-J1, held by four large feathers, half of the shaft surface being feathered. For top speed, drive to the countershaft is through the gears L1 and L, for third speed through K1 and K, through J1 and J for second and H1 and H on the slow. The former two speeds are

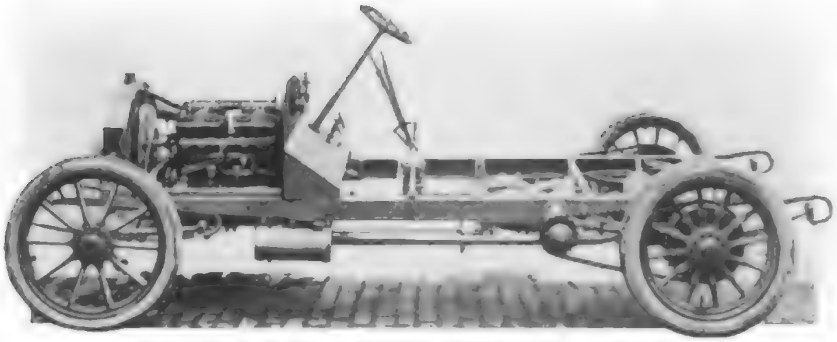


CROSSLEY SPEED CHANGE GEAR AND DIFFERENTIAL



CLUTCH AND CONNECTIONS ON THE 1906 CROSSLEY

Digitized by Google



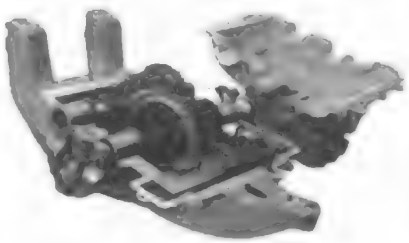
THE 18-22 HORSEPOWER CROSSLEY CHASSIS

gained by the shifting rod F with arm connecting with the gears and the second and first speeds through the shifter E and a short arm which is shown. For reversing, the rod D with its arm coupling with the gear M is used in moving this gear into mesh between H1 and H, it having sufficiently wide face to mesh with both when they are in the positions shown. Both the pinion O on the end of the countershaft G and the bevel P on the differential are supplied with end thrust ball bearings, the differential Q uniting the two drive shafts forming the jackshaft. On this shaft at the left of the gear box is a contraction brake for regular use, the band R being operated through the lever C, which is connected with a good sized footboard pedal.

The Arrol-Johnston 12-15-horsepower is the commercial outcome of the Tourist trophy race and some of its features are worth noting specially. The gear box has four speeds, operated on the Mercedes gate system. The ratios are 6, 14, 21 and 30 miles per hour, the last being a direct drive. The gear shafts run on roller bearings. The coupling between engine and gear box allows part of the weight of the flywheel and clutch to be borne by the gear box roller bearing. The gear box has three-point suspension, the upper half of the aluminum gear box being easily removable without disturbing the shaft bearings. The universal joint for propeller is interesting. It consists of two rings, bolted together at angles of 90 degrees; four axial holes are bored to accommodate bushings, which form the bearing surfaces of two projecting lugs on the jaws of the gear and cardan shafts, respectively. The form secures that all driving effort shall not act as nearly as possible in one plane, thus maintaining a constant driving velocity throughout each revolution of the cardan shaft. To the rear end of the cardan shaft is fitted a combined spring and universal-joint drive.

For their contribution to the 1906 market John I. Thornycroft & Co. offer a 14-horsepower and a 24-horsepower, the former being four-cylindered, with all valves in the cylinder heads and each operated by a separate rocker. The complete shaft can be withdrawn for inspection, the crankshaft actuating the valve tappets being in a separate casing. The engine mechanism is lubricated by means of a gear-driven pump in the crank chamber, while the water-circulating pump and low-tension magneto are bevel-driven off a vertical spindle. Other features are a crankshaft with five bearings, pistons with four rings, automatic carbureter, friction clutch, spur-wheel type differential, a pedal operating on the metal-to-metal brake and a side lever on two V-shaped brake drums on both driving wheels.

Noticeable on the Winton model K is a four-cylinder engine with 4¾-inch bore and 5-inch stroke, with the cylinders cast in pairs, pistons with three rings, oil grooves in cylinders and pistons, while the crankshafts, pistons, etc., are removable without detaching cylinders. While the car



ARROL-JOHNSTON GEAR BOX

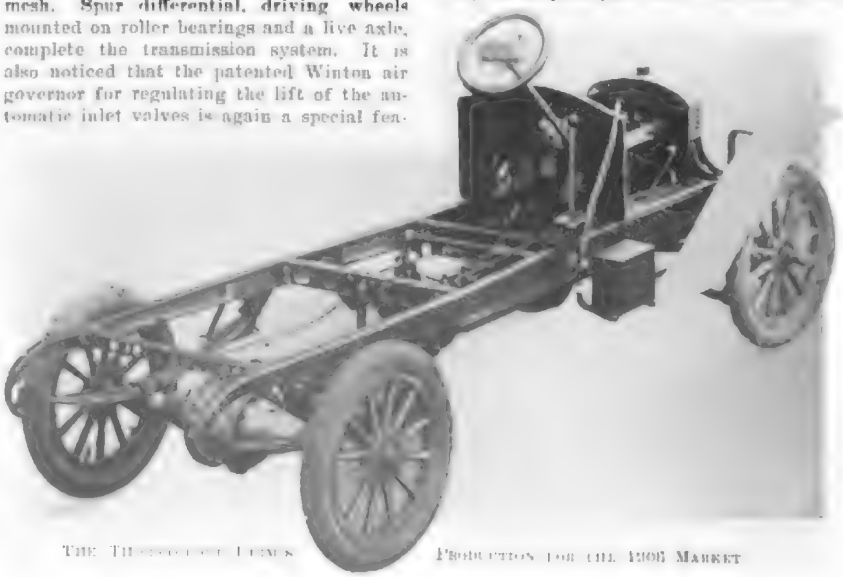
is fitted with high tension accumulator ignition there is provision made for a magneto. An eight-lead Hill Precision lubricator mechanically forcing the oil at a speed in proportion to that of the engine is fitted, instead of the roller oiler. In the gear box it is found that there are but two forward speeds. A reverse is provided, the gear wheels always being in mesh. Spur differential, driving wheels mounted on roller bearings and a live axle, complete the transmission system. It is also noticed that the patented Winton air governor for regulating the lift of the automatic inlet valves is again a special feature. Twin springs, laminated wood mudguards, 17-gallon gasoline tank and a side entrance body complete the details.

Another American car is the Oldsmobile, with two models—a 20-horsepower four-cylinder touring car, a two-cylinder vertical-engined 12-horsepower car, and the 7-horsepower runabout. On the big car is a vertical engine, pressed steel frame and all the latest devices in the details. Among the improvements noted are a ratchet brake, instead of the old differential brake; new type of external hub brakes, with steel bands and lining of camel's-hair belting; new water-circulating pump of four times greater capacity than the 1905 model and chain-driven off the crankshaft; steel tubular front axle, rearrangement of radius rods for driving chain to prevent the chain sagging on the differential casing, increasing flexibility of the long fore and aft springs, four rings to the piston, marine type of connecting rod in place of the old hinged pattern paraffin cup at cylinder head for easy starting, improved lubricating system, valve levers of forged steel, instead of malleable iron, and removable valve stem guides.

English buyers are taking a lively interest in the White steamer, of which there are the new side entrance 18-horsepower car and the double phaeton, with seating capacity for five people. There are also the car with the brougham or limousine body, and the landaulet.

One of the new cars is the Globe, made by the Hitchon Gear & Automobile Co., a four-cylinder 14-horsepower light machine, with the usual pump water circulation, accumulator ignition, expanding brakes and so forth. The feature of this is the patent Hitchon transmission gear, which gives three forward speeds and reverse.

The Enfield people have brought out two brand new models, one a four-cylinder 15-20-horsepower machine, with the engine crankshaft running entirely on ball bearing thrust blocks. An automatic carbureter, water circulation by means of a slow-running gear-driven pump, high tension accumulator ignition, special type of detachable clutch, which can be removed without dismounting the engine or gear box; three-speed gear box with shafts run-



THE THORNYCROFT CHASSIS — PRODUCTION FOR THE 1906 MARKET

Digitized by Google

Arrol-Johnston Brake and Universal-Joint Spring Drive

ning on ball bearings, girder section front axle, propeller shaft to rear live axle, new type of tubular radiator with over 1,000 circular tubes, external metal-to-metal brakes and pressed frame. Ball bearings are used wherever possible and the wheel base is 120 inches, with side entrance tonneau. The main difference between this and the other model is that the latter is driven by a 24-30-horsepower engine.

On the new Pipe the inlet and exhaust valves are both in the cylinder heads and are operated by exterior tappet rods, with overhead rockers. These are seen on a 28-horsepower car with a limousine body and also on a 50-horsepower machine. Outside of this the general details remain about the same.

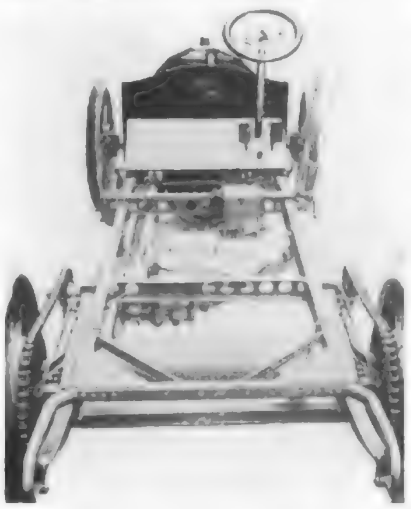
Frenchy is the word that well applies to the new cars of Charron, Giradot & Voigt, the C. G. V. cars having three-point suspension for the engine and separate three-point suspension for the gear box, internal expansion brakes, camshaft gear wheels enclosed, high tension magneto and ordinary accumulator ignition and improved design of chain tension rod. C springs will support the frame, an innovation for this concern, which is also bringing out a new model in a 14-horsepower car.

Unique among its fellows is a 40-52-horsepower Mors, which has seating capacity for eight persons. This French concern also has a town brougham with the 14-19-horsepower engine under the driver's seat, as well as a 24-32-horsepower double landaulet.

Handling the Albion for England and Wales, the Lacre Motor Car Co. is introducing a four-cylinder 24-horsepower car with canopy top, which is declared to be more suitable for winter work than the cape cart hood. There is a glass screen in front and similar ones between the center and rear seats, as well as many other devices that are appreciated by tourists. The two-cylinder 16-horsepower Albion carries seven passengers and the driver and is intended for country house work and shooting parties. Grooved solid tires are fitted. There is another 16-horsepower Albion with an especially long wheel base and double landaulet body, upon which many new things are introduced in the way of luxurious fittings.

Models turned out by Alldays & Onions' Pneumatic Engineering Co. all drive by live axles, have metal-to-metal expanding brakes and ratchet sprags. An 8-horsepower single-cylinder buckboard, three 10-horsepower two-cylinder rigs and a 16-horsepower four-cylinder car comprise the line this concern has for the forthcoming season.

Cars, magnetos and engines are the product of the Simms Mfg. Co., the frame of the cars being partly of the armored wood and pressed steel variety, which carry a 26-30-horsepower engine. There is the pressure-feed system of lubrication and also a new style of cut-out for the low tension magneto ignition. The Simms-Bosch magnetos, both of the high and low



End View Crossley Chassis

tension type, are made by this concern, as are engines ranging from a 2-4-horsepower single-cylinder air-cooler to a four-cylinder water-cooled 100-horsepower engine. On the big fellow the valves and seatings are detachable and are carried in the cylinder heads, with overhead camshafts.

The horizontal engine is played up big by James & Browne. In addition to their usual line they have brought out a four-cylinder 25-30-horsepower car.

A new type of Aster magneto is being turned out by Aster in addition to four models of cars. Some improvements are noted on the Aster engine.

Four models of Argylls are on the market for 1906, the Scottish makers turning out a new four-cylinder engine made entirely in their works. Besides this they have something fresh in the way of a ball-bearing back axle and a metal-to-metal clutch. Among other things considered improved are a new worm, quadrant steering gear, a rear axle casing of the T type, ball bearings throughout, new striker for the clutch, cam action to the rear brakes in place of toggle, roller bearings in the gear box and dust and water shields to the bearings.

The Dennis worm drive is fitted to all types of motor vehicles from light pleasure cars to heavy buses. As shown in the illustration, A is the driving pinion on the differential. The driving pinion is on the differential, the worm pinion running between ball thrusts. The live axle is carried on ball bearings, and the whole is housed in a casing which connects with the axle casing, in which are the spring seatings, the latter forming a part of the brake spider, to which is fixed a double toggle to operate the brake drivers. There is also provided flow and return connections for forced feed lubrication to the worm and differential.

Minerva cars are 16-horsepower four-cylinder and 22-horsepower four-cylinder, pressed steel frames being used in both models. There is an undershield to the engine and gear and the drive is through live axles. Ball bearings are fitted to the gear box at all revolving parts. There is a slight droop to the frame in front which brings the radiator a little lower than the ordinary top of the frame. There is steering wheel control with a foot pedal operating the throttle. There is no pump for next year, the thermo-syphon system being relied on instead. The Eisemann high tension magneto, supplemented by accumulator and coil, is fitted.

Interchangeable camshafts, one on each side of the engine, are featured on the Chenard-Walcker cars, with the engine four-cylindered and of 16-20-horsepower. Direct drive on the top gear is secured and the gear is of the sliding type. Power is transmitted through a live axle and there is no strain other than that of driving.

THE 15-HORSEPOWER DARRACQ CHASSIS

Then, too, there are thermo-syphon circulation, high tension magneto and pump-driven lubrication for other features.

Something new is the Bianchi, made by Straker & MacConnell, the models consisting of a four-cylinder 16-22-horsepower with side entrance double phaeton body; a single-cylinder 9-11-horsepower car with side entrance phaeton body and a two-cylinder engined motor cab with the engine under the driver's seat.

Synchronized ignition and a new Cupelle carbureter are features of the Cupelle line, while the four-cylinder 18-horsepower car has a patented lifting arrangement by which the whole of the underframe and gear can be examined. The light car is a 6-8-horsepower single-cylinder affair.

Talking points on the Singer line are many. In the six models, chief among them being a three-cylinder horizontal engine so constructed as to almost reduce angularity to a vanishing point. A direct drive is had on the second and third gears by an arrangement of planetary gears and clutches on one shaft, and the use of two side chains, only one of which drives for a particular gear. There is forced engine lubrication, one charge of oil being sufficient for 200 miles.

Aster parts, being interchangeable, are used throughout on the Whitlock-Aster cars, of which there are three types—two 12-14-horsepower and one 18-22. One of the former has a double landaulet body seating six passengers, with the rear portion so that it can be opened and closed at will.

Nothing smaller than a two-cylinder car will be made in the Belsize line. There is a three-cylinder engine capable of developing 18-24 horsepower, a four-cylinder 18-24 and a six-cylinder 30-40. In the three-cylinder there is a three-speed gear box to the live axle.

Separately cast cylinders, pressed steel frames of deep section, metal-to-metal clutches, ball bearings throughout, long springs and two push pedals, one operating the clutch and the other the footbrake, are featured on the Climax, of which there are two models—a 14-horsepower and a 20-22. Both the pedals act independently, so it is possible to use the engine for a break.

The Calthorpe Motor Co. has a new 20-horsepower model with a four-cylinder engine, ignition being by trembler coils and accumulators. A friction-driven centrifugal pump maintains the circulation and a fan assists the cooling system. The throttle control is on the steering wheel and the clutch is of the internal type.

Metal to metal has been abandoned in favor of the leather-faced cone type of clutch in the 35-horsepower car put out by J. W. Brooke & Co. Half compression cams are fitted, coming into action automatically when the engine is turned over. The 15-20-horsepower four-cylinder model has internal expansion brakes to the rear wheel and a pressure-feed oil tank on the dash and a single outlet to the engine crankcase. Low tension magneto is used and the throttle is the only control on the steering column.

While the Humber models follow ordinary lines, there are one or two bright features such as high tension magneto ignition and four speeds forward and a reverse. These are found on the 16-20-horsepower Beeston models. The Coventry type is a 10-12-horsepower light car with a four-seated phaeton body, the ignition here being by means of coil and accumulator. There are three speeds and a reverse, with transmission by cardan shaft and the foremost universal joint running in an oil bath. There is more rake to the steering wheel and ball bearings to the back axle and front wheels.

In the Peugeot line are a new 10-horsepower landaulet and an 18-horsepower car. In the former is a two-cylinder engine governed on the throttle and fitted with either magneto or high tension or both systems of ignition combined. There are four speeds and a reverse and direct drive on top speed. An automatic oiler is part of the equipment. The other model has a four-cylinder engine, the cylinders being all in one casting. It has mechanical valves and centrifugal governor.

Four vertical cylinders of 4-inch bore by 3-inch stroke and fitted with horizontal valves and low tension ignition are found on the Lanchester cars. The lubrication system employed enables the car to run 800 miles on one dose of oil. The Pugh-Lanchester patent radiator is a vertical cellular device, the cells being formed between two vertically ribbed sheets of metal fastened together at their edges.

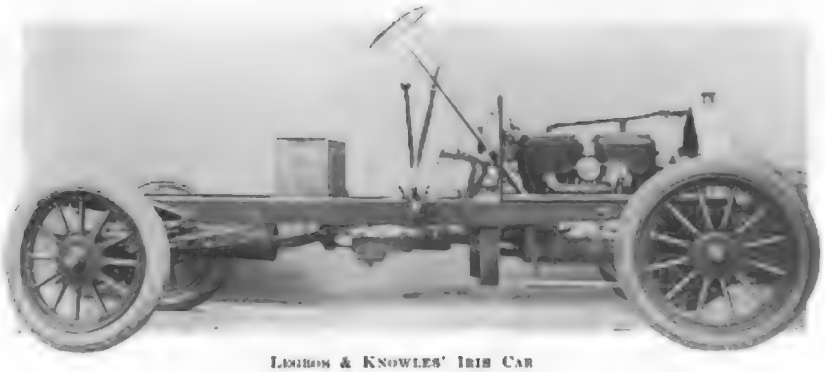
ROLLS-ROYCE DISCARDED

The most original type of car in the Olympia is the eight-cylinder Rolls-Royce landaulette, in which an eight-cylinder 20-horsepower engine is disposed below the driver's feet. In order to secure this, and also in order to simplify and cheapen construction, the cylinders are divided into two sets, inclined from the vertical at an angle of 45 degrees, and slightly staggered towards each opposing pair. The inclination, or, as it is generally called, reversion to the V type of engine, permits the adoption of a crankshaft in which the cranks lie in two planes, just like a four-cylinder engine crank—a very obvious simplification and cheapening in constructive cost. The staggering is induced so as to permit each pair of opposing pistons to work on the same crank. A peculiarity of the Rolls-Royce engine is that the valves are not inclined, but work vertically. Both induction and exhaust valves are set on the same side of the cylinder and mechanically operated. The sparking plugs enter the cylinder from the outer sides of combustion chambers.

Those with plenty of coin will appreciate the luxuriousness of the six-cylinder Napiers, one of the most startling models being a 40-horsepower car of the Pullman type of limousine body, placed on a 125-inch chassis, with room for five persons in the rear and two in the front seats. Two revolving armchairs take care of the extra two in the rear. There are incandescent lamps in the roof, hinged wood tables on the sides, windows that open and shut and silk roller curtains. A 40-horsepower touring car is so constructed that when it is necessary to examine or adjust any of the working portions the complete body can be run back of the chassis. Luggage is provided for by boxes on slides fitting beneath the front and rear seats. Tool boxes are above and below the steps. There is a cape cart hood meeting the front glass wind shield. Another model is an 18-horsepower four-cylinder landaulet, while there is also on the boards a new six-cylinder 60-horsepower touring car.

It is announced that the Gladiator people will discontinue the practice of making a standard complete and will only turn out the complete chassis, which can be fitted with the customer's own idea in the way of a body. The company, too, will make its own four and six-cylinder engines hereafter. Nickel steel shafts are found in the gear box and ball bearings are used everywhere. A multiple disc clutch and the gate change-speed device are used. A foot accelerator governs the engine and the throttle lever is controlled by the clutch pedal, so that throwing out the clutch throttles the engine. On the four and six-cylinder cars the Ginnoli high tension magneto is used, permitting of ready starting, the additional coil and accumulator being a reserve system of

Digitized by Google



LEGROS & KNOWLES' IRIS CAR

ignition. Chain drive is found on the big cars, and the cardan drive is used on the others.

One cannot look at the de Dietrich models without seeing the new ideas which bristle forth. One camshaft looks out for the valves, which are all on one side of the engine, and the covers over the inlet valves form the ignition plates for the low tension igniters. The ignition plugs are at the top, instead of the sides. Instead of a honeycomb radiator there is an improved type of gilled tubing, and instead of being belt-driven the lubricating pump is driven mechanically. There has been a shaking up in the gear box and it and its gears have been remodeled, the gears now being of the sliding sleeve type, with the gate motion for the lever, but having the locking arrangement in a separate box. Gear shafts run on ball bearings, the brakes are internal expansion, the steering joints are adjustable, there is a pressure feed for the carbureter, with a hand pump on the dashboard, instead of the auxiliary tank found in the 1905 product. High tension magneto ignition, ordinary type of sliding spur gear wheels and leather-faced cone clutch are features of the 12-15-horsepower cars.

Some 300 pounds have been taken off the weight of the de Dion 15-horsepower model, which is a four-cylinder car with side entrance and double phaeton body. Each model, except the 8-horsepower machine, has gear boxes with sliding spur gears. The exception, the 8-horsepower, will be built on a tubular steel frame and the others of pressed steel pieces.

The Legros & Knowles car is one which has attracted some attention from British experts by reason of its soundness and the variations in its designs from last season as to induce enquiry regarding the causes for such. One of the main alterations is the substitution of live axle drive for chains on cars as large as 30 and 40 horsepower. A straight membered pressed steel frame is adopted, which naturally cheapens production somewhat. The axles, however, are novel, consisting of stout gauge tubing. The front axle is fitted with a core of solid ash. The rear axle is split to run into a differential casing in the center and carries ball-bearing axle boxes on the extremities. The differential gear is introduced by means of a large port in the rear of the casing and is accordingly capable of being dismounted if necessary without disturbing any other portion of the gear. There is nothing particular in the design of the four-cylinder engine save that the camshaft, which operates all valves, is fitted in a oil tight box, which can be removed from the engine by simply dismounting a few bolts and without disturbing any other portion of the gear. The Panhard change speed gear system has been abandoned for the Mercedes, as this gives shorter and stiffer gear shafts, but, of course, necessitates the gate system of change speed lever quadrant, since there are two separate change motions with the one lever.

Motor cycles and tri-cars, which form the main excuse for the Stanley show, are far more popular in Great Britain, and the continent than they are in America. The Werner people are making two models of motor cycles—3¼ and 4-horsepower twin-cylinder models. It is noted for 1906 there are larger gasoline tanks and wider mudguards, with ample clearance. Besides there are a couple of single cylinder models of 2½ and 3-horsepower. It is possible to get high tension magneto if one is desired, while the Werner spring fork is fitted to all models. The company also has a two-cylinder 5-horsepower tri-car.

The Triumph is of the 3-horsepower class, ball bearings being retained, while several improvements have been made in the engine. The Rex Motor Co. has a line of twenty motor cycles and Rexette tri-cars, as well as the new Aster 18-22 horsepower car. On the cycles there are the duplex spring fork, new muffler, vibrationless frame design, patent foot brake, enclosed spray carbureter and invisible push and pull levers. There is also the Rex triotte, a light two-seated machine fitted with twin-cylinder 5-horsepower motor.

A four-cylinder 3¾ and 3¼ machine is the Durkopp motor cycle, one of the former being fitted up as a tradesman's carrier. The motor has a novel system of magneto ignition and there is also a laminated spring fork of merit. One, two and four-cylinder models of the Kelecom motor cycle are made by the Crypto Car & Cycle Co. The 4-horsepower cycle has band brakes on both wheels, while the other two have bevel gear drive and magneto ignition.

Among some of the most prominent devices in the motor cycle line are the Pullman non-skid band, the Lithanode accumulator, the L. A. C. spring fork attachments, the Watawata belt, Coan's aluminum castings, and a new form of trailer which, it is claimed, can be detached in 60 seconds.

Motor car and motor cycle accessories, bristling with innovations, are met with on every machine to be exhibited. New coils of the single and multi-vibrator class are common, spark plugs in every variety are encountered, and low and high tension distributors have their usual following. Centrifugal pumps in endless design are encountered, and carbureters in every conceivable form are used.

TENDENCIES IN AUTOMOBILE BUILDING

AFTER a careful study of the cars exhibited at the Olympia and Stanley shows in London, the one tendency which appears to be at all radical is that of putting the motor under the driver's seat, a plan adopted on some closed vehicles. As a matter of fact there is hardly a new thing in the English shows—that is, new to American builders—for large wheels, large tires, bevel gear drive, horizontal motors, and even motors under the driver's seat are not new here. The fact that a few cars will be fitted with the motor in any place other than under the bonnet in front will at least be a justification for the theories of one pioneer American maker, Charles E. Duryea, who has all along made claim that this is the only place for the motive power in an automobile. Duryea has stuck to the idea of large tires and at one time fitted his rigs with C springs, so that the innovations of the foreign maker of today are by no means innovations here, and if these new things abroad satisfy the popular demand it will be but an endorsement of Duryea's many pet theories for several years back.

It is evident the bevel gear drive is gradually becoming more popular both with the public and with the buyer, but the tendency of many makers to fit this form of final drive to their cars will by no means drive out the double side chain final transmission for a long time to come. There are so many things in favor of each that it is a matter of individual choice as to which is the more satisfactory for motor car construction.

The placing of motors under the driver's seat is such a radical departure for many concerns that it is a little out of what might be called the ordinary, and it will at least be interesting to hear the arguments which will be advanced for the change on the part of those makers who have altered their views on automobile construction. Some foreign makers have set aside all the arguments and have had the temerity to build other than vertical motors, one or two following out another of Duryea's ideas in constructing an oblique motor, or rather a V-shaped motor of eight cylinders, or two oblique motors made into one.

There is little tendency to build smaller powered cars, for it has been found the demand has been for more power, though not necessarily for more speed. There is a noticeable desire on the part of the foreign maker to turn out cars capable of accommodating at least four and in some instances six people within an up-to-date enclosed body of luxurious design and made with all the comforts that might be discovered in a Pullman coach. There is a reason for this desire on the part of the maker, and that is a demand for such things. And there is a reason for the demand, and that is that people who can afford to own such cars find it more comfortable to travel in such vehicles than in the ill-smelling and slow-going horse-drawn affairs, which, to accommodate an equal number of people and to afford equal comfort, must be ponderous affairs and must be hauled by not fewer than four equines and then at a pace that would by no means suit even the easy-going Englishman.

It has been the complaint abroad that motor cars of recent manufacture were, if anything, too long in wheel base to be easily handled in all sections met on a long tour and particularly where roads are narrow. As a result there has been some tendency toward shortening rather than lengthening the wheel base, whereas, in this country, the tendency has been to increase the length of the wheel bases for the 1906 trade.

There have been few really important changes as far as motor design is concerned, other than that mentioned above, and little in the matter of changes in construction, except, of course, the natural advancement in the matter of workmanship and material and the proportion of parts found necessary to be altered after several years of study on the part of makers and designers.

The visitor to the English, French and American shows of 1906 cars will not be as much impressed with the changes over this year's machines as he was with those of this year over those of last. It is but natural that the changes in design and construction should come by degrees now, whereas heretofore the alterations came with a rush. There will, however, be a marked improvement in bodies, for the comfort and convenience of the motor car user are now being given the attention that has heretofore been lacking on the manufacturers' part.

The maker and the user believe today that the motor car is pretty near a state of perfection. As a matter of fact the next decade will see so many changes that the present day car will be quite as crude, compared with the car of 1915, as the 1895 car is today. The makers are endeavoring to outdo one another in the matter of constructing fine cars. This is brought about chiefly because of the intense competition that is beginning to assert itself, but it is a fact that more than one maker is endeavoring to reach the top rung of the ladder of motor car construction and to be looked up to as a model for comparison.

CHEAP CAR NOT A DISTURBING ELEMENT

THE announcement that the Ford Motor Co. would produce a four-cylinder 15-horsepower car at a price under the half-thousand mark has not disturbed either the retail automobile merchant or other makers. When the announcement was first made it created almost endless talk and with some of the dealers handling low-priced cars there was more or less consternation. That was before the matter had been thoroughly considered in all its lights and side lights. So far as MOTOR AGE has been able to determine the marketing of this car can have no particular effect on the automobile trade unless it is of a beneficial nature. The competing manufacturers might have been expected to say unpleasant things of the company responsible for this low-priced car, but such is not the case to any great extent. As a matter of fact some of the manufacturers, even of low-priced runabouts, seem content in believing that this act will bring into the market the prospective buyer who has waited 4 or 5 years for the price of automobiles to come down.

Many manufacturers of the higher priced cars seem to consider the Ford company's movement to be a means of feeding the market; that it will make purchasers who will sooner or later desire larger powered and more expensive cars to meet what they believe to be their requirements.

The quality of the car cannot be estimated at this time, inasmuch as the first sample has been dismantled and until the automobile show takes place in New York the public will not feast its eyes upon this production. The maker of the car is certainly a well-known concern and has a reputation it can by no means afford to lose. If it proposes to maintain that reputation the car must be well worth the price asked for it, and it is not reasonable to suppose that any corporation which has had the experience of the Ford company would deliberately wreck its reputation by producing an article that would not bear criticism and stand up under the work it is proposed to give it.

It is too early to form an opinion as to what the effect of the introduction of such a car will be upon either the manufacturing or retail end of the business. That opinion can only be formed after the car has been placed in commission and has shown what it will stand. If the maker puts out a car that will sustain the maker's reputation, the possible effect will be a lowering of prices, particularly as far as runabouts are concerned. On the other hand it may be argued that a car of this grade and price will be the means of producing so many automobilists that there will be little chance to even supply the demand for all grades of machines.

Two miles a minute sounds faster than a mile in 30 seconds, anyway.

That "D—n it, do something" advice did do something—it gave Chairman Bob Morrell a dinner.

According to Olympia show reports, bonnets are no longer being advocated by our best automobile milliners.

England's Tourist trophy race has been run and won, and now it is announced that so far the trophy exists only on paper. Fawncy that, now!

Clemens and Merz nearly froze smashing long distance records. Now they know how Peary must feel trying to locate the north pole in an automobile.

Indians running a motor car bus line is the latest. Turn about is fair play—let the white man break loose from the reservation and give us a modern stage holdup.

No trouble is anticipated from the rival shows in New York, but just the same it will be necessary to call out the militia before the A. C. A. exhibition can open its doors.

When New York had to resort to an armory to accommodate automobile exhibitors, Chicago thought it wise to keep up with Gotham and also secured an armory to help out.

Going on the reports of factory improvements and new garages being built, the architects and real estate Jack Horners are pulling some mighty big plums out of the motoring pie.

It is pleasing to some Americans to note that the English makers have, for the coming season, adopted designs long ago discarded by Americans. If they were good, why didn't the Americans stick to them?

The English Daimler concern lays its profit making success to the fact that it has not dabbled in the racing game. But it forgot to mention that the German Daimler concern, and the Fiat, which is the Italian Mercedes, dabbled enough to give the English concern, a whole lot of free advertising.

Senator Morgan objects to cash prizes at Ormond. It is indeed to laugh.

Modern motor car designs are about as changeable as women's fashions.

Show spaces are as hard to get as tickets to the Thanksgiving day football games, only that in the case of the automobile maker there is no scalping being done.

Lancia is coming to prove his title to the speed throne. It wouldn't take many more affidavits like the Bennett and Vanderbilt to convince even the most skeptical.

Another attempt on the Chicago-New York record has petered out. But just think of all the dollar-a-line stuff the promoters of the affair got out of the dailies.

John D. Rockefeller is bemoaning his luck in not getting next to the fact sooner that he could eat cheese without injury to his stomach. His next cause for regret will be that he did not get wise to the joys of motoring in time to be numbered among the pioneers.

THE WEEK IN BRIEF

Henry Fournier secures control of Itala car, made famous by Florio cup race, and will put it in all big competitions; will place agency in New York.

More records broken by National car, Clemens and Merz smashing Vaughn's marks from 650 to 1,000 miles as well as 24-hour record.

Armored military car, with conning tower and rapid-fire gun, made by Daimlers, given satisfactory test in Germany.

Trouble experienced in Cleveland over show, dealers' association being tied up by outsider holding option on armory.

Balance sheet of English Daimlers shows net profit of $415,000 for year, figured to be gross profit of $1,000 to the car.

English shows open, Olympia at Olympia hall and Stanley at Agricultural hall; French makers well represented.

Lancia announced as positive competitor in Ormond meet; Clifford Earp coming over in place of Macdonald.

Coliseum show in Chicago so big Manager Miles is forced to secure First Regiment armory as annex.

Attempt on Chicago-New York record by Bertrand abandoned at Cleveland because of bad roads.

Space allotments for A. C. A. show in New York and national at Chicago announced.

Rival trade associations in Philadelphia consolidate and will hold show.

Megargel on way to Los Angeles, Cal.

We have new marks for 1,000 miles and for 24 hours and they're National records, too.

From all the ante-Ormond talk going on, 1906 can go down in history as the two-mile-a-minute year.

Megargel did not go to San Francisco from Portland under his own power—he cut across lots by taking a steamer.

We've had hill-climbs galore. Why not put on one of those coasting matches so popular in cycling days? Senator, where art thou?

If the steamship companies allowed the motorists to go on the docks with their tanks full, could the latter be arrested on a drunk and disorderly warrant?

The supper shows of the motoring calendar for 1905 come on Thanksgiving day. Those hill climbs will be admirable chasers for the real doings right after the holidays.

Probably the band will be instructed to play "Mistress Mary, quite contrary, how's your garden show?" on the opening night of the Selden affair in New York next January.

The only solution of the show space question is to hold open air exhibitions in 10-acre tracts during the summer time. Perhaps by this means exhibitors would have all the space they ask for.

President Farson proposes to furnish each member of the Chicago Automobile Club with a card which shall absolve him of going to the station when pinched for a violation of the speed ordinance. Why not go this one better and sell tickets good for ten arrests for $10, say?

While the automobilists of Chicago are being held down to a speed limit of from 10 to 12 miles an hour under penalty of arrest for reckless driving, the street cars and horse-drawn vehicles of the windy city keep up their death harvest, not fewer than three deaths having resulted from these sources last Saturday. It is evident that Mayor Dunne is not as antagonistic toward the street car corporations as one might suppose.

TRADE MELON IS CUT

English Daimler's Balance Sheet Shows Net Profit for 1905 of $415,000 on Some 500 Cars

London, Nov. 11—The publication of the Daimler company's balance sheet has caused something akin to a mild sensation in motoring circles this week. It was known that the company had had a good year, but how good came as a regular eye-opener to most people in and out of the motor trade. The company was among the first motor floations in this country. It was the bantling of H. J. Lawson, who is now an involuntary guest of His Majesty, King Edward VII, and was floated in 1896 with a capital of £500,000, to manufacture cars under the patents owned by Gottleib Daimler. Lawson took $200,000 in cold coin for those rights, and nobody has yet managed to prove that they were worth 200,000 cents. The public put down its cash, however, and from that day until this no return has ever been got from the investment. It is, perhaps, interesting to note that Henry Sturmey was one of the original directors.

The concern lived a sort of moribund existence, making no cars for some time, and then Lawson and his lot were shot out. But money was wanted and no money could be had. Change followed change until Sir Edward G. Jenkinson managed to enlist the services of Percy Martin as works manager a few years back. He came from your side of the Atlantic and deserves no little credit for the success the firm has achieved. Under his management the designs were simplified, standardized and reduced to a couple of types—and good ones at that. The drift was stopped and the ship began to pick up leeway. The king bought a Daimler and the trade wind freshened until 2 years ago it was felt possible to financially reconstruct the company with some hopes of reclamation. It was fairly well engineered and at the end of a year the first profit earned was disclosed something less than $40,000 on a capital of $5,000,000.

That was put aside and more working capital secured by preference shown special concerns and as a result a gross profit of $545,000 and a net profit of $415,000 were earned. This is a most remarkable result, for it is doubtful if the output of the Daimler factory for the trading year it covers could exceed 500 cars, so that the gross profit per car must have been close to $1,000—pretty fair in a year which the directors consider was one of great competition. For next year more capital is being called up, despite a created reserve of $150,000; the factory capacity is being quadrupled—$125,000 of fresh buildings and plant having been acquired—and the prices are to be cut about 15 per cent. The directors at their meeting yesterday were most emphatic in asserting that their figures were in no small measure due to abstention from the costly racing game which others had pursued in the belief that it was necessary to do so in order to prove that their cars were high grade. But many think Percy Martin's commercial talent is entitled to much more credit for the success than the directors' policy.

The Daimler profits following so closely on the figures disclosed by the Scottish Argyll concern are regarded as likely to lead to a promotion and floation boom. The peculiarity about these successful concerns is that the Daimler has made its money on selling high-powered, comparatively high-priced cars, while the Argyll profits have been earned out of moderate-priced, medium-powered cars.

BERTRAND TRIAL ABANDONED

Chicago, Nov. 18—If Bert Holcomb's record of 58 hours 35 minutes between Chicago and New York is beaten, another attempt will have to be made, for the Clement-Bayard trial for the coveted blue ribbon mark had to be abandoned the first day of the drive. With Clovis Bertrand at the wheel and with A. G. Schmidt as a sort of aide-de-camp, the French car started out from Chicago early yesterday morning, but got no further than Ohio, where the trip was chucked for the time being because of the miserable condition of the roads. Bertrand and Schmidt got as far as Dover, O., when they became convinced that they had chosen the wrong time for their trip. About half the time they were running on two wheels and the other half they were picking themselves out of the ditches into which they skidded with aggravating regularity. Then, too, the mud continually spattered up on their goggles, effectually blinding them. Therefore, all things considered, the pair decided to quit, traveling into Cleveland in a trolley car and leaving the car in a handy shed near Dover.

LANCIA TO BE AT ORMOND

New York, Nov. 23—Special telegram—Lancia will be at the Florida meet and also compete in Cuba. Negotiations to this end have been concluded by the Hollander & Tangeman and Lancia will come on with George R. Tangeman on his return from his trip to Paris and Turin. Lancia is to have at his disposal both of the Fiats which were piloted by Nazaro and Cedrino in the Vanderbilt race.

According to advices from England received by Morgan, Clifford Earp is to drive a six-cylinder Napier at Ormond in place of Arthur Macdonald, who will be unable to make the trip this year.

Carl Fisher is to pilot a six-cylinder National. It is reported here that George Robertson, who piloted the Christie in the Vanderbilt race, has been engaged to drive the Premier, which failed of completion in time in the elimination trials.

QUAKER TRADESMEN UNITE

Philadelphia, Pa., Oct. 20—The Philadelphia Automobile Trade Association and the Philadelphia Automobile Association were to-night amalgamated under the name of the former. The new organization includes nearly every dealer in automobiles and accessories in the city. New officers will be elected at the next meeting, December 2. Dealers in accessories will be admitted as associate members. It is also intended in the near future to admit owners to associate membership. It was definitely decided to hold the next show in the Export Exposition building.

TURNS A SHOW TRICK

T. C. Whitcomb Secures an Option on Gray's Armory in Cleveland and Ties up His Rivals

Cleveland, O., Nov. 21—Cleveland's local automobile show has been scheduled for the week of February 19, but as to who will hold it and the character of the exhibits, are at present matters of some conjecture in the minds of some people. The Cleveland Automobile Dealers' Association secured the sanction from the national association and has its plans perfected for holding the show the week mentioned at Central Armory. Now comes one T. C. Whitcomb, a local dealer, who claims he holds an option on the big armory for that week, and who says the association will not hold the show, except on his terms and that if they do not accept his terms he will hold an independent show of his own. Thereby hangs an amusing and somewhat lengthy tale.

During the past 2 years the local shows have been held at Gray's armory, under the auspices of the Cleveland club and the dealers' association. Last year Mr. Whitcomb conducted an opposition show in a neighboring large building. He claimed that he was never invited to participate in the big show; then when he heard of the plans he tried to get in, but that his application for space was turned down. So he held his independent show. The association officials claim this was done for effect and that Whitcomb was invited on the same terms as other dealers.

As he related it to a MOTOR AGE man the other night, Mr. Whitcomb says that he determined, after the show last year, that he would get the independent makers and dealers together and hold a big show this winter. He claims that he went to Major McQuig, who was in charge of the Central armory, and, in the presence of witnesses, obtained a verbal option for the use of the armory for the "same week that the association was to hold its show." He also claims he gave a check for a deposit, which, he says, has since been returned to him as paid. This, he believes, constitutes a legal option. The association would have selected Gray's armory, as usual, but for the fact that it was not available. It applied for the use of the Central armory and secured a written option for the week it specified; it appears, however, that it dealt with another man from the one with whom Mr. Whitcomb had dealings.

But despite their written option, the association officials appear to be somewhat dubious over Whitcomb's claims. W. L. Colt, chairman of the association show, made overtures for a peaceful settlement. He proposed that Whitcomb come into the association on the same basis as the other members, paying $90 for a share of stock, thereby participating in the profits of the show. Whitcomb claims the majority of the other dealers only paid $10 a share for their stock and says, as a matter of fact, he does not want to join anyway. He offered to join hands with them without joining the association, providing he was given a share in the profits in return for his option. He also wanted the choice of

spaces. Thus far the parties have failed to get together. Whitcomb says he will go in only on the terms mentioned and the association members decline to consider the proposition. Whitcomb says he will enjoin them from using the armory, and says he is satisfied he can get up a good show among the independent manufacturers are members of the organization, and ise of support from a number of manufacturers if he goes into it. The association claims that fourteen prominent dealers are members of the organization, and that without these, and the goods they represent, a show would be a mere farce.

NEW TOURIST TROPHY RULES

London, Nov. 11—The draft of the rules for the Tourist trophy race of 1906 has just been published. It is stated by those who generally guess fairly correctly on matters before the automobile club councils that the race will be run off in the Isle of Man on May 3 next. Minimum weight of chassis is still fixed at 1,300 pounds, but no maximum is laid down. The main endeavor in the new regulations seem to have been directed toward reducing the possible pace to be obtained, for not only is the fuel allowance reduced to a 25-mile per gallon limit for gasoline cars, but the number of change speed gears is limited to four, save where an expanding type is used, and each car entered will be required to drive on the level at a pace of 12 miles per hour or slower, without slipping the clutch, in order that the top gear may not be made a mere racing ratio for dropping down the mountain sides.

Another new regulation is that no exhaust release must be fitted to the muffler. The load to be carried by each car has been raised to 1,100 pounds, as against 950 pounds in September last, and in order that, as far as possible, standard bodies should be fitted, the backs of which shall have a minimum height from the ground of 49 inches.

The actual trophy, which is not yet in existence, is to take the form of a reproduction of the statue of Hermes in the South Kensington museum.

FIGURES FRANCE'S CAPACITY

London, Nov. 11—Apropos of the calculations of Georges Prade and the output of the French motor factories, Paul Sentier has been investigating the product of French factories that are exported in chassis form to appear under British and other alien names. He estimates that France has twenty large factories of this class, averaging two chassis per day, equal to 1,200 monthly; fifty more, capable of producing one chassis per day, or 750 chassis per month, and so, in all, he computes that France produces 25,000 chassis per year, of which France absorbs 8,000, leaving 17,000 for export.

Of this he believes that 7,000 or 8,000 come to England, as every French factory of this type has been working at full pressure during the past year and many have all their possible output contracted for up to the end of 1906. One critic has endeavored to analyze Sentier's figures in conjunction with the board of trade figures, and they don't convince him that the Frenchman, Sentier is right.

SHOW NOW SEEMS A GO

Brilliant Plans for 1907 for Big Exhibition in France are Revived By Parisians

Paris, Nov. 9—For nearly 12 months efforts have been made by French sportsmen to organize a great sports exhibition in Paris, but the movement has met with so little success that one is inclined to doubt the old saw that "where there's a will there's a way." The government said that a great international exhibition of everything connected with sports, but more especially of automobilism, should be held in 1907, and ordered a parliamentary commission to draw up a scheme. It was apparently not a difficult matter, for a paper plan was soon put before the public, and charmed all by its vastness and completeness.

The big plot of land, near the center of the city, bordered by the river Seine, and having on it the greatest landmark of Paris, the Eiffel tower, was fixed upon as the exhibition ground. The base of the tower would form a unique main entrance, large exhibition buildings would be built, the great Machinery hall left over from the 1900 world's fair, and one of the largest buildings in the world, would be available, and right around the exhibition ground would be constructed a track for automobiles, cycles and horse races. A harbor was also to be built on the Seine within the grounds, for the convenience of motor boats.

But the brilliant plan no sooner came to light than it had to be withdrawn, for the Paris municipal council, to which the Champ de Mars belongs, refused to give it up, even on a government request. Great efforts were made to move the stubborn body of city rulers, but neither persuasion nor threats, nor ministerial influence could move the city council in its decision. Other spots just outside the city boundaries were proposed, but only met with half-hearted support, owing to their distance from the center. Lately there appears to have been a softening among the obdurate councillors and the Champ de Mars scheme is again being brought forward. The organizing committee has just held a meeting and decided unanimously that an exhibition shall be held in 1907; that it shall be held in the center of Paris, and that the Champ de Mars shall be the ground. The latest scheme put forward is one with an estimated expenditure of $4,000,000 and $6,000,000 income. It provides for the erection of two large halls, which will remain permanently for various exhibitions, the utilization of the great Machinery hall for the automobile exhibit, and a central portion reserved for three tracks, one being for automobile races, another for foot races, and the third for Olympic games.

The Automobile Club of France has got hold of a really good idea in its town vehicles' competition, to be held on December 21, during the automobile salon. It is in reality a touring contest through the city of Paris. The thirty odd competitors will be started off at the doors of the Grand Palais and will run 62½ miles over the streets and boulevards of the capital, passing the starting point twice during the run and finishing at the same depot. The award is based on regularity of running, consumption, elegance, simplicity of construction, and suitability for town work. Every stop for any cause whatever, apart from tire troubles, will be penalized, and in order that controlling may be more reliably done it is proposed to ask the prefect of police to allow a cyclist policeman, having a chauffeur's driving certificate, to accompany each car. Both gasoline and electric automobiles are entered for the competition and the same rules will apply to both classes of vehicles.

CHANGING FRENCH LAWS

Paris, Nov. 8—Whilst waiting for the important and busy season of the annual shows, French automobilists have but the question of changes in the existing laws to occupy their attention. It is certain that shortly modifications of the existing regulations will be published, for the assurance to this effect was given yesterday in the senate by the minister of the interior. Senator Gormot has placed himself at the head of the reform movement in France and has not thereby made himself beloved of automobilists. The senator asks that the present law limiting the speed of automobiles to 12½ miles in towns and 19¾ miles in the open country should be enforced, and in his reply the minister of the interior gave an assurance that this would be done.

"We cannot put it below 12½ miles an hour," said the minister, "for many horses reach that speed." He did not say anything about enforcing the present 19¾ miles limit for the open country, for it is admitted by even opponents of automobilists that such a restriction is nothing short of ridiculous. Short-sighted, drunken and law-breaking individuals will soon not be allowed to drive automobiles in France, and when a driving certificate has been withdrawn in one department it will not be possible to skip across to the next legislative district and obtain a fresh one. Youthful prodigies will not be encouraged, for until the age of 18 years no person will be allowed to drive a 35-horsepower automobile. From 21 years of age the chauffeur may drive a car of any power whatever, provided he has first of all gone through an apprenticeship with moderate-sized vehicles. Manufacturers of sirens will be sorry to hear that this device is in great danger of being abolished. A parliamentary commission which has been studying the question has declared in favor of the suppression of the horn also, at least for town work, substituting a bell for it, but giving chauffeurs a liberty of choice when in the open country. Registration numbers under the new French regulations will have to be painted on the car itself and not consist of a movable tag.

HILL CLIMB OFF

New York, Nov. 20—Owing to the late date, the lack of urgent demand by the trade, the poor condition of the hill, and W. J. Morgan's numerous other engagements, the senator has decided to abandon his project of promoting a hill climb on Eagle Rock on Thanksgiving day, leaving the east without a holiday event.

TAG END OF LONG TRIP

Megargel and Fassett Almost Starve in Barlow Pass—Take 4 Days To Go Last 100 Miles

Palo Alto, Cal., Nov. 23—Special telegram—The Reo Mountaineer party reached here last night. It will be in Los Angeles about Saturday. We went from Portland, Ore., to San Francisco, leaving the latter city Monday morning for Los Angeles on our way home.

Speaking about strenuous automobiling, I think Fassett and I had 4 days of about as active mountain motoring as any man has yet tasted just before reaching Portland. Fassett said not for $500 would he undertake another trip across the Cascades at this season of the year, and Fasset is a pretty game boy, too. The Reo Mountaineer pulled out of Wapinitia early on a Monday morning for the 100-mile run to Portland. The Reo Mountaineer can go 35 miles an hour and has done so, but she didn't on this trip, nor could any other automobile. We carried grub enough for four meals and as we spent Monday, Tuesday and Wednesday without coming to a human habitation, it is needless to say on two of those days we went without food.

The road from Wapinitia to the edge of the timber, kept in good order by the numerous teams carting in the winter's supply of kindling wood, was excellent sailing and our car bowled along mertily until we ran into the timber. Even then for the first 10 miles it was not so bad and we did not have to get out but twice to build up over stumps or rocks. Then we came to the first fording of Salmon river.

It took a couple of hours to do it and it was dark when we stopped at the top of the embankment, but we had forded our first stream. We had been informed that we had this same river to ford five times and that it was worse fording at every ford we came to. We found this true.

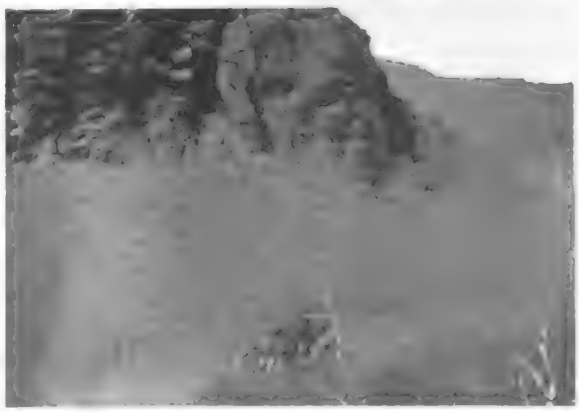
While Fasset was draining the water out of the carbureters and incidentally taking out our wet supplies from the tonneau, the water having come almost to the top of the tonneau, I busied myself constructing a hut of logs and boughs, such as I was wont to build in the woods around Scranton, Pa., in my boyhood days.

Our supply of firewood gave out about 2 a. m., and the snarls and growls that we had heard at a distance early in the evening were heard closer and closer until I sat up and fired my Winchester several times in their direction, then, taking advantage of the confusion, jumped out and got more wood for the fire, expecting every minute to feel a cougar or bobcat come down from the trees above and land on my back or shoulders, for, according to the old inhabitant, that's the way they do. Nothing of interest happened after that except we cooked and ate the remainder of our food for breakfast at daylight.

We were just about to build a camp for Wednesday night when we saw a sight that almost brought tears to our eyes. It was smoke arising from the treetops half a mile further. Whether Indians or white men we didn't much care, for we were commencing to know what real hunger was. It proved to be the United States government camp on Mount Hood and we were made heartily welcome by Father Yonkum and his wife, who live on the mountain top the year around.

At first we had a hard time to make them believe that we had actually automobiled over the Barlow pass and over Mount Hood, considered impassable for even teams in November, but I guess the manner in which Fassett and I stowed away grub that night fully convinced them that we had been doing something out of the ordinary, while the Reo Mountaineer, with muffler gone, tire chains on the rear wheels and covered from end to end with the sticky, yellow clay that lay underneath the soft snow on the mountain road, was a mute witness to the struggle we had gone through together during the past 4 days.

The run from the top of Mount Hood down to Portland, a distance of 60 miles, was easily made the next day and our reception in Portland was well worth the troubles we had gone through on our long trip.—PERCY F. MEGARGEL.



TEAMING IN THE MOUNTAINS MEGARGEL IN WESTERN WILDS

JAUNT A FRUITFUL ONE

Senator Morgan, Back from Florida, Talks of Promising Outlook for Winter Show and Meet

New York, Nov. 18—Senator Morgan got back from his flying trip to Florida today, filled with enthusiasm over the prospects of the southern circuit. His first stop was at Jacksonville, where he arranged to undertake the management of the automobile show to be held there January 4-18, in connection with the food show exposition. An exhibition building covering an entire block diagonally opposite the Windsor hotel, is to be erected, a section of which is to be devoted to the display of motor cars.

"There are now ninety-five automobiles in use in the Florida metropolis," said the senator. "To the best of my recollection the cars represented by agencies are the Rambler, Maxwell, Ford, Olds, Northern, Mitchell, Cadillac, Winton and White. Of these, the Rambler, Olds, Mitchell and Northern have already taken space. So has the Napier. With the new roads contemplated in Florida there is a big chance now for makers to get a foothold there. There will be visitors to the show from Atlanta, Savannah and all the Florida cities and the show will be visited by winter travelers en route to the east and west coast resorts."

From Jacksonville Morgan went to the course and spent 2 days at Daytona and 1 at Ormond. He found the utmost harmony prevailing between the rival towns and all hands enthusiastic over the fine card laid out for the meet. The senator found the beach in splendid shape. There had been a storm 3 weeks ago, which cut away the beach clear to the bluff and added fully 30 yards to the width of the course. He says there was not a sign of red sand on the whole 15-mile stretch on the beach.

Ira Paine, of Minneapolis, the new president of the Florida East Coast Automobile Association, has already taken possession of his cottage at Daytona, and E. M. Steck, the club's former president, has taken down the "To Let" sign and will again occupy his Daytona winter residence.

Morgan's mail indicates great interest here and abroad in the coming tournament. The Hughes Automobile Co., of Cincinnati, writes for particulars about the heavyweight steam and touring car events. He had also a communication confirming the intention of the Darracq people to send over a great flyer to make a bid for the 2-miles-a-minute speed crown, and the other important events of the meet.

Floridians, by the way, have taken to the 2-miles-a-minute race idea with enthu-

Digitized by Google

siasm. The Jacksonville metropolis is to start a voting contest to pick the prettiest girl in Florida, to whom shall be given the honor of placing the golden wreath on the brow of the victor. One penny per vote is to be devoted to the purchase of the crown, which is guaranteed to cost not less than $350, and is now being designed by a jeweler in this city.

It is now announced that Renault Brothers are building a special car in France for the 2-miles-a-minute race, of much higher power than that piloted by Sisz in the Vanderbilt race, which Maurice Bernin is to drive in that and other races in Florida and Havana. There are stories afloat that W. K. Vanderbilt, Jr., has been trying out the Hemery Darracq, which was not sent back to France. The inference is that he still has Florida beach speed aspirations buzzing under his bonnet.

While in Florida the senator had a conference with the Palm Beach powers that be, which resulted in the determination to again run a motor boat carnival in Lake Worth. It will last 3 days and is scheduled to begin on the Tuesday following the close of the beach races. It is probable that there will also be 1 or 2 days of motor boat racing at Miami, the senator says.

All idea of a motor car race between Palm Beach and Miami over the new road, which will be completed on January 1, has been abandoned by the promoter.

E. J. Conill has leased the Clement-Bayard car, in which Albert Clement finished a close second to George Heath in last year's Vanderbilt race, to represent him in the Cuban carnival and Havana cup races. Senator Morgan plans to have the 200-mile race for the Havana cup take place on Sunday, February 11, and wind up the Cuban carnival week, instead of beginning it. This will get contestants and visitors home a week earlier than originally planned. The idea is to have the floral parade on Sunday, February 4; the 2-day tour of the island on Monday, Tuesday and Wednesday; gymkhana contests on the Prado and Malecon on Thursday, and sprint racing on the course on Friday, winding up the meet.

The Itala car, which won the last Brescia race, covering the 311 miles in 4 hours 46 minutes 47⅘ seconds, an average around 64 miles an hour, is to be a competitor at the Ormond-Daytona meet. Signor Maurice Fabri, who is here seeking to establish an American agency, and was a competitor in the Brescia contest, says he will bring the car back with him on his return from the Paris show and drive it in Florida. The cable, by the way, brings the news that Henry Fournier will again be at the wheel in road contests. He has taken on the Societe Paris Automobile, the Itala agency, and will establish branches for that company in Berlin, Rome, London, Nice, Cannes and New York, and have his representatives exploit the car through competition.

NEW MARKS ARE MADE

National Car, Driven by Clemens and Merz, Smashes Vaughn's Long Distance Records

Indianapolis, Ind., Nov. 18—One more record or rather a series of records was added to the National collection at the completion of an attack on the 24-hour mark which was completed at 2:45 o'clock yesterday afternoon. Week before last—on November 4—Jap Clemens smashed the world's 100-mile mark, doing the distance in 1 hour 53 minutes 21⅘ seconds. The latest National performance, in which Charles Merz and Jap Clemens participated, was the breaking of the figures put up by Guy Vaughn on the Empire City track last June for 1,000 miles and for 24 hours. The 1,000-mile time was 21 hours 58 minutes 4⅖ seconds as against Vaughn's 23 hours 33 minutes 20 seconds and, farther back, Wridgeway's 25 hours 50 minutes 1 second. For the journey twice around the clock the National did 1,094½ miles as against the Decauville's 1,015⅝ miles and the Peerless' 943 miles, beating the long grind mark by more than 79 miles. The National first got inside the records at 150 miles, when it was 13 minutes 5⅗ seconds to the good. Then there was a slump and Father Time got away until the 650th mile was reached.

CLEMENS AND MERZ IN THE NATIONAL AFTER RECORD RIDE

For the 24 hours an average pace of 45 7-12 miles an hour, including stops, was maintained. In all 2 hours 54 minutes 12 seconds were taken out this way, while Vaughn only stopped 1 hour 44 minutes 4 seconds in his record drive.

Originally two National cars started in the attack on Father Time, but an accident at the 151st mile to the car Clemens was driving put that machine out of business, so the two drivers then alternated the rest of the way in the one car. At times Merz and Clemens were so numbed by the weather that it was necessary to almost carry them from the car to the judges' stand, where a warm stove, sandwiches and coffee awaited them. Sometimes the two men had to be rolled on the floor before they could get control of the muscles of their legs.

This record drive was started at 2:45 p. m. on Thursday afternoon, November 16. The track at the beginning was in very fair condition. The two National cars were started 30 seconds apart, and ran evenly until the first tire troubles, which occurred within the first 100 miles. The first mile was run in 1 minute 9 and ⅖ seconds. From the first mile until the fifty-eighth there was slight variation in the time, the different miles varying from 1 minute 7⅗ seconds to 1 minute 6⅕ seconds. After this point in the race, the car driven by Clemens showed a little better speed and made miles from 1 minute and 5 seconds to 1 minute 5⅘ seconds, while a little later it dropped to 1 minute 4½ seconds, and then 1 minute 3 seconds, and finally 1 minute 2⅗ seconds on the eighty-eighth mile.

On the **ninety-fourth mile a** tire on Clemens' car exploded. At that time he was 2 minutes 19⅗ seconds inside of his former record, made in the 100-mile race. He lost 7 minutes 18 seconds, in having the tires replaced, but succeeded in breaking the 150-mile record by 13 minutes 5⅕ seconds. The second car, driven by Merz, fell slightly behind and on the 151st mile Clemens' machine struck the fence on entering the home stretch, because of the fact that it was growing dark, and the Prest-o-lite lights, which were to light the track, had not all been lit at that time of the mixup.

The withdrawal of Clemens' car left but one machine in the drive, which was the one handled by Merz at the beginning. It was then decided to alternate the drivers, allowing each to drive from 50 to 100 miles before changing. The car which struck the fence broke the 150-mile record by 13 minutes and 5⅕ seconds. Following is a table showing the new and old records:

Miles	National	Decauville
650	14:08:51 2-5	14:26:47
700	15:10:29 3-5	17:59:59
750	16:20:25 2-5	17:27:10
800	17:17:26 1-5	18:52:44
850	18:23:44 2-5	20:06:46
900	19:44:48 1-5	21:21:37
950	20:54:50 3-5	22:33:16
1000	21:58:00 4-5	25:50:01
1050	23:07:42	.....

INDEPENDENTS ALLOTTED

NEW YORK, Nov. 18—The show down of the independents has been made. The Automobile Club of America made announcement today of its allotments of spaces for what it aggressively terms its sixth annual show of motor cars and accessories at the new Sixty-ninth Regiment armory, January 13 to 20, 1906. Space has been given to 204 exhibitors—twenty-four in the basement, eighty-nine in the gallery, twenty-three in the gymnasium, and twenty-eight in the basement—and applications are still coming in.

With 204 exhibitors—and possibly a few more will be squeezed in before the show opens—the armory show will be such as to at least share equally with the garden affair in the patronage the automobile world will give eastern motor exhibitions in January.

Of the eighty-one exhibitors in the building there are nearly fifty American automobile makers. In this list all the prominent home concerns are found outside of those allied with the A. L. A. M., and with the amount of space allotted each, a representative exhibition may be looked for. The demand for space was such that the show management was compelled to place a number of prominent concerns in the basement, which has been laid off in such a manner as to make a rather desirable

NEW YORK SHOW SPACE

ction. The central portion of the first floor is laid out splendidly and should be the means of accommodating a large crowd f people.

There are eighty-one exhibitors of complete pleasure vehicles -sixty on the main floor and twenty-one in the basement. The isplay of foreign cars promises to be notable. Fourteen importing concerns will exhibit. The imported cars to be shown nclude the Delaunay, British Napier, Renault, Panhard, Mors, Sobron-Brille, Peugeot, C. G. V., Richard-Brasier, Aster, Martini nd Leon Bollee. Notable absentees are the Mercedes, de Dietrich, Decauville, Rochet-Schneider, Clement-Bayard and Fiat, which belong to the licensed division. The Panhard and Renault will also be represented at the Madison Square garden how.

While the automobile sections will prove of intense interest to prospective purchasers, the agent and the owner will find the gallery of especial interest, inasmuch as this section will contain the exhibits of sundries, which this year will contain any number of new things in tires, ignition, clothing, tops, etc. The maker, too, will be found here examining lamps, horns, plugs, coils, batteries, bearings and other things for which he may find use in putting out his wares.

MORE ROOM FOR CHICAGO SHOW

First Regiment Armory, to Be Used as Annex for Chicago Show

Chicago, Nov. 21—So great has been the demand for space at the 1906 Chicago automobile show that Manager Miles has been compelled to secure an additional exhibition hall. The nearest and only available building is the First Regiment armory, which is located at the northwest corner of Michigan avenue and Sixteenth street, and which ranks second to the Coliseum as a hall for exhibiting purposes. Securing additional space was made necessary by the fact that while the Coliseum has 39,000 square feet of exhibition space, the applications cover 64,000 feet, so there was a shortage of 25,000 feet.

The armory building is 300 feet from the Coliseum, the backs of the two buildings being on the opposite side of the same alley. It is the intention of the management to cover the alley in some manner and thoroughly light it. The alley is now provided with an asphalt pavement. The appointments in the armory will be the same as those in the Coliseum.

As a matter of fact, the management is making an effort to turn as much of the public into the armory first as is possible. The passes for automobile agents for both buildings will be issued at the armory only and the railroad tickets will be signed there. It is designed to hold all meetings and conventions in the armory in order to force the attendance into this part of the automobile show.

In the allotment of space the management based the placings according to the number of previous shows at which applicants had exhibited, dividing them into classes. Although Manager Miles stated that an effort was made to provide each applicant with the amount of space desired, even with the addition of the armory it was impossible to do so, and some must be left out. It will be noticed by the accompanying list that in the armory there are many of the most prominent automobile makers in the country, so that even without the efforts of the management to force the attendance of the public into this portion of the show the armory will receive quite as much attention as will the Coliseum proper when the show opens.

The management has made public the list of exhibitors on the main floors of the coliseum and armory, but the work of apportioning space for the galleries has been such that these allotments will not be announced for a week. The exhibitors:

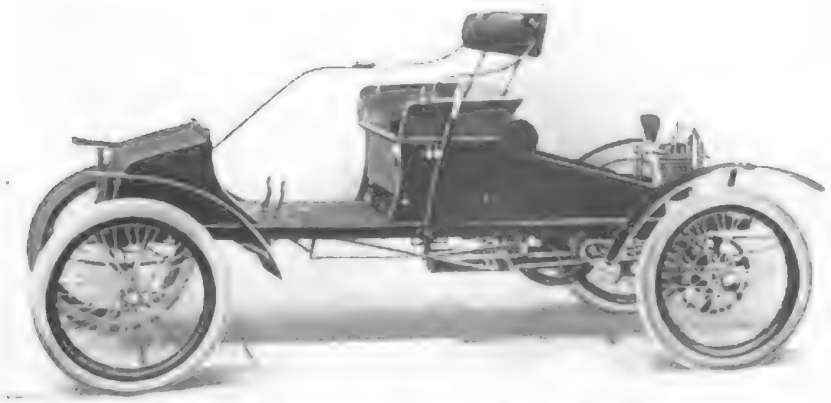
ORIENT BUCKBOARD REMODELLED



THE ORIENT BUCKBOARD AS REMODELED FOR THE 1906 MARKET

THE Orient buckboard for the coming season, fledged in its new feathers, is decidedly different in its scheme of transmitting power from the motor to the rear wheels, friction disks and double side chains now being used. The little machine is still a stoutly constructed model and the addition of a miniature bonnet used for baggage and enclosed compartment in the rear places it further from the buckboard classification than previously. As previously built the motor is not enclosed, the circular head and valve port being exposed to the atmosphere. A three-bladed fan is now carried in front of the motor, and is driven by a flat belt from a pulley on the crankshaft.

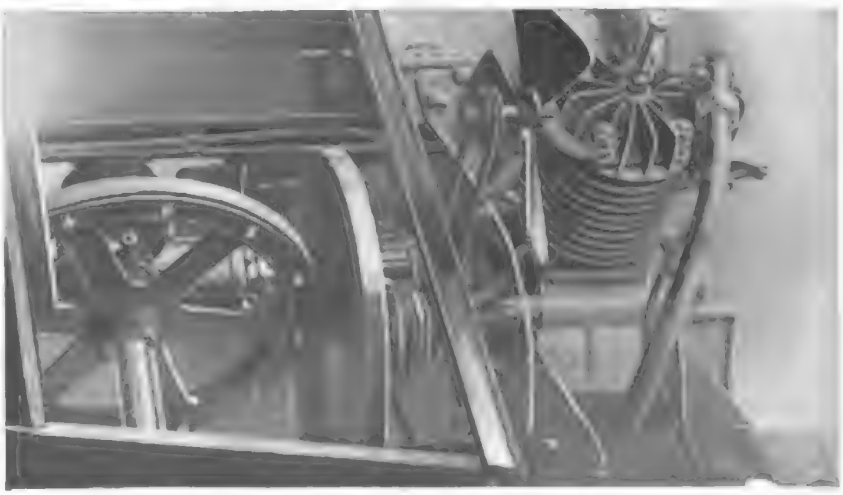
The cylinder bore and stroke are 3¼ and 4¼ inches respectively and a rating of 4 horsepower is given by its makers, the Waltham Mfg. Co., of Waltham, Mass. The cylinder head is a separate casting retained by four vertical bolts passing through the cooling flanges and the heavy flange on the bottom of the cylinder and through the top of the crankcase. The bracket carrying the fan is secured by two of these bolts. The motor hangs in a little sack-like bracket that has a central part, in which the crankcase rests, and four horizontal arms that rest on the top of the trussed main frame and bolted thereto. In fastening the crankcase to the bracketing two bolts unite them at the top of the case near where the cylinder is attached and another pair does similar duty near the base of the case. The case itself is split into two parts, held together by a series of bolts. The bearings for the crankshaft are supported in cages bolted to the case.

The single valve port is carried on the top of the cylinder, the pipe from the carbureter, carried low at the left side, connecting with the top of the housing containing the automatic valve. In the base of the port is the mechanical exhaust valve, with a muffler pipe exiting from the lower angle of the port at the right, coupled with cylindrical muffler carried lengthwise beneath the frame. The spark plug is placed horizontally in the left side of the port between the valves and receives its current from a set of dry cells connected with coil, timer and switch. The commutator is of Orient design, made with wipe contact. The carbureter is also of Orient make. A gasoline tank of 3½

REAR VIEW 1906 BUCKBOARD

gallons capacity, sufficient for 30 miles, is fitted at the rear of the seat.

The big alterations are met in the transmission which is of the friction type. On the front end of the crankshaft is a large friction disk with metal face. Forward of this and mounted on a cross shaft is a friction wheel of almost equal diameter, the periphery of the wheel being covered with fibroid. The motor friction disk is made rigid with the crankshaft but the friction wheel is slidable on the cross shaft, so that it can be moved across the face of the disk to give any range of forward speeds or reverse. This movement is given through an outside lever at the driver's left, the lever being connected by a rod with a bell crank, the end of which works a yoke on the friction wheel hub. Forward speeds are gained by contacting the friction wheel with the friction disk at one side of its center. The nearer the wheel is to the outside of the disk the faster the speed and vice versa; for reversing, the wheel is moved to the opposite side of the disk. The method of contacting the periphery of the friction wheel with the face of the disk is by a ball thrust in the rear of the disk on the crankshaft, this being brought into use by the left pedal in the footboard. This pedal has a ratchet, giving it five different degrees of contact, so that the contact can be varied. On the ends of the shaft carrying the friction wheel are sprockets for double chain drive to the sprockets on the rear hubs. On these hubs are the brakes, consisting of a pair of bands, the drums being united with the sprockets. Application is by the right pedal, the connection being through cable to the foot of the brake pedal. The motor is lubricated by a sight feed device, there being a large oiler carried on the right side for supplying the crank case and cylinder. One pint of oil is said to be sufficient for 90 miles of travel. The body and running gear of the buckboard are unique in possessing 26-inch wire wheels shod with 2½-inch single tube tires, 80-inch wheel base, an ordinary tread of 42 inches but 56-inch when specified. The trussed frame is carried on a set of four full elliptic springs, each having a length of 19 inches. This year the carrying platform of the body is not so conspicuous because of the little bonnet and the sloping back compartment in rear of the seat. Natural wood finish is retained in the body.



MOTOR AND TRANSMISSION ASSEMBLY SCHEME IN 1906 ORIENT BUCKS

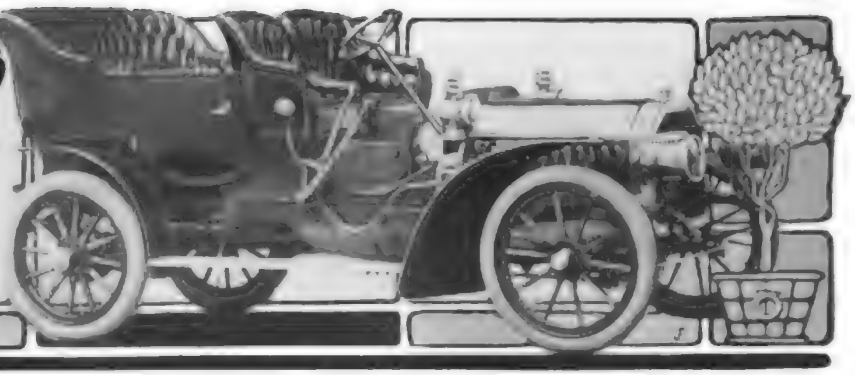
PEERLESS FOR 1906

WITH NEW CYLINDER DESIGN



TWO 1906 models have been brought out by the Peerless Motor Car Co., of Cleveland, O.—one known as model 14, a 30-horsepower touring car accomomdating five passengers, and the other a 45-horsepower machine of the heavy touring car class. Both machines are built with most of the innovations that are the features of next season's machine and in the smaller model, described herein, all the new features are embodied. Conspicuous in the changes noted is the new motor design, with the valves carried in oppositely-placed ports on the sides of the cylinder heads and actuated by push rods acting on the bottoms of the valve stems. Not less noteworthy is the use of a leather-faced expanding clutch, the use of Hess-Bright ball bearings in the road wheels, rear axle, gear box and practically every place except in the motor; the use of a new horizontal tube radiator, new platform spring suspension and minor control features. Among retained features in the machine are the four forward speed gear box with changes made on the selective system, the sub frame for carrying the motor and gear box, arched rear axle and dished rear wheels.

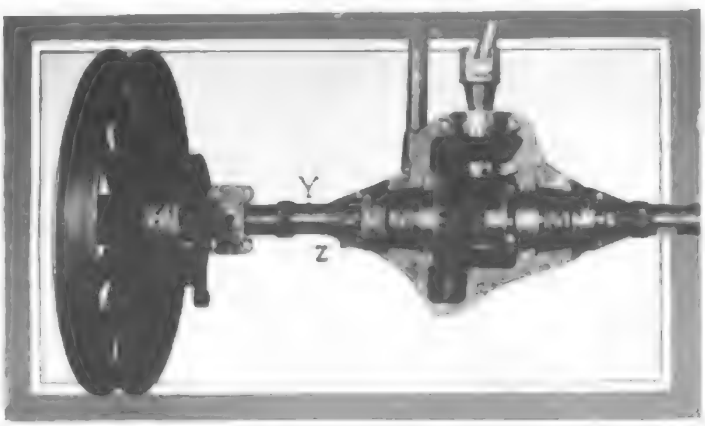
The main frame is made from cold rolled steel with the side pieces parallel throughout and braced by four cross pieces, each reinforced by gusset plates. The cross piece carrying the rear end of the sub frame has integral gusset plates, and similar plates where the sub pieces unite with it. Both motor and gear box have integral arms resting directly on the sub frame pieces. A change in the spring suspension is noted by using a platform combination in the rear, the cross part of the platform being clipped to the center of the rear cross piece, the front of the side parts being shackled to the frame in standard form. Semi-elliptic springs are used in front, with the leaves polished. The front axle is a drop forging of I section, the wheel base is 107 inches and 34 by 4-inch tires are fitted.

In the placing of both the regular and emergency brakes on the rear hubs and operating the first by pedal and the latter by side lever, this year's construction is maintained, but a difference occurs in not having the regular brakes interconnected with the clutch. This makes it easy to stop the car when ascending a hill. The regular brake is used to hold the car until the clutch has taken control and started the car up the hill. As previously, however, the emergency brakes are interconnected with the clutch, application of the former throwing the latter out. The regular brake has a band working without the cast-steel brake drum, the inside surface of the drum forming a wearing surface for the expansion shoe forming the emergency brake. In the illustration the drum is not shown. The band A of the regular brake is fiber lined, and to increase its flexibility has been split at N, where the two parts are pivoted. In holding the band free from the drum when not in use the coil spring H on the top of the band surrounds a short stem attached to the band. On the support K is a washer acting as a spring seat to retain the spring tension. The brake is applied through the bell crank L, connected to one end of the band A by pivoting and to the other end by a short lever. The emergency bronze shoe B is made in one piece instead of two, as formerly, and is carried on the bolt C, the bolt working in a slot, so that when the brake is not applied it is drawn up free from the drum by the coil spring D and at the same time the longer coil spring E holds the upper ends of the shoe free of the drum. For expanding the shoe B a diamond shaped cam F is placed between the ends of the shoe, which are enlarged for the purpose, the cam being rigid with the lever G connecting with an equalizer and the brake lever. The brake drum has a 10-inch diameter and is 2½ inches wide.

Many differences are found in the 1906 motor compared with the one in use the present season, the valves being placed in opposite ports on the right and left sides and operated by vertical pushrods from camshafts within the crankcase instead of overhead valve levers of the walking beam type. The four cylinders are cast in pairs, with cylinders, jackets, heads and valve ports forming integral castings. Aluminum is used throughout in the crankcase, which is a three-part casting, the top A with integral lugs for supporting the motor, the center B between which and the top are carried the crankshaft bearings and the bottom plate C, forming an inspection plate. The usual side inspection plates on the crankcase are not used. To facilitate the draining of oil, the bottom of the case is made with oil grooves running to oil taps. The housing D for the driving gears is at the front end, integral with the case proper, so that all gears work in an oil and dust-tight case, a plate forming the front. Between the crankshaft gear and the two camshaft gears is interposed the idler P, so that the wear on the crank pinion is not great and gear cutting danger is reduced materially, the idler causing the wear to be distributed on the shaft gear.

The cylinders have a bore and stroke of 4½ and 5 inches, respectively, and with a crankshaft speed of 900 revolutions a minute 30 horsepower is generated. Each cylinder is bored, reamed and then lapped and polished. Each piston carries four compression rings above the wristpin, the ring surfaces as well as those of the pistons being machined to give the same weight in each cylinder. Each ring is pinned against rotation and betweeen the rings and throughout the piston length are several oil grooves for distributing lubricant. The wristpin is a hollow rod pinned to one of the piston journals and lubricated by a pair of oil holes with reservoirs on the top of the connecting rod, a shouldered bushing is used to take up side thrust.

The crankshaft is a drop forging running on two end bearings and one between the cylinder pairs, the front bearing 3¼ by 1 11-16 inches, the center 3 by 1 11-16 inches and the rear 4 by 1⅞ inches. Bushings made of white metal are used and oiling is from the splash, which fills large oil

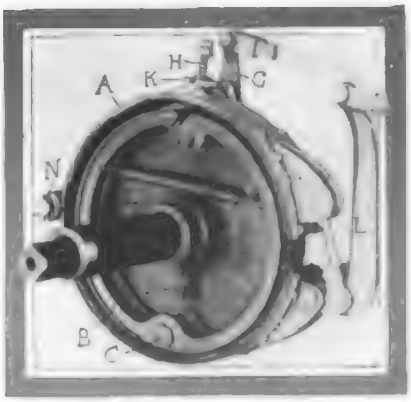


ARCHED REAR AXLE WITH UNIVERSAL JOINTS

Digitized by Google

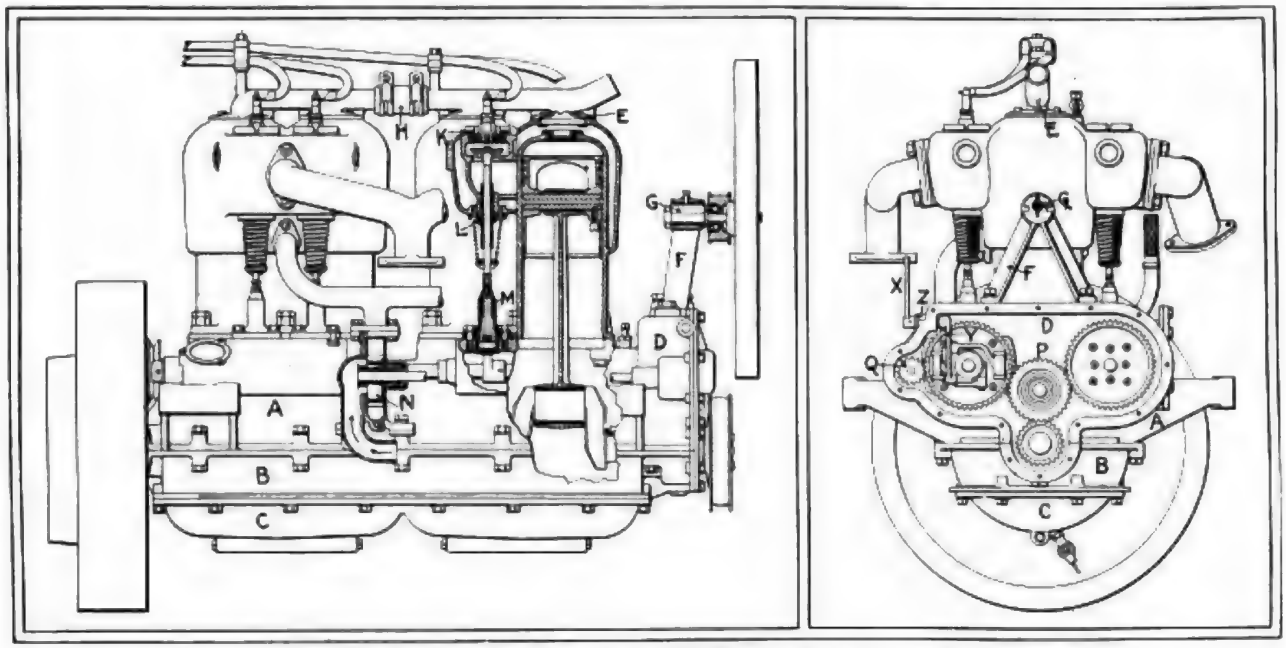
cups over each bearing from which the oil is distributed by grooves in each bushing. On the rear end of the shaft is an integral flange, to which the flywheel is bolted, the latter carrying the clutch.

In the valve disposition the intakes are placed on the right side and the exhausts opposite, each located in the upper part of the port and removable by unscrewing a cap K in the port head. Both intakes and exhausts have a diameter of 2 inches and a 5-16-inch lift, being interchangeable throughout and made with the heads and stems integral. Each stem works in a long guide L, which has a tight fit with the bottom of the port and is retained by means of a shoulder and pair of screws. The top of the valve spring rests against the bottom of the sleeve shoulder and the sleeve projecting downwards practically the entire length of the spring, supports the valve stem throughout its length. Push rod construction is standard, the rollers being held on the



EXPANDING FRICTION CLUTCH

The governor is of the standard centrifugal type and connects with the throttle in the intake pipe through the arm X, which has a long bearing in the crankcase at Z and connects with the governor weights through the arm Y. The spark control on the steering wheel is a thumb lever on the throttle arm or lever, working in a semi-circular quadrant, the object of carrying the spark lever on the throttle arm being that the two are always together, one hand sufficing to care for both. The throttle lever is connected with a worm shaft within the steering column, which raises or lowers a sleeve connected at its lower end with the throttle, but the spark lever is on a short arm with an offset, in the center of the column, with a vertical rod in the column attached to the offset, so that a movement of the lever raises or lowers the center rod, which has bell crank connections with the commutator. Ignition is by jump spark, with current taken from storage battery carried on the running board to a quadruple coil on the dash, and gear driven commutator located on the right side of the motor just back of the rear cylinder and driven by bevel gears from the inlet camshaft. The commutator is set at an angle of 60 degrees, so that all of the oil within the case will not work out through the bearings. Instead of a contact brush in the commutator a roller contact is used, the roller running in oil in order to eliminate wear. Spark



INLET SIDE AND FRONT END VIEWS OF THE 1906 PEERLESS FOUR-CYLINDER MOTOR

cams through coil springs M within the rod housings, the coil resting at its upper end on a collar of the housing and at its lower end on a collar on the push rod. The camshaft is 13-16 inch in diameter and runs in white metal bearings.

Mixture to the motor is supplied from a float feed carbureter of the auxiliary air valve style, the latter under spring tension. Surrounding the mixing chamber is a water jacket supplied with water from the cooling system. The carbureter is carried close to the cylinders at the right, so that a short Y piping serves to connect each pair of cylinders and the throttle is under control from the steering wheel and also from a governor carried on the inlet cam gear.

PLATFORM SPRING SUSPENSION AT REAR

plugs are placed in the valve caps.

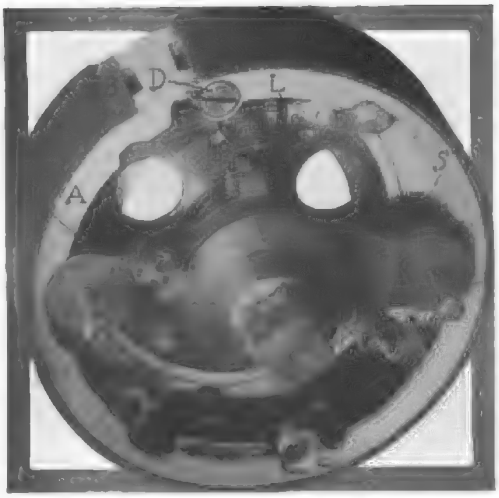
Water circulation is maintained by a gear-driven centrifugal pump N on the right side of the motor, the gear being housed in the same compartment with the cam gears. The water is taken from the base of the radiator and delivered to the lower part of the jackets, the entrance being between the inlet valves at the right side. Instead of leaving the top of the jackets through small openings, the top of the jackets are made open and large plates E cover the openings and form the union with the pipes to the radiator. Between the pairs of cylinders is a hose connection H, giving a flexible union, so the the cylinder vibration little effect on loo

Digitized by Google

the uions in the water system. The new radiator is built on the flat tube principle, the entire frame work carrying the tubes and forming the tanks made in a single casting. The tubing consists of a set of three tubes one behind the other and the set covered by a single flange perforated with small holes and having ragged edges. The fourteen sets of cross tubes thus form a continuous path for the water. The bottom cross tube is connected at one end to a collector or tank in the base of the radiator casing, to which is coupled the piping to the pump, and in this collector is a drain cock for emptying the radiator. In rear of the radiator is a rotary fan belt-driven from the crankshaft. The fan is carried on a bracket F resting on the motor casting, and has an eccentric bushing G carrying the fan shaft, by means of which the adjustment of the fan belt can be changed at will. The shaft runs on roller bearings with oil tight cases.

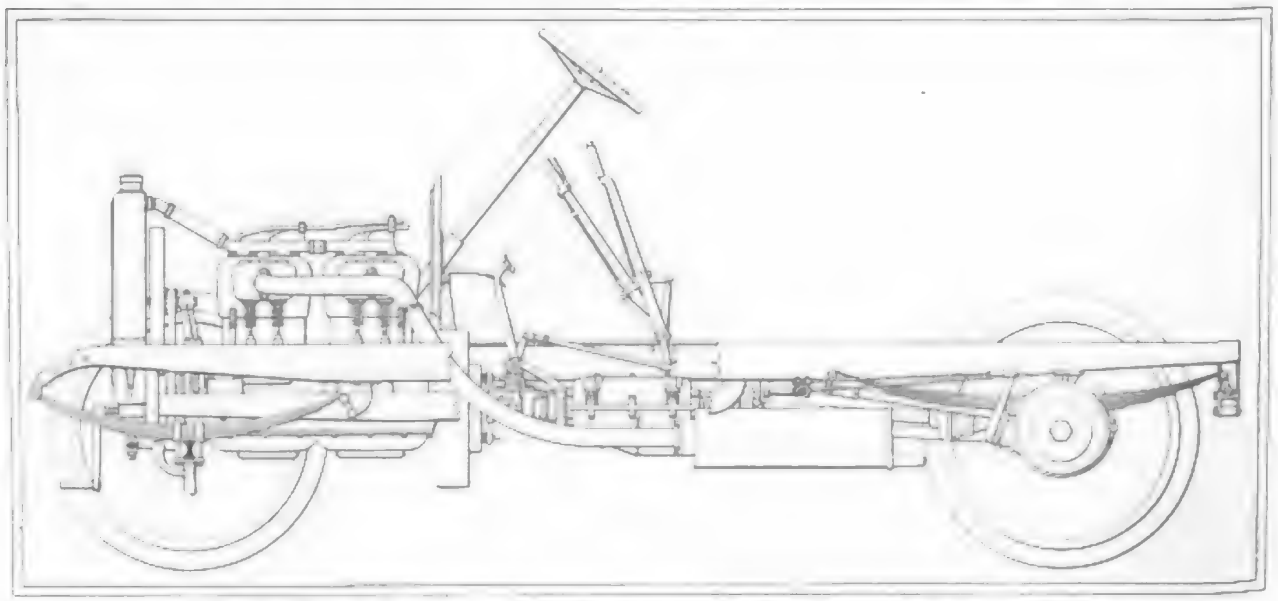
Motor lubrication is cared for by a sight-feed lubricator on the dash, oil being pumped through the leads. One lead passes to each cylinder and others to each of the crankcase compartments, so that oil after passing around the pistons and lubricating the wristpins drops into the base, supplying the splash, from which the crankshaft bearings are supplied. Steering is by an irreversible worm and segment gear, the column with the worm being carried on races of ball bearings, and in the steering knuckles are other ball bearings for carrying the weight of the front part of the car.

The cone clutch of the present season has been dropped and in its place is one of the expanding type, the friction part of which is a leather lined steel band expanded by a pair of coil springs. The general construction of the clutch can be followed from the illustration, all but two of the expanding parts being shown. The expanding band is 3 inches wide and the clutch diameter is 10 inches. The clutch shaft M has its bearing on the continuation of the crankshaft and the end connecting with the shaft to the gear box is squared, with oval surfaces, so that the two-part steel clamp fitting over it gives the same elasticity as a universal joint. The clutch carrier A is an aluminum casting surrounded by the broad steel band B with its leather facing C. At one end the band B is anchored to the carrier by the stud D, but at the other end is attached to the hollow lug F, which has opposite to it a similar lug E secured to the inside of the band B. In expanding the band it is necessary to force the lugs E and F apart, this action expanding B within the flywheel. In working this expansion there is a double oppositely-threaded stud L, one of the threads of which enters the threaded lug E and the opposite one the threaded lug F, both of which are made with internal threads to receive the worm L. The coil spring S and another at the opposite side of the clutch force outwardly the double arms K, which also carry the collar for attaching the arms H, which are connected with the clutch pedal for disengagement. As the springs S force the arms H outward a short arm, with ball and socket connections at one end with H and at the other end with an arm depending from the stud L, partly revolves the stud. It will be remembered that L has the opposite double threads and this part of a revolution is sufficient to separate the lugs E and F to give positive drive between the band B and the flywheel. The stud L is notched on its top surface where it meshes with a screw, used for varying the adjustment should the clutch slip. In disengaging, the clutch pedal forces the arms H into the flywheel against the tension of the springs: the arm is also forced in, and another arm, being carried in the same direction, accomplishes a part revolution of the stud L, thereby drawing lugs E and F closer together and withdrawing band B from contact with the flywheel. The ends of the arm fitted with ball and socket joints are adjustable by means of small screws. Within the hollow part of the clutch shaft M are small end thrust ball bearings. The entire mechanism is protected by covering from dust and wind.



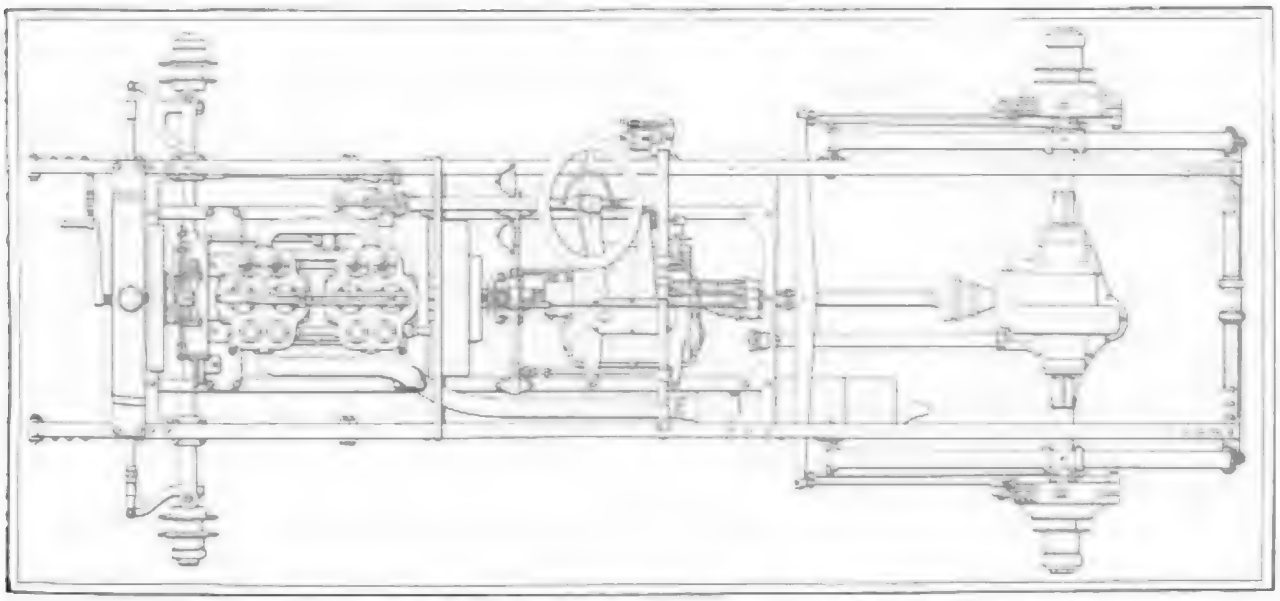
Peerless Expanding Clutch

The success given by the present type of gear box in which changes of speed are made on the selective principle without passing through gears has led to the maintaining of the gear set practically as it was, with the exception of minor changes. The use of Hess-Bright bearings in all parts of the case in place of plain bearings as used this season is in keeping with 1906 tendencies and the use of a double set in the large bearing for the front end of the main shaft is a guarantee of strength. The four forward speeds and one reverse are gained by one lever working in a three slot quadrant, the two outer slots having forward and back positions



Exhaust Side of Peerless No. 14 Chassis, Showing Operating Devices and Spring Suspension

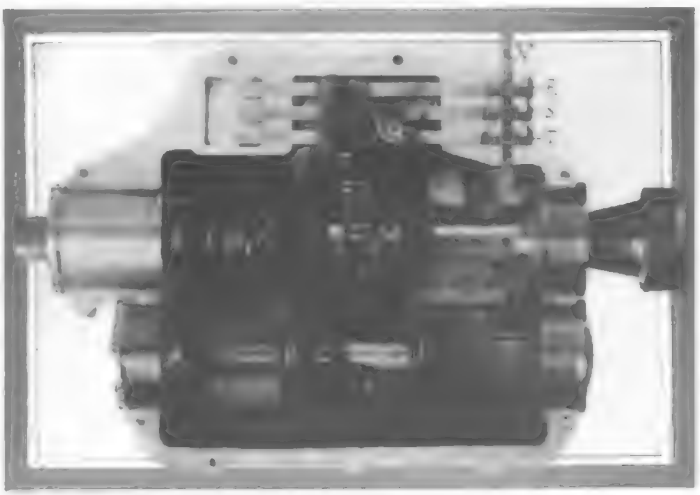
Digitized by Google



PLAN VIEW OF PEERLESS NO. 14 CHASSIS, SHOWING NEW MOTOR AND MOTOR AND GEAR CASE SUPPORT

and giving the forward speeds and the inner one having a forward position only for the reverse. The interlocking system has been retained. The method of carrying the gear box by the top half is an old feature, there being four integral lugs for resting on the sub frame. By carrying the bearings between the case parts and having the lower part removable by simply dropping it, the maker claims it is easier to replace gears. A feature of the aluminum case is the scraping of the inner surface, the object being to remove particles of sand from the casting cores.

In obtaining different speeds it must be remembered that three sliding units are used—the first consisting of the two gears H and K, which are made integral; the second of gears L and M, bolted together and the third the reverse idler N, in the base of the case, which is in mesh only when in use. For direct drive the unit H-K is moved forward through the arm P, so that H with its internal teeth slides over gear F, which is made integral with gear E and both are carried on the clutch shaft W, whereas the unit H-K is on the squared main shaft. In this way the clutch and main shafts are locked together and the drive is direct along to the rear axle. For third speed gears K and B are meshed, the drive then being from the clutch shaft through gears E and A to the counter shaft, thence from the latter to the main shaft by gears B and K. For second and slow speeds the unit L-M is used, gear L meshing with C for the former and M meshing with D for the latter, the arm Q serving to slide the unit L-M. In reversing, the gear N, made double the width of others, is moved forward so it jointly meshes with gear D on the countershaft, and M on the main shaft, the latter gears being as shown in the illustration, the idler having sufficient width of face to mesh with both. The method of sliding the three units is through the three shifting rods R, S and T secured respectively to the arms P, Q and O, connecting with the sliding units. If direct drive is wanted an arm depending form the sleeve carrying the change speed lever slides into the large notch on the outer end of the shifting rod R and at the same time the interlocking arm V, which works through a series of slots in the under surface of the three shifting rods R, S and T, has one slot in its upper surface and when this slot is brought beneath the rod R the rod can be moved to the front, while the rods S and T are locked against similar movements by the part of the interlocker V, which has no slots in its upper surface. With the shifter R free it is moved to the front and H is meshed with E. When the second or slow speed is wanted the shifting rod S is needed and when the lever at the driver's right is moved sidewise to bring it into the quadrant for these speeds, the interlocker V is simultaneously moved, so that the slot in it is directly beneath the rod S and it is free to move either to the front or rear. The button on the shifting lever at the driver's seat is only used on the reverse, the lever when in the center of the quadrant being free to move into either slot, but it cannot enter the reverse until the button is pressed. Drive to the live rear axle is through a propeller shaft, the shaft being relieved of all strains from the axle by a torsion rod. The Peerless rear axle is arched so the road wheels are dished 2 degrees. The arching is made possible by the use of universal joints in the drive shafts at either side of the differential, the joints being of the simple jaw variety and contained within the outer part of the differential housing. The joints are shown at X in the view of the axle, and at Z in the same illustration is shown the manner of bolting the differential housing to flanges on the axle housing Y instead of brazing or pinning it in place. Another rear axle change is the brazing of the plates on which the springs rest in place and the use of radius rods from the axle housing to the side pieces of the main frame. A spur gear differential is maintained, but Hess-Bright bearings have been installed throughout the axle, being used for end thrust at one side of the differential and also against the propeller shaft. Adjustments are fitted for both the large bevel on the differential and the small bevel pinion on the propeller shaft.



PEERLESS FOUR-FORWARD SPEED GEAR SET

Digitized by Google

From The Four Winds

Transporting Fox Hounds by Motor Power to Hunting Grounds Near Nashville, Tenn.

Right Way—The bishop of Liverpool has been presented with an automobile by his diocese in England and to make the present a good one the sum of $700 a year for 6 years has also been settled on him for the maintenance of the car.

Ex-Mayor Tours—Ex-Mayor James D. Phelan, of San Francisco, has returned from a long visit to Europe, on which Miss Phelan accompanied him. Mr. Phelan made an extensive tour of France, Germany and Spain in his new Mercedes car. They visited many out-of-the-way, primitive places.

Chadeayne On Road Again—W. C. Chadeayne, the motor cyclist who recently completed a record-breaking run from New York to San Francisco, left the latter city Thursday, November 16, for Los Angeles, from where he will travel on into Mexico. Chadeayne will not attempt any records on the run down the coast, owing to the poor condition of the roads.

Good Work—The Grand Forks Automobile Club of Grand Forks, N. D., is reported to be doing great work in the cause of motoring. Its work in the last legislature, when it defeated a bad law and was instrumental in the passage of a good measure, is its chief claim to fame. It is claimed to be the strongest motoring organization west of St. Paul and Minneapolis and east of San Francisco.

Prize to a Steamer—F. F. N. Baldwin, in a steamer runabout, captured the time prize, the Knight cup, in the annual hill-climbing contest of the Rhode Island Automobile Club up Stump hill, near Pawtucket, R. I., last Saturday, going up the incline in 35⅘ seconds, with B. F. Blackinton, last year's winner, 10 seconds behind. Arthur S. Lee, in a 30-horsepower Pope-Toledo, won the class for big cars.

Kick From Farmers—A halt has been called in the building of macadam roads around Binghamton, N. Y., because the farmers in the territory object to keeping good roads in condition at their own expense. The supervisors are reported to believe that the cost of maintenance of a road should be borne in the same proportion on which it is constructed; that is, the state should pay 50 per cent, the county 35 per cent and the town within which the road is located 15 per cent. The farmers believe the motorists should help pay and it is reported that a movement has been started whereby automobiles will be taxed for the maintenance of roads. It is expected this tax would amount to about $400,000 a year, which could be used keeping macadam roads in condition.

Still Homeless—The question of new permanent quarters still is in abeyance before the Milwaukee Automobile Club. The committee appointed by President Sherburn Becker has several sites under consideration, but as yet no definite action has been taken.

Owners to Organize—Rumor has it that a number of owners of automobiles at Toledo, O., will form a company to erect a new automobile garage in the heart of the business district of the city. It is said that the company will be capitalized at $50,000. Toledo now has six garages, and if this project materializes the city will have double the garage space it had a year ago.

Road Money Goes Begging—Mrs. Howard Gould, en route from Virginia to New York city in an automobile, stopped long enough in Philadelphia to give the newspaper men there her impressions of the roads, especially those between Baltimore and the Quaker city. Her opinion corresponds with that of Wizard Edison, who, a few weeks ago, handed out several uncomplimentary jabs at the road system of the keystone state. The fact that at the last session of the Pennsylvania legislature there was passed a good roads bill, calling for the expenditure of upwards of $6,000,000 in 6 years, would naturally lead the outside world to believe that a great road improvement boom was on in the state. Not so. The terms under which the state offers its aid to the counties and townships are, in many cases, considered to be unfavorable to the latter, the result being that there is no rush to take up the state's offer. It is even intimated that this state of affairs was foreseen by unscrupulous advocates of the bill, who, with a big balance in the favored treasury banks, saw good opportunities of borrowing money at low rates of interest to advance private schemes. Had the terms offered to townships and counties to embark on road improvement been as favorable, for instance, as they are in New Jersey, the full amount appropriated would have been quickly applied for, and there would have been no uncalled-for balances in the treasury for the use of favored political borrowers. The real good roads advocates of the keystone state are hoping that the recent political revolution will result in the passage of a law that will prove satisfactory to all hands.

Motor Wagon Freight Line—W. J. Morgan, promoter of the southern circuit races, who has just returned from Florida, says three express companies have been formed, and will run motor wagon freight lines over the new road between Miami and Palm Beach. This road is 60 miles long and will be completed by January 1.

Quizzed by Uncle Sam—The good faith of the advertisement printed in Minneapolis papers by Arthur H. and Dwight E. Jackson is questioned by the United States postal authorities, who brought them before United States Commissioner Abbott to explain an advertisement which offered for sale a 1904 White steamer for $600, the car to be shipped for inspection on the payment of $300. It is said in the complaint that a machine of inferior make and not worth $300 was forwarded. Using the mails with fraudulent intent is charged. The men were held to the next federal grand jury.

Roosevelt Relents—President Roosevelt has decided that Walter Eldridge, chauffeur of the bureau of standards of the department of commerce and labor, had just provocation for his profanity when he got in front of the president's carriage with his automobile, causing his dismissal. He has been reinstated. Eldridge became confused when ordered to get out of the way by the secret service men and turned in front of the president's carriage. Irritated by the detectives' calling down, he dropped a choice swear word which caused the president to abrogate about half the merit law and fire him.

Good Roads Missionary—Asa Goddard, chairman of the routes and maps committee of the A. A. A., will start this week from New York on an extended tour in an automobile, in the interest of the national organization. He will first work toward Boston, by the shore route, via New London and Providence. He will carefully remeasure the distances, so as to bring the route cards up to date. He will also make appointments of official hotels and garages. Nor will his work end here; for he will do recruiting work also among clubs and individuals. In fact, he will act as a peripatetic A. A. A. missionary a-motor.

Stirs Up the Farmers—Farmers along the road from Chicago to Cincinnati are reported to be up in arms and searching for Frederick Innes, a Chicago bandmaster who recently drove from the windy city to Cincinnati in a motor car to win a bet from a friend of his who wagered he could not cover the distance in a certain time. On the way Innes worked up a race with another friend, L. G. Conn, of Elkhart, Ind., the loser to pay for a trip to Europe. The bandmaster lost his first bet by 52 minutes, but the second he won. So fast did he skate across country that he left a trail of angry country people behind him, who vow they will make him pay for his

Digitized by Google

speeding. It is this kind of work that stirs up the enmity of the people and starts the motorphobists talking.

Helped Jolly a King—Dr. W. A. Spring, an American dentist who resides in Dresden, took part in the recent demonstration in honor of the king of Saxony, his Winton car, gayly decorated, occupying a prominent place in the parade, Dr. Spring himself being at the wheel.

Must Slow at Corners—Commissioners of the District of Columbia are considering the advisability of amending the police regulations by requiring automobilists in turning street corners on streets outside the fire limits to slow down to 4 miles an hour. Many complaints have recently been made that automobilists in the outlying districts are very reckless in turning corners, and it is likely this practice will be curbed by framing a regulation to cover it.

Horsemen Holler—The big Scoing Philadelphia rubber wagons, which, like all automobiles in the Quaker city, have the run of Fairmount park, are getting themselves disliked by the horsemen, who claim that the leviathans frighten their animals. At a recent meeting of the park commissioners an appeal was received asking that the huge machines be either prohibited the use of the park or compelled to restrict their operations to certain roads well away from the east and west river drives and other main arteries of travel through the people's popular pleasure ground.

Enough For Miller—Evidently Major C. J. S. Miller, whose big Fiat car was driven so successfully by Chevrolet last summer, has had enough of racing, for it is now announced he had changed it into a touring machine, a light tonneau with a seating capacity for five having been put on. S. B. Stevens is another who has converted his racing car into a touring rig. Offsetting this, racing is said to have gained a recruit in George Gould, who has ordered a 40-horsepower French car with a light racing body, which the enthusiasts are counting on seeing in the Ormond competition. Ostensibly the Gould car is intended for use on the grounds of his country home on Long Island.

Aid to Fox Hunting—In Nashville, Tenn., an automobile owned by Professor J. F. Draughon is put to a novel use. To the automobile is attached a trailer designed by Professor Draughon. The trailer is attached to the automobile by a coupling similar to that used on railway cars. The trailer holds twenty dogs and has an upper deck. Tents are carried on this part of the trailer, while underneath is a compartment which is used to carry cooking utensils, etc., in the event a long hunt is planned and executed. Some of the best hunting grounds are about 15 or 20 miles from the city and it was for this reason that the professor hit upon the plan of attaching a trailer to his car, as by so doing he is enabled to leave Nashville late in the afternoon and yet reach the hunting ground on time without worry or loss of time from his business and turn his dogs loose fresh and ready for the sport. When he arranges for a trip at some distance he sends his horses to the hunting place or some convenient rendezvous in the afternoon and when he and his friends arrive in the afternoon the horses are saddled and the dogs let out of the trailer fresh and the fox is soon going. After the chase by special signal the dogs come in, get into the trailer and the hunting party is soon on the return trip to the city.

Chip on Oldfield's Shoulder—Barney Oldfield, who was in Philadelphia last week with his new Peerless racer, en route to New York after a trial of the flyer on the Ventnor-Longport beach course, below Atlantic City, announced he has the car that can win the Florida 2-miles-a-minute race. George T. Thompson, of the Eastern Automobile Co., of Philadelphia, which handles the Peerless, stated that Barney was anxious for a real try out of the car and was especially anxious to get a chance at the Thomas Flyer, on road or beach, and at any distance, for any amount from $500 to $1,000.

Contest for Cups—The first of the month the competition for the mileage and touring cups offered by the Cleveland Automobile Club will be decided. The mileage cup goes to the club member who owns the automobile which has made the greatest mileage over the streets and public highways between May 1 and December 1. The other trophy is for the member who has toured the most extensively in the same time, no trip of less than 100 miles being considered. It must also include at least 1 night's stop in a different locality from that in which the original start was made.

Another First One—The oldest inhabitant is claiming that to Rev. J. Carhart, who resided in Racine, Wis., in 1870, belongs the credit for making the first automobile in this country, it being asserted that 35 years ago the minister turned out "a four-wheeled concern resembling an old-fashioned buckboard, with a vertical steam engine attached to the rear axle. Out of necessity it was noisy, and is said to have been erratic in proportion, showering sparks in profusion. Many runaways were said to have been caused by it in the public roadways, and when one day a valuable race horse, a descendant of which was Jay-Eye-See, the famous trotter, was killed in a mad dash from terror at Carhart's automobile, it was banished by law," says the chronicler down in Texas, who is anxious that the minister be given proper credit for his inventive genius in the automobile line.

Lighthouse Story Revamped—The usual quota of automobile hunting experiences is making its appearance with the opening of the gunning season. New Yorkers who were returning to their quarters near Rising Sun, Md., after rather poor success with the gun, so the latest story goes, were startled to have a bevy of wild ducks dash against their machine in the darkness. It appears that the brilliant searchlight on the front of the car dazzled the birds, and they flew against the glass shield in sufficient numbers and with such force as to shatter it into fragments. When the party jumped out and had gathered in the stunned birds their day's bag was of quite respectable proportions.

Chain of Garages—Dave Hennen Morris, the incoming as well as retiring president of the Automobile Club of America, had some interesting recommendations to make in his report, read at the annual meeting. One of them was decidedly radical. Not satisfied with the establishment of a club garage, with accommodation for 350 cars, he made the suggestion that the club establish other garages on the east side, down town, in Long Island and in West Chester and New Jersey. There are some 1,000 cars owned by club members. Many, no doubt, would continue to be stored in the public garages devoted to particular makes, that their owners might have the advantage of duplicate parts at hand and repairs by workmen directly familiar with the machines. With the enormous number of cars now in this city and thousands more likely to seek storage facilities next season, the A. C. A.'s new scheme is not likely to create even a flurry of opposition in the trade, as the club garages could, of course, be open only to the cars of the members. Much doubt, though, is expressed of the practicability of this utopian scheme of President Morris.

American Automobile in Parade Given in Honor of King of Saxony

THE REALM of the COMMERCIAL CAR

WHEN it was announced in the Fitchburg, Mass., papers some time last June that Fitchburg would in the near future have an automobile service of traction to nearby towns and villages not directly on the steam or trolley roads, it was skeptically received. However, it is now an accomplished fact and, what is more, has proved a big and popular success from the start, thanks to several wideawake merchants and professional men of the place, whose foresight saw the possibilities of trade being brought to that city from the outlying districts.

The Fitchburg Auto-Transit Co. is the title of the new line of passenger conveyance, and the first run was made on July 4 this year, when two large motor wagonettes or buses, made by the Knox Automobile Co., of Springfield, Mass., were placed in commission and quickly forged their way into the good graces of the public, both in Fitchburg and other places to which they ran—Ashby, West Townsend and Townsend, places lying to the north and west and close to the New Hampshire boundary. It was at first suggested that the service should be between Fitchburg and Greenville, N. H., via Ashby and Townsend, but it was found that with the limited vehicles employed it would be impossible to provide a satisfactory time schedule and the second named place was cut out of the proposed plans. Since the beginning of the service four trips have been made daily from Fitchburg to Ashby and also four to Townsend, but owing to the condition of the road to the last named place it has been reduced to three, which number of trips has been maintained continuously to the present time. That the instituting of the line has been successful is shown by the fact that over 700 passengers were carried weekly by the machines between the aforesaid towns, the fares of which were 25 cents and 35 cents for each person in either direction.

After the new service had been in operation a short time applications poured into the company's offices from managers of clubs and other societies for the conveyance of their members to places of interest in the state and elsewhere. The company yielded to the popular demand and two touring cars, each capable of carrying fourteen passengers, were built to special order and supplied by the Knox concern. In these cars parties have been conveyed to such places as Brattleboro, Vt.; Boston, Taunton, Springfield, Worcester, Winchendon, Webster, Gardner, Wachusett Mountain, Mass., and several places in New Hampshire. On one occasion 150 people from a local church were carried from Fitchburg to Wachusett lake and back without any semblance of a mishap, the outing being both novel and enjoyable to all concerned.

The run from Fitchburg to Ashby is really a pleasant one, the road—a state one—being well laid and fairly level, with the exception of a couple of pretty steep hills, one being just beyond the city line, and the other entering Ashby. The average speed is about 10 miles an hour, the rate of propulsion ascending the steep hills being about 5 miles on the low or second gear. Many pretty sights are to be witnessed on the Ashby trip, snug farm houses nestling among the hills and in the valleys, while wooded slopes and silvery streams abound on the way. The terminus of the line at Ashby is the Elmwood hotel, a famous hostelry, 108 years old, where the old stage coaches from Boston, Peterboro and Keene, N. H., stopped in bygone days for a change of horses. There at the Elmwood a motorist, whose appetite has been whetted by the exhilarating automobile trip and the fine fresh air, can have the inner man well supplied at a small cost, which makes it the Mecca of near-by motorists.

So far as scenery goes, the Townsend route is equally fine, but the roads, though fairly level, are in an extremely bad condition until West Townsend is reached, when a fine piece of macadam state road, wide and level, is struck. A place which attracts the attention of the passengers on the run on the Townsend route is the Bruce farm, which is occupied by George Duveney, a French Canadian, and his family, numbering in all thirteen members. The house or shack—it is nothing more than a flat-topped wooden erection, which is more fit for a wood or coal shed—is 3 miles from the school at West Townsend, to which place several juvenile members

PRIVATE PARTY ON OUTING IN LARGE FITCHBURG BUS

Digitized by Google

Passing the Celebrated Bruce Farm, Where Thirteen Lively Children Rule Supreme

of the family are conveyed in a team every morning and taken back in the afternoon.

The opening up of Townsend by the Auto-Transit Co. has not only proved a boon to the residents, but also to the drummers, who can now make their calls and get back to the city the same night, where formerly they were compelled to make an overnight stay.

One of the most satisfactory features of the working of this new automobile service is that not a single accident has marred the running of these machines from the commencement, with the exception of several minor mishaps that have not interfered with the schedule of trips.

The cost of operating so far this season has been reasonable, 1 gallon of gasoline being sufficient for each machine to travel 8 miles. The total cost of running each machine, including man, repairs, rent of garage, gasoline, oil, carbide, etc., etc., amounts to 10 cents per mile. The future plans of the company, of which two well-known Fitchburg men—Horace F. Gove, president, and Ernest C. Ford, secretary and treasurer—are at the head, are bright and it is expected that at the general meeting of the company in the near future outlines of new machines and the opening up of new routes will be submitted.

CHANCE FOR A PROMOTER

While the opportunities for motor bus investments are probably more numerous than interested capital could just now care for, local motorists have wondered why some one has not investigated the possibilities for a paying commercial car venture in Salem, O. Particularly attractive is 10 miles of cross-country roads between Salem and Lisbon, the latter city the county seat. At present the only connection between the two points is an unpretentious railway line, with limited passenger service. In spite of this, the travel is heavy and many drive daily, Salem's population being about 10,000 and Lisbon's 6,000. The road is in good condition, its objectionable features being two hills, one about a quarter and the other about a half mile in length, but of only moderate grade. Almost half way between the two cities is Shelton's grove, a popular summer park, which would be very liberally patronized should a regular bus line offer a more convenient mode of travel. It is the nearest park, of any consequence, to Salem. Salem has 13 miles of paved streets and only about 4 miles of street railway. Consequently, there is a crying demand for the transportation facilities that a motor bus line would meet. Two long avenues, extending from the northern to the southern boundaries of the cities, have no car lines and will probably never have, because of the aversion of certain property owners who do not wish to see the pavement disturbed. Residents who live on these avenues would welcome a motor bus line enthusiastically, it is asserted.

Small Car on Townsend Route Leaving Fitchburg

TALK OF STEAM LORRIES

Testimony as to the reliability and practicability of a steam lorry has been given to the Thornycroft company of England by Vickers Sons & Maxim, who have been using one machine continuously for 5½ years. It is fitted with a 25-horsepower engine, supplied with steam from a high-pressure tubular boiler. Cannon & Gaze, a concern in Kent, have been using one of these lorries for 5 years. A sample of a week's work shows it travels 176 miles in that time, carrying 23 tons. This only includes 5 days, 1 day being taken to clean out the boiler. Coal bills, they say, are under 1 ton a week, while the repair bills generally run under $350 a year. To start out with, this lorry was designed to carry 3 tons and haul a trailer with 2 tons, but it proved more economical to discard the trailer and load the wagon with from 4 to 5 tons. The concern thinks the lorry a great saving, as most of its journeys would be too far for horses, while the railway rates and carters, delivering at the other end, would eat up the profits.

Another testimonial on the merits of the steam lorry is given by Smith & Forrest, oil refiners and importers at Manchester, England, who have a lorry and trailer which have been working nearly 3 years and in that time have run 13,169 miles and carried nearly 8,000 tons. The rig is used to carry pitch or oil for road

Digitized by Google

GUNNER'S ENTRANCE, GERMAN MILITARY WAGON

repairs within a radius of 15 miles of the plant. It is enabled to deliver direct, and thus save a lot of time. They ascribe some of their success with the lorry to proper lubrication, care being taken that the motor cylinders are well supplied with a proper quantity of heavy, high test oil, other grades not standing the heavy service of the machine.

ARMORED MILITARY CAR

It has remained for the Germans to bring automobile construction to bear on warfare and one of the most recent developments along these lines has resulted in an armored automobile with conning tower and a rapid fire gun attachment. The machine is from the workshops of the Daimler people. As yet it is an experiment, but recent tests show that it ought to in a short time realize the dreams of military experts who have been for years looking forward to a safe and rapid conveyance for heavier arms. Light pressed steel is used as a covering for the motor hood and the same material is used to shield the gears and the driver's seat. Needless to say, the conning tower is also covered in the same way. The steel is scarcely ½-inch thick and the whole conveyance weighs little more than some of the heavier types of touring cars. The driver is seated in a compartment separate from the tower part, but may enter it through a connecting door. Two small openings in the front give him an opportunity to see the road before him and to guide the car. A smaller opening between his compartment and the tower permits the gunner to direct him. An outside door fastened on the interior permits him to leave the car if he so desires. The tower has plenty of room inside for the gunner and the machine gun and also the ammunition, which is stored in compact apartments. The top of the tower through which the gun is pointed can be rotated so that the fire can be directed to any quarter. The gun by its machinery can be projected or withdrawn from the opening as the gunner desires. The driving power is to the four wheels, making it possible to climb steep grades. A 60 per cent grade is mounted as easily as the ordinary touring car climbs a slight hill, it is claimed. Without the four-wheeled drive this would be altogether impossible.

In the tests recently made, the machine made an average speed of 25 miles an hour on the country roads and made detours into broken fields and roads with marvelous ease. At all times it showed itself capable of covering the ground and being maneuvered with remarkable ease. The test as to its ability to maneuver on broken ground was watched with especial interest by members of the military, to whom the question of handling guns on heavy ground is of great importance. The motors are four-cylinder, 40-horsepower, of the Mercedes type and are more solidly built than the average touring car motors. During the test not a break or strain or heated bearing was evident. The question of the armor plate has caused considerable discussion among the experts. The plate used in the construction of the armored automobile is of sufficient thickness to shield the gunner and driver and the motors from light ordinance such as used by the machine and by cavalry and infantry. Heavier plate cannot be used, since it would make the machine too heavy and unwieldy. It has been the desire of the makers to have a machine light enough to travel rapidly and cross light bridges and at the same time be armored and also effective as a carrier of dispatches and messengers.

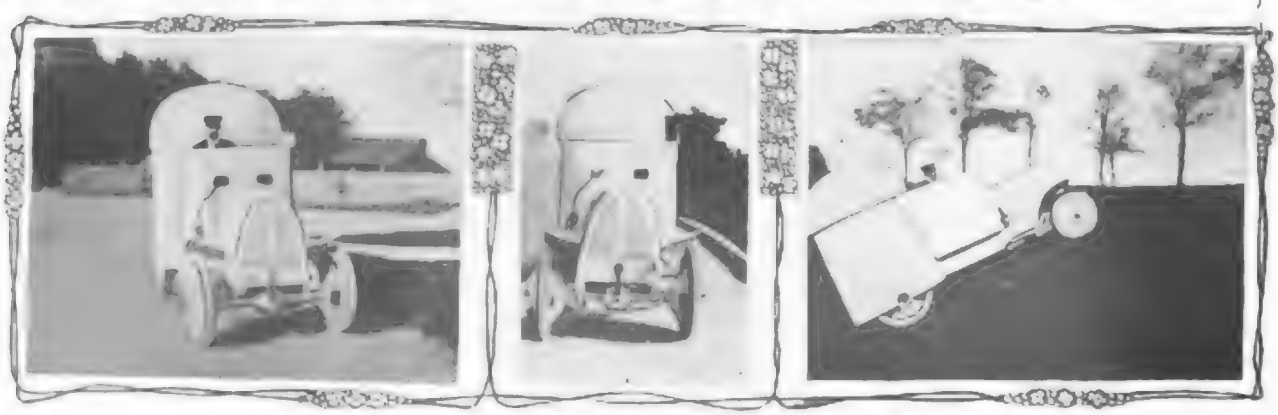
Accurate measurements of fuel and other tests have not yet been made, but it is believed by those who have watched the machine work that it can be handled as economically as to fuel and repairs as the ordinary freight truck in use in many of the larger German cities.

The encouragement with which the builders of the armored automobile have met in the tests has caused them to announce that they have under construction a motor boat, eight cylinders, 220-horsepower, which will be armored and fitted with a rapid firing gun. The boat will be given a test, it is said, in next year's motor boat trials at Monaco. It will, they declare, be a revolution in the building of dispatch and small torpedo boats.

This same firm is said to be working on a light armored hospital wagon which will be able to carry aid to the wounded in the thick of battle.

BUCKEYES LIKE THE IDEA

R. M. Owen, proprietor of the Ohio Oldsmobile Co., of Cleveland, whose establishment was recently moved to 27 Vincent street, back of the Hollenden hotel, the old stand of the defunct Cleveland Automobile & Supply Co., has been able to work extensively into the commercial vehicle side of the game. He fitted up the Springfield-Jamestown automobile bus line, which was the subject of a recent article in MOTOR AGE, and last week he sold two Olds buses to John Jenks, of Mechanicsburg, O., who will operate an automobile stage line between Mechanicsburg and Urbana, giving regular two-hour service to connect with traction lines for Springfield, Dayton, Cincinnati and other large cities. Another decided novelty credited to the genius of Mr. Owen is an Olds railroad inspection car fitted up with a covered top and serving as a special distributing car for the Dayton Journal, an enterprising newspaper. Dayton has nine traction lines radiating in all directions and the car makes a circuit of a large number of towns every day delivering bundles of papers. It has a speed of 40 miles an hour and keeps on the schedules of the high speed traction cars of that district. It takes the place of automobiles used for this purpose, which, while most satisfactory while the roads were in good condition, were apt to delay things during muddy weather. If this car proves satisfactory others will be purchased. In general lines it follows the construction of the Olds railroad inspection car brought out some years ago.



DAIMLER MILITARY WAGON WITH FOUR-WHEEL DRIVE MANEUVERING AND DOING ROAD WORK

COMMERCIAL STEPPING STONES

HOSE WAGON MADE FOR THE TORRENT HOSE CO., OF ITHACA, N. Y.

Epworth League Scheme—An automobile stage line is to be run between Corpus Christie, Tex., and the Epworth League camp. The line will probably be in operation by early spring.

Sees a Good Thing—O. L. Mead, of Monroe, Mich., is going to start an automobile service between Ann Arbor and Saline. Accommodation for twenty-two is provided and four trips per day will be made. The motor line is specially suitable in that neither steam nor electric lines connect the places.

Quick and Speedy—Hipps' Parcel Delivery is the name of a new institution which has recently started business in Cleveland, O. As its name implies, it will deliver packages throughout the city, using for the work several gasoline delivery wagons recently fitted up. Rates are moderate and the service is speedy and reliable, so it looks like a winning proposition for the energetic promoters.

Praises Automobile—Charles E. Ladd, superintendent of public parks of Springfield, Mass., uses an automobile in making all of his daily inspections of the parks and boulevards in and around the city. In speaking of the merits of the automobile for such work he says: "In September, 1902, I purchased a Knox single-cylinder runabout. Since that time I have used it summer and winter, through rain and shine, except when the ground has been deeply covered with snow. About March 1 of this year I placed an odometer on my machine, which shows that I have run more than 10,000 miles this season. I do not feel that it is an extravagant statement to make that this machine has been driven more than 40,000 miles during the past 3 years. The simplicity, reliability and durability, together with the reasonable cost of maintaining the automobile, places it, in my opinion, second to no machine on the market. I have had the cylinder rebored but once and, so far as I can see, it runs as well as when I purchased it and is, evidently, good for many years' service. As to the actual cost of running the machine, I find that I go from 18 to 23 miles on a gallon of gasoline and use 1 quart of oil to every 175 miles. My experience with tires has probably been about the same as that of other owners of automobiles. I consider the average distance that a tire can be run to be from 6,000 to 7,000 miles, although I have recently taken off a tire that has been run 10,000 miles."

They Beat the Band—Lyon & Healy, pioneer music dealers of Chicago, Ill., who have recently started using three Knox wagons for delivering pianos in and around the city, have placed an order for three more wagons of the same make. This firm has for several years hired teams for its delivery work and since the expiration of the contract for this work has commenced its own delivery system, using horses and automobiles. So far the preference is for automobiles, which are making much better time and doing all-round more satisfactory work than their rivals, the horse-drawn vehicles.

Fire Hose Wagon—The Neustadt Automobile & Supply Co., of St. Louis, Mo., has recently manufactured for the Torrent Hose Co., an Ithaca, N. Y., concern, a fire hose wagon built after Neustadt design. The wagon gear part is of exclusive Neustadt design, the 22-horsepower motor is manufactured by an outside concern, however, and consists of a pair of horizontal cylinders of standard lines, coupled up with a planetary gear box with final drive to a differential countershaft, placed crosswise in front of the rear axle, and connected by two side chains with the rear wheels. The running gear is in strict conformance with present methods, including steel frame work, long, half-elliptic springs and artillery wheels with 3-inch solid tires. On the front beneath the footboard is a finned tube radiator for cooling the motor cylinders. Nobody could mistake the body as being designed for anything else but fire department work, it being fitted with low steel sides and heavy brass railing, nickel-plated, with regulation cross step at the rear and brass uprights at either side. The driver's seat is a double cross one in front, upholstered, and around the right of it are such operating parts as vertical steering column, change speed parts, brake levers and throttle and spark control levers. The wagon load is 2,000 pounds of rubber hose, four men and the driver.

Tribune in Line—The Tribune, one of the most enterprising daily papers in Oakland, Cal., has installed the first of a fleet of motor delivery wagons that will soon be used exclusively in distributing the Tribune throughout the city, suburbs and near by places. The Tribune hopes to complete its entire city delivery within ¾ hour after the last copies are off the press. The wagons are typical gasoline machines with forward bonnet and radiator and drive through a propellor shaft. The carrying compartments are of delivery design, with rear entrances and curved canopy over the driver. The use of automobiles for newspaper delivery is rapidly gaining ground in many large cities where competition is keen and early delivery means larger sales. This is particularly the case where several editions are published daily.

Nothing Doing?—The Union Transportation Co., the title of the company organized by the colored people of Nashville, Tenn., to thwart the successful operation of the Jim Crow law as passed by the last legislature and which became effective on July 5, seems to have dropped out of the affairs of the motor world. After an unsuccessful attempt to operate four second-hand cars that were purchased from New York dealers, the company declared the machines of no use and sent a representative to St. Louis, where it was stated that no expense would be spared to start the venture on a paying basis. At the time of the departure of the company's representative it was given out that nine cars were to be bought and used in the transportation business. The cars have not arrived and it is believed that the company has gone out of business. Many more negroes are riding on the street cars than heretofore and by the reports of the street car company for last month it was shown to have been a banner month in the transportation department, the colored folk preferring to ride in the trolleys.

WATER COMMISSIONER IN SPRINGFIELD, MASS., USES KNOX CAR

Among Makers and Dealers

GARAGE OF JOPLIN AUTOMOBILE CO., AT JOPLIN, MO.

Hawaiian Representation—The control of Hawaii territory for Winton cars has been given to the Pioneer Automobile Co., of San Francisco.

One in the South—Jacksonville, Fla., now boasts an automobile factory, conducted by M. C. Hutto, formerly manager of the East Coast Automobile Co. The model he is making is a 24-horsepower four-cylinder car.

Place Fiat Agencies—Hollander & Tangeman, of New York, have placed Fiat agencies with the Harry Fosdick Co., of Boston, for New England, and the Rochester Automobile Co. Negotiations are in progress for a Chicago agency. Agents are to be appointed in the leading cities.

Nails Typewriter Rumor—The rumor has been persistent that the Smith Premier Typewriter Co., of Syracuse, N. Y., would soon enter into the business of manufacturing automobiles, but the rumor has been denied by the officials of that company. Alexander T. Brown, one of the heaviest stockholders in the H. H. Franklin company, is vice-president of the Smith Premier Typewriter Co.

New Chicago Maker—Chicago has another automobile factory, though at present it is on a small scale. Torgerson & Hansen, 228 One Hundred and Eleventh street, Roseland, are finishing their first sample, which is a single-cylinder runabout. The motor is of the horizontal pattern. The firm has not decided at what price the car will be marketed, but hopes to put it out to sell at a figure which will suit the pocketbooks of the class of people interested.

Seeks Factory Site—The Forest City Motor Car Co., a company formed at Cleveland a short time ago by W. Stone, U. G. Smith, C. H. Taylor and others, has a proposition before the board of trade of Massillon, O., relative to the location of its plant in that city. At present the company is building cars in a small way, but it has made plans for a factory of considerable size and desires to begin work for next year as soon as possible. The proposition involves the formation of a $100,000 company, the Massillon people to subscribe to $30,000 worth of stock. It looks as though the deal might go through as the people of that little city are hot after new factories.

After Salon Exhibit—Joseph S. Josephs, manager of the Auto Import Co., of New York, sailed on the Kron Prinz Wilhelm on Tuesday, to arrange for the shipment of the Rochet-Schneider Paris salon exhibit for the Madison Square garden show.

Gets Reo Agency—The Reo agency in Washington, D. C., has been secured by L. S. Jullien, formerly with the Cook & Stoddard Co., and he will carry the full Reo line at the garage of the Cahill Automobile Co., on L street, a part of which he has secured.

Going Uptown—The Homan & Schultz Co., New York, agent for the Rambler and the National, will leave the Thirty-fifth street district and join the uptown movement. It will on February 1 take posession of a five-story garage, 50 by 100 feet, which is now in course of construction for this company on West Sixty-second street near Broadway, and between the White and Cadillac garages.

Tips on Portugal—Some details of the import trade in automobiles in Portugal are to hand, from which it is learned that in 1901 twenty cars, valued at $37,915, were imported, eighteen of them coming from France. In 1902 the number had increased to fifty-one, of which thirty-six came from France, five from Germany and the balance from other countries. In 1903 the total automobile imports were valued at $212,531 for 118 cars, of which France furnished eighty, Italy ten, the United States thirteen and Germany three. In 1904 the number of cars imported was 109, valued at $229,265, while in 1905, up to May 31, the number was forty-two, valued at $81,125. The duty on finished automobiles is $120, and on unfinished cars $70. The principal firms engaged in the automobile business in Lisbon are as follows: A. Beauvalet & Commandita, 31 Praca dos Restauradores; Sociedade Portugueza, 4-26 Rua do Jardim do Regedor; F. Street & Co., 156 Rua do Poco dos Negros. In Oporto the principal dealers are: Teixeira & Irmao, Rua da Sa da Bandeira; Empreza Automobilista do Porto, Rua de S. Lazaro; Joao Garrido, Rua de Passos Manoel. All have good garages.

Kelsey Promoted—C. W. Kelsey, former representative of the Maxwell-Briscoe Motor Co., at Philadelphia, is to be the general sales manager of the company with headquarters at Tarrytown, N. Y.

Cutting Signs Lease—General Cutting, New York representative of the Olds Motor Works, attended the meeting of Oldsmobile agents at Lansing last week. Before his departure he signed a lease for a three-story building on West Fifty-first street, for use as an exclusive Oldsmobile garage and repair shop.

Another Merger—Rumors from Pontiac, Mich., have it that a deal is pending by which the Pontiac Buggy Co. will become a part of the Cadillac Automobile Co., of Detroit. It is said that R. F. Monroe, controlling stockholder and manager, proposes to acquire the interest of the other stockholders and then make the merger. It is figured that the increased capacity of the Cadillac plant will be able to use the entire output of the Pontiac company.

Talk Over Selden Suits—The meeting of the A. L. A. M. executive committee, held in New York last Thursday, was devoted mainly to consultation with S. R. Betts, senior counsel, and other Chicago and New York counsel, on the status of the Selden patent suits. The taking of the final testimony of the plaintiff in rebuttal will begin at Rochester next Wednesday. The final arguments will be made in January and the case will then be in the hands of the court for decision.

Austrians Raise Prices—Information comes from Austria that the rubber goods manufacturers in that country have decided to raise the prices on all kinds of rubber goods, tires included, because of the enormous increase in the price of raw material. Goods over the price of 10 kronen will go up 20 per cent, the increase to go into effect at once. In Germany the rubber men protest they cannot longer continue to sell tires and other technical rubber goods at the prevailing prices and an effort is being made to get the larger makers together, the competition being so fierce that they cannot raise the prices in accord with the increase in the price of raw material.

Working 22 Hours Daily—The Anderson & Sons Co., of Detroit, Mich., has just rearranged its working schedule so that its day shift works 10 hours and the night shift 12 hours, so that the factory, notwithstanding the fact that it has been greatly enlarged, is in operation 22 hours in every 24 hours. Of the automobile part of the company's work, Mr. Anderson says: "The automobile manufacturers are placing their orders freely. We are making 6,000 crankshafts for Detroit manufacturers, and are beginning to hesitate about making promises for early deliveries for any more. The business already contracted for next year is equal to this year's entire product. A new grinding machine we are installing to finish crankshaft work will do the work within a quarter of a thousandth of an inch. It is the use of such machines that has made

Digitized by Google

the reputation of American manufacturers, and enabled them to compete with the world, no matter how low wages may be in other countries."

Another German Show—The next annual show of the Automobile Club of Germany will be held during February and is expected to be the largest show ever held in the Fatherland.

Olds People Entertain—Oldsmobile agents from all parts of the country were entertained at the factory last Friday, shown all the fine points of the 1906 models, given a banquet followed by a vaudeville show, and the next day they were all taken over to Ann Arbor to see the Wisconsin-Michigan football game.

Another Big One—Joseph S. Heller, of New York, importer of the Pipe cars, has received from his architect plans for a seven-story and basement garage, shortly to be built by him on upper Broadway, near Sixty-sixth street. Mr. Heller also contemplates the opening of a garage in Brooklyn.

Winton Tour Ends—The trans-continental automobile exposition trip, conducted by Sales Manager Shanks, of the Winton Motor Carriage Co., ended in Stockton, Cal., Friday of last week. The company's new model K was exhibited in twenty-five different cities from coast to coast, the car having been on the road 55 days and having passed through seventeen states and the Dominion of Canada. The route was from New York west through Chicago and St. Paul to San Francisco, and then east through Canada via Canadian Pacific Railroad.

Track in Moline—A circular test track, 22 feet wide and a quarter of a mile in circumference, is being built at Moline, Ill., by the Moline Automobile Co. for testing purposes. The company has added a new model to the two it has been making—a 35-horsepower car. It is said to be counting on turning out 400 machines in 1906.

Crankshaft Orders—The Anderson & Sons Co., a tool manufacturing concern located in Detroit, announces that it has already received orders for 6,000 crankshafts from Detroit automobile manufacturers. For this purpose it is using a new grinding machine which is said to do the work within a quarter of a thousandth part of an inch.

To Make Engines—The Buckeye Gas Engine Co., of Delta, O., was perfected last week, being incorporated under the state laws of Ohio by C. C. Reed, J. M. Longnecker, F. Briggs, C. R. P. Waltz, N. F. Carmon, W. T. Saxton, O. J. Wisman, G. R. Anderson, A. J. Fraker, John Latzer, Byron Yarnell, W. E. Fowler and W. E. Ramsey. The new concern will employ from fifty to 100 men and will manufacture gasoline engines, motor engines and special machinery. The company has purchased the plant of the Underwood Mfg. Co., at Elmore, O., and will move the machinery to Delta. A whole block has been purchased for the erection of the buildings, the first building to be erected to be 108 feet long and 55 feet wide when it is completed.

More for Houpt—The E. R. Thomas Motor Co. has added to the territory of Harry S. Houpt, its New York agent, Fairfield county, Conn., which includes the cities of Bridgeport, Norwalk, Stamford and Danbury. The New York agency territory already includes besides Greater New York all of Long Island and Hudson and Bergen counties in New Jersey.

To Boom Gaulois Tires—The Gaulois tires are to be exploited in this country by the Gaulois Tire Co., a corporation recently formed, subsidiary to the Decauville Automobile Co., of New York. This tire is made at Clermont, Ferrand, France, by Bergougnan & Co. It has never before been introduced in this country. Paul L. Snutsel is the manager of the new concern.

Corbin Trip Over—Manager Bretz, of the Corbin Motor Vehicle Corporation, New Britain, Conn., completed his 2,800-mile business tour in a Corbin car, at Pittsburg. The route followed included the principal cities through the Mohawk valley to Buffalo, thence to Cleveland, Detroit, Chicago, Indianapolis, Cincinnati, Columbus and Pittsburg. Several agencies for the Corbin car cars were closed in each of the states passed through during the tour. The novel method worked well.

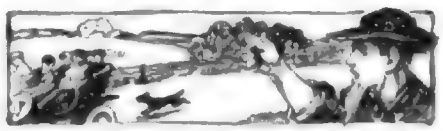
LEGAL LIGHTS AND SIDE LIGHTS

BACKS UP THE MOTORIST

Frederick Coleman, representing the White steamer in England, has just scored a victory in the courts which is hailed with delight by John Bull's leading motorists. His contention that driving above the legal rate of speed on a highway that was deserted at the time did not endanger the public was sustained by Recorder Philbrick, of Essex county, before whom the case came on an appeal. Coleman was arrested and fined for driving at a speed dangerous to the public on the London road, Lexden, near Colchester. He admitted driving at a speed above the legal limit, but denied having driven to the public danger. Convinced that the motoring world was anxious to know if it was possible for an automobile to be driven at a speed exceeding the legal limit and yet not to the public danger, Coleman took an appeal. Before Recorder Philbrick he succeeded in proving that no one was in danger at the time. The counsel for the prosecution pointed that in fixing the legal speed limit of 20 miles an hour the legislature must have arrived at the conclusion that anything above that limit must be dangerous, whether there be any actual danger at the time or not.

CLAIMS A NUISANCE

An injunction suit has been filed against the Haughton Automobile Co., of Washington, D. C., by the Dewey Hotel Co. and others, the claim being made that the company maintains a nuisance in its garage in Stanton court, in the rear of the Dewey hotel. The nuisance complained of consists of "unseemly noises and foul odors"



arising from gasoline cars stored in the company's garage. The case has occasioned a lively discussion among many of the leading motorists in the city who see in such an action trouble ahead in the way of private garages, located on the rear of residential lots.

FARMERS' WISE WORDS

At the thirty-ninth annual session of the National Grange, Patrons of Husbandry, which was held in Atlantic City last week, Worthy Master Aaron Jones, in the opening speech, paid his respects to automobilists who travel the roads at a speed detrimental to the safety and comfort of other road users. He said in part:

"No innovation in modes of travel has caused more general comment than the appearance of automobiles and the consequent disturbance of travel. Accidents of the most shocking nature have been of common occurrence. In some sections of the country travel upon the country roads has been reduced to the driving absolutely necessary, cutting out all pleasure driving. There is no doubt of the right of automobilists to legitimately use the highways, but that use should be regulated by wise laws vigorously enforced and the penalties for their violation should be sufficiently severe to serve as an effectual warning against violations by others. Automobilists should unite with the people in the work."

NOT A HOUSEHOLD EFFECT

The treasury department has been advised of an interesting decision just rendered by the board of general appraisers in the case of John Magee against the collector of customs at New York. Mr. Magee contended that an automobile imported by him should have been admitted free of duty under paragraph 483 of the existing tariff act, as a manufacture of the United States returned, under paragraph 504, as a household effect, or under paragraph 697, as the personal effects of a returning resident of the United States. The collector of customs, in transmitting the protest of Mr. Magee, stated that the automobile in question was of French manufacture, being a 24-horsepower Panhard, which, not being disputed by Magee, made it necessary for the board to overrule the claim to free entry under paragraph 483. The board found from the oath or declaration of the importer that he and his family sailed from the United States on February 7, 1905, and returned on July 4 of the same year. It is apparent that this declaration is inconsistent with any right to free admission under paragraph 504, which provides that the article in question must have been actually used abroad by the importer for not less than 1 year. Paragraph 697 limits the right of free entry of articles purchased abroad by residents of the United States to a value of not more than $100 upon complying with the regulations of the treasury department. These facts left Mr. Magee with not a leg to stand upon, and his protest was therefore overruled by the board of general appraisers in New York.

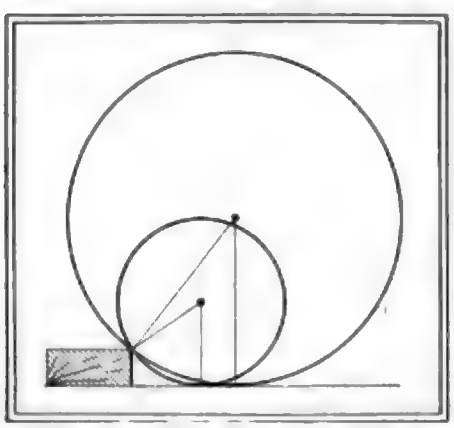
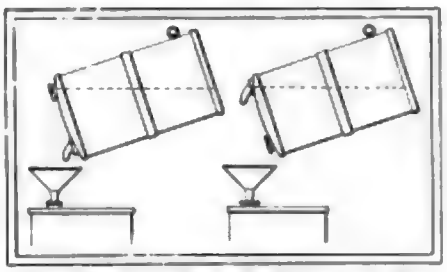
POURING OIL—Some one has said: "Our life is made up of little things," and it is certainly true that knowing the difference between right and wrong ways of doing even little things goes far to make or mar the pleasure of using a motor vehicle. It would seem that everyone knows how to empty the contents of an ordinary tin can, but such is far from the truth. The opening is usually in one corner and it seems natural to turn this corner down for the purpose of pouring. If the can is full the contents run down the outside and, as air bubbles enter at irregular intervals, the flow is irregular, so that it is impossible to pour steadily or into a small opening. If, however, the can is turned over, bringing the opening at the highest point, the difference in result is almost magical. The liquid flows steadily, can be poured as slowly or rapidly as desired and the danger of spilling is very largely reduced. The condition holds true unless the can is almost empty, when, of course, it should be turned with the opening at the bottom. The illustrations show the matter quite clearly. With a little practice one can fill tanks and oil cups without a funnel, which is not only decidedly convenient at times, but in connection with heavy oil, avoids the use and the necessity of cleaning the funnel. If not cleaned, the heavy oil gathers dirt, which goes into the oiler at the next filling, for which reason, if for no other, the use of a funnel should be avoided. When a funnel is necessary a sheet of paper rolled into a horn and held with a common pin makes a very satisfactory one, and can be thrown away after using. It will even serve very satisfactorily for use with water.

A tin pail with a wire around the edge is better to pour from than a wooden one, for the water will not run over the edge and down the outside of the pail so easily. A tin can or pail with or without a bail, fitting outside the lubricating oil can requires no additional space and is frequently handy for water, washing hands, carrying gasoline, etc.



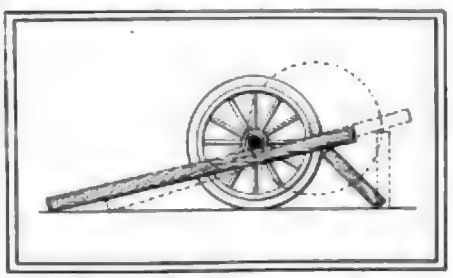
ILLUSTRATING LARGE WHEEL ADVANTAGE

Care of Hands—Caring for an automobile is dirty work and how to clean one's hands is a question of importance. If the skin is soft and smooth, the dirt and oil do not enter the surface and are readily removed with soap, but if hard and rough,



WRONG WAY AND RIGHT WAY TO POUR OIL

the situation is different. A few drops of glycerine, diluted with an equal or greater part of water, well rubbed into the hands each evening will keep them soft and smooth and without the disagreeable redness and unpleasant feeling caused by pure glycerine. Glycerine has a great affinity for water and not only spreads with difficulty, which prevents it from reaching the crevices where it is needed, but it withdraws the moisture from the skin and tends to inflame it. Dilution with water prevents this and makes it a very agreeable dressing, superior to most, for chapped hands and faces.

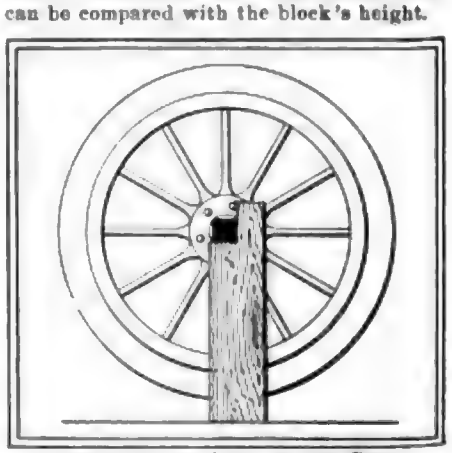


GOOD SCHEME FOR A TEMPORARY REPAIR

Before taking up a dirty job, if one will soap the hands well with a toilet soap, the crevices will be filled, largely keeping out the dirt, and since the soap dissolves readily, the hands are readily cleaned. Washing the hands with thin oil will frequently remove the dirt, without making the hands rough, as is the tendency of gasoline or kerosene. Strong soaps remove the dirt, but are likely to roughen the skin. Abrasive soaps, like Sapolio, are considered better by many people. Rough corn meal or saw dust frequently serves nicely. Pine sawdust, moistened by turpentine, followed by a good lather, is recommended. Ammonia is unpleasant to use, but it has a tendency to convert the oil into soap, thus rendering it soluble and is, therefore, favored by some.

Cuffs—The average man would take the stitch in time that saves nine more frequently if he was not afraid of soiling his cuffs. An automobile is a dirty machine at best, and with most makes it is not easy to make adjustments without preparing for the work by donning overalls and blouse, or, at least, removing coat and cuffs. This the average driver does not like to do, unless absolutely necessary, so he keeps going, trusting that nothing will happen of serious import before he reaches his destination. If, on the other hand, he could make the adjustment with little trouble, he would most likely do it and prevent greater trouble. Cuffs serve to keep one's coat sleeves clean, as well as for ornamentation, but they lose their value for these purposes if they are handled by the soiled fingers which usually result from tinkering an automobile. If, however, they are fastened to the inside of the coat sleeves, instead of to the shirt sleeves, they may be removed readily with the coat and without handling. They can be so fastened by most forms of cuff holders and many up-to-date tailors attach a button to the inside of the coat sleeve, at the proper distance from the end to hold the cuff, so that it projects just the right amount, no more and no less. This arrangement is most satisfactory for daily use and at the first sign of trouble, the cuffs and coat go off together, leaving the man free to make any reasonable adjustment. After one has worn cuffs attached in this manner, he will wonder why he ever used any other.

Emergency jacks for raising the car wheels when accidents occur on rural roads are such as environments permit. One time a rail from a fence with a block or stick of stove wood for a fulcrum does the work, the rail and block being as shown in heavy lines, when the car is slightly pushed ahead, until the fulcrum is vertical and the wheel raised from the ground. A vertical block with shoulder on the end can then be placed as shown. Large road wheels have a great advantage over smaller ones in passing over road obstacles, as is shown in the illustration. The wheels' radii can be compared with the block's height.



QUICKLY MADE JACK FOR THE ROAD

EDITOR'S NOTE — This is the nineteenth and last of a series of articles by Charles E. Duryea. These articles will be prepared for publication in book form and will be distributed by the American Motor League to its members during the coming year.

BRIEF BUSINESS ANNOUNCEMENTS

Chagrin Falls, O.—The stables and garage of F. H. Townsend, recently destroyed by fire, are to be rebuilt.

Nashville, Tenn.—A new garage is to be opened in the building on Third avenue, north, formerly occupied by the Huber Mfg. Co.

Auburn, Ind.—The Model Gas Engine Works will remove from this city to Peru, where new buildings have already been commenced for the company.

Providence, R. I.—The Shepard company has secured the Columbia line electric and gasoline for Providence. The business has been previously handled by the Davis Co.

Long Island City, N. Y.—Mohler & DeGross, manufacturers of gasoline and gas engines, announce the sale of their plant to F. A. Seitz, who will carry on the business under the old name.

New Haven, Conn.—Efforts have been made to organize a company with a capital stock of $50,000, to manufacture automobiles fitted with a new engine designed by F. C. Billings, of Billings & Spencer.

Cleveland, O.—T. C. Whitcomb is enlarging his establishment on Erie street, near Huron. The coming season he will handle the Rambler, Premier and Maxwell lines and may take on a high-powered car.

Utica, N. Y.—The Wolcott property on Bleecker street, lately purchased by J. Abrams, will probably be the site of the garage to be erected by the Utica Motor Car Co., which was recently organized. The lot extends from Bleecker to Jay streets.

Boston, Mass.—Frank W. Sanborn, of Concord, N. H., will handle the Thomas Flyer for 1906, and the Maine Motor Carriage Co., of Portland, Me., will represent that car throughout its state, C. S. Henshaw, the New England agent, having closed with them recently.

Cincinnati, O.—A new automobile garage has been opened. R. C. Crowthers has leased from D. H. Jenike the property at 130 East Ninth street, near Main, and will represent some outside concerns which for some time have desired to secure a Cincinnati agency for pleasure vehicles, trucks and other motor conveyances.

Boston, Mass.—George H. Lowe, former manager of the White Sewing Machine Co., has identified himself with the Wayne company of New England. Mr. Lowe will have a third interest in the company, and at the coming meeting will be elected vice-president. The office of the company will remain at 509 Tremont street.

Richmond, Va.—The Richmond Mfg. Co. has been organized to take over the entire output and business of the Southern Machine Mfg. Co. The company, while making a specialty of gas, kerosene and gasoline engines, will also do a general foundry and machine business. Among those interested in the new venture are Edgar Allen, Jr., who has been elected president of the company; Abner C. Goode, W. B. DePoy and J. G. Snyder.

Troy, N. Y.—The Troy Automobile Exchange has opened a branch for the sale of Wintons in Schenectady, N. Y.

Worcester, Mass.—Harrington Auto Station No. 1 has renewed its contract with the Electric Vehicle Co. for Columbia cars in Worcester county for 1906.

Nashville, Tenn.—The Southern Automobile Co. has closed a deal with the authorities of Vanderbilt university for a 5-year lease on the Broad Street Amusement Hall property and is preparing to build.

Lynn, Mass.—A new punctureless tire is being manufactured by W. J. & J. R. Mitchell and will be known as the Mitchell punctureless tire. This tire combines the principles of the pneumatic and the cushion tire.

Cleveland, O.—The new establishment of the Price Brothers Carriage Co. will be complete in every detail, embracing four floors and basement, 40 by 200. Baker electric vehicles will be handled exclusively.

Bath, N. Y.—The Kirkham Motor Co., which was organized several months ago to carry on the manufacture of motors for automobiles, has decided to enlarge its plant with a view to an increased output. A committee has been formed to consider and advise upon an increase of the capital stock.

LATE INCORPORATIONS

New York City—The Olborah Co. has been incorporated with a capital stock of $3,000.

Cleveland, O.—The Motor Car Supply Co. has filed articles of incorporation with a capital stock of $10,000.

Wilkesbarre, Pa.—The Matheson Motor Car Co. has been incorporated with a capital stock of $1,100,000.

Chicago—The Kelley-Hunter Co. has been incorporated with a capital stock of $15,000 to engage in the sale of automobiles.

Marmaroneck, N. Y.—The Suburban Automobile and Garage Co. has been incorporated with a capital stock of $25,000.

Cleveland, O.—Among recent incorporations at Columbus was the Paxon Motor Co., of this city, with a capital stock of $10,000.

Worcester, Mass.—Incorporation papers of the Worcester Automobile Club have been passed with a charter list of 125 members.

Portland, Me.—The Adams-Sutton Motor Co. has been incorporated to deal in motor vehicles. The capital stock is $40,000; nothing paid in; par value $100.

New York City—The McGlehan Mfg. Co. has been incorporated with a capital stock of $20,000. The company will manufacture odometer and automobile supplies.

Hartford, Conn.—The Evarts Machine Co. has filed a certificate of incorporation with a capital stock of $25,000. It will manufacture and deal in machinery, especially engines and motors.

Charlotte, Mich.—The Dolson Automobile Co. has been incorporated with a capital stock of $100,000, taking over the business of John Dolson & Sons. The carriage business has been closed out and hereafter automobiles only will be made.

Buffalo, N. Y.—A certificate of incorporation has been filed for the E. R. Thomas Realty Co. with a capital stock of $1,000. The company will conduct a garage and was formed to take over the title of the property in New York city at Sixty-third street and Broadway recently purchased.

Seattle, Wash.—The Broadway Automobile Co., Winton agent in Seattle, will open a branch house in Portland, Ore.

New Britain, Conn.—F. A. Law, of Hartford, is the assignor to the Electric Vehicle Co. of a patent for a steering axle for vehicles.

Pittsburg, Pa.—The Central Automobile Co., which was lately organized by Edward G. Mooney and Edward Seely, has leased the George McNulty livery stable.

Detroit, Mich.—A new plant is in course of construction at 18 Piquette avenue for the North Woodward Garage Co. It is to be a two-story fireproof building.

Pittsburg, Pa.—The Central Automobile Co., which was recently organized by Edward G. Mooney, has leased the George McNulty livery stable and awarded a contract for alterations.

Denver, Col.—Business has been so good with the Folker Automobile Co., at 1535 Tremont street, that it has been forced to buy the adjoining property, which will be remodeled into a garage.

Buffalo, N. Y.—The Kane-Champlin Co. has closed with the Reo company for the exclusive representation of its cars in Buffalo and vicinity. It will occupy rooms at the corner of Elliott and Tupper streets.

Milwaukee, Wis.—A second story will be put on the garage of Thomas B. Jeffery & Co. It will cost $9,000 and the space will be used for the storage of automobiles, the cars being carried up by an elevator.

Albany, N. Y.—Instead of building a garage on Pine street, the Albany Garage Co. has bought the property at 28-30 Howard street, with a frontage of 68 feet and an area of 4,800 square feet. It will erect a four-story structure.

Hartford, Conn.—The Capitol Foundry Co., manufacturer of automobiles, marine and stationary engine castings, has established its plant here and will be under the personal supervision of F. W. Stickle, president and general manager of the company and formerly superintendent of the Manufacturers' Foundry Co., of Waterbury.

Cleveland, O.—The Peerless Motor Car Co. last week exercised the option on some 5 acres of property on which its plants are located and took over the acreage, which is held under 99-year lease. The new buildings which the company is erecting are nearly completed and are partly occupied. It is understood that the company has plans for two more additions in the spring.

New York City—The Correspondence School of Automobile Engineering, formerly located at Akron, O., has moved to the Flatiron building, New York. The school has been reorganized on a more substantial basis than ever, and now is incorporated under the laws of the state of New York, with a capital of $30,000. R. E. Olds has succeeded A. J. Saalfield as president; R. M. Owen has become treasurer in place of E. R. Adam, and Robert H. Montgomery is secretary, instead of G. S. Rowe. Victor Lougheed will continue as vice-president and general manager.

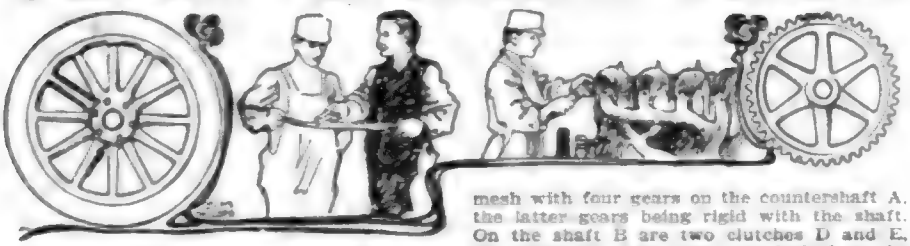
Current Automobile Patents

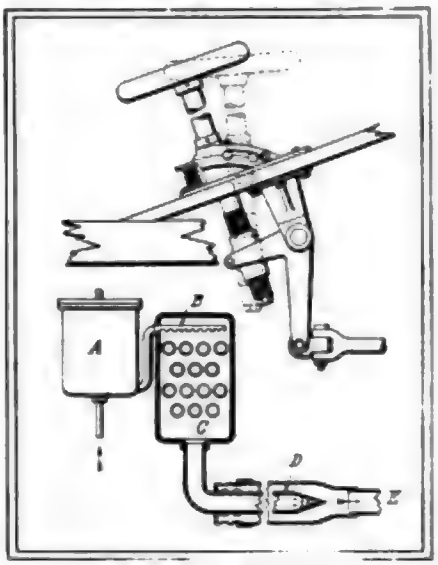


Tilting Steering Wheel—No. 804,375, dated November 14; to Herbert H. Buffum, Abington, Mass.—The tilting steering gear referred to in this patent has the ordinary steering wheel with a long screw on the bottom of the column, enclosing which is a nut moved up and down when the steering wheel is turned to the right or left. Pivoted to the nut is a bell crank with its fulcrum bracketed to the under surface of the foot board and the other end of the bell crank connected with a rod running to the tie rod which unites the steering knuckles. For tilting purposes a quadrant is bolted to the upper surface of the foot board, and in this is a plain slot with a semi-circular notch at either end. In this slot works a pin inserted in the steering column and on the upper end of the quadrant is a coil spring pressing upward, so that when the steering gear is in its working position the pin rests in the notch of the slot closest to the driver. To put it in its tilted position the end of the quadrant is depressed by foot pressure so that the pin leaves the notch, when the wheel can be tilted forward through the slot and lodged in the notch at the forward end, where it is retained by the spring tension upon the removal of the foot from the quadrant.

Oil Carbureter—No. 804,589, dated November 14; to Giovanni Enrico, Turin, Italy—The inventor has a carbureter for using heavy oil, the object of the device being for the operation of commercial trucks, using this fluid for fuel. Where heavy oil is used the volatilising requires additional heat, which the inventor obtains by a series of pipes in the vaporizing chamber C. Through these pipes flows hot exhaust from the muffler pipe. The flow of oil is regulated by a float within the chamber A, oil passing as needed to the chamber C through the pipe B, which has a serrated opening in the top of the vaporizing chamber. Oil entering by this pipe falls around the heating tubes and is vaporized. Being drawn downward through the pipe D by motor suction it is sprayed through a nozzle at the end of this pipe, where it mixes with air and passes by way of the piping E to the cylinders.

Individual Clutch Gear Box—No. 804,212, dated November 14; to William R. Cary, Milwaukee, Wis.—This invention is an individual clutch gear box for giving different speeds in automobiles. On the main shaft B are loosely mounted four gears in constant mesh with four gears on the countershaft A, the latter gears being rigid with the shaft. On the shaft B are two clutches D and E, by which the four gears are locked to the shaft. Each gear is made with a wide overlapping rim, so that the clutch has sufficient expanding surface to work on the gears at either side of it. The expanding device is a friction ring expanded by a V-shaped block, operated through the central rod C within the hollow shaft B. The expanding of any one of the two clutches is through a lever with pinion working in a rack on the rod C.

BUFFUM'S STEERING WHEEL



ENRICO'S OIL CARBURETER

Change Speed Gear—No. 804,740, dated November 14; to Columbus K. Lassiter, Schenectady, N. Y.—In this transmission gear the main shaft A extends into the rear of the case and has its end bearing within the shaft C. On shaft A is a sliding gear B, which is eccentrically mounted on the shaft, so that the gear can be meshed with any of the five different gears on the countershaft D, the drive in each case being from the gear B to the countershaft gears and then back again to the shaft C through the intermediate gear E. For direct drive the gear B locks with the gear on the end of the shaft C by means of dental face teeth. The turning the gear B on its eccentric bearing is automatically accomplished as the gear is moved into mesh with any of the countershaft gears, so that the action of changing speed is as simple as in any sliding gear.

Multi-tube Tire—No. 804,613, dated November 14; to Frank A. Magowan, Trenton, N. J.—A novelty is presented in this patent in that the pneumatic tire described has an outer tube of the hose-pipe variety, not being split longitudinally between the flanges. Within it is a nest of three air chambers, one within the other, each in turn connected with three separate valves, the valve stems forming a similar nest one within the other. When the tire is first put on the outer air chamber is inflated, leaving the two inner ones resting against that part of the tire adjacent to the rim. In case this tube is punctured the second air chamber is inflated. When the second is punctured the third is brought into service, but with all three punctured repairs must be made.

Semi-Pneumatic Tire—No. 804,772, dated November 14; to Franklin G. Saylor, Franklin, Mass.—This tire has an oval-shaped cross section with a slightly U-shaped air tube adjacent to the rim, the concaved part of the tube being next to the tread of the tire, but between the tube and the trend is a large core piece made of rubber-coated yarn wound and twisted together. The yarn is a resilient core and also acts as a protector, so that the air tube cannot be punctured.

Soft Core Tire—No. 804,369, dated November 14; to William F. Beasley, Plymouth, N. C.—Take a cross section of the ordinary solid rubber tire and cut an oblong opening midway of the tread and base and extending nearly to either side, and in this opening place rubber braces similar to two W's placed end to end, the height of the W's being equal to the height of the opening and the length equal to the opening, so that they form a resilient core, and one has the cross section of this tire. The same inventor has a previously numbered patent for a semi-pneumatic tire in which in the outer casing are four concentric tubes with a circular air chamber, half of which is filled by a soft rubber core, the other half being filled with air.

Many-tube Tire—No. 804,701, dated November 14; to Olin M. Bigger, Holt, Cal.—This tire with an outer casing held in place by ordinary clincher rims represents another attempt to produce a puncture-proof tire, or at least one in which, should one puncture occur, the entire air supply is not lost. Within the outer casing are six small inner tubes lying side by side, each with a separate valve. Connecting the six separate valves is a six-branch pipe with one valve at the common part of the pipe, so that to this part an air pump can be attached and the air will pass this valve and through the other valves into each of the separate air tubes. Should one of the air tubes become punctured, five remain intact.

American Motor League

OFFICERS

ISAAC B. POTTER, President, Potter Building, New York.

CHARLES E. DURYEA, First Vice-Pres., Reading, Pa.

JOHN A. HAWKINS, Second Vice-President, Pittsburg, Pa.

FRANK A. EGAN, Secretary, 152 Nassau St., New York.

FREDERICK B. HILL, Treasurer, 20 Hanford St., Boston.

National Headquarters Vanderbilt Building, New York

THIS LEAGUE

Is Now Collecting Route Information

covering all automobile routes in the important states and will publish road books for motor car users as fast as complete information is received. The A. M. L. is the only organization engaged in this work, and it invites the co-operation of all persons interested. For full information and membership blanks address American Motor League, Vanderbilt Building, New York City.

OFFICIAL STATIONS

The league is now appointing official stations in all the various cities and towns which contain a substantial number of motor car users, or which are found on lines of popular tours. It is the aim of the league to bestow this official appointment upon only responsible concerns, where repairs, supplies, storage, charging, etc., can be had at fair prices, and when a dealer is found whose methods and prices are beyond complaint his name and address should be sent to the secretary. His business should be encouraged. The list of official stations will be published in convenient form for the use of league members and a list will be sent to each member and to many other motor car users within the next few weeks.

THE OTHER KIND

The league is also making a list of those proprietors who make a victim of every tourist and resort to all kinds of dishonest methods to compel him to empty his pocketbook in the settlement of fraudulent and fictitious charges. The number of these frugal buzzards is becoming smaller from month to month, but they are still to be found in every state, and if reports are correct some of them play their game behind the sign boards of pretentious establishments. If the reader has been plucked by one of these pirates, who has charged him the fivefold price for supplies or repairs, let him not hesitate to send the name and address of the offender, with full particulars, to "Secretary American Motor League, Vanderbilt building, New York city." The name of the person sending such information will in no case be disclosed, but investigation will be made and the information kept for the use of other tourists, who may thus escape a similar experience.

STATION APPOINTMENTS

The following information relates to the appointment of official stations, and is printed in response to many letters of inquiry:

1—The American Motor League is a national body made up of owners and users of motor cars. It has members in over 700 cities and towns and is the largest organized body of automobilists in the world. Its purpose is to supply its members and others with road books and tour books, maps and other printed information and with lists of the best and most reliable stations, where supplies and repairs can be obtained. Stations properly recommended are entitled to official appointment and these appointments are made from time to time as the growth of the league requires.

2—Each official station is supplied with an official certificate which must be framed and hung in the office or other conspicuous place in the official station. An enameled sign is also supplied, bearing the official league emblem, and this should be put in a conspicuous place either inside or outside the station, as the proprietor prefers. Appointments of official stations are announced in the official organ of the league—MOTOR AGE—and in all road books, tour books and station lists issued by the league for the use of its members. Official stations are also listed for the use of its touring members who ask for information on special routes.

3—All official appointments are permanent. A station appointment is not terminated unless the proprietor violates the official contract. The appointment is therefore a very valuable one and will become more so from year to year.

4—Under the official contract each league member is entitled to a discount of 10 per cent on all bills amounting to $1 and upwards when dealing with the proprietor of an official station. But this discount is never allowed unless the member claiming the same exhibits to the proprietor an unexpired A. M. L. membership ticket.

5—To partially cover the cost of station signs, certificates, correspondence, extra paging in road books from year to year and office expenses entailed in the maintenance of a station department, each proprietor receiving the appointment is required to pay a nominal fee of $10 therefor. The proprietor may, if he prefers, send the sum of $5 as an advanced payment on account; but he will thereafter be required to pay the sum of $2 annually for a period of five years, making a total of $15 in all.

6—Blank applications for appointments of official stations will be sent by the secretary on request, but no applications will be acted upon until officially approved.

PRINTING FOR STATIONS

Designs are being prepared for a handsome form of letterhead, envelope and business cards to be used by proprietors of A. M. L. official stations, and in a few days the secretary will lay before these proprietors a very attractive proposition, by the acceptance of which they can obtain their stationery at a very low price. It is the object of the league to send as many patrons as possible to these official stations, and it is proposed, at the same time, to so enlist the proprietors and managers of these stations in the work of the league that the exchange of benefits will be fully realized on both sides. Many of these proprietors added their names to the membership list and others are doing so from week to week.

DANGER SIGNS

The secretary is still sending out danger sign stencils and the league will be glad to supply these to any motor car user, whether league member or not, who will undertake to put up a danger sign or two at any point or points where they are urgently needed. The secretary will send at the same time full printed directions for making and putting up these signs. The cost is very slight and the benefit is likely to be incalculable. In many parts of the country the approach to dangerous railroad crossings should be marked by these signs; in other places the roads are skirted by deep ditches and dangerous gulleys, often approached by sudden turns, so that a tourist, unwarned by the friendly sign, is placed in a condition of extreme peril before he is aware of it. Many lives might have been saved and painful, dangerous and expensive accidents averted, had these signs been used more generally within the last 3 years.

GOOD ROADS

The league is about to send out a little book on the practicable improvement of country roads. It is the second of the series and is a companion volume to the little book on "Macadam Roads," of which an edition of 5,000 copies was sent out last year. "Country Roads" is a convenient little book of sixty-four pages, fully illustrated, and will do much to educate the people in the practical ways of improving country roads.

LEAGUE MEMBERSHIP

There is no initiation fee. The dues are nominal—$2 a year for each member. The membership roll is open to all automobilists of good character and to all who believe in the development of automobiling. It is such people that the league is desirous of securing for members and every effort is being made in this direction. The secretary will send full printed information on receipt of postal card request. Address American Motor League, Vanderbuilt building, New York city.

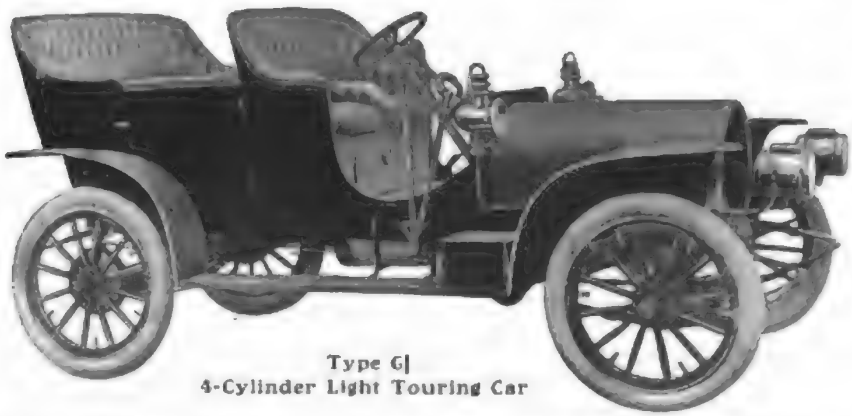
FRANKLIN



Type G
4-Cylinder Light Touring Car

Air-cooled. Shaft drive. Sliding gear transmission. Three speeds and reverse. New and perfect disc clutch. Force-feed oiler on the dash. Side doors. 88-inch wheel base. 4 or 5 passengers. 35 miles an hour. 12 "Franklin horse-power." 1400 pounds.
$1800 f. o. b. Syracuse. Full head- and tail-light equipment.

A Talk to Franklin Dealers

How are we to sell a 12 "Franklin horse-power" car for $1800 when people can buy for $1700 a car rated at 20 horse-power?

The answer is: Forget power rating. Show what the car will do.

Show that our car does all the other one does and more, and that ours does it easier and cheaper.

Show that power-rating taken by itself means nothing at all. It is only a name.

What does a man care whether his car is named Jenny or Susy, so long as it does the work?

What will the car do? That's the whole question. Stick to that.

You know and we know that our $1800 G car does more than any other car at anywhere near the price. That it does more than the average $2500 car. That it carries as many passengers and carries them faster, safer and more comfortably.

We both know that there are cars costing $3,000, and rated at all kinds of power, that cannot keep up with our G car, particularly on hills, and that haven't strength and durability.

How can we make these facts plain to others?

This is how:—Tell the truth; but tell the *whole* truth.

State only facts; but state them **all.**

If you say to a customer that a Franklin Car is only 12 "horse-power," you do not tell all the truth.

You should tell him that it is 12 "**Franklin** horse-power." You should explain exactly how and why 12 "Franklin horse-power" does as much as 20 horse-power in any other car; and more than in most of them.

If you say any less you are cheating yourself. You are doing injustice to the car. You are not giving your customer a square deal.

He wants a car that will do certain things. You can give it to him and save him money. It is up to you to show him this fact so plainly that he can't miss it or doubt it.

You benefit him as truly as yourself.

The "horse-power" myth is rapidly losing its hold on intelligent motorists.

Everybody knows that you can buy 20 cart-horses for less than one "Dan Patch." The difference is what Dan Patch will do.

You can buy a 20 horse-power steam roller for $1500, but it wouldn't make a hill-climber.

Don't talk "horse-power." Don't *think* it.

Think and talk "Franklin horse-power;" and what it will do.

WINTON

WHY SOME BEARINGS ARE BAD

There is a big difference between bearings that are **ground** to a smooth-as-glass finish and bearings that are merely "machined" and **not** ground.

No. 1 illustrates the surfaces of brass and steel in a **not** ground bearing. First, let us understand that the brass part of a bearing is **never** ground. The steel part **should be**, but often is **not** ground. Notice the ragged looking surfaces! Magnify a **not** ground bearing before it is used and you'll see just such ragged roughness as this.

No. 2 shows what happens after this bearing has been run a while. Brass is **soft** metal; Steel is **hard**. Therefore, the rough edges of the **not** ground steel cut into the brass until all the crevices in the steel are filled with brass. Then that bearing is no longer a Steel-against-Brass bearing, but becomes Brass-against-Brass, **soft** metal against **soft** metal; thereby creating the greatest possible volume of Friction, Heat and Wear. There couldn't be a **worse** bearing. Ask any mechanical engineer.

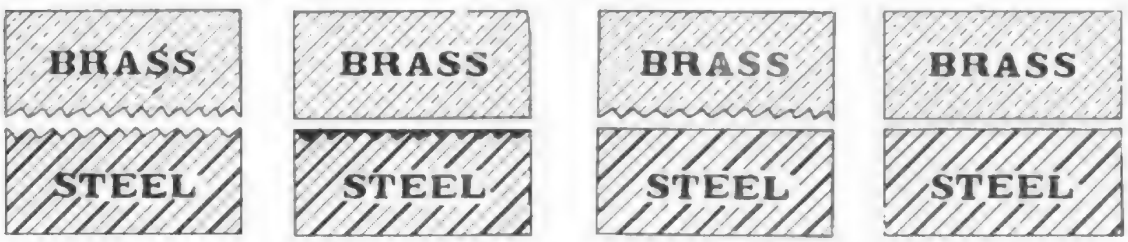
Now let us examine a bearing made of **ground** steel and not-ground brass.

No. 3 shows this bearing before use. Note that the steel is **perfectly smooth** and has no crevices to fill up with brass. But the brass is just as ragged as in No. 1.

No. 4 shows what happens to a **ground** steel bearing when used. The smooth, hard steel does not dig into the brass, but instead presses down the rough spots in the brass until the brass becomes as **perfectly smooth** as the steel itself. Just the way an iron in the laundry smooths out the rough spots in a freshly washed collar and puts a mirror finish on it—with no damage to the iron and a great improvement to the collar.

All steel bearings in the new Winton **Model K** are **ground.** That's why **Model K** glides along without ruinous friction and consumes so marvelously little lubricating oil.

Friction means **wear** and **expense. Avoid** both by using a Winton **Model K.**



THE SMOOTH RUNNING WINTON MODEL K—Four cylinder, vertical, water-cooled. Thirty H. P. or better. Superb Twin Springs. Shooting oiler. Individual clutch transmission. Best of Ignition and Carburization systems. The magnificent Winton Pneumatic Governor. $2,500 f.o.b. Cleveland

The typical American motor car—Americanized Encyclopædia Britannica.

MITCHELL

"The car you ought to have, at the price you ought to pay."

Our 1906 Line includes the Following Models:

Runabout

Model 2 B, 2-cylinder 8-10 horse-power, vertical motor, mounted in front . . $750

Touring Car

Model 4 B, 4-cylinder 18-20 horse-power $1500

Also a tip top Commercial Line and two new models, the announcement of which at an early date will sensationalize the trade.

We cannot take care of many more new agents, but a few GOOD ones—YES.

WHICH WOULD YOU RATHER READ ABOUT?

¶ There has been quite a little discussion going on lately as to whether air-cooled cars do or don't require more cylinder oil than water-cooled cars. We also note with interest the evident pride with which the announcement is made every once in a while, that someone or other carried four passengers a hundred miles for a microscopic fraction of a cent less per passenger per mile than other cars usually cost.

¶ If a customer was to ask us for exact figures as to how much per passenger mile it costs to run the Stevens-Duryea for oil and gasoline, we doubt if there's a man at the factory who would know—we'd have to guess at it, for at the prevailing prices of gasoline and oil, we think life is too short to figure out such hair-splitting economies.

¶ Our guess would be that the Stevens-Duryea will average 15 miles to the gallon of gasoline in the hands of the average owner and a factory expert might do 25 miles to the gallon. The Stevens-Duryea will run 200 or 300 or perhaps 400 miles per gallon of oil. But if the Stevens-Duryea should run 50 miles per gallon of gasoline and some other car but 10 miles per gallon, the saving would be only $40.00 in 5,000 miles, which is a year's riding for most people. And if we use a gallon of 50-cent cylinder oil every 100 miles, or if 'twas only a pint, the saving would amount to only $22.00 in a year.

¶ But let us suggest some good, real, live topics to talk about, like the following:

¶ How much will my tire bill be for 5,000 miles? will it be $5.00, $500.00 or $1,000.00???

¶ How much will my repair bill be for 5,000 miles? will it be $10.00 or $100.00 or $1,000.00???

¶ How much will it cost to overhaul my car after it has run 5,000 miles? will it be $50.00 or $500.00???

¶ How much will my car have depreciated by the end of the year? will I lose $500.000 or $1,000.00 or $2,000.00???

¶ Will the car I buy in 1906 be dropped from the market at the end of the year so that my car will be out of date, and so that I can't get repair parts if I want to run it a second year?

¶ Will my car be just as quiet, just as smooth, just as free from rattle and noise after 5,000 miles as it was when new?

¶ Will it have just as much power?

¶ Now the answers to these questions are not expressed in fractions of cents "per passenger mile." They deal with hundreds or even thousands of big, round dollars—and the man who wants to secure economy that is really worth while, can get accurate, precise, trustworthy information from us as to what the Stevens-Duryea has cost on each of these items. Furthermore, we are not giving you this data about a car that we're going to stop making at the end of the season, but on the car you buy for next year. Other manufacturers who change models every year, can tell you what the car they are abandoning has done,—but this information doesn't do you a particle of good. If you ask for information about the car they expect to sell you, the information you get in reply is based on what about one or two trial cars of the "new" model have done for two or three months in the hands of factory experts. Wouldn't you rather know what 350 have done, in all parts of the United States, in the hands of all sorts of drivers?

Next Week We Will Tell You

One of Our Three New Models

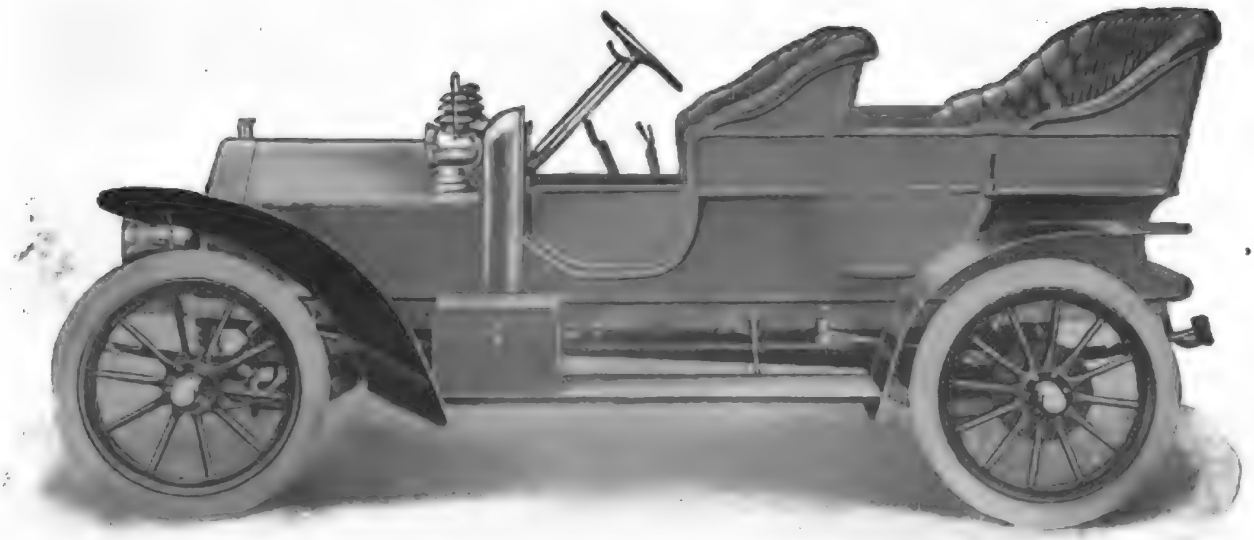
MOTOR—4-Cylinder—26-28-H.P.
DRIVE—Shaft Bevel Gear.
FRAME—Pressed Steel.
WHEELS—32 x 4.
WHEEL BASE—101 inches.
TRANSMISSION—Sliding Gear.
FRONT AXLE—Solid-forged.
GROUND PARTS—All Cylinders, Pistons, Piston Ring, Crank Shaft, Valves, Universal Coupling and Transmission Shafts.
EQUIPMENT—Five Lamps, Horn, Tools and Storage Battery.

We also have an 18-H.P., Two-cylinder Touring Car with Detachable Side door Tonneau, listing at $1,100—and a Runabout 12-H.P. at $800.

Write us for complete details and agency proposition.

C. H. BLOMSTROM MOTOR CO., Detroit, Mich.

Digitized by Google



The Oldsmobile Palace Touring Car, Model "S," price $2250, detailed description of which appeared in this publication last week, is notable equally for its carefully proportioned body, its strong, simple and well-balanced chassis and the wonderful attention to detail evident in every part of its construction. The car is low hung, yet has plenty of clearance, and the long wheel base of 106 inches gives a rangy appearance, which is most attractive. The four-cylinder vertical water-cooled motor is of the most thoroughly approved type, and easily develops from 24 to 26 h. p. The tendency to create dust is lessened by the construction of the dust pan and longitudinal arrangement of all parts hung beneath the car, all of which is conducive to general comfort in touring. The transmission is sliding gear, three speeds forward and reverse. The control is of the selective type, the changes being made with a single lever. The brakes are very strong and positive in action. The transmission brake is operated by a foot lever, while the rear hub brakes are controlled by a hand lever. Complete equipment, consisting of two acetylene headlights and generator, two oil lamps and one oil tail lamp, together with tools, etc., is furnished with this car.

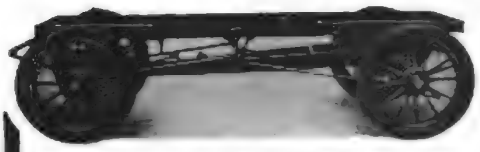
THE MARMON

"A Mechanical Masterpiece"

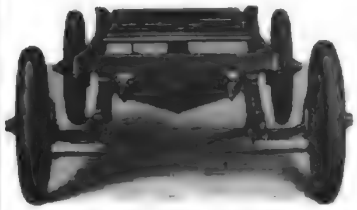


Side View—Normal Position.

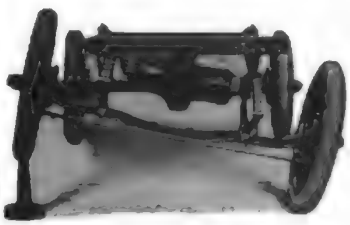
No Jolts for Passengers

No Strains for Mechanism

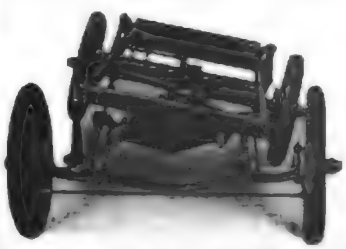
One Front Wheel and Opposite Rear Wheel Each Raised Over a Foot. Not a Strain Anywhere.



Front View—Normal Position.



Front Wheel Raised Over a Foot, Body Level.



Rear Wheel Raised Over a Foot, Lower Frame Level.

THESE pictures afford a clear view of the mechanical beauty of a car that is in all ways superb.

They show how easily the Marmon meets and overcomes the roughest road conditions, through its remarkable flexibility.

The first effect realized is the freedom from jolts and vibrations—a very luxury of motion over any and all roads, unknown in *any other car*.

More important still, no matter how rough the road, the running gear adjusts itself naturally to the ruts and bumps without subjecting the mechanism to binding or twisting strains. This is true of *no other car* regardless of price or prestige.

To determine how any other car would act under similar test, nail three legs of a chair securely to the floor and try to lift the remaining leg. Make some slight allowance in favor of the car because of its springs, and then charge against it the costly mechanism it carries and the great variety of roads over which it must travel, often at high speed. The entire mechanism is thus racked by twisting strains and ruinous friction in any such rigid construction, and not the least of the sufferers are the tires and the passengers.

The Marmon elasticity is supplemented by full elliptic springs but is primarily due to a patented exclusive feature.

Double Three-Point Suspension

Luxurious solid cast aluminum body on one frame, power plant on another frame, *each frame* suspended on three *pivotal* points. Raising or lowering one wheel does not affect the other wheels. No matter which wheels are raised, no matter how the two frames are tilted, the entire power plant and rear axle are *always* in perfect alignment. Straight and rigid shaft drive (without any sort of flexible couplings) delivers a greater percentage of power to the wheels than is possible in any other scheme of transmission.

The Marmon oiling system (fully patented) has no equal. Starting and stopping with the engine, a constant and uniform flow of oil is forced through the hollow crank shaft directly into all the main engine bearings, crank and piston pin bearings. Simple, unfailing, very economical; has no adjustments. Spur planetary transmission (clutches included) running in oil.

Four cylinder motor; perfectly air-cooled. Spark and throttle control on steering wheel.

The Marmon is stylish, strikingly handsome and very quiet. It is "A Mechanical Masterpiece" in whole and in every part, replete with distinctive features that appeal instantly and forcefully to all who seek a really superior car.

Full description in Booklet No. 1. Write for it.

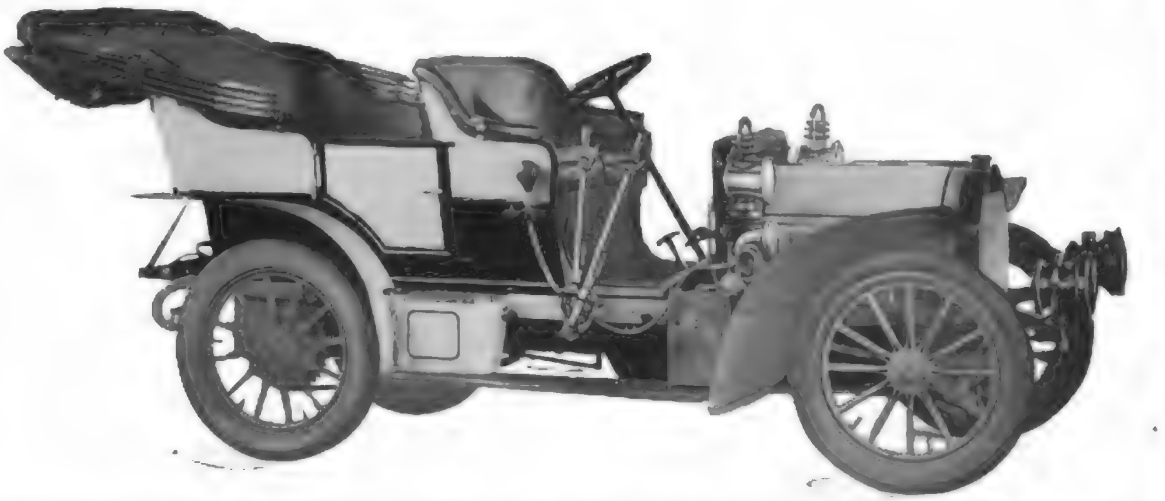
Locomobile

EASILY THE BEST BUILT CAR IN AMERICA

We announce two new styles for 1906, a powerful four-cylinder touring car, price $3,000, and a larger car at $5,000, both with complete touring equipment. These models are almost identical in design, contain the same carefully selected material, and are constructed with equal care throughout,—the result of years of careful and consistent manufacture of the standard type of four-cylinder touring car.

Locomobiles are fully equal in mechanical details and running qualities to the best imported cars, but are especially designed for American roads.



SPECIFICATIONS OF 1906 MODELS

TYPE "E" LOCOMOBILE, 15-20 H. P.

Price, $3,000, ready for touring.
Equipment, 5 brass lamps, horn, tire, carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
Body, double side entrance, seating 5; fitted with top irons; color and striping optional; top and luggage carrier extra.
Motor, 4-cylinder, 3⅜" bore, 4½" stroke.
Lubricator, large mechanical lubricator.
Carburetor, automatic, with balanced throttle valve.
Governor, centrifugal type, prompt and positive in action.
Ignition, make and break with iridium contacts.
Magneto, low tension, our own design and manufacture.
Aluminum Pan, placed underneath the machinery.
Clutch, cone type with ample surface.
Transmission, 3 forward speeds and reverse.
Drive, double side chains.
Universal Joint, double universal joint between clutch and transmission.
Running Brake, double acting type, large and powerful, metal to metal surfaces.
Emergency Brakes, internal expansion type, large and powerful, metal to metal surfaces.
Combined Brake and Sprocket Drum, bolted to each rear wheel spoke.
Axles, "I" section hand-welded axles.
Tires, 32"x4" on all four wheels.
Wheel Base, 93".
Weight, about 2,000 lbs.

TYPE "H" LOCOMOBILE, 30-35 H. P.

Price, $5,000, ready for touring.
Equipment, 5 brass lamps, horn, tire, carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
Body, double side entrance, seating 5; fitted with top irons; color and striping optional; top and luggage carrier extra.
Motor, 4-cylinder, 4½" bore, 5½" stroke.
Lubricator, large mechanical lubricator.
Carburetor, automatic, with balanced throttle valve.
Governor, centrifugal type, prompt and positive in action.
Ignition, make and break with iridium contacts.
Magneto, low tension, our own design and manufacture.
Aluminum Pan, placed underneath the machinery.
Clutch, cone type with ample surface.
Transmission, 3 forward speeds and reverse.
Drive, double side chains.
Universal Joint, double universal joint between clutch and transmission.
Running Brake, double acting type, large and powerful, metal to metal surfaces.
Emergency Brakes, internal expansion type, large and powerful, metal to metal surfaces.
Combined Brake and Sprocket Drum, bolted to each rear wheel spoke.
Axles, "I" section hand-welded axles.
Tires, 34"x4½".
Wheel Base, 106".
Weight, about 2,900 lbs.

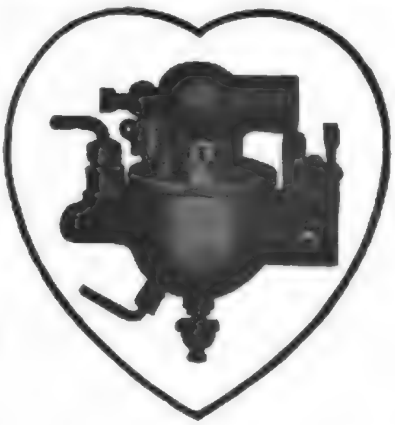
THE HEART OF THE AUTOMOBILE



The Schebler Carburetor

Standard of the World

1,094 3-16 miles in twenty-four hours continuous running on a circular track; 1,000 miles in 21:58:00 4-5 continuous running on a circular track, breaking all world's records by 1:35:19 1-5.

This is the world's record travels of a National car fitted with a SCHEBLER carburetor at the Indianapolis Fair Ground Track, November 16th to 17th. Hundreds of miles were reeled off with scarcely a variation of a second in the time of each.

Is it any wonder that eighty-three of the largest marine and automobile engine builders in the United States and Canada are equipping their motors with the SCHEBLER?

A carburetor that gives a perfect mixture at all engine speeds, regardless of weather conditions, is truly *"The Heart of the Automobile."*

THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

has arrived and is now on exhibition at our showrooms. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. Equal to any car, built in any country at any price. Make and break spark. Sims-Bosch Magneto. Bevel gear drive. Continental Tires. Aluminum bodies.

MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order?

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.

THE RAINIER COMPANY, Broadway and 50th Street, New York

ANNOUNCEMENT

CORBIN CARS FOR 1906

Model E, Light Touring Car, Price $2000

Four cylinder vertical, air cooled engine 24 H. P. mechanically operated valves. Jump spark ignition with synchronized system of distribution of the high tension current. Positive force feed lubrication. Sliding gear transmission, selective system having three speeds forward and reverse. Pressed steel frame and steel pan construction. Bevel gear drive rear axle of the floating type. Front axle I beam section drop forged in one piece. New type worm and sector steering gear. Internal and external brakes on rear hubs. Body of graceful design, side entrance of the latest French type, roomy in proportions and luxurious in appointment. Wheel base 100 inches. Extra long springs of special design and great flexibility. Wheels 32 x 3½ inches. Weight 1800 pounds. Speed up to 45 miles per hour. Two gas lamps, generator, three oil lamps, horn and full complement of tools constitute the equipment.

Model G, High Powered Runabout, Price $1800

The specifications of this model de luxe two passenger car are identical with the Model E with the exception of wheel base, 93 inches. Body latest French type for two passengers, divided front seats. Long, graceful tail box. The metal parts are lightened wherever compatible with safety. Speed 50 miles per hour.

Annular Ball Bearings Are Employed Throughout

ONE MILLION PEOPLE OR MORE

will suffer from cold feet and benumbed limbs during the progress of the many football games throughout the country on Thanksgiving Day, this year.

Everybody who has ever witnessed a gridiron battle in other years will recall that one unpleasant feature of the afternoon's sport.

DAVIS ROBES OF COMFORT

SOLVE THE PROBLEM ... ABSOLUTELY AND FOREVER

Imagine the pleasure of watching the game, snugly encased in a luxurious, soft and roomy, air-tight, plush-lined Robe of Comfort. No cold can possibly attack your feet or limbs. **It makes you feel as Warm as Toast.**

How many people will prove the wisdom which experience is supposed to bring by ordering at once a Davis Robe of Comfort, and thus be prepared not only for such outdoor occasions as football games, but for winter automobiling, carriage riding and sleighing as well, for **many years to come.**

Davis Robes of Comfort are patented. You can get them from us only, but there are **Three Ways to Obtain a Davis Robe,** any one of which is entirely satisfactory to us. Read them:

1st. When cash is sent with order, **WE PREPAY EXPRESS CHARGES.**
2d. We send C. O. D. with privilege of examination before accepting.
3d. We send on approval to responsible people and pay **return** charges if not satisfactory.

PRICE

Standard Robe, $10.00 **Baby Bear, fur front (elaborate) $20.00** **Arctic Over-Pants, $10.00**

NOTE.—We cover this robe, on order, with seal skin, lynx, otter or any kind of fur desired. Prices on application.

This is The DAVIS ROBE OF COMFORT

It is exactly what you want if Comfort interests you. Plenty of room for the feet and legs.

Made of Finest Pure Rubber Drill or Best Grade of Mackintosh, entirely lined with heavy imported dark green Plush. Wearing portion under feet covered with calfskin.

Fastens with Heavy Large Glove Clasps. Adjustable to any size waist. Can be carried on the arm when not in use. Light in weight and not bundlesome.

Expressed to ANY ADDRESS on same day order is received.

It will keep you **WARM in the coldest weather.**

WE GUARANTEE IT

Money refunded if for any reason goods are not satisfactory.

Illustrated Booklet and testimonials of prominent business men from both city and country everywhere free on request.

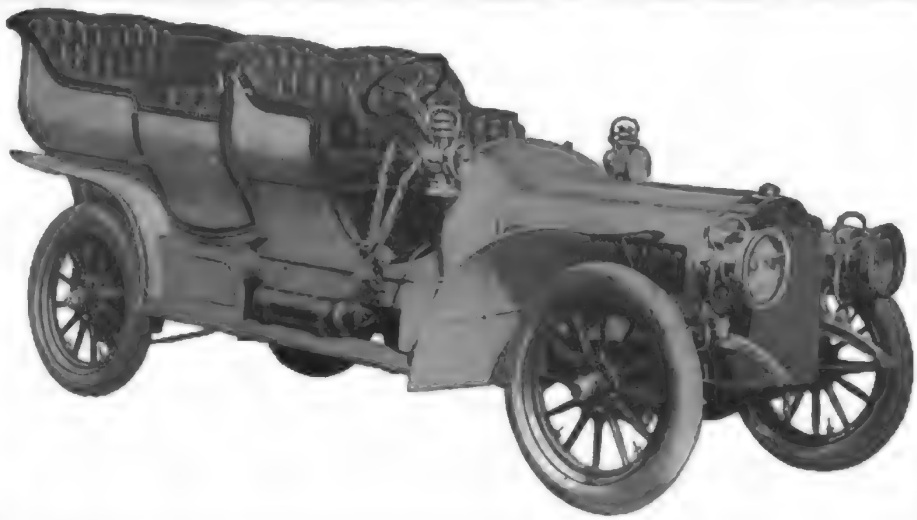
The New Thomas

Greatly Exceeds My Most Sanguine Expectations Experts Say It Is a Wonder



NO customer is so critical or hard to please as the manufacturer, who, regardless of cost, absolutely determines to do his utmost to build the best car in the world.

But, when an ordinary Stock Touring Car, without special preparation or intention, runs sixty miles an hour on the level, and climbs a 10 per cent grade on the high speed at forty miles per hour, within an hour after it first leaves the shops, it is something that not one car in a thousand will do.

Under favorable conditions we should do sixty-five miles an hour.

I am more pleased than ever with its speed, hill-climbing, quiet operations and mechanical superiority, and cordially urge disinterested automobile experts everywhere to rigidly investigate our claims, and compare our material, workmanship and design with the highest-priced cars in the world—we will win the verdict.

An Investigation of Goodrich Tires

Mr. E. Shirts, cashier of the Citizens' State Bank, Noblesville, Ind., after using a set of Goodrich Tires through the year of 1904 and all of 1905 up to date, without a repair of any kind, decided to take off the tires for examination just to satisfy his curiosity. **All he found was Goodrich Rubber and Goodrich Fabric perfectly united and looking just as good as new.** His letter:

"In the spring of 1904 I purchased a Cadillac automobile, Model B, equipped with **Goodrich Tires, 3x30 inches.** I used those tires all the season of 1904 and all of this season without a repair of any kind, not a single puncture, and the tires look as good as new, with the exception that the treads are flattened down some. I have had such remarkable success with them that a few weeks ago I took the front ones off to see what they were made of, and found them in perfect condition, not even rim-rusted.

"I have driven my car every day that was fit to be out with my family and have kept them busy both seasons and my experience with them has been one round of pleasure."

THE BAILEY "WON'T SLIP" TIRE. Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, skewing or skidding. :: ::

Volier Horns

¶ The *reeds* are what stick most horn makers. Successful metal mixtures and tempering processes for horn reeds are the secrets of a very few men. The non-corrosive, vibratory metal reeds in genuine Volier Horns, which are unaffected by weather and which keep their tone indefinitely, are a feature which alone make Volier Horns superior to any other horns offered in America; *but,* in addition, there is the matter of

¶ The *bulbs.* In ordinary horns the bulbs are steam cured. They split and crack from use and vibration. In Volier Horns the bulbs are *chemically* cured — another secret process. The *chemical* curing makes Volier bulbs soft, pliable and tough. Volier bulbs do *not* split or crack.

¶ Horn fashions are set by the Volier, which we exclusively import from France. Witness the "Dragon" horn craze this season, founded on the Volier "Dragon."

¶ We can now give you illustrations and quotations on the 1906 Volier styles.

RED BANK, N. J., Nov. 13, '05.
THE CADILLAC MOTOR CAR CO.
Detroit, Mich.

GENTLEMEN:

I think you are entitled to know of the good work the single-cylinder touring car that I have been running this summer has done. It has never failed to take me wherever I have started to go and have run it almost 5,000 miles since July. It always comes back stronger and seemingly with more power than when starting out.

One of the interesting runs I made was to Atlantic City, a distance of 106 miles from here. Made the run in 5 hours, each way, without having to make a stop for anything and the whole run of 212 miles on 10 gallons of gasoline and less than a cup of oil.

Another run from here to Trenton, 45 miles in 2 hours, speaks well for a car of this power.

These trips were made with four people in car, up and down hills and slacking up while going through towns.

I think there is more real **pleasure** and less **trouble** embodied in the little single-cylinder touring car than any car built, regardless of cost.

This car that I have been running and described is only what all the other cars of this type we have sold have done.

Wishing you all success, I am,
Yours respectfully,
[Signed] JOHN H. MOUNT,
Of the firm of J. W. Mount & Bro.

The new **Stoddard-Dayton** Model D Touring Car has speed and symmetry in every line.

Yet there is not an ounce of weight, not an inch of steel, not a bolt, a nut, nor a bearing, sacrificed that means reduced strength or safety.

At highest speed, the STODDARD-DAYTON is instantly and positively responsive—always under perfect control.

Here is how stripling-weight and dependable strength are ideally combined: The frame is made from hot-rolled, high-carbon, pressed steel. This steel is so tough, so close-textured, that the frame will bear great weight without deflecting a hair's breadth.

In the STODDARD-DAYTON the weight and strain are so evenly distributed that no point gets the brunt. The four-vertical-cylinder (4½x5 in.) motor, of special type, and the transmission are carried on dropped sub-frame, substantially re-inforced. There are roller bearings throughout. The speed change is of the selective type; you can go from high speed to low speed in a second, without clashing or friction. Mechanical lubrication keeps all working parts swimming. Sturdy artillery wheels, 32x4 inches; 12 spoke front, 14 spoke rear. Proportion of power to weight: ***One*** horse power to every ***sixty*** pounds. An exquisitely modeled car, finished in pearl gray, with tan upholstering—distinctly an art creation. Other colors optional.

The 1906 STODDARD-DAYTON at $2,250 represents an honest commercial value between two extremes: (1) a four-cylinder car at a high or fictitious value; (2) a four-cylinder machine at a low and impossible valuation—the most expensive kind of economy. It is the right car and the right guarantee is back of it to insure your satisfaction and protection.

Write for our 1906 catalog descriptive of the new STODDARD-DAYTON Touring Car, Runabout and Limousine. Mailed free.

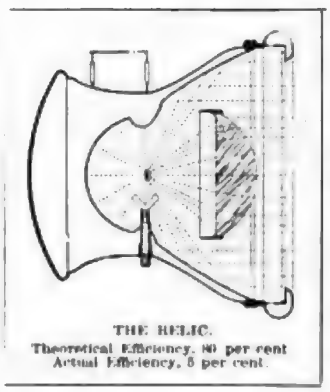
"Again—as good as it looks"

CERTAINLY!

THE WORLD DO MOVE But Sometimes It Moves In a Very Small Orbit

FOR EXAMPLE



THE RELIC.
Theoretical Efficiency, 80 per cent
Actual Efficiency, 5 per cent.

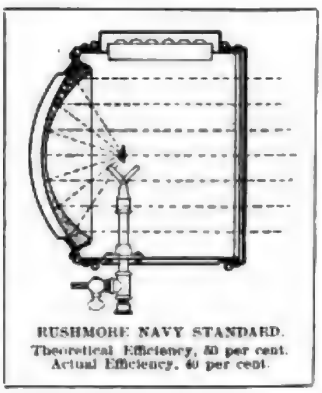
Here is a Searchlight which we used to make many years ago. We call it the Relic.

Theoretically it utilizes nearly every ray from its source of light.

Practically, in the presence of burning acetylene, the spun copper, silver plated reflector cannot be kept bright or even clean, and it absorbs most of the light instead of reflecting it. We discarded the Relic ten years ago, because of its ridiculously low efficiency compared with the Rushmore Navy Standard (short focus) Lens Mirror which we have since used.

The patents under which we manufactured the Relic have since expired, and it has been resurrected by some of the other fellows as the latest ever.

When you compare "Lamps" compare them as we did—in the dark—and see that their flames are the same size.



RUSHMORE NAVY STANDARD.

The "short" fracture shown above, while characteristic of poor oak, happens to show the fracture of poor hickory. The other fracture shows the quality of "Imperial" spokes.

Talks on Wheel Making No. 7

A bursted tire is robbed of its danger if the car is equipped with "Imperial" wheels.

Don't lull yourself into a sense of false security by imagining that all wheels rank alike. Read what the *Horseless Age* has to say on the subject:

> "As an illustration of what can be accomplished by suitably disposing material, no better example can be found than the wood wheels fitted to motor cars. No part of the car has its material subjected to stresses under a greater variety of conditions. True, there are wheels which are of no value; wheels, in fact, which have no factor of safety and are ready to collapse at the first turn; but they are not the wheels one ought to find on a car."

Collapse is usually traceable to two causes—defective material or unsound construction. And sometimes to both.

The excellence of "Imperial" wheels is based upon the perfection and refinement of orthodox methods.

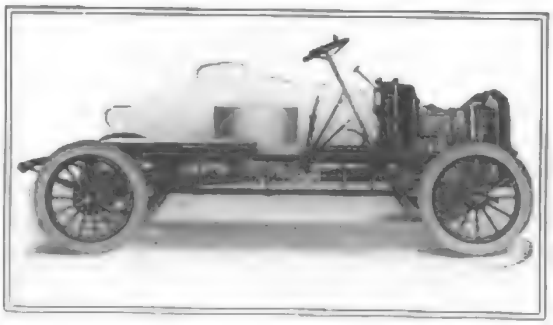
THE INCOMPARABLE WHITE



Above is shown the chassis of the Model "F" White car which we are now delivering with touring car, runabout, limousine, victoria and landaulet bodies.

Steam power, as utilized in the White car, possesses unique advantages. There is absolutely no noise, no odor, no vibration and the speed of the car is controlled entirely by throttle. There is an ever-present reserve of power which is often found most useful.

The White steam generator is totally unlike any other steam-making device ever designed. To illustrate the radical difference, we might point out that in our generator the water is at the top and the steam at the bottom. In every other type of boiler the steam is at the top and the water at the bottom. The safety, simplicity and reliability of the system is demonstrated by the performance of the thousands of White cars now in use.

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

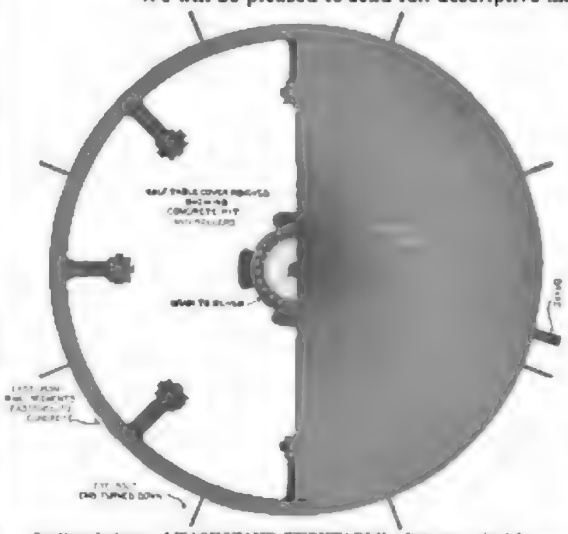
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.



Sectional views of WASHSTAND-TURNTABLE. Patent applied for.

PHILADELPHIA, PA. Aug. 17th, 1905

The Continental Caoutchouc Co.,
43 Warren St., New York City.

Gentlemen:

Your favor of Aug. 15th. is received and we would say that you were misinformed in regard to our tires.

We have travelled over seven thousand miles with the set of tires mentioned in your letter and have never had a pump on the rear tires (34x4-1/2) but have experienced some trouble with inner tubes on the front pair and we think it is because we are using too small a tire there (34x3-1/2).

Our machine travels very fast over the worst class of roads and the distance of seven thousand miles means something.

This is the only pair of tires we ever heard of going this distance without being pumped.

Yours very truly,
Jones-Corbin Motor Co.,

Boston, Mass. Nov. 4, 1905.

Jackson Automobile Co.,

Jackson, Mich.

Gentlemen:-

We are sending you today under separate cover a photograph of a "Jackson" car that has been run this season over 10,000 miles by the odometer. We really believe it would pay you to get this into the Trade Journals if the expense is not too much.

You wrote us sometime ago that you would have either the Model "C" or "D" made with detachable tonneau with fish-tail deck. Have you as yet decided which model you will have in this way? If so, kindly write us the price of machine without the tonneau. We believe it would be advisable to have the cheaper car with detachable tonneau.

Yours respectfully,

E. P. BLAKE COMPANY

Per E P Blake

Mgr.

Enc. EPB-B.

P. S. The tires on this car are Diamond detachable. The two forward rims have never been touched and the two rear tires have been retreaded once. This car is owned and driven by Mr. H. H. Bates, Brockton, Mass.

THE accompanying letter and picture explain WHY every agent we had on our list for 1905 has contracted for Jacksons for 1906; ¶ *Why* every "Jackson" driver is an advertisement; ¶ *Why* you, if you have the auto fever, should buy the Jackson; ¶ *Why* the Jackson has the world's record for five miles on a circular track for two-cylinder cars; ¶ *Why* the Jackson won second in the non-stop run from Chicago to St. Paul.

THREE MODELS:

MODEL "C" $1250.00, 20-24 H. P.
MODEL "D" $1500.00, 20-24 H. P.
MODEL "G" $2500.00, 40-45 H. P.

Change Tires 30 Seconds Goodyear Universal Rim

SUPPOSING you were 25 miles from home, and your tire exploded. And you hadn't another with you. And when you stopped at the garage, the man said: "I'm sorry, but I haven't a single tire of that make."

Wouldn't it make you mad?

Of course it would, if you had an *ordinary* rim.

But if you had a Goodyear Universal Rim, you would smile and say: "Bring on any old tire, as long as it's a clincher my rim will take it." And in less than three minutes you would be enjoying the scenery once more.

Because it *isn't* an all-day job to take off and put on a tire when your car has Goodyear Universal Rims. Just jack up the wheel and in 30 seconds the old tire is off, and in another 30 seconds the new tire—ANY kind—is *on*. You need no tools but the hands—and are "fixed up" and on the road while the man with *ordinary* rims is hunting for his crowbars and levers.

Figure 1

You see the flange comes right off on Goodyear Universal Rims, like Fig. 1.

And then a 30-inch tire (for example) slides right on to the 30-inch rim like Fig. 2, as easy as you would put on your hat. On an ordinary rim you would have to pry that 30-inch tire over a 31-inch flange.

Figure 2

You know what a profanity-inspiring job that is, and it doesn't do the tire any good, either.

Now this is all there is to taking off and putting on a tire when you have Goodyear Universal Rims. See how simple and easy it is.

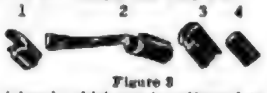

Figure 3

The rim is made up of four parts, like Fig. 3.

Nos. 1 and 3 are the removable flanges (rings), which can be adjusted to any clincher tire.

No. 2 is the base of the rim attached to the felloe of the wheel. It can be used without fitting on any standard wheel built for the standard clincher rims.

No. 4 is the locking ring, which holds the flanges in place.

Figure 4

If you have decided to relieve yourself of all tire troubles and in consequence ride Goodyear Detachable Auto Tires, a section of the rim, when put together, would be like Fig. 4.

Or, if you ride an ordinary clincher tire, the rim section would look like Fig. 5.

The ring which holds the flanges in place is split at a point alongside the valve stem, like Fig. 6.

Figure 5

It can't be removed (and, of course, the tire can't come off) while the flange presses against it.

This flange is kept tight against the ring by a plate which slips over the valve stem, like Fig. 7.

Figure 6

When you wish to remove the tire, loosen the nut which holds the valve stem down, and push the stem up through the rim. This pushes up the plate and lets the flange ring slide inward, like Fig. 8.

Then lift out the locking-ring, slip off the flange, and pull off the tire.

Time, 30 seconds. No tools but the hands.

Figure 7

Those who are weary of tire troubles are specifying Goodyear Auto Tires on Universal Rims. This equipment *costs no more* than the ordinary kind, and multiplies the pleasures of motoring many times.

Figure 8

Ask for our "Good News Book" and find out all the good points of the Goodyear Auto Tire and Universal Rim. It's of vital interest to the Manufacturer, Dealer or User who is satisfied with nothing but *the best*.

THE GOODYEAR TIRE & RUBBER CO., Wallace Street, Akron, O.

The Expected Revolution Has Come

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should not buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the two cycle two cylinder Elmore engine. Understand—the two cycle two cylinder Elmore engine produces **two impulses every time the flywheel turns.** As you know, the two cylinder four cycle furnishes only one impulse every fourth time the flywheel turns. In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

The Steel Ball Co., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6-day endurance and economy run at Long Branch. In a run of 3,202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of all this we fully realize and its help in getting this record for our FRAYER-MILLER car. Yours truly,

THE OSCAR LEAR AUTOMOBILE CO.

THE STEEL BALL COMPANY
840 Austin Avenue
CHICAGO ... ... U. S. A.

HAVE YOU SEEN THE NEW **KOKOMO** MECHANICALLY-ATTACHED

AUTOMOBILE TIRE?

It is just what you have been looking for.

Quickly attached and detached.
Creeping and Rim Cutting entirely avoided.
Made of the very best material and workmanship throughout.
Write us for full particulars.

"SOOT-PROOF" WINS

Five Prizes Were Awarded to the Cars Using "Soot-Proof" Plugs

The "McMurtry" Prize for the car having the least ignition trouble was awarded to a Reo using "Soot-Proof" Plugs. These cars covered a distance of 700 miles during the National Economy Test of the New York Motor Club, October 30 to November 4, 1905.

These cars had absolutely no spark plug troubles, and the original plugs were used throughout the entire run. Thus again has the "Soot-Proof" Plug demonstrated its superiority, reliability and economy.

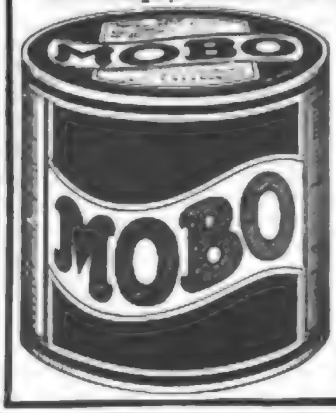
The Care *of the* Car

Washing the body of the machine, keeping the polished surface free from lubricator, road dust and gutter muck is just as essential to the life of an Automobile, as is the attention given the running gear.

Mobo, the new cleanser for Automobiles, will easily and quickly remove grease, dirt and grime and all traces of a hard run, without dulling or scratching the highly polished surface.

MOBO

is unlike common soap, as it positively contains no free alkali. Being a preservative as well as a cleanser, it prevents varnish or paint from peeling or cracking, and adds a fine gloss to the surface.



Mobo may be used with profit on leather goods, harness or woolen fabrics. Cannot harm the most sensitive skin, as it is a purely vegetable oil preparation and absolutely contains no free alkali. Put up in 2-lb. and 8-lb. cans; also in tubs, half barrels and barrels.

If your supply man does not keep *Mobo*, send us his name and address, and we will see your wants are supplied.

JOHN T. STANLEY
New York.

GARFORD TOURING CAR PARTS

The great problem of the hour for the automobile manufacturer is to develop the details of his engine. This study is so absorbing and important that the duty of producing axles and other parts has been left to other specialists.

Our specialty is the manufacture of parts for the very highest class of cars—parts that are as good as life insurance. We make:

REAR AXLE: Independent Shaft Drive, Ball or Plain Bearing, Weight Carried Entirely on Axle Tube

FRONT AXLE: I-Beam Section Nickel Steel Bed, Ball or Plain Bearing

CHANGE GEAR
STEERING GEAR
CLUTCH
DISTANCE ROD AND BRACKET
PROPELLER SHAFT
LEVERS FOR EMERGENCY-BRAKE AND CHANGE-GEAR

Parts of one size are suitable for cars weighing up to 2400 lbs. and of 30 h. p.

Parts of the other size are suitable for cars weighing up to 2800 lbs. and of 50 h. p.

Write for Circular No. 12.

WE MANUFACTURE

Gilbert Automobile Fabric Supplies

We originated supplies of this nature, have many patents on them. We make nothing but the *best.* We take *pride* in the bright ideas brought out by our designer, and we back up these with materials of quality and fine workmanship.

Jobbers and Dealers. Our 1906 line will be ready December 1st; it will be a winner. If you don't catalog this line you will make a big mistake.

Don't ruin your *reputation* by handling *spurious imitations* of our goods. *That "just as good gag" is played out,* you don't want to have to use it.

We *advertise to your benefit.* Do the imitating pirates? *No!* We make high class goods. Do the above named gentry? *No!*

Our supplies sell for standard and fair prices. We protect you and the dealer. Do the imitators? *No!*

Well, an insurance investigating committee could not discover any demand for, or quality and originality in *"just as good"* kinds offered you by bearded gentry, from the sweat shop districts.

Now the public want the best. We make it, and if there is publicity and value in advertising we intend to see that they get what they want.

Will you give it to them?

The "Breech-Block" Plug

The Plug With a Handle

To take out your watch or open a Breech-Block requires just the same time, same tools, same effort, and one twist cleans the entire porcelain to the whiteness of snow.

To remove the porcelain only, loosen the clamping nut and it drops out of its holder, and the gasket of copper drop with it. No digging!

It is nickeled inside and out. Highly polished and dust-proof. Sparks between two unprotected points and not between one point and the shell. Its points are protected.

Porcelains are hand turned and so perfectly glazed that soot cannot stick to them. Their threads are cut to perfection, and every particle of the idea of cheapness is left out of them.

Postpaid, Anywhere, $2.50. Booklet free. Made by

EARL CANEDY, 2002 West Ave., CHICAGO HEIGHTS, Ill.

Digitized by Google

¶ The Automobilist who today doesn't include a Jones Speedometer in his list of accessories is eliminating two thirds of the pleasure of automobiling—and is encouraging the officer of the law to make his arrest.

¶ When the Judge says: "Did you have any *positive* means of determining the speed at which you were traveling?"—he is asking if your car was equipped with a Jones Speedometer. Don't forget that!

¶ The Mounted Officer with his primitive stop watch method of timing the Automobilist can seldom make a case. Guess work testimony doesn't go in court. The Officer means well, but his method is wrong.

¶ Our Speedometer Bulletin contains speed information and tells of our Protection Tag. Free on application.

THE HAM
GOLD BLAST
AUTO LAMPS
"THE LAMPS THAT LIGHT THE ROAD"

MR. MANUFACTURER:
Don't close your lamp contract for 1906 until you look over our line. We have no competition in light giving and burning qualities, and our lamps will surely interest you.

MR. DEALER:
Isn't it worth something to sell your customers lamps that will not only satisfy them, but will bring them back to tell you what a fine light they give, how steadily they burn in the strongest winds and over the roughest roads, and what a good fellow you are for selling them good lamps. They'll tell their friends about it, too.

MR. AUTOMOBILIST:
Are you discouraged with the oil lamp proposition? If you are, we know you haven't tried the

HAM COLD BLAST AUTO LAMPS

because they are a delight to the most critical. They are strongly built, handsome in appearance, give a powerful light, and are always reliable, as they are wind proof and will not jar out. Never smoke, consequently the interior is always bright and clear, and there is no odor.

MOTOR AGE

VOL. VIII NO. 22 CHICAGO, NOVEMBER 30, 1905 $2.00 Per Year

LONDON'S OLYMPIA SHOW CLOSES

LONDON, Nov. 25 - Special cablegram — When the fourth annual Olympia show shut its doors tonight it brought to a close an exhibition that produced more business for the motor car manufacturers than any other of the kind ever held in England. On all hands there were evidences of big business and hardly an exhibitor passed out the door for the last time without a bulky order book. Of course, it is impossible to estimate accurately the volume of trade done, but one authority, figuring on each of the 300 exhibitors having done at least $25,000 worth of business, declares the total orders will run up to $7,500,000, although a more conservative estimate places it at $5,000,000. S. F. Edge did particularly well, it being reported that he had received one order for sixty-six six-cylinder chassis, ranging in price from $5,000 to $7,500. He also landed another order for twelve chassis of the same type, this last being sent in by an Italian syndicate. It is also said the Rolls Royce people have sold practically their entire output through the show and that the liveliest interest was displayed in their new eight-cylinder car, although the latter is really not yet on the market. The Daimler company is especially proud of an order received from the prince of Wales for a car similar to the one owned by King Edward, while at least seventy other orders were booked, it is reported. Panhard & Levassor got their share of the plums, the gossips say, it being reported that something like forty cars of one type were disposed of during the show, while the others were in brisk demand.

London, Nov. 18.—The Britishers' big show at Olympia was apparently just a trifle too big for them to manage properly, as it was in a state of moderate dishabille when the public was admitted at noon yesterday. There was little excuse for this, as exhibitors had been in for over a fortnight. Only one stand, however, complied with the regulations on Friday morning. That was the Napier. The British ability to hustle was fairly clearly demonstrated, however, on Friday, by the afternoon of which most of the exhibits were fairly ship-shape.

There was no formal opening ceremony, but the usual luncheon, presided over by the chairman of the society, was held, at which the most interesting statement made was that the expected division of next year's show into two or three sections held on different dates will not take place. Sidney Straker definitely stated that next year's exhibition would be held in November on the same lines as the present one.

In dealing with the progress of the year, Arthur Stanley, M. P., chairman of the automobile club, estimated that the value of the cars running in the United Kingdom was not less than $75,000,000, and his estimate of the trade to be done during the next 12 months was as low as $10,000,000. Most of the speeches centered round the provisions of road facilities for motors, but throughout there was a strident note of suppressed triumph at the success scored in face of a very earnest if concealed attempt of the French motor trade to prevent the

GENERAL VIEW OF THE OLYMPIA AUTOMOBILE SHOW IN LONDON

Digitized by Google

ascendency of the British show by withholding their models.

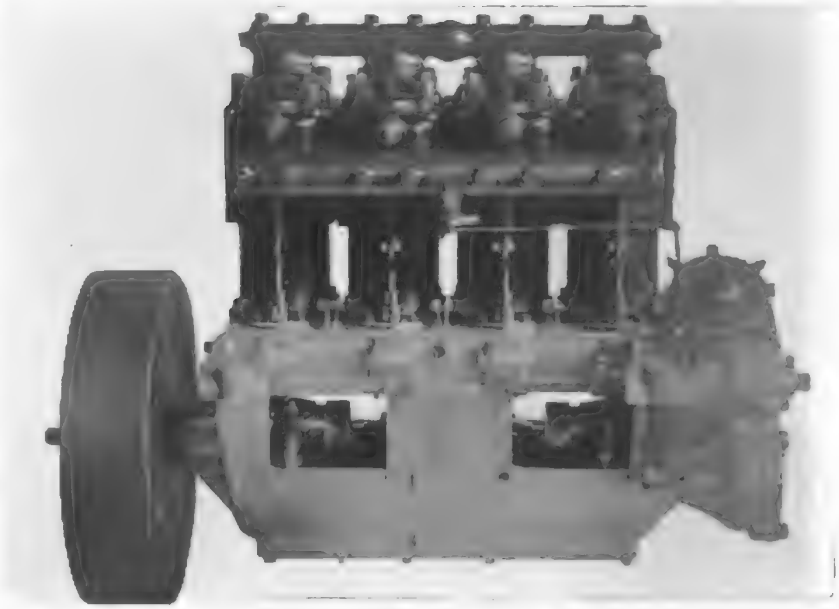
Every French model promised or applied for is on view, including some which have been sent across with a distinct stipulation that nothing would be published concerning them in the press until the Paris show.

An analysis of the prices show that the Mercedes, as usual, tops the list, the dearest car in the exhibition being a 70 horsepower chassis, which sells at $9,000. It is run close by the 60-horsepower six-cylinder Napier at $7,250. The cheapest six-cylinder car on view is the Standard, a Coventry built car, which is ticketed at $3,600. Of course, in four-cylinder cars the Mercedes holds the palm, while the cheapest is the Spiker, a Dutch importation, marked at $2,300. The very small class of three-cylinder cars is topped by the Bellsize selling at $2,750, the cheapest being $1,250. In two-cylinder cars the Maudslay heads the list with $3,000, and the Maxwell, which comes to us from your side, brings up the rear with $850. In single-cylinder cars the prices range from the 9-horsepower de Dion at $1,500 to the 6-horsepower Rover at $525. Thus the motor car manufacturer demonstrates that he provides for every pocket.

In mechanical details the clutch seems to be the principal point round which interest centers. The laminated disc has been adopted by the Gladiator, Standard, Argyll, Crayshaw-Williams, Fiat, Bellsize, Clement, James & Brown, Maudslay, Iris, Bianchi, Climax, Albion, Thornycroft and Martini. The single disk is adhered to by the de Dion, Iden and all the American exhibits, except the Winton, which, like the Napier, relies on a metal cone. Expanding clutches are only fitted by de Dietrich and Brouhot.

With regard to bearings, it is interesting to notice that the Mercedes, which fits ball bearings to every moving part, including the crank shaft, is followed by others, including the Enfield, the Spiker and Hurtu. Firms like the Napier give ball bearings to wheels, gear and live axle, but maintain plain bearings in the engine. This is the general practice in the better class, but there are some firms, such as Rolls-Royce, Bellsize and de Dion, Sims, Wellbeck and Thornycroft, which only use plain bearings throughout.

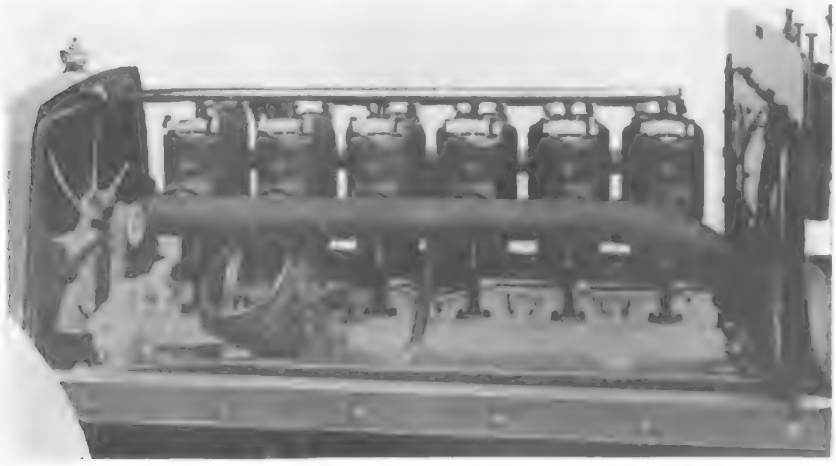
The great advance made by the Mercedes type of gear system has been already noted, and practically embraces every car that has been really redesigned for 1906, with the exception perhaps of the American exhibits, which, with the exception of the Winton, retain the epicylic type. Another feature of contrast between American methods and our own is the adoption of roller bearings on your side as against ball bearings on this. Every American exhibit has roller bearings to the live axle, and some have rollers also to the wheels. The only roller bearing firm on this side is the Argyll, which has introduced the system into its gear box, and claims high advantages for it. In all probability there will be a set towards roller bearings during the coming season.



THE COVENTRY HUMBER 12-14-HORSEPOWER MOTOR

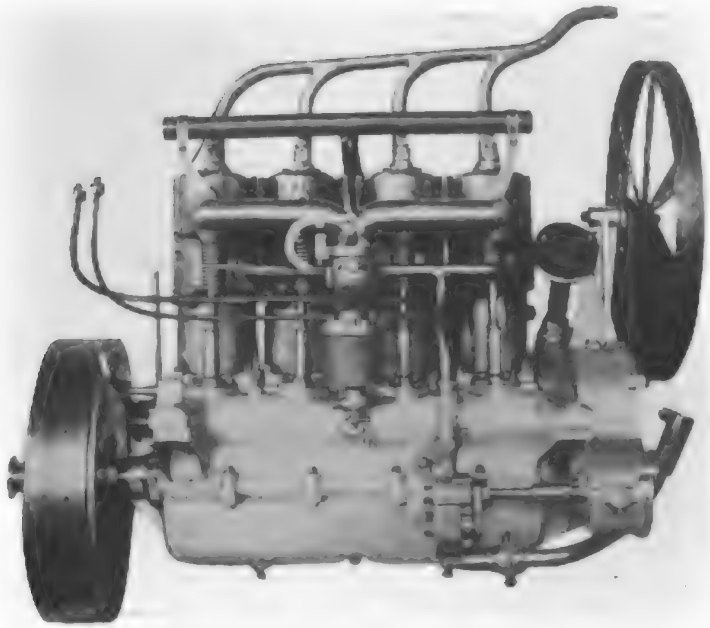
From a trading point of view the chief characteristic of the show is the prevalence of the landaulet type of car. This is principally intended for town use, but the increase in the number of covered cars of all types is very distinct. A few years ago the baldest form of canopy top without a glass screen in front was considered a luxury, then came the cape hood, but in the present shown the brougham and the landaulet are evidently the types of covered cars that will be sold during 1906. In almost every instance town types are of the four-cylinder design. The exceptions are the Panhard three-cylinder landaulet, the Napier six-cylinder, the Gladiator six-cylinder and the Rolls-Royce eight-cylinder. The reason for this multiplication of cylinders is variously given, but the plain fact of the matter probably is that town driving requires a large excess of power for the speed attainable. The absence of vibration is also a cardinal necessity, while freedom from noise and a capacity for traveling at low speeds without altering the gear, combined, of course, with the sound prices paid for these types of vehicle go to make the multiple-cylinder engine a universal type in this class of car. For touring vehicles, pure and simple, the side entrance of the body has entirely deposed the one-time tonneau. Last year there was a very obvious tendency to unduly lengthen the wheel base in order to provide sufficient room for this purpose. As, however, these cars, in actual use, were found to be unhandy in traffic, and for getting round corners or sharp turnings at speed, there has been a very general tendency toward reducing the actual wheel base while maintaining the length of body necessary to give the passenger room required. This has been done in almost every instance by providing extra long suspension springs to the rear axles, the extra length in the frame being supplied in an extended spring hanger. Some indeed decentralize the driving axle on these springs, but it is a practice which does not seem sound, and is not likely to obtain much vogue. In point of comfort and even luxury a very great amount of attention has evidently been devoted by makers of the high-priced cars, the Napier company, for instance, provides C springs on one of its landaulets, but for some reason have not staged the type, and several other makers have, it is said, adopted the same form of suspension.

Another characteristic of the show is the triumph of the pressed steel frame. When such devoted exponents of the tubu-



EXHAUST SIDE OF THE PANHARD & LEVASSOR SIX-CYLINDER MOTOR

Digitized by Google



THE REESTON HUMBER 16-HORSEPOWER MOTOR

lar frame as de Dion-Bouton and the Gladiator company abandon their favorite type, it is an eloquent testimony to the weight of motoring opinion. But the pressed frame has not only superseded the tubular; it has also beaten out the reinforced or flitch plate type, even on the smallest cars. From a constructional point of view the pressed steel frame is the last word and from a factory point of view it is probable that with the large increase in output the actual cost of producing the latest forms of pressed frames will compare very favorably with the armored type so general a few years ago.

The form of pressed frame in which the webbing of the section front of the dashboard was extended to form a sort of apron enclosing all gear but the engine crank case, does not find so much favor as last year. This was found to be all right in a big car in which plenty of room could be given, but in small cars it was something of a nuisance, and so it is being replaced by sliding panels of aluminum which fit in between the engine casing and the frame and can be withdrawn for cleaning or repair purposes. The full apron underneath the whole engine gear is not favored for the same reason—it interferes with accessibility. Accessibility indeed is quite a universal feature. Even a year ago it was evident that some of the leading cars were not the work of one designer, so much was one portion of the fitment allowed to interfere with proper access to some other. But that has been almost entirely swept away, and in the sweeping away some of what one may call the automaticity of the lubrication of many cars has been sacrificed to simplicity. The automatically-lubricated engine is all right so long as lubrication is automatic, but the accessibility to pipes of small diameter in order to properly convey the lubricant leads to clogging and dry bearings, while the multiplicity of lubrication pipes, high and low tension wire leads, water circulation and exhaust pipes, had so filled up the bonnet of an up-to-date motor car, that when any repair or adjustment was required, it was difficult at times to get properly at it without disconnecting these and so wasting time. Hand lubricators dealing positively with each bearing are now being reverted to, the argument being that any driver worth his salt will look after these things when he knows that they must be looked after; but when he has a perfect right to assume that these are being automatically attended to, failure on the part of the automatic device is certain to result in more or less serious damage. In this way the engines of 1906 have come to present a simplicity of outline, and the dashboards a comparative bareness that look strange beside the crowded and formidably furnished affairs of previous shows.

In radiators foreign firms seem to have found a means of rendering their cars distinctive in appearance, a sort of trade mark whereby each brand can be distinguished—not at all a bad idea commercially. And they have gone to the honeycomb radiator for this effect. Such firms as the Delaunay, Belleville, Germain, Gladiator, Spyker and Hotchkiss have adopted the honeycomb radiator with most artistic effect, viewed end on. British firms, however, have not sought for artistic effect—or have not secured it. They have to a great extent abandoned the honeycomb in favor of the vertical-tubed radiator, gilled, of course, and it must be admitted that this to a great extent lacks the appearance of the older type, although it is probably equally satisfactory in operation and certainly considerably cheaper to manufacture, besides being free from the tendency to leak under the effects of road vibration which is the fatal weakness of the honeycomb type. Necessity rather than choice has forced the British manufacturer into this, as so much of the water supply in this country is impregnated with calcareous and other deposits that the honeycomb type of cooler becomes rapidly furred up unless special means are taken to prevent it.

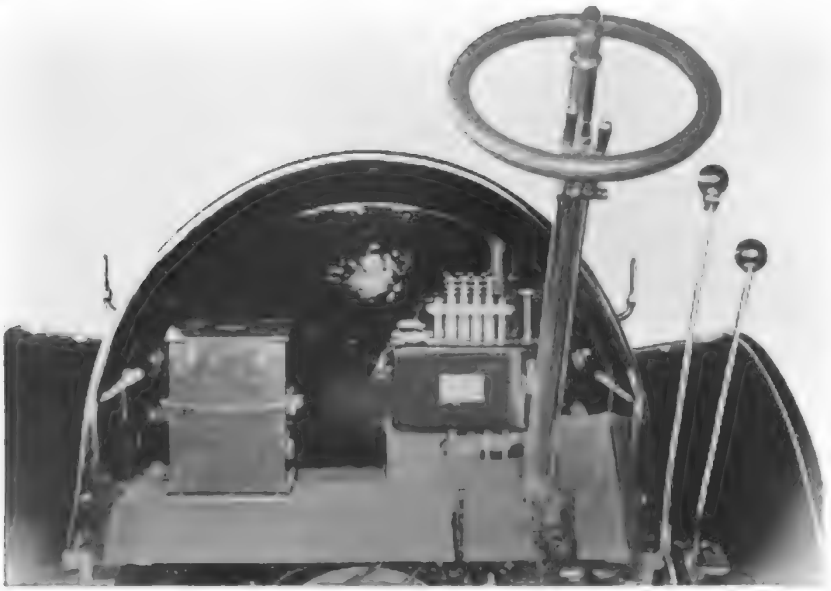
In bonnets the Mercedes and locomotive types in various modifications seem to be the leading lines. Some of the Mercedes types are quite squat, while some of the locomotive or barrel-shaped class are inordinately large for the amount of gear they cover or conceal. In splash guards a very much-needed measure of attention is noticeable. Some cars are to be seen in which the wheels are screened off from the frame and body. Splash guards follow the wheel contour more than formerly, and are carried nearer to the ground. Chain-cases to driving wheels are evidently going to be the thing on high-grade cars where chain transmission is retained, and nobody will quarrel with what is once more a sensible tip adopted from the cycle engineer.

The dashboard with curved over top and sides, first seen on the Daimler cars, has found a considerable number of imitators among British exhibitors, and is undoubtedly one advance on the bare and somewhat low dashboard, which continental designers have always favored. The curved dash permits the designer to dispose his coil, lubricators, manometer, speedometer and other warning paraphernalia under cover to some extent and move out of the way of harm while the appearance is not at all displeasing to the eye.

Another marked feature is the greatly

THE MUCH-DISCUSSED SIX-CYLINDER NAPIER MOTOR

Digitized by Google



ROUNDED METAL DASH OF THE 16-HORSEPOWER BEESTON HUMBER CAR

extended adoption of ball-bearings for every part except the crankshaft. It is proposed to fit them here also, but up to the present nobody has actually done so. When one remembers the scorn with which earlier motor designers flouted everything that savored of cycle practice, this adoption of the cycle manufacturers' pet form of bearing is instructive. Ball-bearing thrust blocks were the first step, and Mercedes designers set the fashion by fitting them to wheel hubs and gear shafts. Now they are finding their way into the steering pivots, magneto, countershaft chain wheel bearings, and, of course, live axle bearings. The danger to be apprehended from fractured balls or powdered bearings was found to be so largely the result of light or flimsy construction necessary to secure adjustability, that, once the latter doubtful advantage was dropped, and bearings made of size and material commensurate to their work, the indispensability of the ball-bearing for motor car construction became evident. At the moment the D. W. M. bearings are almost entirely relied upon and although "made in Germany" they are so satisfactory that their rivals are not having a very gay time.

It may be plainly said that although there are about half a dozen types of disk, or laminated, clutch on the market, there is little difference between them. But that difference is somewhat intricate as disk clutches require careful assembling and accurate designing and forming. They are consequently considerably more costly to make than the other types and the general desire to cheapen them is balked by the necessity to provide something that will cause the disks or plates to automatically free themselves when the clutch pedal is depressed and the clutch spring withdrawn. In the Hele-Shaw type, flat springs are imposed between the plates of each set—drivers and driven—so that, while the clutch spring pulls all the plates together to take frictional contract, the super-imposed springs in the laminations tend to separate the disks as soon as the pressure of the clutch spring is withdrawn. In the Bradley, which in various modification is seen for the first time on cars at a show, this separating function is performed by a series of studs, which are so arranged, and are of such length, that every plate or disk has three equidistant studs that do not find a passage through it. That is to say, if there are ten plates there are thirty freeing studs of which only twenty-seven pass through plate No. 9, twenty-four through plate No. 8, twenty-one through plate No. 7, eighteen through plate No. 6 and so on. The studs are of just sufficient length to exercise a pressure against the particular plate acted upon, in opposition to the superior power of the clutch spring. In this clutch a scissors action is introduced by the clutch spring which, situated between the actuating members of the drivers and driven disks, pulls the latter into frictional contact by forcing the actuating members asunder. As soon as the clutch spring is compressed the operating members, each carrying its circle of freeing studs, immediately commence releasing the disks—each being practically released in succession, and so on throughout the whole series. The Gladiator people, for instance, make their disks from mild steel case-hardened, and curves the edge of the disks so that main in frictional contact with each other, or with the opposing set, against the pressure of this curved edge or rim once the clutch spring pressure is withdrawn. In a sense, the Hele-Shaw design is improved upon by making the case-hardened rim of each disk take up the function of the flat spring adopted in the Hele-Shaw. It would be idle to deny that disk clutches have given bother, but they have only done so when badly constructed or neglected. The question of suitable lubricant in suitable quantity, suitable steel suitably treated, and correctly designed bearing surfaces, have been solved satisfactorily, and the disk clutch at the moment appears destined to outlast all others where the matter of cost is not a bar. The expanding metal-to-metal clutch is practically the only alternative for high-powered cars and the weight and massiveness of this is certain to cause its rejection in time, even granting that it is a very satisfactory device.

The usual form of expanding clutch is one arranged inside the fly wheel with cast iron shoes engaging with the internal circumference of the fly wheel. It is partly enclosed to retain a certain amount of oil and to exclude dirt and dust. It is normally held in engagement by an adjustable spring and provision is made to take up wear in the clutch shoes. A ball-bearing thrust is fitted which comes into operation when the clutch is being disengaged, but is really a superfluity, as there is very little end thrust. The clutch shoes are withdrawn by a wedge action operated by the sliding fork of the clutch, the wedge neutralizing the action of the spring and drawing together the clutch shoes.

In engine construction little that is really novel is to be noted outside the mere matter of cylinder duplication referred to above. At one time it appeared as though the three-cylinder type was to have a place, but this does not now appear probable. Firms making three-cylinder engines in this country have not had a too happy time. So far the only commercial success attained in three-cylinder design has been the Panhard, and even concerning this rumor has been tolerably busy. It is said that probably but for its undoubted adaptability for landaulet design this might have been dropped by the big French firm. As it is, it still remains a standard in the United Kingdom, although it is significant that it is not a standard in France. There has been to some extent a reversion to the practice of casting cylinders in pairs and in minor ways considerable diversity of treatment is observable, some placing the valve pockets on opposing sides of the cylinder, others on the same side, but less gear is shown exposed. A general tendency is to enable the half-time cam gear to be withdrawn bodily if required, and in other ways this question of accessibility has been carefully treated not only in the engine but in every portion of the car design. The tendency toward fast-running engines is more pronounced, nearly every fresh aspirant and a considerable number of the standard firms now fix 1,000 revolutions as their basis for calculating power, even on the largest cars. This, of course, indicates the lightening in construction which brings other benefits in its train. Firms, however, like the Daimler, Panhard, Mercedes, Wolseley, and others have made little alteration and still run their engines at speeds of from 750 to 900 revolutions.

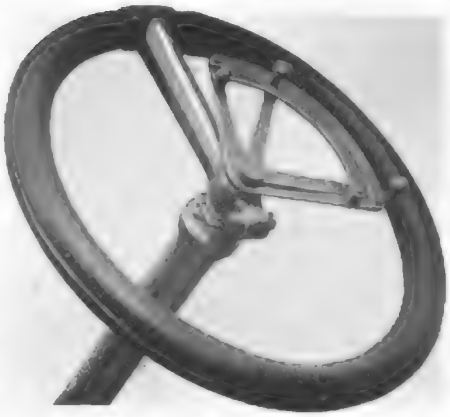
As was generally expected, the Wolseley company has now definitely commenced the abandonment of the horizontal engine, which is only found in the two smallest types manufactured; and it is also significant that despite their phenomenal victory in the Tourist trophy race, the Arrol-Johnston people in introducing a four-cylinder type, have adopted the vertical engine. James & Brown, the Singer company and some from your side such as the small Oldsmobile, the Adams-Hewitt and Cadillac retain the horizontal type, but broadly speaking, in this country at least, it has

Digitized by Google

become obsolete, not through any inherent defects of design, but simply because public demand is evidently in favor of the vertical type. In gears there is little to arouse comment beyond the increased adoption of the Mercedes type of split gear sleeve operated by the gate type of movement. This is more particularly noticeable on cars of 12 to 14 horsepower and upward, as the single long gear shaft of the Panhard type was found to spring under heavy driving pressures when gears began to wear a bit. By splitting the gear sleeve in two, the shafts, of course, can be maintained at much greater strength for the same weight. This and the adoption of ball-bearings to the gear shafts sum up the principal change in design. In the large power cars four speeds are invariably given, with direct drive on the fourth; in the small cars and the cheaper types three only are given in each case, the top speed being a direct drive.

In carbureters the influence of the Tourist trophy race is plainly visible. Automatic carburation is universally claimed, some insisting on greater success than their fellows by devices more or less founded on the Mercedes design, in which separate spray chambers are provided, which come into operation in sequence, according to the demand of the engine. Thus, if the car is running light, one spray chamber is sufficient to provide the necessary fuel, but the driver can, at will, bring all or any of these spray chambers into operation, and automatic arrangements are also provided by which the engine itself has a selective power in the same direction.

Not a little attention has been paid to convertible bodies, for your Englishman is just getting wise to the fact that it is economy to have two or possibly three bodies, particularly if he is at all luxurious and has a pocketbook long enough to stand the strain. The ability to make a quick shift from a touring car to a runabout or to a limousine is one that appeals strongly to the well-to-do classes. A touring car is not always a desirable machine to travel in going to the opera, so if it is possible to change bodies without great loss of time one really has two cars at his disposal. Or if the man of the house desires to knock around town in a runabout he finds the convertible



Humber One-Arm Steering Wheel

body to be just what he wants. It really is a three in one combination. One of the quick-change bodies greatly admired comes from the shop of W. and F. Thorn & Co., and can be turned into an open car, a landaulet or a victoria. For example, the landaulet is secured by slipping the front pillars on to the back of the front seat, which carries the front glass when it is raised from behind the seat. Two men can put the rear portion of the landaulet into position, which is firmly held by metal dowels which slip into slots prepared for them. The victoria hood goes on even easier when substituted for the landaulet top. This gives a car which affords sufficient protection in inclement weather. An ingenious spring fitting and stay striking device allows the landaulet head or victoria hood to be swung into position.

Lieutenant Windham has brought out a system for building the car body so that the back part can be almost instantly removed, and a runabout can be had. This is accomplished by means of a small, light steel flitch fastened to the sides of the frame of the chassis. In position this forms an L-shaped guide, the vertical and horizontal surfaces of which measure only about an inch. The lower edges of the sides of the body are made of corresponding shape, so that the latter may slide into position from the rear. The extreme forward portion of the bottom part of the body is cut aslant and abuts closely to the rear ends of the woodwork of the front seats. An automatic lock fastens the body, but to make it certain and insure greater rigidity there are two or three steel pins fastened into corresponding holes in the transverse members of the frame. No lifting tackle is required, wooden legs with rubber-tired castor wheels enabling one man to run the body on to the chassis. When it is being removed, the front legs can be dropped before the body is clear of the chassis. When once off it can be wheeled away. With this device the machinery is easily gotten at. And, too, one chassis affords a side-entrance tonneau, a brougham or a shooting brake body converted in a minute. Or a runabout can be had just as easily.

In tires it was noticed that the Dunlop people have a novelty in the way of a new security bolt, designed to obviate the liability of the old bolts to fold over and crinkle, which has often resulted in a burst tire. The new bolt is made with a comparatively stiff base of india rubber over the steel bolt-head. The rubber is clothed in canvas, which is believed to make it impossible to get out of shape.

While the Olympia shows of course attracted the most attention with its magnificent display of automobiles and parts, the Stanley affair at Agricultural hall is not overlooked by any means. That old standby, started away back in the cycling days, is doing business at the old stand, not in the least daunted by the splendor of the Kensington affair. All the motor car makers are not at Islington by any means, there being several instances of makers taking part in the Stanley and cutting out Olympia, although probably in most cases this is because they could not get satisfactory space allowances at the big hall. In addition there are motor cycles, tri-cars and pedal bicycles, while is anything, the exhibition of motor parts and sundries is far more complete than the rival affair can show. This is particularly true of the smaller articles. The Stanley is, in a smaller way, almost as handsomely decked out as the other one, while the attendance is keeping up in a way that shows the interest taken in shows by the British Public. The best part of it all is that people seem to go to the show to buy,

THE SELFISH INDIVIDUAL MOTORIST

IT HAS about become a settled fact that motoring organizations cannot depend upon the average motorist to be of any help in the matter of securing for the automobile community those things which have been earnestly sought since the automobile became at all popular.

The average automobolist—and more particularly the one who abides within the gates of most of the American cities—seeks his own pleasure and thinks little of his neighbor.

He might be of some service to the community if he were so disposed and if he only realized what organization and work mean. But he will not leave his own pleasure getting long enough to even sit down and do that little bit of thinking.

A few enthusiastic motorists in the country are hammering away with but scant support from the motorists at large and none too much from those who seemingly ought to have a vital interest in all that might be of benefit to the motoring community. It is not to be wondered that it is discouraging to the leaders of the automobile organizations—the national bodies and the clubs.

The fact that a club, for instance, is enabled to boast the enrollment of 500 or 1,000 names of prominent motorists as members is of little value when it comes to securing that to which motorists are entitled, to say nothing of what they think they should have, and, considering all that other users of the highways secure, what they really ought to have.

Names will not work and names do not nowadays carry any considerable amount of influence with them. It it the work that one does that makes him a valuable member of a club and not his name.

The clubs and other organizations which are in existence in most of the large cities of the United States are woefully lacking in earnest and hard working members. The average man is content to sit around and permit his brother member do his share of the work. He feels sufficiently puffed up to regard the use of his name on the membership roll as sufficient on his part.

He is missing a whole lot he might have in motoring freedom if he were to realize what it means to put his shoulder to the wheel and help out the men who are burdened with all that club life brings.

The lack of unity on the part of members, too, has had an ill effect. The public and the authorities know too well that there is little actual interest taken by club members, and so the club's influence is far from being what it might be.

Too frequently automobile organizations, particularly clubs, have been taken to task for not being of a more representative character and for not accomplishing more for the benefit of automobiling than has appeared in the surface.

Sifting the matter down possibly the managements of the clubs are justified in doing nothing more than furnishing entertainment for those members who take sufficient interest in the organization to attend these entertainments.

The individual motorist, whether a member of a club or not, who makes no effort to promote the good of automobiling in the matter of just legislation and good roads, should make no complaint whatever and his voice should never be heard. The citizen who has a vote and does not exercise the right of franchise is not in a position to criticize the results of elections and the acts of public officials. The motorist who does nothing and who says nothing is in exactly the same light.

The club member who does nothing and says nothing is in every manner a detriment to the organization; his membership should not be sought.

It always has been and it probably always will be that the organizations of the character of automobile clubs are dominated by a few public spirited and enthusiastic individuals who for their work and their time receive nothing more than criticism and abuse but who are usually charged with grafting.

There are officials whose names in the public press occasionally and on nice stationery always appeal to their owners; they are of no benefit to the organizations. These officials, put there by the membership at large for their apparent influence, can be of little benefit to any organization as long as they do nothing but permit their names to be used.

Man should be known for his deeds and not for his words. The number of men interested in the welfare of automobiling today could be placed under the fifty mark, and these fifty men are endeavoring in all decent forms to benefit the automobiling hosts. On the other hand, the automobiling hosts sit idly by and permit a few to do the work that should be divided among the thousands.

The difference between the cyclist of a decade ago and the motorist of today is that where the cyclist was compelled to fight for his right—because he was not burdened with money—the average motorist of today can afford and prefers to pay a fine, for instance, rather than be bothered fighting what might be a case of injustice.

The motorist who has permitted such a case to go by the boards deserves not only to be mulcted out of the money he paid as a fine, but the condemnation of all motorists, for by such action he has been guilty of encouraging graft, and the more encouragement the grafter receives the harder will be the burden of the automobilist.

It should be the endeavor of the clubs to punch up the individual motorist to the point of enthusiasm that will turn him from a drone to a worker. In no other manner can automobiling receive that to which it is justly entitled and have a standing in the country which will force recognition.

SETTING A VERY DANGEROUS EXAMPLE

WITH motorists clamoring for more liberality in the matter of speed laws, claiming few infractions thereof, it seems a little inconsistent for dealers and makers to flaunt a red flag in the face of the bull by attempting to break road records and to announce wonderful speed qualities of their cars on the highways.

The past few weeks have seen reports of a number of cases wherein those who should have been most careful were guilty of infractions of the laws governing speed of automobiles on the road. It requires only a few such cases to undo the work of many, work that has been accomplished by extraordinary effort for a good many years.

The motoring organizations that have persistently fought for liberality on the part of the authorities are receiving scant aid from the manufacturer, or the agent, or the individual motorist who tears through the country at such speed as will give him the credit of having gone from one to another place in a shorter space of time than did anybody else. If there is one who should be the observer of the law relating to speed, it is the man who is earning his living by the sale of cars, for the responsibility of the acts of the scholar are upon the head of the teacher.

The authorities and the rural residents are at present in no mood to be trifled with; they have some cause for drastic actions, and to fan the smouldering coals can in no manner do the least particle of good. It is commendable on the part of some that they do their stunts on tracks, where no harm to and no criticism from the public can be forthcoming.

Motor Age believes few of the present day speed laws are as liberal as they might be, but as long as these laws exist they should be respected. If they are not what they should be motorists ought to work to have them made satisfactory. To go out and break speed regulations will by no means tend to have speed limits raised; rather, it will tend to have more drastic regulations take their places.

Turning the Week

Selden Patent Suit

Did it ever strike you that motorphobia might be another name for the green-eyed monster?

Maybe the Glencoe trustees believed, when they put up their warning sign to scorchers, that "a soft answer turneth away wrath."

The scorcher caught red handed can settle back and think with pleasure how many Thanksgiving day dinners he is paying for today.

A proposed commercial line in Texas will, it is announced, run from "some point on Tremont street to Mike's place." There's nothing like having a good terminal.

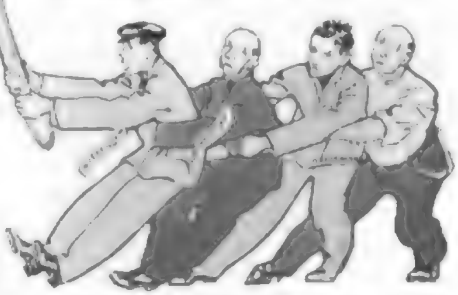
Many a motorist is today taking a tour through Turkey in his own dining room.

That the Thanksgiving day turkey will not be caught scorching is the hope of the motorist.

Maybe the Gliddenites are going through Canada next year to avoid Constable Quinn.

Cruel law-makers want Detroit automobiles to wear aprons. Next thing they will want them to go into the kitchen.

The Coliseum may be likened to a commercial wagon in that it has the First Regiment armory for a trailer for the approaching Chicago show.



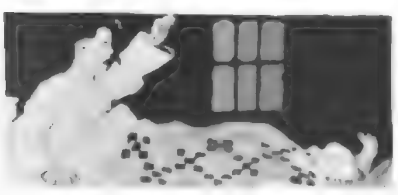
The Week

It's going to be a hard winter for the constables who were not far-sighted enough to make hay while the sun shone. The spendthrift will have to take to the snowball diet.

To hear all this racing talk one would imagine winter is just outside the door, only waiting until the Thanksgiving turkey is well digested before making anti-freezing compound almost as necessary as gasoline.

Those French makers who would only show at Olympia upon condition that the press would not give away the details of construction of their 1906 models resemble the ostrich who stuck his head in the sand and imagined he was well hidden. Over here such secrecy would only stir the press to redoubled efforts.

Bing-bang went the broadside of allotments from the Coliseum and New York armory last week. Boom-boom reverberates from the Madison Square garden this week. The attack from Olympia has been answered and it only remains for Paris to complete the war concert in the automobile world.



Michigan towns and villagers infected with good roads enthusiasm, many of them hastening to take advantage of state aid law with idea of securing best highways in country.

Announcement of list of spaces taken for Madison Square garden show is made: provision made for 220 exhibitors; twenty-one on waiting list; maps not ready.

Glidden tour committee decides to start next year's run from Buffalo, route going through Canada and White mountains and ending in New York city.

National Grange of Patrons of Husbandry recognizes motor car as "an innovation in modes of travel which must be accepted."

Olympia show closes in London after successful run, one authority claiming $7,500,000 worth of business was done.

Automobile Club of Philadelphia secures concession which will save members journeying to Harrisburg for licenses.

Conditions governing France's big tire race in 1906 given out: no one manufacturer can start more than four cars.

American Motor Car Manufacturers' Association meets in New York, admits new members and talks show.

R. L. Jefferson reaches Turkey, being first motorist to make trip, going 2,509 miles in 31 driving days.

Rumor has William K. Vanderbilt, Jr., in Florida trying out Hemery Darracq for January meet.

C. S. Rolls lectures before Ladies' Automobile Club of England on his motoring experiences.

Changes are made in Cuban program, sprint races being billed for Monday, February 12.

Percy Megargel, passing through California, greatly impressed with oil roads of state.

Joe Tracy sails for Europe to buy fastest racer obtainable for unknown customer.

Frederick Dufaux breaks French kilometer record, doing 23 seconds flat.

Show for automobile parts people talked of for Chicago next fall.

At Marshall field, Chicago, at the Michigan-Chicago gridiron battle today, it was hard to tell whether the affair was an automobile parade or a football game.

They say too many cooks spoil the broth, but it's a safe bet that when all the exhibitors get into the garden the only spoil connected with the affair will be the result of a well-conducted exhibition.

R. L. Jefferson—England's Percy Megargel—writes F. R. G. S. after his name. What's that mean? Probably Free Ride Going South, as indicated by his recent trip from England to Turkey.

Pittsburg is certainly up to date with its automobile ghost. The American people who work are familiar with the ghost that walks once a week, but they have yet to strike an aristocratic one that rides.

Just think what an ideal automobile ordinance Chicago will have when the city fathers are each provided with an automobile as per the plot that is hatching. Even liberal France will have to go to the Windy city for a model.

OIL ROADS THE THING

Percy Megargel Has Nothing But Praise for California Highways —Conditions on Coast

Palo, Alto, Cal., Nov. 21—Somewhere between here and San Francisco my suit case tumbled out of the tonneau of the Reo Mountaineer and now I am obliged to wear stage clothes, on and off the car. My leather and courduroy combination, while quite in place at the hunting camps in the Cascade and Rocky mountains, looks rather the worse for wear and considerably the worse for grease in the dining rooms at the semi-tropical hotels along the California coast. The lost case contained all my personal possessions carried on the trip, but I suppose this is one of the fortunes of war, or rather of touring.

The much-talked-of, much-written-of oil roads of California were no disappointment. The half has not been told, for never have I enjoyed an automobile trip more than the run from San Francisco to Palo Alto and they say that this is the worst stretch between San Francisco and Los Angeles, 500 miles further south. If such is the case it is no wonder the automobile and the motor cycle are so much in favor in California. Never once did I have to resort to low speed on the run from the city, while the oiled surface of the road did away with the obnoxious dust so frequently encountered in the east.

Few eastern automobilists have any idea what winter motoring in California is, or they would ship their machines to the Pacific coast at the first sign of frost and stay here until the winter months have passed. Imagine, if you can, a broad, oiled highway, wide enough for many automobiles or vehicles to pass at full speed, lined on either side by high shade trees and palms. In the east I have occasionaly run through such an avenue for ½ mile or so, but here it is the same for mile after mile. All cross roads seem to be built in the same manner. Every few miles we come to some small town, whose houses are all of the picturesque kind that I thought only existed in the guide books issued by the travel-seeking railroads.

Palo Alto, famed the world over for the wonders of the Leland Stanford University, is a typical college town and an up-to-date one, too. The 2,000 odd students—and many of them are odd—that comprise the university forces, distinguished according to class by the fantastic headgear worn—red hats, painted plugs and wide brimmed cowboy styles designating members of the three upper classes, while no hats at all or battered relics of what once might have been proper head coverings, show only too plainly the trials and tribulations of the freshmen at the big school.

At the big football game between Stanford University and the University of California, 230 automobiles were parked on the college campus. This will give a person some idea of the general use of the automobile in California.

Not only do automobiles sell out here, but the bicycle business is on the increase yearly, while motor bicycles cannot be shipped into California fast enough to supply the demand. Four hundred bicycles was the week's business done by one San Francisco jobber last week, they tell me. To anyone in the east who thinks the bicycle is a thing of the past, a trip to California would convince him otherwise.

The express on automobiles to California is something enormous and freight is almost as high. Machines that sell in the east for $1,250, bring $1,400 here and larger machines a correspondingly higher price. The Sunset Automobile Co., of San Francisco is manufacturing a two-cycle, two-cylinder runabout, but all other machines are of eastern make. While the larger machines find many purchasers, the demand seems to be for a popular price, popular weight tonneau car, the tonneau of which can be detached when a runabout is desired. Cars to meet San Francisco requirements should possess at least 12 horsepower, while 16 is preferable.

Luckily for us, the Reo Mountaineer is well equipped with powerful brakes, for the hills one encounters in the city of San Francisco are far steeper than anything I have encountered in either the Rocky or Cascade mountains. Of course, they are paved and much smoother, making it easier to climb them, but with their smooth surface it is an easy matter for a car not provided with ample brakes of a powerful nature, to get beyond the control of the operator and do untold damage. The street cars used on these hills are all cable cars, no electric being powerful enough to be kept in control during the descent. From Palo Alto we run to Los Angeles and then across Arizona and New Mexico to Kansas.—PERCY F. MEGARGEL.

BUCKEYES NOT AFRAID

Cleveland, O., Nov. 26—W. L. Colt, chairman of the Cleveland Automobile Dealers' Association show committee, says the club has no fear that the project will be interfered with by T. C. Whitcomb or any one else. As intimated last week, Whitcomb claims to have an option on Central armory for the show week. The dealers' organization claims it has a signed and sealed contract giving it the use of the armory for that week and an option can make no difference. George Collister, who will manage the show, is getting out plans of spaces and entry blanks and these will be sent out this week. Central armory is much larger than Gray's armory, where the show has been held heretofore, and the only reason it was not used before was the fact that there were no provisions for heating the building. It is believed the association can accommodate 50 per cent more people than ever before.

HAS NEW AIRSHIP

Toledo, O., Nov. 27—Roy Knabenshue, the aeronaut, is building a new airship at his home city, for his use. The new craft will be much improved, with a more powerful engine, while other defects in the original air vessel will be corrected. The greatest difficulty the aeronaut had at first was with the carbureter, which produced an uneven flow of gasoline, causing the engine to stop, and the ship to come to earth. Knabenshue is now using the invention of Charles W. Parsons, of Toledo, an inventor of a vacuum carbureter which has solved this problem.

FIX UP GLIDDEN TOUR

Next Year's Run Will Start at Buffalo and Run Through Canada to New York

New York, Nov. 25—The A. A. A. Glidden tour committee, in announcing the route and starting point of next year's run, has given marked consideration to westerners, who in the last tour were asked to come to New York for their start. Next year the run will be for the greater part of the way through Canada. The start will be made from Buffalo on July 23 and the jaunt last for 2 weeks. The start will be made from Buffalo at the special invitation of the Buffalo Automobile Club, one of whose members, Percy Pierce, is the present holder of the cup. The Canadian motorists, and particularly the Toronto Automobile Club, which extended a special invitation, have been urgent for the past year that the tour should be in part in their territory. They had magnificent roads and unsurpassed scenery to offer and the committee did not resist the temptation to select a new path and new surroundings in a run through Canada.

Beginning at Buffalo, the tourists will visit Niagara Falls, crossing into Canada, visiting Hamilton, Toronto, Kingston, the Thousand Islands, Ottawa, Montreal and Quebec, thence heading south to Poland Springs, Me., next crossing the White Mountains country, traversing Vermont to Lake Champlain, thence to Saratoga, to Albany, and following the Hudson river to New York City.

The route will be a circuitous one, taking in the best roads in Canada and the most picturesque sections of the New England states. The distance to be traveled will be nearly 1,500 miles. The test will be a particularly severe one, owing to the mountainous and unimproved condition of many of the roads to be traversed. Niagara Falls will be visited en route to the Canadian border. Special arrangements are pending with the Canadian customs authorities so that no trouble may be experienced from that source. From Niagara Falls the route will be over a fine old gravel road through St. Catharines, Grimsby and Hamilton, to Toronto, where the first night's stop will be. The tourists will be entertained by the Toronto Automobile Club.

The second day's run will be over the famous Kingston road, the best macadamized highway in Canada, passing through Whitby, Oshawa, Bowmanville, Port Hope, Coburg, Belleville and other old Canadian towns to Kingston. As this point is the military headquarters for Ontario and at the beginning of the St. Lawrence river and the Thousand Islands, it is possible that a day may be spent in the neighborhood by the tourists.

Dirt roads of inferior quality will be ridden over on the third day via Brockville and Prescott and thence north to Ottawa, the Canadian capital. Here will be a night stop before beginning the short but tedious journey over dirt and rock roads to Montreal, the largest city in the Dominion. Better roads and a more interesting run will be had on the fifth day

Digitized by Google

along the south shore of the St. Lawrence to Quebec, one of the oldest and most picturesque cities on this continent.

From this point the itinerary is not so well fixed in mind, but will include a run south over the uncertain Maine roads to Poland Springs, thence west through New Hampshire and the White Mountains to Bretton Woods for a day's rest, then traversing Vermont to Lake Champlain; thence to Saratoga and Albany and along the Hudson river to New York.

Though the route chosen will be interesting from a scenic standpoint, it will be so severe a test for so short a time to be occupied that those who know something of the roads to be traversed believe that the itinerary will need to be considerably curtailed. These point out that the worst roads of the Canadian loop could be obviated by making the run from Kingston direct to Montreal instead of turning north at Prescott. It is believed also that an improvement will be made by taking a more direct route from the White Mountains to New York via Massachusetts.

TIRE RACE CONDITIONS

Paris, Nov. 18—Conditions which will govern France's tire race, styled the coup de bandage, have been made up. Not more than four cars can be entered by one manufacturer. The entrance fee of $600 is fixed for each car up to February 15, but after that date the fee will be doubled, the entries being closed on May 15. The distance to be covered will be from 620 to 930 miles, and the race may be cut into two stages if necessary. The weight of the chassis is not to exceed 2,650 pounds, including two seats. Each vehicle must carry a box behind the seats capable of containing 880 pounds of dead weight in the shape of sand, this load being so arranged that it is carried directly over the rear axle. The cars must have the same type of tires on all four wheels. These tires will be divided into two classes, one consisting of ordinary pneumatic tires and the other solid tires of all kinds and springs, etc., or a combination of solid tires and springs. Elastic wheels cannot be used with pneumatic tires. The covers and non-skids, if used, will have to be marked, and must not be changed during the race, but four spare air tubes may be carried with each car, and marked in the same way. Repairs can only be carried out by the driver and his mechanic with the aid of tools on board. The solid tires will also be marked, and no part can be replaced during the race. Nevertheless, the maker of a solid tire may apply for permission to carry spare parts, and the sporting commission will decide whether this application can be granted. In sending in an entry, the maker must submit a drawing of his tire, a complete tire, the pieces that he would like to have the option of changing during the race, and a full account of the operation of replacing.

AUSTRALIAN WIN

New York, Nov. 24—Cable advices received by the Continental Caoutchouc Co. from the factory at Hanover, Germany, that the reliability race between Melbourn and Sydney, Australia, was won on a Mercedes car fitted with Continental tires.

SMOKY CITY IS ON MAP

Importance of Pittsburg in Motoring World Now Recognized by Makers—Plans for 1906

Pittsburg, Pa., Nov. 27—At last Pittsburg is on the map. Every railroad that has a town along its line that manufactures automobiles is doing a good passenger business carrying the representatives of those factories to the Smoky City. Five years ago such an outlay for car fare would have been thought financial imbecility. Now there is not a motor car manufacturer however thick he may have been who has not been pricked hard and deep the last 2 years by the thought that his firm was not getting any or at least not enough of the hundreds of thousands of dollars' worth of business that was going out of the busiest town in the world. He is wide awake this fall. Not a stone will be left unturned to get next to the Pittsburg dealers, old and new, and carry off their cash.

Such a scrambling for agencies and for agents has never been seen in Pennsylvania before. If the man of means or credit that calls Greater Pittsburg his home cannot find an automobile in 1906 to suit his tastes and right at home, too, he must be a veritable petticoat enthusiast of the fifteent variety. Over sixty models will be ready for his inspection by the first of the year. They will range in cost all the way from $500 to $5,000. Their respective claims for being able to stand the Pittsburg hills and so-called pavements will be marvelously strong, for manufacturers have learned a thing or two in the last 2 years and are taking note of these little bits of wisdom in planning their new machines.

From the early days of automobiling, when the Autocar and the Peerless were among the pioneers on Pittsburg streets, the industry has grown to such proportions that nearly a dozen new agencies have been added to the list for 1906. Several old firms have taken on one or more new agencies. The new firms naturally are getting the new agencies and there is going to be the fiercest kind of rivalry this year between the opposing forces.

To begin with the older agencies. The Banker Brothers Co. will handle in 1906 the Pierce, Stevens-Duryea, Cadillac and Studebaker in all their models. The Stevens-Duryea was handled last year by the Keystone Automobile Co. Banker Brothers last year had the Buick and the Northern.

The Standard Automobile Co. will handle the Pope-Toledo, Franklin, Winton, Packard, Royal Tourist and the Oldsmobile. The Standard has given up the electric business and the Pope-Waverley will be taken over by B. L. Brown, its electric manager, who will establish a new place in the garage now occupied by the Hiland Automobile Co. as soon as the latter's new building is completed. The Royal Tourist is a new agency for the Standard and is the first time it has come into any extensive prominent here.

The Keystone Automobile Co. under its new manager, G. P. Moore, formerly of Chicago, will stick to the White steamer and the Ford. These cars have proven great favorites in Pittsburg. The company has given up the agency for the Stevens-Duryea and the Columbia. The Keystone has the exclusive Pittsburg agency for the Exide battery of the Electric Storage & Battery Co., of Philadelphia and this department of its business was very profitable last year.

One year old, the Hiland Automobile Co. will sell the Autocar, Peerless, Thomas and the Buick. The Autocar has been hitherto the only agency of the Hiland people. The Liberty Automobile Co., also organized 1 year ago, will stick to the National, which it handled with good success last year. It has given up the Ford and Acme agencies. The Central Automobile Co., recently organized, will start business with the Reo and the Stoddard-Dayton. The Reo was sold last season by King & Larimer and the Stoddard-Dayton is a new agency in Pittsburg. The Central will be ready for business in its new garage about December 15.

L. G. Martin, the Oakland automobile dealer whose garage is close to the main entrance of Schenley park, will pin his faith to the Rambler. Last season he handled the Thomas. The East Liberty Automobile Co., which has just been announced, has taken on the agency of the Jackson. This is a brand new agency in Pittsburg. The Atlas Automobile Co., which has dealt hitherto exclusively in second-hand cars, will shortly take on a new agency as it is now negotiating for three well known cars. The American Motor Co., which expects to locate downtown, has not announced its agencies nor have King & Larimer, of the east end.

Most suggestive about this agency business now is that the agencies are being signed up fully a month earlier than last year. Since October 1 manufacturers have been sending their representatives to this city to look over the field and make a choice of firms to handle their respective cars. The fact that many local wealthy automobile buyers visited the factories themselves early in the fall to get an idea of the 1906 models was enough to make the local dealers hurry up in closing their contracts and the automobile business will be in much the best shape by January 1 that it has ever been as a result.

NEW INDEPENDENTS

New York, Nov. 25—The American Motor Car Manufacturers' Association's executive committee completed a 2 days' session today. Those present were: J. C. Couzens, Ford Motor Co.; William M. Lewis, Mitchell Motor Car Co.; A. C. Newby, National Automobile Co.; Benjamin Briscoe, Maxwell-Briscoe Motor Car Co.; and Roger B. McMullen, manager. Mr. McMullen said the meeting was devoted entirely to show matters and the discussion of the allotments of space. The E. W. Bliss Co., of Brooklyn, the Whitehead torpedo people, was elected to membership and so was the Moone Motor Car Co. of St. Louis, an offshoot of the Moone Buggy Co., an extensive carriage building concern. This raised the membership pin the association to twenty-two. Mr. McMullen said 300 models would be exhibited at the independent show.

AIRS VIEWS ON STEEL

French Expert Reads a Paper On Use of the Metal in Constuction of the Automobile

Washington, D. C., Nov. 24—In consideration of the fact that American automobile manufacturers have taken decisive steps to discover the best steel for their use by engaging an expert to coöperate with a man appointed by the steel trust, the paper read at a recent meeting of the British Iron and Steel Institute at Sheffield by M. Guillet, of Paris, on steel for motor car construction in France is particularly interesting. In part, according to advices received by one of the branches of the federal government, the paper was as follows:

"No one could question the fact that the industry which, during the last few years, has had most influence on the metallurgy of the special steels was that of motor-car construction. The special steels actually in use in France for the construction of motor cars could be classified as: 1, steels with low percentages of carbon and nickel pearlitic steels, used for parts requiring cementing and quenching, such as shafts and gears which engage directly; 2, steels with medium percentages of carbon and low percentages of nickel, used after quenching and reheating, and for a large number of parts, such as shafts, gearing and pinions; 3, steels low in carbon and with high percentages of nickel, used for valves; 4, chromium steels, with high carbon and low chromium percentages, used for bearings; 5, silicon steels; 6, nickel-chromium steels, and, 7, a new steel known as NY, the composition of which has not been published."

A man with practical motor car building experience, and, in several countries, a great experience in the manufacture of steel articles, recently said there was no great need for increase of resistance to shock in steel used for the larger type of automobiles. The present steel was serving very well, he held. It is, however, important for the smaller cars with lighter parts. He said he was able to obtain satisfactory British steel, that he did not think the French were able to get better steel than he was using, and that a German automobile firm, owing to important connections with the steel trade, had been able earlier than the rest of motor manufacturers to get the assistance of the best German steel makers in the selection of the right steel for each part and its kind of work in motor cars. This expert assistance of steel makers has been valuable in bringing this car to the front; but now that the automobile industry was one in which the development of sales would profit any steel company, the same German steel companies and other steel companies, including British, having awakened to the possibilities of the market, are offering the kinds of steel to automobile builders they need and making clear regarding each kind its best use.

The demand in America at present is for high carbon steels suitable for crank shafts for high speed four-cylinder, four-cycle motor, as in this part of the automobile frequent weakness is found, crank shafts frequently giving way with a too sudden starting. Americans are also searching for a grade of steel suitable for valves. In this grade of steel the carbon percentage should be small and nickel percentage high, a composition that resists pitting most successfully and stands high temperatures without serious depreciation of its cohesion.

Experiments in the manufacture of these particular grades of steel have been conducted in Europe for over 4 years and most satisfactory results have been obtained, but the limitations of the supply and the cornering of the market by a few of the leading concerns succeeded for a time in keeping the masses of manufacturers out in the cold—they not even being able to buy a supply at any price.

BRITONS POOR ROAD MAKERS

Washington, D. C., Nov. 24—Road experts connected with the United States department of agriculture are much interested in a recent official report concerning the results of unintelligent, unscientific road repairing along the Thames in London. This great road along the Thames, one of the most important thoroughfares in London, known as the Thames embankment, was very rough, and efforts were made to remedy this condition. One would think that a sound knowledge of roadmaking would surely be displayed in repairing such a thoroughfare as the Thames embankment, but the methods pursued were far from being scientific. After the scarifier had been at work and the road torn up, loads of blue metal were dumped down, but this stone was of a very uneven nature, both as to size and shape, many of the pieces being long and narrow, while others were small and approximately cubical, and there was additionally a large proportion of irregularly shaped stones. The loads were roughly spread across the roadway, and in many cases the wheel ruts of the carts were not even raked out. Over this chaotic heap was strown—shade of Macadam—pulverized clay. Water was then copiously flooded on to this interesting mass to induce the clay to get in between the crevices or chasms in the roadway. This it speedily did, although naturally much remained as mud on the surface. Then the steam roller got to work, and soon the roadway looked quite smooth and nice. But it did not stay in that condition long and a spell of bad weather soon made it as rough as ever.

EMPIRE STATE PROJECT

Buffalo, N. Y., Nov. 27—One of the latest rumors in connection with the Niagara, N. Y., Lockport and Ontario Power Co.'s electrical transmission line is that it is the intention of the company to build a broad, smooth roadway, similar to the state roads, and to operate a line of electric vehicles, including large motor car buses and touring cars, as a public carrying service for passengers. A complete and extensive transportation system will be established, with a regular schedule, beginning at Lockport and running through to Rochester. From Lockport it is also intended to build another roadway to Tonawanda and Buffalo along the right of way obtained for the branch line.

ROLLS AS A PIONEER

Prominent Englishman Lectures on His Adventures in Early Days of Automobiling

London, Nov. 18—C. S. Rolls is one of society's favorites in the automobile way and, like a wise young man, he has turned it to commercial account by opening into the motor car trade in the west end of London. He has something of genius, too, in getting the press limelight always on or about him. We are now in a rather dull period for trade since the selling season has ended and until some time after the show it will not be reopened. Under such circumstances it was a smart move on the part of Lord Langattock's heir to lecture this week before the high born dames of the Ladies' Automobile Club on his motoring experiences. These have been long varied and exciting and Rolls is no bad raconteur.

Rolls' lecture was illustrated by a variety of lantern slides from his unique collection. He commenced by showing an illustration of an Italian vehicle built as early as 1649, which was propelled by springs wound up by manual labor. Descriptions were then given of early attempts at mechanical road locomotion, including a vehicle driven by mechanical legs; for in the early days it was not believed that sufficient adhesion could be obtained to propel a car by applying power to its wheels until Trevithick, the father of the high-pressure engine, demonstrated this in the year 1800. Trevithick's steam carriage was the first successful vehicle that carried passengers along an English highway. Illustrations were shown of steam coaches built by Hill, James, Gurney and Hancock. The two last named ran regular services of motor omnibuses about the year 1830 between Gloucester and Cheltenham, Glasgow and Paisley, and in various parts of London. These early vehicles proved themselves commercially and mechanically successful until they were driven off the roads by popular prejudice and opposing interests. Large heaps of stones were laid across the routes to obstruct the vehicles, and prohibitive tolls were exacted at all turnpikes. At one turnpike, for instance, where a coach-and-four paid $1, a steam coach was charged the sum of $11.72.

A select committee of the house of commons appointed in 1831 reported completely in favor of the new locomotion. Notwithstanding this, an act was passed which made it virtually impossible to run steam vehicles with any commercial success, and between that period and 1896 anything running on the highway that carried its own power was tied down to a maximum speed limit of 4 miles an hour in the country and 2 in towns, and a man to walk in front waving a red flag.

The lecturer narrated some experiences he had had in the early days of motoring, prior to the passing of the 1896 act, which abolished the 4-mile an hour and red flag regulations. Before radiators were fitted a car could never run more than 10 miles; the cooling water then had to be changed. Rolls, who brought to Cambridge the first motor car ever seen there, remarked that

Digitized by Google

he had frequently got into trouble through getting back late at night after a breakdown, but that he had squared numerous dons and others by taking them out on the car. Many of these runs, however, ended in pushing the car home with the assistance of his venerable passengers. He described some hair-breadth escapes, including a runaway down one of the steepest hills to be found in Gloucestershire.

Rolls told of his first ride of any length in this country prior to the passing of the 1896 act. He had already been summoned and fined for exceeding the legal limit of 4 miles an hour and for not having a man walking in front waving a red flag. His first run to Cambridge, which took place one night, was full of incidents. He started by giving a friendly policeman a lift. Frequent stops had to be made to empty out the water which boiled and take in fresh water, which generally had to be got by climbing over into private gardens, and so forth. When the car was stopped in a village it made so much noise that everyone woke up, and infuriated night-clad figures appeared at the windows. Towards the end of the journey the occupants of the vehicle all fell asleep, including even the driver, a rude awakening being caused by the feeling of the car bumping on the grass at the side of the road. The journey was eventually accomplished in 11¾ hours.

In November, 1896, the night before the run from London to Brighton to celebrate the emancipation of the motor, an axle broke and the car overturned with a tremendous crash; the occupants, however, escaped with a bad shaking. Another run in the same year was from London to Mr. Rolls' home in Monmouthshire, which occupied 3 days—a fortnight's work having been devoted to the preparation of the car. During this run, when descending Birdlip hill, one of the most dangerous descents in the country, all the brakes gave out, and the car bounded forward out of all control, skidding and swerving round every corner. The car had a canopy, which made it very heavy, in addition to which there was a glass screen in front, that, coupled with the darkness which was coming on, made it extremely difficult to steer round corners on a strange road. At one moment a light was seen straight ahead, and it was thought that a collision was unavoidable, for it would have been impossible in the narrow road to pass another vehicle. Happily, however, the light turned out to be a house and Rolls went on his way rejoicing.

FARMERS COMING AROUND

Philadelphia, Pa., Nov. 25—The automobile took up a surprisingly large portion of the deliberations of the National Grange of the Patrons of Husbandry, which closed its sessions at Atlantic City on Wednesday of last week. Naturally much opposition—oftentimes bitterness—was apparent in the discussions, some of the delegates favoring drastic legislation governing the operation of automobiles on country roads, but on the last day a much more generous spirit seemed to prevail and the conservative element downed the extremists. The Grange recognized the motor car as "an innovation in modes of travel which must be accepted."

GOOD ROADS THE CRY

Michigan Has the Improvement Fever and Towns and Villages are Seeking State Aid

Grand Rapids, Mich., Nov. 27—Michigan is being swept by a good roads reform. From the upper peninsula to the Indiana boundary line and from Lake Huron to Lake Michigan the cry for good roads is heard. Counties are taking it up individually and in some cases the townships are acting on their own responsibilty. The villages and townships are taking advantage of state aid in the bettering of their highways and the reform will result in Michigan having the best roads in the country, it is expected.

Since the village of Shelby in Oceana county received a check for $1,250 from the state for completing 1¼ miles of stone road during the past year, many villages and townships are making efforts along the same lines. The voters of Benona township in the same county are even now considering a proposition to bond the township for $10,000 to build four miles of macadam road in the near future.

The village of Crystal was the scene of a good roads meeting on the evening of November 24 at which the proposition of adopting the township road system was discussed. It is probable that it will adopt this system and a great many other villages are expected to follow in its footsteps. During the year 1905 there has been nearly $35,000 spent in Oceana county alone toward the betterment of the roads.

From Ontonagon county, 'way off in the northwestern corner of the upper peninsula, comes the news that the County State Land Road Association has been formed for the purpose of bettering the highways. Jerome Brown of Matchwood is president. While this looks like a local affair, as it would seem that no automobiles would ever penetrate to this section of the wolverine state, the impression is incorrect, for, in spite of the thick timber and the unfavorable climate, the automobile has already become firmly established in the upper peninsula.

In Muskegon county, where it would seem as if nothing could be done for the roads, on account of the deep sand, the townships are discussing the advisability of bettering the highways. The same can be said for almost every county in the state, excepting that the roads in the inland counties can be improved with a great deal less labor.

State Highway Commissioner Horatio S. Earle is very enthusiastic over the prospects for better roads. In addressing the Normal Farmers' institute of Ingham county, at Lansing recently, he explained the new road law. He declares the county road law and the state reward road law provides the best system of making roads in the United States. Under the law, if adopted, a 1 mill tax is spread on all property in the county and the tax is expended by the county road board in keeping in repair and building such roads as are deemed necessary to adopt as county roads.

Mr. Earle says the law needs some amendments but that these will undoubtedly be made at the next session of the legislature. It has already been adopted by twenty counties in the state and has been found ideal. The state also gives aid toward the establishment of good roads by giving premiums for work done and this will protect the townships and counties in their expenditures. With all this encouragement it would seem that the taxpayers would fairly tumble over each other in their efforts to make for Michigan a good roads system that will compare favorably with any in the United States.

ROAD BOOK OF RIGHT SORT

Cleveland, O., Nov. 26—The Cleveland Automobile Club, through its secretary, Charles Marvin, is preparing to issue a road book covering all the important roads in Ohio. In connection with it will be a series of maps of the different counties, showing the roads, their condition in various kinds of weather, points of identification, heavy grades, hotels, eating houses, garages and fuel supply depots, telephone lines, electric lines and other detailed information of value to tourists. It is believed it will be the most complete book of its kind ever issued in any state and it will be published for the members of the club and its friends. Mr. Marvin has spent many months in procuring and compiling this information. The system he used was long and arduous, but it has been thorough and effective. First he wrote to editors of papers in all important towns asking for the names of several enthusiasts in the town. Then he wrote to each of these parties in the same town asking for the same line of information. In this way he secured a great variety of information from each district. He has made several trips over some of the most important routes.

REGISTRATION MADE EASY

Philadelphia, Pa., Nov. 27—The Automobile Club of Philadelphia has made an arrangement with the automobile bureau of the state highway department of Pennsylvania whereby the individual members of the club will not be compelled to journey to the state capital to secure their license tags, but may fill out applications at the club's quarters and have them forwarded. The new law, which will go into effect January 1, allows the holder to use his license tag on any machine he may choose to drive, but while in Pennsylvania no machine can legally carry any tag but that issued by the state. The 1906 license will also be recognized in New York state without further registration. The fee, however, will be $3 instead of $1 as formerly. Non-club members are wondering whether some arrangement cannot be made whereby they may be similarly accommodated without being compelled to travel to Harrisburg, which means $5 carefare and a day lost. License blanks will be issued in about a week.

TALKS SHOW FOR PARTS MEN

Chicago, Nov. 28—A. M. Andrews, 184 La Salle street, secretary of an organization styled the Automobile Parts, Appliances and Accessories Co., of Chicago, announces he is preparing to hold a show for this branch of the industry in Chicago next September or October. He states he has promises of support from the trade.

GARDEN SHOW ATTRACTS MANY

Accommodations Are Found for Only 220 Exhibitors, Twenty-one Having To Go on Waiting List—Thirty-two Pleasure Vehicles on Main Floor—Maps Not Ready

New York, Nov. 25—It has been found impossible to find accommodations for all the applicants for space at the Madison Square garden show and twenty-one have been placed on the waiting list. This appears from the announcement issued to-day by the Licensed Association of Automobile Manufacturers of the exhibitors and allotments for the sixth annual show in the garden, which will be held January 13-20, 1906.

Provision has been made for 220 exhibitors. In making the allotment the show committee, which is made up of George Pope, M. I. Brock, C. R. Mabley and M. L. Downs, has placed thirty-two exhibitors of pleasure vehicles on the main floor, and ten in the restaurant. In the basement there will be nine exhibits of commercial wagons. Exhibitors of parts, accessories and machinery have been placed in the balconies, raised platforms and concert hall.

Efforts are being made to secure space for those who are now on the waiting list, but exhibitors are not prone to give up any space alloted them, for they have already been cut down to the limit. The committee could well have sold half as much more space as it had, notwithstanding the armory exhibition.

The importers' section embraces Smith & Mabley, Mercedes, Panhard and Renault; Sidney B. Bowman Automobile Co., Clement-Bayard; American Darracq Automobile Co., Darracq; Hollander & Tangeman, the Hol-Tan Co. to be, Fiat; Auto Import Co., Rochet-Schneider; de Dietrich Importing Co., de Dietrich, and Gallia Electric Carriage Co., Gallia electric.

Maps showing the exact space allotment are not yet ready for publication. The exhibitors will be:

J. Stevens Arms & Tool Co.
Walter Automobile Co.
Apperson Bros. Automobile Co.
Cadillac Motor Car Co.
Royal Motor Car Co.
Waltham Manufacturing Co.
Northern Manufacturing Co.
Pope Manufacturing Co.
Elmore Manufacturing Co.
Olds Motor Works.
H. H. Franklin Manufacturing Co.
Electric Vehicle Co.
Buick Motor Co.
Sidney B. Bowman Automobile Co.
Smith & Mabley.
American Darracq Automobile Co.
Decauville Automobile Co.
Hollander & Tangeman.
Auto Import Co.
George N. Pierce Co.
Packard Motor Car Co.
Autocar Co.
Peerless Motor Car Co.

CHANGE CUBAN CARD

New York, Nov. 28—Special telegram—At a conference on the Havana program Bowen, Senor Conill and Senator Morgan amended the schedule so as to have the sprint races on Monday, February 12, which will allow the racing men and visitors to catch the steamers which leave Tuesdays instead of Mondays. Conill has given a silver plaque for a mile race, to be known as the Conill trophy, and leased the 130-horsepower Clement-Bayard from Clement, with Villeman, a French crack, as driver. Senor Terry, who has raced abroad, will also defend the Havana cup with a big Mercedes racer, with himself as driver. Joe Tracy sailed today with a commission from an unrevealed customer to buy the fastest racer obtainable. It is rumored that Alfred Vanderbilt has a 250-horsepower racer building in this country for the Ormond meet. The Vanderbilt Locomobile will be in Florida with a factory driver.

HOME FOR BAY STATERS

Boston, Mass., Nov. 24—On December 1 the Bay State Automobile Association is to take up new quarters at the Woodland Park hotel, Auburndale, its board of officers having this week leased that portion of the hotel known as the casino. This embraces the billiard room, bowling alleys, a large reception room and a private cafe—just what the club has long desired. The hotel is about 8 miles' ride from Boston proper, over the finest of boulevard roads, and in the heart of what is known as the riding district. The new quarters will be dedicated to the cause of motoring by the holding of a gigantic smoker about the first of the month. Similar events will follow each other in rapid succession throughout the winter season.

JOLLY FOR JOLIETERS

Chicago, Nov. 27—The Joliet & Aurora Electric Railway connects these two Illinois cities and between them passes through several small places from which it is the intention of the company to run automobile feeders to outlying places distant from the electric line and thereby greatly increase the earnings of the road. One of these feeders will be from Yorkville to Plano and Sandwich. Over the route it is the intention to run two fourteen-passenger buses, each of which is expected to make the trip one way in 1 hour.

LAUGH IS ON THE EARL

Russell Tattles on Fellow Motorists and Is Himself Fined Later On for Scorching

London, Nov. 18—About a month ago Earl Russell, who ranks as one of the leaders of English automobiledom, as instanced in the membership of the Automobile Club of Great Britain and Ireland, was stirred to wrath by the reckless inconsiderateness of a fellow motorist who drove past him into Kingston-on-Thames at a pace that must have been hot to have shaken up a hardened sinner like the earl. Accordingly, he laid information against the offender and gave up a day to having him punished. The Kingston bench was loud in its commendation of the earl and in fining the offender $25 said some nice things about his lordship's public spirited action. But the British automobile forces were not so enthusiastic. They took up an attitude of reserve bordering on disapproval and went so far as to suggest that the police should be allowed to do its own dirty work without any assistance from motorists.

That ended the situation, apparently, but it had a sequel which was only disclosed a short time ago. This time it was Earl Russell who was the delinquent, and the court was at Guildford, in Surrey, also, and only 20 miles further on the Kingston road. He was accused by the police of having driven his car through a police trap at the rate of 26 miles an hour. He admitted the probability of the speed, but took occasion to point out that no road user was incommoded, much less endangered, and urged that the offense was merely a technical breach of an absurd rule. He went on to shake a monitory finger at the Guilford bench, whom he accused of having already fined every one of eighty drivers summoned for similar offenses under similar circumstances, their total purgings reaching nearly $2,500 in 7 months. But so far as one could judge by the result he seemed to have merely added insult to injury, for the fine for his breach was promptly assessed at $50 and costs. He appealed for a new trial, but just the same every motorist in London laughed contentedly at the turnup, which has shown to Earl Russell the ingratitude of police and magistrates. The incident is not an elevating one, and while, on the one hand, it indicates that those who live in glass houses should not throw stones, it also goes to prove that even the leaders of automobilism designedly flout the laws that have been laid down for their government. They arrogate to themselves the right to drive at a pace in excess of that conceded by law when they like, and that fact is doing more to arouse popular antipathy to motoring than the actual indiscretions would otherwise have caused. It causes the public to look with indulgence if not approval on the concealed police trap, for if private individuals put themselves above the law and there is no other means of bringing them to their proper senses, then the trap is not merely justifiable but necessary.

If sensible motorists as a class would lay information against the real road hogs in their ranks the public would soon turn against the police trapping methods. But these motorists believe that the law will be altered to suit their views and so rest on their oars. It is practically certain, however, even at this early hour, that any alteration in that way will be accompanied by restrictions and conditions which will render police duties much more simple and punishment more severe. It is said that an automatic and visible speed signal will be insisted upon in all cases where a self-registoring speed indicator open to the inspection of any police officer is not carried. In that instance the remedy will be worse than the disease so far as the steady-going motorist is concerned, for, unless he consents to carry a signal that will put him in jeopardy of prosecution on every slight declivity, he will have to put up with what is practically certain to be a self-condemnatory evidence. The legal limit may be raised to 25 miles per hour—and it may not; but the speed meter and the speed register is bound to come. Out of that belief quite a number of instruments to meet the case have been devised and the board of trade is searching for one which it will be in a position to insist upon. So far it has not been successful, as its conditions are not exactly those which will go to make a commercial article until the law is altered.

The motorists are putting up a great fight before the motor car commission and are straining every nerve to get the speed limit altered to 30 miles per hour. They have employed skilled sporting timekeepers to test the speeds of the electric trams that are spreading so fast throughout England, and one result is certain to be the imposition of recording instruments on these vehicles also. As it may interest motorists on your side to know how our tram traffic moves, I append some of the certified figures put before the commission.

Town	Number of cars	Average speed of all cars included in previous column	Average speed of six fastest cars	Speed of the fastest car timed
London, Streatham-hill	22	18:05	20:45	21:22
Ealing	84	13:52	17:44	18:44
Newport	56	12:04	16:16	17:25
Manchester	20	17:01	20:36	21:25
Leeds	34	16:41	22:00	22:70
Cardiff	39	14:18	16:58	17:30
Derby	10	15:75	17:06	18:00
Cheltenham	20	12:46	13:50	14:06
Bath	27	13:28	15:27	16:07
Bristol	38	12:01	14:76	15:00

It will be seen that the larger the population the greater the tram speed—and that it is appreciated by the business man most of the critics will vouch.

We are told here that the French government has practically decided to issue their forms of drivers' license graduated as to the horsepower of the car driven. Class A will only be licensed to drive cars of less than 8 horsepower; class B will include cars up to 24 horsepower, and class C cars above 24 horsepower.

WILLIE K. AT ORMOND?

New York, Nov. 28—Special telegram—It is reported today from several sources that W. K. Vanderbilt, Jr., is, with Manager MacWilliams, of the Laroche company, at Ormond trying out the speed qualities of the Hemery Darracq on the beach course at that place.

Digitized by Google

1906 POPE-TOLEDO

THE 35-40 horsepower Pope-Toledo for the coming season is another machine in which numerous important changes over present construction are met. The Pope Motor Car Co., of Toledo, O., has had the machine under severe test since the midsummer, during which time it has covered more than 8,000 miles, and is reported to have given satisfactory tests of fuel. In a test run of 782.7 miles 49 gallons 3 quarts of gasoline were consumed, an average of 15.8 miles to the gallon. The last 210 miles of the road were in fairly good condition and for this distance 9.8 gallons of gasoline were used, making an average of 21.5 miles to the gallon. During the test two passengers and 800 pounds of sand were carried.

The noteworthy feature of the new machine is the new motor, with valves in the cylinder heads, the exhausts being operated by overhead rocker arms. The automatic inlet valves and copper water jackets remain. The gear box remains the same except in that an internal gear is used instead of clutch teeth in getting the direct drive, and an interlocking scheme has been added. Other new features noted are new body design, auxiliary gasoline and oil tanks, internal regular brake, I-section axles in front and rear and straight frame side pieces. In addition to the 35-40 horsepower machine the company has a 20-horsepower side entrance car in which the cylinders are cast in pairs, with integral water jackets instead of copper jackets. In the largest model, a 50-60 horsepower machine, the motor and gear box design are the same as in the 35-40 horsepower car.

The running gear carries with it most of the marks of 1906 construction, conspicuous among which is the 104-inch wheel base and the use of four semi-elliptic springs, the front pair being practically flat and the rear pair thrown outside of the frame pieces. The sub-frame for carrying the motor and gear case is retained and instead of offsetting the main frame pieces alongside the motor they are made straight. I-section front and rear axles, made from steel and subjected to a tensile test of 110,000 pounds per square inch, differ from the present style. The front axle carries Lemoine type steering knuckles and is dropped in Mercedes fashion, one drop between the knuckles and seatings for the springs and a central drop between the springs. The rear axle is dropped inside the spring seatings, giving plenty of room for the vibration of the body. Thirty-four by 4-inch artillery road wheels are used.

In the new motor of the vertical four-cylinder type the bore and stroke are 4⅝ and 5¼ inches, respectively, and at 900 revolutions 35 to 40 horsepower is produced. A novelty is met in making the cylinders with the wall parts A made separately, but with the heads B cast in pairs. The well-known Pope-Toledo copper waterjackets C remain, the top parts acting as gaskets between the top of the walls A and the heads B, the bolts D uniting the three parts. By placing the valves side by side in the top of the heads, the automatic inlets at the right and the exhausts at the left, the head pieces B are of considerable depth to make room for the valve cages, which are separate, one for the inlet and another for the exhaust. These cages have a ground fit in the cylinder heads and are slightly tapered, like an inverted cone, to give an easy dropping fit into the casting. The accessibility of both inlet and exhaust castings is one of the features of the motor, not over 40 seconds being required to remove an exhaust cage and only a little more time to take the inlet cage out. A double yoke serves for holding the cages in position, one end resting on the inlet cage and the other on the exhaust cage, the yoke itself being held to the cylinder head by a horizontal bolt, the end of which may be seen at M. This bolt passes through the center of the yoke which is pivoted thereon. In the end of the yoke above the inlet cage is a vertical setscrew which passes through the yoke end and rests on the inlet cage, so that tightening the screw raises that end of the yoke and forces the other end down upon the exhaust valve cage, thus anchoring both in position. In removing the valves it is only necessary to loosen this setscrew, when the bolt M can be knocked out of position, the yoke lifted off and the cages pulled out.

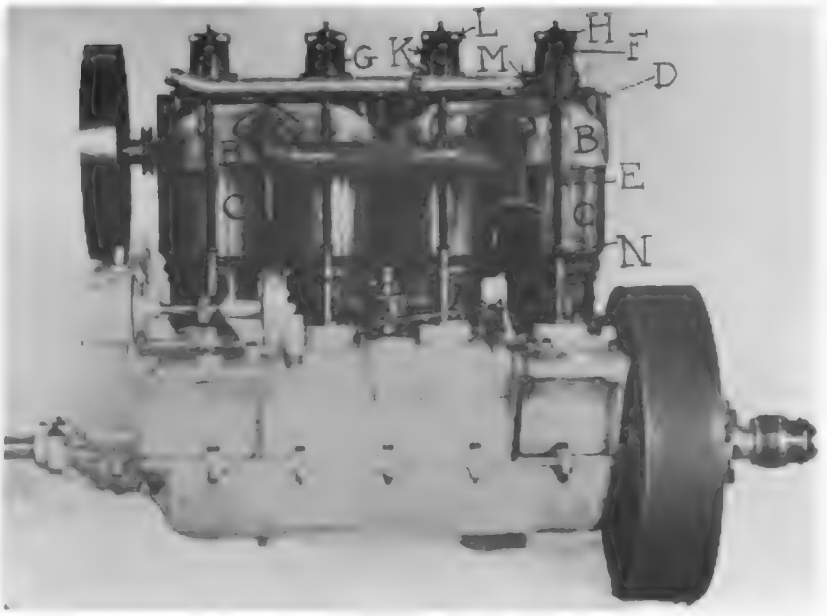
In operating the exhaust valves the push rods E carry rollers on their lower ends and rest upon cams pinned in position on the camshaft. The tops of the rods carry nuts F screwed in position and held in any position by the locknut G. The tops of the nuts F taper by a concave curve to a small part that enters the end of the rocker arm H, the end having a cone-shaped expansion with an eyehole in the center, permitting the small part of the nut F to pass through the eyehole and the tapered portion to rest against the

THE 1906 POPE-TOLEDO LIMOUSINE BODY

Digitized by Google

cone part, giving the same action as if rollers were used on the tops of the rods. Small springs N hold the rods constantly against the ends of the rocker arms. The rocker arm at its center is pivoted at L on a hardened pin working in bronze bushings and having a separate oiler on top. The end of the arm resting on the top of the valve stem is slightly rounded to give easy action on the stem. The curved arms K carry the rod L for the rocker arms. By not having the push rods E made with a yoke at the top end and pivoted to the ends of the rocker arms the valve cage removal is facilitated.

The Pope-Toledo carbureter is carried on the inlet side close to the crankcase and connects by a Y piping with the pairs of cylinder heads. In general design it is similar to that now used, the throttle being a horizontal sliding drum with deep serrations at one end, through which the mixture passes to the inlet valve piping. This drum is connected with a thumb lever working on a quadrant on the steering wheel, a similar lever on the same quadrant serving to advance and retard the spark. The needle valve controlling the flow of fuel to the spraying nozzle can still be adjusted from the outside, there being a small set wheel for varying the valve and a locknut for holding the wheel in any position. Feeding the gasoline to the float chamber is new in that it flows by gravity. The main gasoline tank, holding 12 gallons, is carried beneath the chassis frame at the rear, and within the top part of the hollow dash is a 5-gallon running tank, the other being known as the reserve. On the running tank is a glass gauge in plain view of the driver showing the amount of fuel on hand. Under the seat is an air pump operated by hand, with connection to the reserve gasoline tank. A few strokes of the pump will place sufficient air pressure in the reserve tank to force gasoline into the running tank. On the dash is a small air gauge. In the oiling scheme air pressure is used. A six-feed Hill oiler is carried on a motor arm close to the exhaust pipe, with a lead running to each cylinder, another to the gear housing the camshaft gear at the front with a branch to the

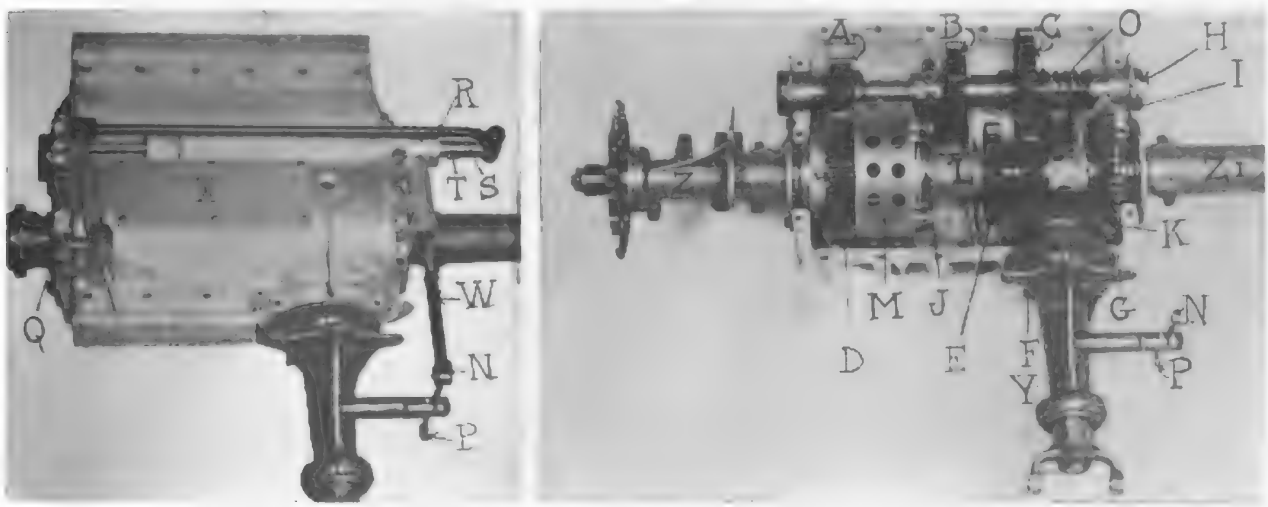


Left Side of the 35-40-Horsepower Pope-Toledo Motor

water pump and the sixth to the clutch. Each lead passes through a small sight glass on the dash. The mechanical oiler reservoir carries a limited supply of lubricant but beneath the chassis is carried a 2-gallon oil tank, supplied with air pressure from the air pump. As plain bearings are used throughout in the motor the bushings in each are grooved for conducting the oil flow, and over each bearing is a large oil receptacle, constantly filled from the splash. Each piston has an oil groove, which, together with the three compression rings, gives a good distributing system over the cylinder walls.

Jump spark ignition is retained, with current supplied by storage or dry cells, but arrangements are made for attaching a magneto. The spark plugs are carried horizontally on the inlet side, the high tension wires being supported in a fibre tube. On the exhaust side is the commutator, carried on a short shaft between the pairs of cylinders and driven through bevels by the camshaft. The revolving contact is a small roller, held against the stationary contact segments by a coil spring. From the carbureter can be noted the connections with the bottom of the steering column, the rod from the commutator casing connecting with a cross rod between the first and second cylinders, a lever arm on the right end of the rod uniting with the lever on the steering wheel through the usual bell crank and sleeve within the steering column. A four-vibrator Splitdorf coil is carried on the dash.

In the water system a centrifugal pump has been fitted, being carried low on the exhaust side and driven by a separate shaft. From this shaft is driven the fan by a circular belt. The pump draws its supply from the radiator base, delivering it to each water jacket at the right side. There is one exit at the top for each pair of cylinders, the flow being to the top of the radiator. The horizontal tube radiator has the tubes connected in sets of



Speed Change Gear Set of the 1906 Pope-Toledo, Closed and Open

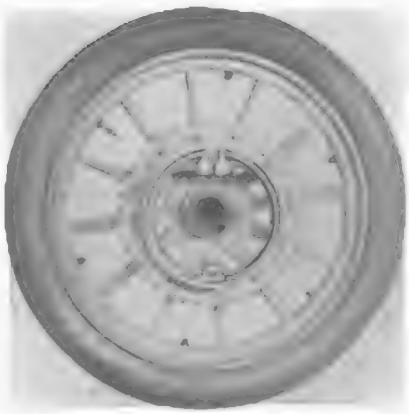
Digitized by Google

six, so that water passing from the top to the bottom goes from right to left through a set, then back through another set of six, which course is continued until the bottom is reached.

The crankcase construction is standard throughout, the crankshaft with its five bearings is carried in the top part, the base serving only as an oil pan. Side inspection plates are eliminated. The motor lugs rest directly on the subframe, and a change is noted in the main frame in having the side pieces straight throughout.

Pope-Toledo gear sets differ materially from the regular style used in double chain drive cars in that the main shaft and counter shaft within the case are carried crosswise of the car, with the inner ends of the two-part drive shafts of the differential countershaft within the casings Z and Z1 forming the main shaft of the gear box and the countershaft H parallel with and behind it. Plain bearings are used within the case for carrying the countershaft, three being used, one at either end and a third practically midway of the shaft. The crankcase is made from aluminum alloy in two parts, with the bearings between the parts. To strengthen the bottom half, it is reinforced by cross webs in the center within the case, other webs being used on the outside. The case takes its support from the main frame through cross frame pieces and in addition to this support the jackshaft brackets are hung between and rigidly bolted to vertical flanges of the side pieces of the main frame, making the case and jackshaft support rigid with the frame.

In securing the speed changes a single sliding unit of gears E and F is used. These gears slide on the sleeve L, and to this sleeve is keyed the bevel G, which is continually in mesh with gear K on the end of the propeller shaft within the casing Y. The gears A, B and C revolve with the countershaft H. Within the jackshaft housings Z and Z1 are drive shafts connected at their outer ends with the sprockets for chain drive to the rear hubs, and at their inner ends are inserted in the differential M spur gears. The large gear D is attached to the differential. It must be understood that the sleeve L with its three gears E, F and G is loose on the drive shaft within the housing Z, that the two gears E and F can slide on the sleeve but must revolve with it, so that at all times the three gears E, F and G are revolving at the same speed. For direct drive the unit E F is moved to the left, so that gear E slides within an internal gear within J, thus transmiting to the differential and through it to the two halves of the jackshaft. For second speed ahead gear E is meshed with gear B on the countershaft and the drive is then from the propeller shaft through bevels K and G to sleeve L and gears E and B to the countershaft and then to the differential through gears A and D. For slow sped gears E and C are meshed as shown and the drive is the same as in the second speed, and when reversing gear F is meshed with the idler and at the same time gear C on the countershaft is meshed with the idler, the latter being moved to the right against the tension of the spring O, which serves to throw the gear out when passing out of the reverse.



THE POPE-TOLEDO DOUBLE BRAKE DRUM

All gears in the speed changing set, as well as other parts connected with them, are claimed by the maker to be made from specially treated steel, 225,000 pounds tensile strength to the square inch. In the manufacture of this steel much experimenting has been done and time spent, but the manufacturer claims a product capable of withstanding rough usage such as received in all change speed sets.

A glance at the top of the case shows the inspection plate X for examining the gears and beside it is a small opening for pouring oil into the case. In shifting gears the bottom of the change speed lever at the driver's side is connected with the double arm lever Q, which connects with the cross rod R, which is in turn connected with a rod S paralleling it within the gear case and which carries the yoke for moving the sliding gears. In connection with the rod S is the interlocking device, preventing the shifting of gears with the clutch engaged. In rod S are several small half spherical holes T. The rod W connects at N with the top arm of a double lever, pivoted on an arm carried on the propeller shaft housing. The bottom arm P of this lever connects with the clutch, so that when the clutch is withdrawn the arm P is forced backward and the arm N is drawn ahead, pulling with it the rod W, the further end of which is rounded to fit into the holes T. When the rod W is thus withdrawn from the holes in the rod S the rod can be shifted to the right or left to change gears, and the clutch cannot be engaged until one of the holes S is in line with the shaft W, so that the shaft entering the hole permits the rod W to move to the rear at the same time the arm P goes forward, allowing the clutch to engage, otherwise if the holes T are not in line with the rod W the clutch cannot be engaged, which means that when gears are not perfectly in mesh the clutch cannot be engaged.

Both of the regular brakes, as well as the two for emergency use, are carried within drums on the rear wheels, the drums being within the sprockets and bolted to alternate spokes of the road wheels. This season the regular brakes were on the jackshaft, but the new machines are novel in that both brakes of the internal expanding type operate within the same drum, which is made extra wide for the purpose. Both shoes are made narrow and are expanded on the cam principle, the emergency brakes being operated by a side lever and the others by pedal. The emergency lever is pulled to the rear in application, so that the driver can at the same time use the clutch pedal to brace himself. Both sets are interconnected with the clutch, the application of either sets releasing the clutch. Metal to metal surfaces are used in each set.

The body design differs materially from that of 1905. The tonneau is made roomy. There is accommodation for three in the regular seat and a lift seat has ample room for a couple more, making the seating capacity seven. The lift seat is a neat device carried on a pair of uprights pivoted at top and bottom and held in position by a locking brace rod. When not needed the seat rests in the front of the tonneau and can be used as a footboard. The side entrances are wide and in each is a leather pocket. Body lines are characteristic, heavy curves with sharp angles being combined. The back has square corners, with three panels and a pronounced forward curve at the bottom. Back fenders take the curve of the wheels, the front are large and readily detached if needed to examine the motor. Both bonnet and dash conform in shape to the radiator, which at the top has a decided angle. Heavy upholstering is used throughout and all standard colors are furnished. As a protection against mud splashing past the footboard and fenders onto the body leather flaps secured to the frame side pieces, have their other sides fastened to the inner sides of the running board and fender.

The Pope-Toledo type XII limousine, illustrated on another page, is a fully equipped vehicle, made along 1906 lines. It has roomy side entrances, and is upholstered and finished according to the purchaser's specifications. The enclosed compartment has such accessories as speaking tubes, silk curtains, drop windows, anti-rattling devices, eight candle power electric lamp, lift seat for two additional passengers, and other accepted limousine requisites. The demand for this style of machine is showing a marked increase, many buyers preferring it to the open or cape top touring car.

A tendency noted in this new Pope model is the comparative light weight for horsepower carried. A year ago 1 horsepower for every 100 or 110 pounds of car weight was considered favorable construction. This ratio is now a matter of the past and in this car there is 1 horsepower for every 54 pounds of weight. Throughout other parts of the machine similar weight reductions are made.

STORIES OF LITTLE MOTOR TOURS

ROUGH IT OVER BAD ROADS

A conquest of some of the worst roads in the states of New Hampshire and Maine has recently been achieved by a party of Bostonians, who have just returned from rather an extensive trip through that country. The party consisted of Mr. and Mrs. D. R. Harvey, Miss Gladys Harvey, George W. Harvey and W. P. Stahl, and they made the journey in a Stanley touring car.

In their travels through the eastern part of Massachusetts and through New Hampshire and to the wilds of Maine the party met with many interesting experiences, but fortunately were not compelled to lose any time owing to the condition of the roads, which in spots were particularly bad. Nor did they experience any trouble whatever with their car or their tires, everything going as smoothly as could be desired.

The party, all in one car, left Boston at 8 o'clock, going direct to York, where lunch was eaten. The time of arrival was noon, the average speed of the morning trip being 20 miles an hour. Portland was reached early that evening, and the night was spent there. The following morning the start was made for Bremen, and during the day's ride the party encountered all sorts and conditions of roads and went some 25 miles out of the way in order to cross the Kennebec river, owing to the toll bridge at Wiscasset having been abandoned.

The party spent a couple of weeks in Bremen, touring to different places of interest thereabout, and proving to the satisfaction of the natives that, although the roads were not in the best of condition, an automobile could travel over them with safety and dispatch. The return trip was made in excellent time, the run from Bremen to Portland being made in less than 6 hours' running time. The greatest trouble experienced by the party was the lack of sign boards en route and the general inability of the drivers to take care of themselves as well as their fractious horses; in fact, the main trouble, according to the motorists, was with the drivers, and not with the horses.

THROUGH TWELVE STATES

Mr. and Mrs. Lyman W. Welch and Mr. and Mrs. J. W. Shank, of Grand Rapids, Mich., have returned from a 7 weeks' trip through twelve different states, in which 2,850 miles were traveled in Mr. Welch's 12-horsepower Thomas without a punctured tire, accident or hour's delay. The tourists started from their home in Grand Rapids, driving to Detroit, where they took the boat for Cleveland, O. From Cleveland they drove to Pittsburg, and then proceeded until they struck the old national pike which runs from St. Louis to Washington. After traveling 200 miles, which was one continuous run up and down hill, they shipped the machine to Washington by rail, as the road through the mountains was Jersey. From there they went to New York, to Baltimore, Philadelphia, Atlantic City, Asbury Park and other famous resorts in New Jersey. From there they went to New York, spending a week in that city. From New York they drove to Boston, going through Albany, Syracuse and Schenectady. From Boston they ran to Buffalo, where they shipped the machine to Detroit. They again drove across Michigan to Grand Rapids, where the long trip ended.

OUT OF WASHINGTON

Members of the new Automobile Club of Washington are taking advantage of fine fall weather by participating in club runs, promoted by the road officers. The highways leading out of the capital afford plenty of opportunity to enjoy motoring to its fullest extent, and the Washingtonians have not been slow to grasp at their opportunities. One of the recent jaunts was particularly pleasant.

The start was made promptly at 8 o'clock, the first car away being a 45-horsepower Pope-Toledo, with Royce Hough at the wheel, and having as passengers a number of newspaper men, including the MOTOR AGE correspondent. This was the pilot car and to it was left the duty of laying the course to Frederick. Starting from the Pope garage on Fourteenth street, the pilot car, with a jolly party aboard, wended its way briskly through the city and was soon on the Brightwood road. There was an entire absence of dust, a light rainfall the night before having put the road in fine condition. The first stop was made at the dividing line between Maryland and the District of Columbia, where toll was demanded and paid. The crisp air with just a suggestion of approaching fall, made riding very pleasant and the fine condition of the road enabled Hough to hit it up in great shape. Again at Olney, 20 miles out of Washington, another toll gate was encountered, and the party had to dig for more coin. It was a pleasure to pay toll on the road as far as Ridgeville, for it is kept in excellent shape and there was no thank-you-mams to bump one out of the car. Passing Ridgeville, a pretty little village resting on a hillside, the hilly country was encountered. From there to Frederick it was a succession of hills, which would not have been so bad were it not for the fact that every hundred feet or so there was a ridge in the road. These ridges might make good resting places for tired country horses when hauling heavy loads of hay, but they are extremely uncomfortable from an automobilist's point of view. The scenery in this part of the country is magnificent and just at that season of the year it was doubly so. On all sides were evidences of the great crop harvested this year in the great state of Maryland. The people all along the road are very friendly to automobilists and every passing car gets a wave of the hand. Newmarket, with its quiet country manners, turned out en masse to welcome the Washington motorists. From Newmarket it was a short run into Frederick, where the county fair was in progress, and where the motorists in their peculiar clothing were the observed of all observers. When the sights of the fair had become wearisome a short run about the city was taken and then the homeward trip began, Washington being reached just after dark. The round trip, a distance of 106 miles, was made by every car without a single tire or mechanical trouble and did more than anything else to show the advantages of a club.

MOTORPHOBIA ABROAD

Frank Fries, of San Francisco, has just returned from a 6 months' sojourn on the continent and is enthusiastic over automobiling as he found it across the Atlantic. "Motoring abroad is vastly different from motoring in our country, as the roads are of the best quality, especially in France, and a person can speed along at a good clip without fear of hitting a chuck-hole or meeting any foreign obstacle in one's path," he says. "The French are absolutely motor crazy and the drivers of the most reckless type. In Paris the speed limit is never observed and one can see car after car winding its way at break-neck speed through the slower-moving vehicles without fear of the gendarmes or any other police official. Germany is newer at the game than France and hence there is more ill-feeling towards the motorists. Once, while touring from Schwalbach to Frankfort, we received the contents of a bucket of sand in our faces because an machine ahead of us had incidentally run over a dog which had rushed at the front wheels with such speed that it was unable to stop in time. Many such incidents of the hatred of the country folk in Germany for automobiles could be cited. The roads in Germany, although very good, cannot compare with those of France, which I consider perfect. The feeling against motor cars in Switzerland is even much stronger than in Germany. On account of the many ways in which the street arabs annoy the automobilists, such as by putting tacks and glass on the road, it has led the motorists to get up a petition to boycott this small but prosperous republic. In Great Britain I found motoring is not encouraged. The speed limit on the high-roads has been fixed at 20 miles an hour over the highways of the kingdom.

Speed Change Gear, Clutch and Operating Mediums on the New Premier

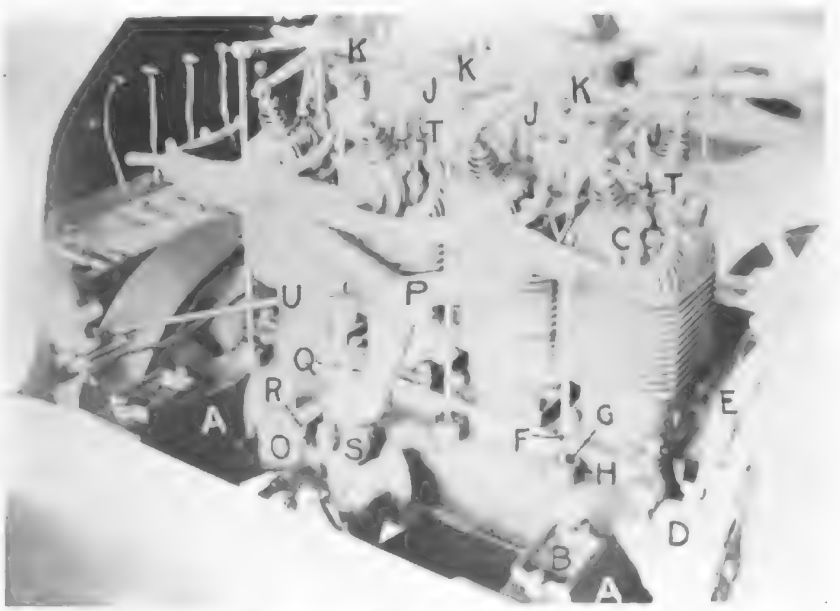
piece M, made rounded at its lower end, where it rests on the round valve stem, the result being almost the same as if a roller was used. The piece M can be adjusted by a screwdriver. The heavy valve spring is retained by a washer N, cotter-pinned in place, and rests in a large circular seating I in the valve cage. The valve stem and head are made separate, the head being held between a collar on the stem and the riveted end of the stem. The valve cage is made with a sleeve almost as long as the valve stem and instead of pivoting the walking beam on a short arm above the cylinder head, a rod extends over the four cylinders and sleeves K separate the walking beams. For supports there are the four vertical pieces J held to the cylinder heads through the unions T.

The carbureter of Premier design has a separate float chamber O and a cylindrical mixing chamber S, within the latter being a vertical sliding drum throttle, the top of the drum being fastened to the rod Q, so that the drum can be raised or lowered from the steering wheel through the connecting rod U. In the drum are two sets of slots, one for regulating the flow of mixture through the piping P to the intake valves, the other acting as a bypass, so that air can pass into the mixture, without passing the spray nozzle. On slow speeds the bypass is not used, the air entering the mixture passing the spray nozzle. The flow of gasoline through the nozzle can be altered by the hand wheel R, a turn to the right or left varying the supply. Hot air is taken in through a screened pipe adjacent to the crankcase. The carbureter is carried on a bracket dropped from the crankcase. The attachment of the intake piping P and the exhaust piping Z is by a pair of cross rods V, an end threading into the intake pipes between the first and second and another between the third and fourth cylinders, the opposite ends passing through the exhaust pipe Z at Y and being held in place by nuts W. The tightening of the nuts tightens the union with the valves. In removing a valve cage it is first necessary to loosen these nuts, so that after the valve cage nuts and walking beam are removed the cage can be lifted out.

Ignition is by jump spark, with battery current. The plugs are placed at an angle in the center of the heads between the valve cages, the high tension wires being carried in supports on the right side. Snap connections are used. On the exhaust side of the motor is the commutator, located on a short vertical shaft and driven by the camshaft. For oiling the motor a four-feed McCord oiler is used, with sight feeds, carried on the dash and the oiler beneath the bonnet. The oiler is driven by belt from the left camshaft. The four leads go to the cylinder walls, where they supply the splash and care for the crank and wrist pin bearings as well as for the five bearings on the crankshaft. This shaft is a forging, with babbitted bearings. Each piston carries four compression rings and an oil groove, and has the piston pins secured to the journals. Bronze bushings are used for the pins.

The method of transmission from the motor to the rear axle is told in the illustration showing the clutch, gear box and front part of the propeller shaft. The flywheel is made with fan blade spokes to draw hot gases from around the motor and carries on its hub five brass disks R, held in place by six studs S, attached to the flywheel spokes. Alternating with these disks are six others of wavy unfinished steel. Carried on the clutch shaft are four large fan-shaped keys holding them rigidly with the shaft. One of the latter disks is shown at O. Each is round and without peripheral lugs like the flywheel disks. Connecting the clutch shaft with the gear box is the jaw-type coupling I, for taking up differences in alignment. In engaging the clutch the hollow cone P, containing within it the clutch spring, is forced forward by the spring, so that it separates the rear ends of the three short levers T, the opposite ends pressing against the disk O, thus locking the eleven disks together. In disengaging the inner pedal, pressed forward, carries the two drop arms N backward and these, carrying at their lower ends bronze shoes working within the collar on the cone P, withdraw the cone against the pressure of the spring, permitting the levers T to relieve the pressure from the disks. The levers T are carried on a separate collar on the clutch shaft.

The sliding gear set gives three forward speeds and a reverse, the drive on high speed being direct. The gear set shown in the illustration is of standard type, but the maker is pushing through a special Premier design giving three speeds ahead. Within the aluminum case—with the entire top a removable inspection plate—the main shaft Z is squared and carries the sliding unit,



Inlet Side of the New Premier Model L Motor

Digitized by Google

PREMIER REAR AXLE CONSTRUCTION, DIFFERENTIAL INSPECTION CAP REMOVED

composed of a pair of gears bolted to a sleeve. The support of the case is novel in that it is carried by four integral arms which rest on the tubings B and C which at their front ends enter the back arms of the crankcase supports and at their rear ends are carried on the double channel cross piece A, being babbitted in the eyeholes in the latter but clamped in split eyeholes in the motor arms. The gear case arms rest on the tubular members and are bolted thereto. Both bearings in the main and countershafts are of the Hess-Bright type and are carried in cages in the gear box ends, the case not being split in line with the cages. For shifting gears the side lever D, the lower part of which is shown, moves from the back of the quadrant to the front in going from reverse to neutral and then through the forward speeds, ending with direct drive. The lever is attached to the short sleeve E, having a bearing on the brake rod K. Depending from it is the arm Y, which has double ball joint connections, with a cross arm X, which attaches to a vertical hub passing through the gear box and connected with the arm F, which in turn has a link connection with the bronze sleeve G on the sliding rod in the top of the gear case. The sliding unit is shown in neutral position. The back gear on the countershaft and the reverse idler cannot be seen. For slow speed the large gear on the sliding unit meshes with the small gear on the countershaft; for second speed the small sliding gear meshes with the second forward gear on the countershaft; for direct drive dental clutch teeth on the front side of the small sliding gear are interlocked with similar teeth on the rear side of the small gear on the end of the clutch shaft, shown at the front end of the case. Not the least interesting feature is the interlocking system, providing that with the application of the emergency brakes the clutch is withdrawn and with the use of the regular brake on the propeller shaft back of the gear box the clutch may or may not be withdrawn, according to the wishes of the operator. The interlocking scheme with the emergency brake lever H is through the rod K, which carries the brake lever, having on its left end a short two-arm lever, the top arm connecting through the rod J with the clutch rod and the other through the rod L with the expanding emergency brakes within the rear hubs. Pulling the lever H back draws the rod L forward, applies the brakes and simultaneously draws the rod J back, disengaging the clutch. The regular brake, a friction band, is carried from the side of the frame through the rod W and is applied by the outer pedal, which works on a sleeve on the clutch rod M and connects with the brake band. On the pedal sleeve is a short lug V2 and attached to the clutch rod M is another lug V1, so placed that when the clutch pedal is pushed ahead lug V2 presses against V1, thus rotating the rod M and carrying the arms N to the rear and disengaging the clutch. When desired the lug V1 can be removed, being pinned in position, the brake losing its interlocking feature.

In protecting the motor, as well as the multiple disk clutch, from mud splashed by the road wheels, a combination metal apron scheme is used. The bottom of the crankcase is practically a bare aluminum surface, requiring no protection, and to prevent mud reaching the top or side of the motor metal sheets are placed between the motor arms, thus forming an apron, but not hung so low as to act as a dust producer on dry roads, yet fully protecting the motor. Projecting backwards from the motor is a short semi-circular pan enclosing the lower half of the flywheel and the multiple disk clutch and extending partly beneath the gear box. The gear set being reached through a large inspection plate in the top of the case, it is not necessary to suspend an apron beneath the entire case. This system of aproning, while small and scarcely visible from the side of the machine, is sufficient for all conditions.

Alignment of the multiple disk clutch, crankshaft and gear box is gained by first mounting the motor on the frame and then inserting the tubular frame pieces B and C carrying the clutch and gear box in the crosspiece A of the main frame. The tubular pieces at first fit freely in the eyeholes in this crosspiece, but after the gear box ends have been bored to carry the cages for the main and countershafts and these are mounted in alignment with the crankshaft, the tubular pieces B and C are babbitted into the piece A, so that both shafts of the gear box are aligned with the crank and clutch shafts.

The hollow metal dash, made extra deep and with the sides extending well to the back, thus forming sides for the front part of the foot board, acts as a cross support for the main frame. Within it are carried the coil on the right and the mechanical oiler at the left. On the next lot of machines the oiler will be removed to the side of the motor, close to the exhaust piping, and only four small sight feeds will be carried on the dash.

The steering gear of the worm and sector type is enclosed in an aluminum housing, carried partly on the side piece of the main frame and partly on the tubular piece for carrying the gear box, being bolted direct to the former and resting on a bracket bolted to the latter. The sector axle passes through the right side piece of the frame, where it carries a long drop arm, with ball and socket connections with the shaft connecting with the right steering knuckle. The tie rod between the knuckles passes in front of the axle. The steering column is standard throughout, being of the tubular type with sleeve and rod for the throttle and spark levers and the usual bearings within it. Steering knuckles are of the Lemoine type, carried in the usual manner on the axle ends. Double races of ball bearings carry the front road wheels.

In lubricating all parts of the machine except the motor, separate oilers are used. Within the gear box is an oil bath, and the same method is adopted within the differential housing, and in the steering gear case.

PREMIER MODEL L, WITH SIDE ENTRANCE AND HOLLOW DASH

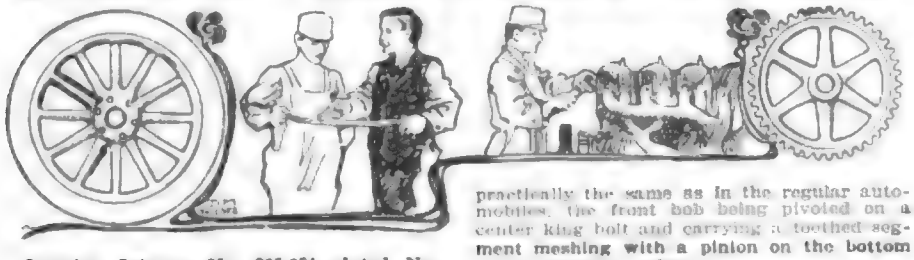
Current Automobile Patents



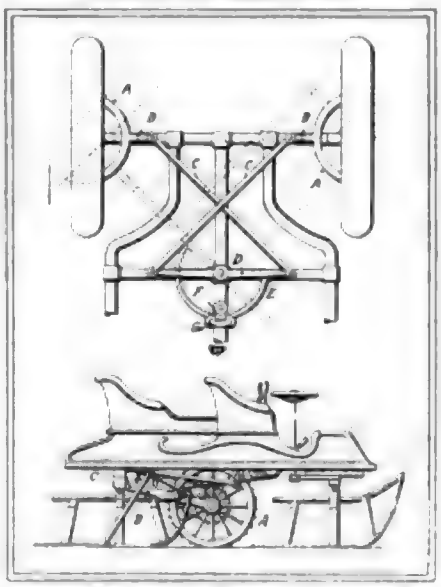
Steering Scheme—No. 805,274, dated November 21; to John W. Eisenhuth, Brooklyn, N. Y.—In his steering gear the inventor attaches to each front road wheel a semi-circular yoke A, to the center of which is the arm B. The yokes are connected to the bottom of the steering column, which carries the small pinion F, by having this pinion mesh within a segmental rack E, made rigid with the lever D, which is pivoted at its center to the vehicle frame. The right and left ends of this lever are connected by the cross rods C with the opposite arms B on the steering yokes. Back thrust caused by the pinion F on the segment E is overcome by the revolving bushings G pivoted on yokes on the main frame and bearing directly on the segment. When turning to the right, the movement of all the steering parts is as shown by the dotted lines.

Clutch Gear Set—No. 804,999, dated November 21; to William E. Blair, Buffalo, N. Y.—The invention relates to an individual clutch gear set in which the main shaft A and the counter shaft B have corresponding speed gears C, D, E, F, each set continually in mesh with those of the other and both sets loosely mounted on their respective shafts. The expanding of the clutches locking the different gears with their shafts requires the use of rods H and K, respectively located within the hollow shafts B and A. On each rod are four conical-shaped collars intended to bear against the pieces T within each gear and which work expanding portions, locking the gears to the shafts. By the exact location of the collars on each shaft it can be noted that moving the shaft H to the front and the shaft E to the rear through the medium of the pinion M and the shifting rod L, the respective gears, F-F, E-E, D-D and C-C, can be meshed in the above order. Connections with the shifting rod L with the change speed lever are made at N.

Motor Sleigh—No. 805,318, dated November 21; to Alanson K. Ramsdell, Old Orchard, Me.—The automobile sleigh referred to is propelled by a large driving wheel A with toothed tire. The wheel is carried on a pivoted arm B, above which is a short spring constantly pressing the rack downwards to hold the driving wheel to the ground. Drive from the motor is through the sprocket C connected by chain with the large sprocket on the drive wheel A and sprocket C, in turn connected with the crank shaft of a small motor carried beneath either the rear or the front seat. Steering and changing speeds are practically the same as in the regular automobiles, the front bob being pivoted on a center king bolt and carrying a toothed segment meshing with a pinion on the bottom of the steering column.

Three-Part Tire—No. 804,891, dated November 21; to Arthur J. Slade, New York, N. Y.—The inventor's tire consists of three elliptical bands of fabric and rubber placed side by side on the wheel rim and held in position by retaining flanges and a cross bolt passing through them. Each band is originally made circular in cross sections and formed by alternate layers of rubber and fabric, each layer being vulcanized or cemented to the adjacent ones. The entire band, after completion, is pressed into elliptical shape and placed on the rim so that the long diameter of the ellipse is in a radial direction.

EISENHUTH STEERING GEAR



RAMSDELL'S MOTOR SLEIGH

Goodyear Tire—No. 804,806, dated November 21; to Will C. State, Akron, O.—In the pneumatic tire referred to the wheel rim is made with an inverted clincher lip F at one side and a U-shaped seating A at the other, in which is sprung the split ring piece B for holding the tire in position. To assist in retaining the tire on the wheel, the valve stem D carries within the tire the wedging part C, which bears against the inside of the tire lips. On the lower end of the valve stem is the thumb nut E, so devised that by it the part C can be drawn towards the rim, thereby wedging the tire lips between the respective lips F and B. In this way the tire is securely held in position, whether inflated or not.

Tire Thread—No. 804,892, dated November 21; to James M. Small, Piqua, O.—This protective tread for pneumatic tires consists of a strip of material for covering the tire tread and has tongue pieces on either side for fastening the tread in position. On each tongue piece is a metal plate, the plate terminating in a hook which lies in the recess between the rim and the tire on each side of the latter. Engaging the hooks are metal rings with turnbuckles. In attaching the protector, the rings are made as large as possible until the hooks are in position, when, by means of the turnbuckle, they are tightened until the tread is held firmly in position.

Gear Shifting Levers—No. 804,971, dated November 21; to James W. Packard and William A. Hatcher, Warren, O.—The shifting lever for giving the forward and reverse speeds has pivoted on either side of it an arm with lateral projecting lug, by means of which the lever can be engaged in one arm for giving the reverse speed and with the other for giving forward speeds, there being on the lever arrangements for it, connected with the lugs on the arms. A spring is provided to normally hold the lever in engagement with the forward arm and a guide is provided to hold it in engagement with the backing arm when this arm is moved from its normal position.

Steering Wheel—No. 804,955, dated November 21; to John W. Johnson, Kokomo, Ind.—The steering wheel is made with a pitted rim, which is enveloped in a hard rubber cover which is permanently vulcanized upon the rim and anchored in position by the pits. The four spokes of the wheel enter the rim part through openings in the rubber covering.

Steering Frames—No. 804,946, dated November 21; to William Hanna, Cincinnati, O.—The steering device referred to is one intended for a four-wheel drive automobile, in which the drive shafts in each axle are driven by propeller shafts and bevel gears with universal couplings between the wheel spindles and the axle shafts. For steering purposes each wheel spindle is carried on a rectangular framework, the four pieces being pivoted at the corners and the two side pieces having a yoke to which is attached the wheel spindles. A steering gear is connected up so as to turn the wheels—the front ones to the right and the rear ones to the left or vice versa.

Differential Housing—No. 803,121, dated October 31; to Frederick C. Miller, of Cincinnati, O.—The invention is a rear axle for shaft-driven automobiles and consists of a tubing, the intermediate walls of which are swaged apart from the center of the tube, forming a housing. A wheel shaft projects through the tube into the housing and there is a transmission mechanism within the housing. The aim of the design is to have a differential housing without the use of a separate housing which would have to be secured to the ends of the tubing containing the driving shafts in the axle.

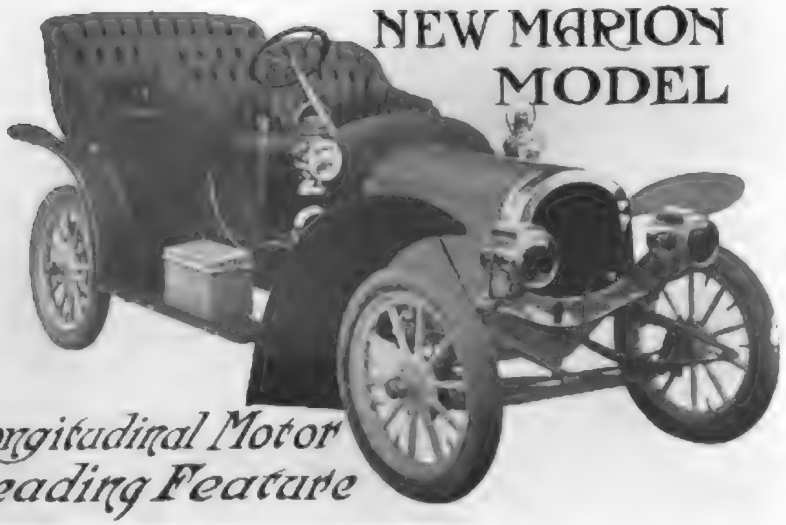
NEW MARION MODEL



Longitudinal Motor Leading Feature

THE Marion Motor Car Co., of Indianapolis, Ind., has just brought out its 1906 car, to be known as model 5. It is an air-cooled four-cylinder 24-28 horsepower touring car accommodating five passengers. The 1906 machine is radically different from anything heretofore introduced by the company, having a motor placed lengthwise. Not less noteworthy as far as the Marion is concerned is the assembly of the multiple disk clutch, speed change gear and differential. All are confined in one case, forming a compact arrangement. One of the points in the makeup of the car is the new brake system, both foot and hand brakes being contained in the large drums placed on the rear wheels, and fastened by six bolts, which pass through alternate spokes. The road wheels are of artillery pattern, ball bearings being used in all. Plain bronze bearings are used throughout the motor with Hess-Bright ball bearings for the fan.

The main frame is made from cold rolled steel and is 124 inches in length and 32 inches wide. The side pieces are parallel throughout and are braced by three cross members, each reinforced by gusset plates. The motor is supported by four arms fastened to the frame direct, the transmission case gaining its support from the middle cross member in front and held in position in the rear by the jackshaft, which is supported on ball bearings on either side, attached to the under side of the main frame.

The spring suspension is of the accepted style, full elliptical 36-inch springs being used in front and 38-inch semi-elliptical springs for the rear. The front axle is made from steel tubing ¼-inch thick and of 2-inch diameter, being slightly dropped from the knuckles to the spring seats, but being straight between the seats.

Many changes are made in the 1906 motor, the exhaust valves being placed in domes at the top of the cylinders, serving as receiving chambers for the exhaust gases. The new pull rod, and extension arm acting on the exhaust valve spring cap, is actuated by a roller under the exhaust valve cam. The commutator is driven by a horizontal bevel gear shaft from the camshaft, the commutator shaft extending through the left side of the engine case adjacent to the second cylinder. The cylinders cast separately, with circular radiating flanges, outside of which are the cylinder stud bolts. The exhaust valve dome takes the place of flanges usual on air-cooled cylinder heads. The motor has 4½-inch bore and 4½-inch stroke.

Aluminum is used throughout the crankcase, which is a two-part casting. The top part with integral webs for supporting the crankshaft bearings and the bottom part forming a reservoir for engine lubrication, is divided into four oblong compartments, no inspection plates being used. The case is arranged on the right with cup-like places, with covers, to permit pouring in enough oil for from 200 to 225 miles of running. No other lubrication is used.

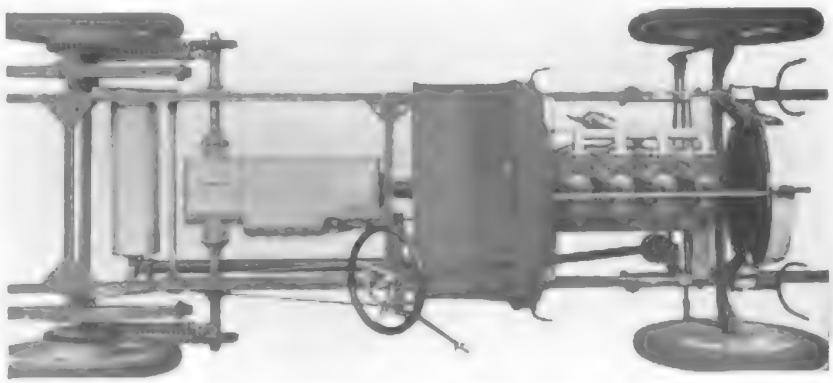
The housing for the camshaft gears, placed at the front end, is integal with the case proper, so that the gears work in an oil bath in a dust tight case. The pistons carry three compression rings above the wrist pin and one below. The rings, as well as the piston, are ground to equal weight. Each ring is pinned against rotation. The wrist pin of hardened 1¼-inch steel, is hollow and is pinned to one of the journals in the piston. The crankshaft is made from forged 30 point carbon steel, 1¾ inches in diameter and runs on five bearings. The bearings, 2½ inches long and of plain bronze, are oiled from the splash. Each bearing receives its support through four bolts passing through cross braces in the upper half of the case, thereby relieving the lower half from strain. On the rear end of the shaft is an integral flange, to which the 19-inch flywheel, of the six-spoke fan type, is bolted.

In the valve disposition the intakes are removed by unscrewing a cap on the port head, which also contains a priming cock. The exhaust valve is 2 inches in diameter and the intake 1½ inches, the former being placed in the large receiving dome.

Ignation is by jump spark, with 6-volt 40-ampere storage battery, the spark being controlled from the wheel by a thumb lever, as is also the throttle, working in a notched semicircle. Steering is by a Brown-Lipe irreversible gear placed well forward under the hood.

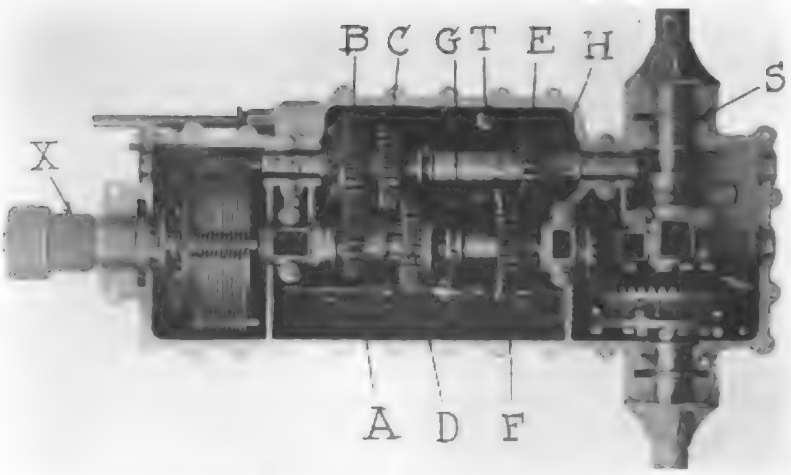
The multiple disk clutch consists of alternate steel and bronz disks, nine of each being used, one set being attached to the shaft coupling with the crankshaft and the other secured to the main shaft in the gear case. The clutch is actuated by a bronze yoke running in a bath of oil. A spring contained in the sleeve at X holds the clutch in engagement and end thrust is cared for by ball thrust bearings between the sleeve and clutch spider. A universal joint between the flywheel and transmission case provides alignment.

The present type of gear case in which changes of speed are made by three separate shafts, may be considered a combination, having involved both the straight sliding and selective types, being selective from the intermediate speed to high and sliding from the neutral to reverse, the neutral notch on the shifting rod being placed between the low and intermediate speeds. The transmission with its four sliding units is so constructed as to slide two members toward each other simultaneously, thus lessening the distance traveled by each by practically half. For example, in obtaining slow speed ahead one sliding unit on the main shaft is moved back and at the same time another sliding member on the secondary shaft is moved ahead, meeting midway a gear on one meshing with a corresponding one on the other. The illustration of the transmission shows the gears in the



Top View of the 1906 Marion Car

Digitized by Google



CLUTCH, SPEED CHANGE GEAR AND DIFFERENTIAL OF THE MARION

eutral position. When driving in all peeds other than the high, the gears and B which transmit power to ie secondary shaft are always in ngagement. To obtain low speed ie gears E and F engage, each traveling qual distance. The power is then being ansmitted from the gear A to B and E F. On the intermediate speed the gears and D engage, traveling equal distance. he power is then transmitted A to B and om C to D. When the high gear is ob-ined the pinion A disengages with the ar B and locks with the internal gear , which travels forward to receive it. his leaves the secondary shaft idle and cks the primary shaft, so that the only ars in mesh are the bevels, which trans-it the power to the jackshaft. When the verse is obtained the gear F slides back d engages the gear H, which is perma-ntly fastened to the reverse gear shaft. ie gears E and G travel toward each her and engage at the same time. The wer is then transmitted from A to B, to G and H to F, this reduction being eater than in any of the other speeds. ith this construction complete speed anges are obtained by a travel of 3 9-16 hes of the gear shifting rod. The secondary shaft does not revolve while driving on high gear and the reverse gears are in action only when the car is being driven backward. By this arrangement of the sliding members it also makes the gear case more compact than would otherwise be possible.

Three ring oilers are used, one of which is shown in the accompanying illustration at S on the jackshaft, the other bearings throughout the transmission case excepting two thrust bearings in aluminum housing of the differential being of the plain bronze type, with square openings at the top of each bearing and covered by wire screens, which act as filters for the oil. The gears are of machine stock with six pitch. The interlocking notches on the shifting rod may be seen in the illustration. The top of the nut T is hollow and contains a spring and finger, which, while engaged in a notch, holds the gears in their respective positions, no quadrant being used at the shifting lever.

A controvertible side entrance body, so the car may be used as a runabout or for touring purposes, is fitted. Wood is used in the body construction, the only metal contained therein being the aluminum hollow dash, which encloses the coil. The upholstering is in black leather, tufted. Wide fenders of the detachable style are used, which are readily removable. The housing over the sprockets of the double chain final drive, as well as the battery box, are of metal. A tool box hung below the back end of the car gives room for tool carrying purposes. The bonnet has a rounded top, with three hinges, one on top and one on each side.

MOTOR CAR LITERATURE

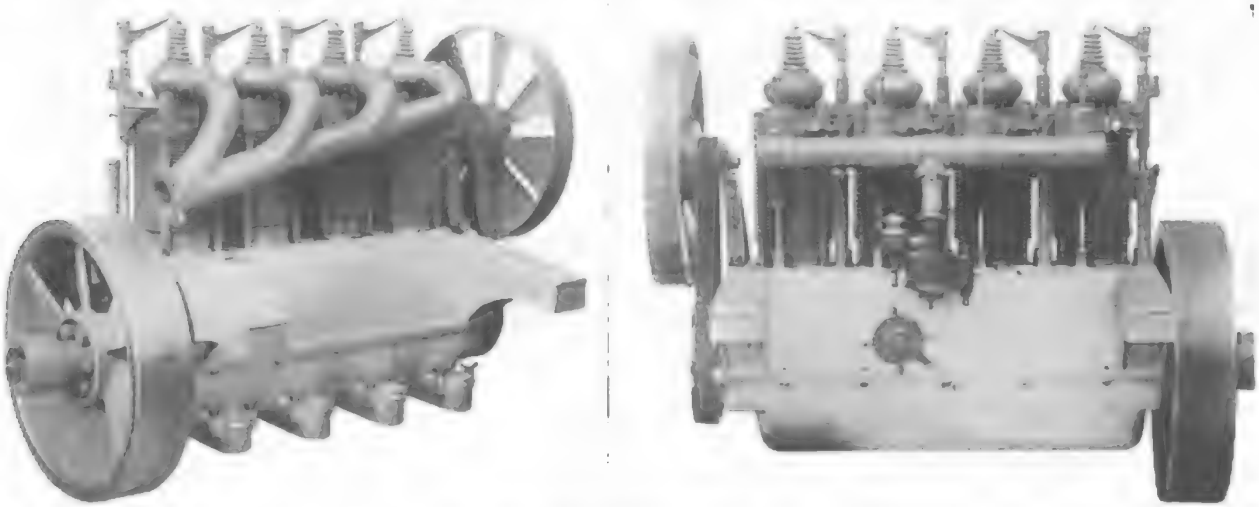
Saks & Co., of New York, have issued a 200-page flexible-covered descriptive catalogue of the latest things in automobile clothing, for both men and women. Naturally most of the space is devoted to fur and other winter clothing, but a considerable portion is taken up with storm goods. The illustrations are from photographs taken from life and are well printed from half-tone cuts. Every conceivable kind of fur is now used in the manufacture of automobile apparel.

The Edmunds & Jones Mfg. Co., of Detroit, Mich., has issued a catalogue for its 1906 line of automobile lamps, both oil and gas. Including the searchlight, there are ten different models shown.

A new catalogue of rules, micrometers, and other measuring devices, has been issued by the Brown & Sharpe Mfg. Co., of Providence, R. I. The book, besides being a catalogue and price list, contains many valuable tables.

The neatest product in lamp literature that has appeared for some time is a new catalogue published by John H. Graham & Co., selling agents for the C. T. Ham Mfg. Co., of Rochester, N. Y. The book is shaped like a motorcar head light with the front cover showing the point of the lamp with light burning and the back cover giving a rear view of the lamp. The coloring is in black and bronze on a white ground. About twenty pages are given over to large illustrations of the lamps and information and prices on them. All sizes and styles are quoted.

The latest White bulletin, the house organ of the White Sewing Machine Co., of Cleveland, O., contains a series of tour stories, made in White steamers. Each tour is profusely illustrated.



HAUST SIDE

THE 1906 FOUR-CYLINDER MARION MOTOR

INLET SIDE

Digitized by Google

FROM THE FOUR WINDS

Nutmeg State's Strength—According to the latest statistics, Connecticut had 2,292 automobiles licensed in the state on November 14.

To Tax in Germany—The kaiser needs the money, so the German government is digging up ways of replenishing the imperial coffers. As a result, it is proposed to put a tax of from $25 to $37.50 a year upon pleasure automobiles.

Tracy Going Abroad—For the second time this year Joe Tracy, who finished third in the Vanderbilt race, is going abroad. He expects to sail this week and after taking in the Paris salon he will go to England to study the railway motor car, for Tracy was an engineer originally and much of his success as a driver is due to his mechanical ability learned years ago.

Helps the Monks—Monks whose hospice is at the top of Mount Saint-Bernard, France, have solved a transportation problem. The roads being so bad that ordinary vehicles have trouble getting to the top, the automobile was called on when the monks laid in their winter supplies, the 16-horsepower car easily making the ascent and saving the fathers quite a bit in cartage.

Seattle Selections—More than seventy members are now enrolled on the books of the Automobile Club of Seattle, of Seattle, Wash. The annual election resulted in the choice of Alfred Battle as president, N. H. Latimer vice-president, F. R. Seymour secretary and treasurer and A. S. Kerry and Walter S. Foster as two of the five directors. The club has purchased 1,000 signboards which will be posted in the surrounding country for the guidance of motorists.

Long Motor Cycle Trip—One of the longest continuous trips ever taken on a motor cycle will be made by Paul Stamsen and Harry Lowes, of Muskegon, Mich., this winter, when they will undertake to make the trip to San Francisco, Cal., in 35 days, their object being to demonstrate the durability of the motor cycle for long distance trips. The route will be from Muskegon to Chicago, then through Missouri, Kansas, Colorado, New Mexico, Arizona and California to their destination.

Really Roughing It—An automobile party from Joplin, Mo., consisting of Mr. and Mrs. Arthur Bendelari, Mr. and Mrs. Spencer K. Ortt, Miss Clara Paige and Nat Paige, recently had a thrilling experience on a trip to Kansas City and return. To start with the roads were poor, then the tourists ran out of gasoline and had a time getting more; they broke part of their steering gear on the return trip and had to do some amateur blacksmithing, and to cap the climax they encountered a washout so that they were forced to pass the night on the road. They stopped at a farm house, but there wasn't room for them, so they borrowed blankets from the farmer and slept in a haystack the rest of the night.

LOADING AUTOMOBILES ON STEAMSHIPS

Another Bennett Cup—James Gordon Bennett, donor of the international automobile trophy, has hung up another cup, this time the Aero Club of France being favored. The mug will be for a distance trial for spherical balloons, to take place at Berlin next May.

New Kind of Record—Some person with plenty of time on his hands counted the automobiles that passed over Washington bridge at Bridgeport, Conn., on the way to New Haven to take in the Yale-Princeton football game and found that 879 cars went by that one point. He figured that placed end to end they would reach 2 miles and that the aggregate cost would run close to $4,000,000.

Compiles Good Roads Dope—Sam Huston, Ohio's highway commissioner, has compiled a pamphlet showing the remarkable growth of the interest in New Jersey, Massachusetts, California, New York, Maryland, North Carolina, Maine, Rhode Island, New Hampshire, Pennsylvania, Michigan, Iowa, Utah and Colorado in the matter of road investigation and the principle that the state should aid localities in the improvement of the leading highways, the states being ranked according to the strength of the movement.

Phantom Motorist—Pittsburg has a phantom automobile. It flits about the east end at breakneck speed and hovers around Homewood cemetery and the dark boulevards of Schenley park. The officious policemen in the park are telling strange tales of the muffled woman in a white touring car that goes racing through the Bigelow monument every dark night and sends her machine half over the cliffs in the park. Last week negro chauffeurs were terrified by the ghost and their comrades are now carrying rabbits' feet to ward off impending danger. So general have the stories of the phantom automobile become that a midnight automobile party is to be held to hunt down the strange apparition.

Come Up Fast—Out of a total of $250,000 members of the Automobile Club of America have subscribed for $211,000 worth of second mortgage bonds on the new club building on West Fifty-fourth street, New York.

Warns Scorchers—Glencoe, Chicago's suburb made famous by its recent attack of motorphobia, has gone about the suppression of scorching in a different way than bumping the bumps and arresting offenders on sight. Now large steel signs, "Warning. Run slow," are posted along the Sheridan and Green Bay roads and the authorities are hoping they will have some effect.

Fool Drivers—New Haven, Conn., motorists are looking for jokers who are scaring them by means of a dummy figure. They operate on Orange street, where the asphalt begins and they work at night. The unknowns hide along the street, a stout rope being tied to the dummy. As the automobile approaches this figure is yanked across the street in front of the car, at the expense of the driver's nerves. Then the conspirators hot-foot down a convenient alley and make their escape.

Fast Kilometer—After a delay of several days on account of the heaviness of the roads, due to recent rains, Frederic Dufaux, November 13, beat the French flying kilometer record by 2 seconds, making the distance in 23 seconds flat, at Salon, France. The course was soft at that and uphill on the Crau road in the direction of Arles. Baras holds the world's record of 21 seconds, made at Ostend.

Oldfield's Latest—Barney Oldfield is perfecting plans to reproduce on the stage an automobile race by means of automobiles in action and moving pictures. He has been at work for some time testing alcohol instead of gasoline and he claims that in all probability he will use alcohol in his racing cars on the track. In the stage act the cars are in a neck and neck race with moving pictures showing the scenes on all sides as the race progresses. The opening will be in Newark.

Turkey Trip Made—R. L. Jefferson has been reported safe in Constantinople, which gives him the honor of being the first motorist to cross Europe to the Turkish metropolis. The Englishman went from London to Constantinople in 31 driving days for the 2,509 miles. The Turkish government insisted upon giving him a military escort through the province of Adrianople, which caused some delay, Jefferson having to accommodate the pace of the car to the speed of the horses. The Rover car stood the journey well and his Dunlop tires kept their original covers throughout the trip, only one inner tube having to be changed. The tires on the

Digitized by Google

front wheels were not touched, making the journey on one inflation.

New Jersey's Record—Since 1892, when the state aid law was first passed, New Jersey has spent $5,745,515.28 on 1,043.529 miles of good roads, the cost ranging from $1,554 per mile for a gravel road to $25,500 per mile and averaging $5,505 per mile. The cheapest macadam road cost $4,282 per mile.

Ball Player a Chauffeur—Sammy Strang whose claim to fame is that he is a member of the New York National League team which won the world's baseball championship, is now driving a car for a Philadelphian, with the idea of going south this winter, it is reported, and taking part in the Ormond beach meet.

Cops Go Some—New York policemen who ride motor cycles competed for the championship of the police department last Saturday over a course running from Caton avenue over the Ocean speedway to the Concourse at Coney Island, a distance of 10 miles. Benjamin Mallon, on Commissioner McAdoo's staff, won in 14 minutes 4-5 second, next, and Charles M. Murphy, once a famous cycle racer, who rode a mile back of locomotive pace in 54 seconds, third in 15 minutes 31 seconds. Mallon and Murphy have been protested, it being claimed they rode racing machines which were not owned by them.

Chauffeurs Organize—The Detroit Chauffeurs' Association, not a union but a club, has been formed, with twenty-four charter members, the object of the organization being "the betterment of those engaged in the business, mechanical instruction and social relaxation." Charles Ternes is the temporary president and William T. Guenther secretary.

Aprons Unnecessary—A Detroit alderman has asked that all automobilists in that city be required to equip their cars with aprons to prevent oil from dripping on the asphalt pavement, but the Detroit Automobile Club, through President Broadwell, has entered a strong protest with the committee to which the ordinance was referred, claiming that aprons would collect oil and that when going up an incline this oil would be thrown on the pavement in large spots, doing far more damage than the ordinary drip. Besides, he argued, this collection of oil in an apron creates a dangerous condition, making explosions possible.

As They Do It in England—Returning travelers speak with interest of the careful manner automobiles are handled in crossing the English channel. Every precaution is taken to prevent an accident, the cars being put aboard and taken off steamers by means of a huge crane. It costs $20 to get an automobile across the channel in this manner.

Even in Canada—Canadian farmers, no doubt envious because they have to rely on the horse for their transportation, built a fence across a road near Port Hope, Ont. A. O. Geiger, a motorist, smashed into the fence in the dark and had a close call. The editor of a Cobourg newspaper, while sympathizing with the farmers because automobiles scare horses, condemns the action and calls it "a mean trick and a crime."

THE READERS' CLEARING HOUSE

EARLY AMERICAN MAKERS

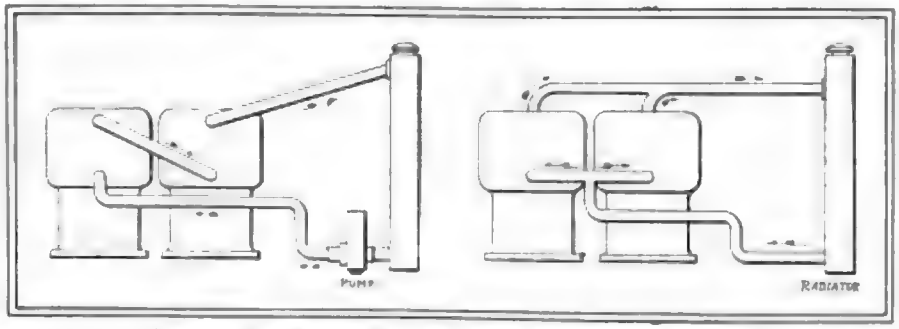
Toledo, O.—Editor MOTOR AGE—Having had a controversy with several of my friends on automobiles, I wish to ask you to inform me as to who invented the first successful automobile, and when; also who manufactured the first gasoline automobile for the market and when, in the United States?—VICTOR CHRISTEN.

This is a disputed point, and of course much depends upon what would be considered a successful automobile. Duryea, Haynes-Apperson, Winton and Olds were the first in the field in this country.

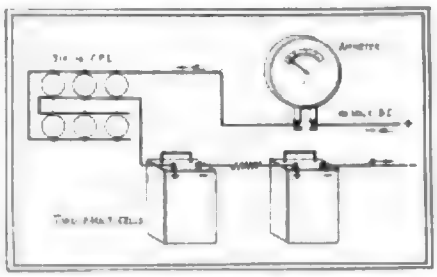
PIPING WATER-COOLED MOTORS

Flint, Mich.—Editor MOTOR AGE—Will you inform me through the Readers' Clearing House if the following method of piping for a four-cylinder water-cooled motor is advisable? The cylinders are cast in pairs and the honeycomb radiator forms the front end of the bonnet. From the base of the radiator the water is drawn by the gear-driven pump to the base of the water jacket, surrounding the rear pair of cylinders. From the jacket it passes from the center of the top of the jacket to the base of the jacket for the front pair of cylinders and finally exits from the top of this pair to the top of the radiator, as shown in the drawing. In this way the back pair of cylinders gets the cold water and the front pair the warmed water from the rear. Would it be an improvement to have the cool water strike the front pair first?—W. P.

For the water circulation it is preferable to have the water in both cylinders as near the same temperature as possible. When the water is distributed to both cylinders evenly, as shown in the second drawing, the cooling is more even. Where the water is introduced to rear cylinders first, the hot water enters the front cylinders at a higher temperature than that of the water in the rear cylinders, which is cooled by the force of the air through the radiator.



INCORRECT AND CORRECT WAY OF PIPING IN THE WATER SYSTEM



WIRING FOR CHARGING BATTERIES

MOTOR DIMENSIONS

Aurora, Ill.—Editor MOTOR AGE—Will you kindly answer the following questions regarding a motor with a bore of 4¼ inches and 4-inch stroke? How thick should the walls of the cylinder be, what length for the connecting rod, what thickness and width of the rim of the flywheel and the diameter?—S. D. C.

For a motor 4¼ by 4 inches the cylinder walls should be about 7-32 inch thick; the connecting rod about 10 inches; flywheel about 3½ inches wide, ¾ inch thick and 16 inches in diameter. These dimensions are approximate only, as there are many things to be taken into consideration, such as speed of motor, strength, etc.

TIRE FILLING

San Diego, Cal.—Editor MOTOR AGE—Can you give directions for making a filling for single tube tires? I have seen samples of a material resembling rubber, which is pumped into the tire in place of air, making a solid tire.—C. W. W.

There are some cases in mind of the mixing of tire filling, the ingredients of which seem as yet in the experimental stage and not generally known to the trade.

CHARGING BATTERIES

Indianapolis, Ind.—Editor MOTOR AGE—Can you give explicit directions in the columns of the Readers' Clearing House on recharging batteries? I operate an electric runabout and have occasion to have it charged in different plants in this and other cities. After charged in some garages I find a greater supply of current than obtained in other places. What I would like is a short rule, so that when having my machine charged I would be certain that it is being done properly and the battery not injured. F. W.

The accompanying diagram illustrates the wiring for charging batteries on any line of 110 volts. With the arrangement of the six 16-candlepower lamps this may be used with or without ammeter. The capacity of the batteries can be determined by testing them with a small volt-meter, 2 volts per cell making a 4-volt battery.

Digitized by Google

Among Makers and Dealers

ADDITION BEING ERECTED BY THE PACKARD MOTOR CAR CO., of DETROIT, MICH.

Elmore-Switch—A. Elliott Ranney & Co., New York agents for the Elmore, have moved their headquarters to 1851 Broadway.

Belgian Show—The date for the opening of the Belgian automobile salon has been definitely set by the committee for January 13, the affair to continue until the 25th of that month.

New Wayne Agents—A. T. Wilson, 1548 Broadway, Denver; Paxson Motor Co., Cleveland, O.; and the Greenville Auto Co., Greenville, S. C., are recent appointments of the Wayne Automobile Co.

Moving to Detroit—The Winkley Co., manufacturer of oil hole covers and oiling devices, which has just acquired the Garlus carbureter and the Eureka separator, has decided to move from Hartford, Conn.

Opens Dayton Place—John S. Johnson, formerly associated with Earl Kiser, has taken the old stand of the Day and Night Auto Co., on Fourth street, Dayton, O., where he is handling the Winton and Autocar.

Is Reorganized—The Standard Automobile Co., of Rochester, N. Y., has been reorganized and will handle the Jackson. A. H. Sowers is secretary and general manager and S. R. Snook, E. H. Lapp, and F. E. McClellan directors.

Vienna Show Dates—Dates for the Vienna show have been selected, 10 days, starting March 18, having been set aside for the exhibition. The affair will again be held in the Gartenbauhalle, although it will be necessary to overflow into adjoining buildings.

New Hub Concern—A new company has been formed to handle the product of the Olds Motor Works in Boston. The new organization is called the Adams-Sutton Motor Co., incorporated with a capital stock of $40,000. The president and manager of the company is Walter O. Adams, formerly general manager of the Crest Mfg. Co., of Cambridge, and later assistant sales manager of the Ford Motor Co., of Detroit. David Sutton is the secretary-treasurer. The company will occupy quarters in the new Motor Mart and will be ready to show the new Oldsmobile cars during the latter part of November.

De Dietrich Garage—The de Dietrich Importing Co., of New York, has leased for 5 years the 25-foot building, 5 West Forty-fourth street, for garage purposes.

In S. & M.'s Old Place—Smith & Mabley's former garage at Seventh avenue and Thirty-eighth stret, New York City, has been leased by L. C. Jandorf, a dealer in second-hand cars.

Big Tire Fire—Seventy-five thousand dollars' damage was done to the plant of the Dunlop Rubber Co., at Birmingham, England, on November 10. Thirty thousand tires were destroyed or damaged.

Medal for Oldsmobile—It is announced that the Lewis and Clark exposition at Portland, Ore., has awarded a gold medal to the Oldsmobile exhibit, which is claimed to have been the only one of the sort decorated.

Cross for Charley—The cross of the Order Merite National de Bulgarie has been conferred by the prince of Bulgaria upon M. Charley, the Mercedes concessionaire for the United States and France. This is the third decoration M. Charley has received, the French government bestowing the others.

Lozier Move—The Lozier Motor Co. has been obliged to quit abruptly its temporary New York salesroom at 22 West Forty-second street, on which it had only a temporary lease. It will occupy other quarters until it can get possession of its new garage at Broadway and Fifty-fifth street early in December.

Frayer-Miller Changes—On the 1906 Frayer-Miller the wheel base has been increased to 100 inches, the hood has been shortened, the wheels and tires are larger and the front axle is of the one-beam variety, with Timken roller bearings. The cam gears, formerly in front of the engine case, are all enclosed and run in oil. There is a four-speed transmission and reverse running on Hess-Bright bearings, as is also the case with the rear axle. The body is larger, there are new brakes working internally and externally on the rear wheels and a new spring suspension is fitted.

Viquecot Locates—The Viquecot company, of New York, has leased the former de Dietrich garage at 215-217 West Forty-eighth street. Louis Caswell is the manager in charge.

After More Mors—Edward Lillie, manager of the Mors Automobile Co., of New York City, sailed for Europe this week to attend the Paris show and arrange for 1906 shipment of Mors cars.

Progressive in Joplin—The Joplin Automobile Co. wishes it distinctly understood that it is very much on the automobile map, its garage at Joplin, Mo., being among the best known in the state.

New Auction Firm—Harlan W. Whipple, Carl Page, Walter C. Allen, Carl H. Page, Charles G. Wridgway and R. J. Mooney have organized the Auto Auction Association of America. The first sale will take place on December 4.

Novelty Anyway—Commendable up-to-dateness is shown by the proprietor of the Koenig garage and machine shop at 179 West Main street, Tarrytown, N. Y., who has issued a map on which the best route to his shop is outlined in heavy black, while on the back are given some of the best tours around Tarrytown.

Bowman's Emissary—W. Tilford Jones, chief stockholder of the Sidney B. Bowman Automobile Co., of New York, sailed for Europe on Tuesday to attend the Paris show and arrange for 1906 importations of Clement-Bayard cars. He will endeavor also to persuade M. Clement to send over a racer for the Ormond meet.

Deere Doings—The Deere-Clark Motor Car Co. has started work on its new factory building at Moline, Ill. The plant will be 100 by 300 feet and will occupy 12 acres of ground. The Deere line will consist of a 22-horsepower two-seated car and a 2-ton commercial truck, designed by Mr. Clark, who is credited with 10 years' experience in the building of automobiles.

Going to Florida—The Wayne car is to be represented in Florida by a party of 18, which will travel south in a private car from the New York shows, in charge of Manager Kull, of the New York branch. The car will be side-tracked near the beach. Three servants will look after the wants of the visitors. Immediately after the close of the races the Wayne special will be sent flying to Chicago for the Chicago automobile show.

Jackson Agents—The Jackson Automobile Co., of Jackson, Mich., announces the following appointment of agents: E. P. Blake Co., New England representatives, Boston, Mass.; Jackson Automobile Co., distributor for the eastern states; E. K. Hauser, Washington, D. C.; Diamond Motor Car Co., Philadelphia, Pa.; East Liberty Auto Co., Pittsburg, Pa.; Standard Auto Co., Rochester, N. Y.; L. C. Howard, 1655 Broadway, New York city; Ormond Auto Co., Brooklyn, N. Y.; Paxson Motor Car Co., Cleveland, O.; Seidler & Minor Co., Detroit, Mich.; Hagmann & Hammerly, Chicago; Motor Car Co., Minneapolis, Minn.; David Bradley Co., Fond du Lac, Wis.; Jackson Automobile Co., St. Louis.

Digitized by Google

Mo.; Charles R. Johnson, Coldwater, Mich.; Charles T. Bisch, Springfield, Ill.; C. R. Dench, Erie, Pa.

Burr President—Louis E. Burr, with C. P. Kimball & Co., the carriage builders, for more than 20 years, has been elected president and general manager of the Woods Motor Vehicle Co., of Chicago.

New Partner—A. E. Schwartz, a graduate of the Paris Institute of Technology and formerly associated with the William Schwartz Co., of that city, is now associated with A. L. Kull in the ownership and management of the Wayne Automobile Co., of New York.

Pope-Toledo Agencies—The different concerns handling Pope-Toledo automobiles during the past season have all signed up for the same line during the coming season. The H. L. Keats Auto Co., of Portland, Ore., has taken the general agency for the states of Washington and Oregon.

In the Market—E. A. Jenkins, who has just bought from J. A. James his garage and taken over the Buick agency, announces he is anxious to hear from manufacturers of garage equipments, being on the market for lathes, turn tables, washing machine and brass flexible buffing outfit for use in the garage.

Packard Improvements—On the 6 acres of land the Packard Motor Car Co. recently purchased is being erected a two-story 60 by 175 feet structure, of wholly steel, concrete and glass which is designed to be absolutely fireproof. The new building will be used as an addition to the company's motor and chassis erecting departments. With this additional 21,000 feet of floor space the Packard people will have added 75,000 square feet of space to their plant in the last 10 months.

Lots Doing—The Standard Roller Bearing Co. has purchased the property of the Pennsylvania Iron Co. at Forty-ninth street and Marion avenue, adjoining its present plant. This gives the company a total of over 5 acres and a floor space of 145,000 square feet. Into the new place will be moved the annular ball-bearing and automobile axle departments and the brass foundry. Another purchase of land was made recently, space being secured from the American Ice Co., on which is being erected a foundry for making crucible steel castings.

Body Company Reorganized—The Pontiac Body Co. has been reorganized with R. F. Monroe, who held the controlling interest in the company and also the position of general manager, as principal owner. Mr. Monroe has purchased the interests of Chauncey Brace, H. F. Messenger, J. A. Jacokes, J. A. Graley, and Albro Green, who formerly held stock in the concern. He has associated with him in the business D. E. Strohn, superintendent of the factory, and John Parker, bookkeeper. The company has contracts with the Cadillac, Bloomstrom, Buick, Bartholomew, Peoria, Lebanon, Welch and Rapid automobile companies. Mr. Monroe states that the rumor that the company is about to become a branch of the Cadillac company is without foundation. He says the connection with the Cadillac company lies only in the contract to supply the latter company with bodies.

BUSINESS BRIEFS

Ashtabula, O.—C. L. Scrivens has opened a garage and salesrooms.

Columbus, O.—The Capitol City Automobile Co. has filed a notice of assignment.

Waterloo, Ia.—The Corn Belt Auto Co. has been appointed district agent for the Reo during 1906.

Columbus, O.—A plant for the manufacture of automobile bodies will be erected here by George Heinlein.

Boston, Mass.—Philip W. French has accepted a position as the sales manager of the Napier Automobile Co.

Des Moines, Ia.—W. W. Sears has recently been appointed agent for the Reo in Des Moines and vicinity.

LaCrosse, Wis.—F. J. Neetzel has taken the Rambler agency for western Wisconsin, but will not open his garage until next March.

Newark, N. J.—C. S. Calvert, formerly connected with the Motor Car Co., will have the local agency for the Winton next season.

Jackson, Mich.—The Jackson Body Co., manufacturer of carriage and automobile bodies, has been placed in the hands of a receiver.

Detroit, Mich.—The Detroit Motor Car Co. has secured the agency for the Peerless cars and is temporarily located at 170 Jefferson avenue.

Baltimore, Md.—A permit has been issued for the erection of a garage at the northwest corner of Mount Royal avenue and Charles street, for George Miller. The estimated cost is given at $55,000.

Pittsburg, Pa.—Excavating has been started at 5909-15 Center avenue for the new garage to be built by the Hiland Automobile Co. The estimated cost of the building is about $50,000. The floor space will be 21,000 feet, the first floor being occupied by the offices, while on the second are to be the reception rooms and the salesrooms. The Hiland company has taken the agency for the Thomas cars.

NEW INCORPORATIONS

Brooklyn, N. Y.—The Private Garage Co. has been incorporated with a capital stock of $2,000.

Newark, N. J.—The Newark Garage & Repair Co., of 727 Lake street, has been incorporated with a capital stock of $10,000.

Newark, N. J.—The Roseville Motor Co., whose registered office is 830 Broad street, has been incorporated with a capital stock of $25,000.

New York City—The Leon Rubay Co. has been incorporated to manufacture automobiles, cars, etc. The capital stock of the company is $25,000.

Forth Worth, Tex.—The Fort Worth Automobile Co. has been incorporated with a capital stock of $10,000 for the purpose of dealing in automobiles.

Albany, N. Y.—The Craven Sectional Tire Co., of this city, has been incorporated with a capital stock of $40,000, and will engage in the manufacture of automobiles.

Toronto, Ont.—The Toronto Motor Boat Co. has been incorporated with a capital stock of $40,000, and will engage in the manufacture of boats, launches, gasoline engines, etc.

Baltimore, Md.—The Mar-Del Mobile Co. is occupying a temporary garage at 872-4 Park avenue while its new building is being constructed.

Detroit, Mich.—J. P. Schneider, 187-189 Jefferson avenue, has relinquished the Peerless and Buick agencies, and has taken on the Pierce.

New Haven, Conn.—Owing to the stress of other business, C. H. Torrey has given up the Knox agency, which has been taken up by E. T. Hale, 166 St. John street.

Kansas City, Mo.—Coming directly from France, Lemoing, O'Beirne & Co. have opened a garage and repair shop at 1737 Grand avenue. They will handle the Panhard.

Toledo, O.—The Toledo Storage Battery Co., which makes the X-cell dry battery, is seeking a site on which to erect a new plant, its Ottawa street place being too small.

Pittsburg, Pa.—The shareholders of the Standard Automobile Co. are to vote January 15 on a proposition to increase the company's capitalization from $75,000 to $125,000.

Kansas City, Mo.—The Kansas City Motor Car Co. has succeeded the Caps Brothers Mfg. Co. and is building a factory at Sheffield, which will be ready the first of the year.

Kansas City, Mo.—The W. R. Dempster Machinery Co. has just completed an addition to its plant at Sixteenth and Walnut streets, where it will handle the Maxwell in the southwestern territory.

Chicago—J. H. Manning, who has been connected with the New York White branch with Carl Page, will hereafter be associated with the management of the Chicago branch with Webb Jay.

Indianapolis, Ind.—Announcement has been made of the sale of the Indiana Automobile Co. to Crawford Fairbanks, who has taken immediate possession. This company has the Winton agency for 1906.

Cleveland, O.—The Brock Garage Co., dealer in second-hand cars, has outgrown its present quarters at Erie and Bolivar streets and has been forced to rent another place two doors from its headquarters.

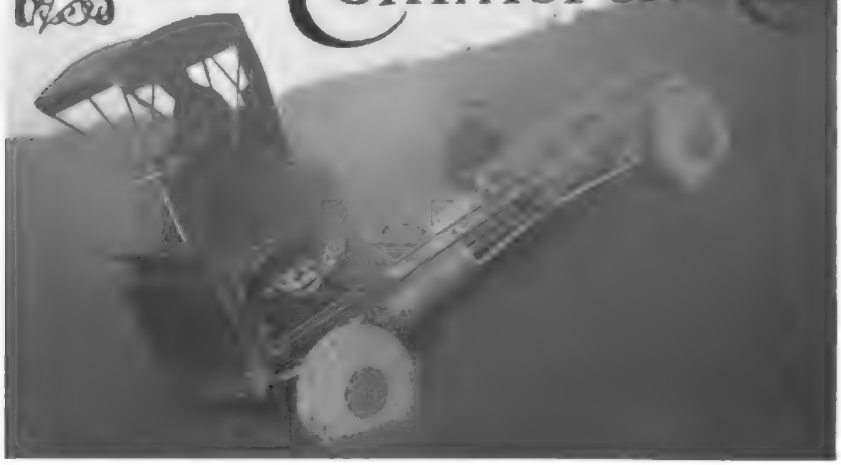
Minneapolis, Minn.—O. W. Anderson, 511 Masonic Temple, is interested in a company which proposes to build 100 automobiles during the coming year. A location somewhere in the Twin cities is being sought.

Bridgeport, Conn.—From plans by a Boston firm of architects the American Locomotive Co. will erect a large brick garage, 47 by 100 feet. Though it will have the height of a two-story building, it will have but one floor.

Detroit, Mich.—Charles H. Grant has resigned the management of the Ford retail store, and has taken a position with the Buick Motor Co., and after making a trip through the south in the interest of this company, will take up the management of the local branch, which the Buick company will shortly open.

Digitized by Google

The Realm of the Commercial



BACKING UP GRADE, THE FOUR-WHEEL DRIVE UNDER PERFECT CONTROL.

TRIES OUT FOUR-WHEEL DRIVE

Four-wheel drive in commercial trucks has an able exponent in the Four-Wheel Drive Wagon Co., of Milwaukee, Wis., which has been experimenting with a large 5-ton machine for the last 12 months. MOTOR AGE in its issue of July 27, gave a detailed description of the experimental truck which was driven by chains to each of the front and rear wheels, but the company has recently completed one of its shaft drive models which has double propeller shafts, one to the front and another to the rear axle for driving respectively the front and rear wheels.

Several of these machines are now being pushed to completion, the company is enlarging its factory space and promises are good for ready sales, as several concerns already having placed orders, among them being the Pabst Brewery Co., of Milwaukee, and the Sears-Roebuck Co., Chicago. The organization of the company has been completed several months and all necessary finances are in the bank and among its directors can be noted such men as Nelson P. Hulst, William W. Aldis and Edwin Reynolds. So far over $100,000 has been spent in experimenting with the machine and bringing it to its present state of development.

In experimenting with the machine a MOTOR AGE representative had an opportunity to watch it doing many of its little tricks, ordinarily considered impossible for heavy machines, such as climbing a 13½-inch curb from a standstill with the wheels touching the curb, traveling with a 6-ton load through snow 2 feet deep, pulling flat cars on a railroad track with a load weighing in all 44 tons and having an 8-ton load itself, the grade on the track being 3 per cent; pushing a 5-ton load of cement blocks over a 5-inch curb and traveling 7½ miles per hour over good roads with an 8-ton load. The four wheels being used for steering as well as driving, makes it possible to maneuver it in very close quarters, a 25-degree turning angle serving to turn it completely around in a circle equal in diameter to the length of the machine.

Like the experimental model, each truck has a four-cylinder motor carried lengthwise beneath the driver's seat with a multiple disk clutch connecting it with a sliding gear transmission carried beneath the truck platform to the rear of the seat. In the chassis view this gear set is shown. Extending backward from it is the primary shaft A which delivers the power to the propeller shaft running to the rear axle within the housing B. Another shaft C connects with the front axle, there being a bevel pinion on the end of the shaft B to transfer to the rear axle and a similar pinion on the front one. The use of four driving wheels calls for three differentials, one in the center of the rear axle, the same as in any touring car, a similar one in the center of the front axle and the third within the case D, where the power is transmitted from the shaft A to shafts B and C, this one acting between the front and rear wheels to care for any difference in wheel diameters occasioned by wear on the tires. The shaft A within the top part of the casing D terminates in a sprocket and this sprocket is connected by a 4½-inch Morse chain to another sprocket on the end of the main propeller shaft B, both sprockets as well as the chain being contained in the oil-tight case D and running in oil bath. The propeller shafts B and C are united near the casing D by a universal joint, which allows of the transmission of power through the necessary angle, caused by the weight, of this part of the shafts above the axles and so allows for depression of the springs. The sprocket on the propeller shaft B is pressed over the central differential. The gears connecting the two propeller shafts B and C with their respective axles, are both cut and hardened and made large to give added strength. A roller in the same plane as the propeller shaft takes up all thrust and lateral strain occasioned by the bevel gears. To protect the propeller shafts as much as possible each is encased in a continuous casing with each axle, a ball and socket joint in the casing covering the joint universal joint E at the center, which allows the casing to take care of all depressions of the springs.

The carrying of the propeller shafts as well as the large differential within the housing D is accomplished by the dropped frame member S in which is carried a bearing for the front propeller shaft. To support the large differential casing are used cross arms F that rest on the large radius rods G connecting with the front and rear axles and being supported from the center of the frame pieces by the triangular block H. Truss rods K assist the blocks H in supporting their load and for further strength the dropped piece S is braced to

FOUR WHEEL DRIVE DOING AN UP-GRADE STUNT

Digitized by Google

the rear part of the frame by the angle rods T crossing near their centers.

The facility with which the differential within D can be examined is meritorious. The small top part of the case containing the bearing for the shaft A can be removed by eight bolts being taken out when the shaft A can be, owing to its universal joints, turned to the side out of the road. After this the upper half of the casing D can be taken off, as can the top part of the housing on the rear propeller shaft, thus exposing half of the driving parts. The top half of the transmission gear box is removable as shown, exposing then all of the gears, the bearings and the shifting elements.

All four road wheels are steered through the horizontal shaft L having bearings in the blocks M suspended from the main frame. The shaft L terminates in front in a gear sector which meshes with a worm on the steering column, the latter operated by hand, and in rear ends with the arm N, which connects through the rod P with the yoke J, which is attached to the wheels and through which it is turned. A heavy tie rod R connects the steering yokes on each pair of wheels. A rotation of the shaft L turns the front wheels say to the right and the rear wheels to the left and an opposite rotation gives an opposite movement to the front and rear wheels.

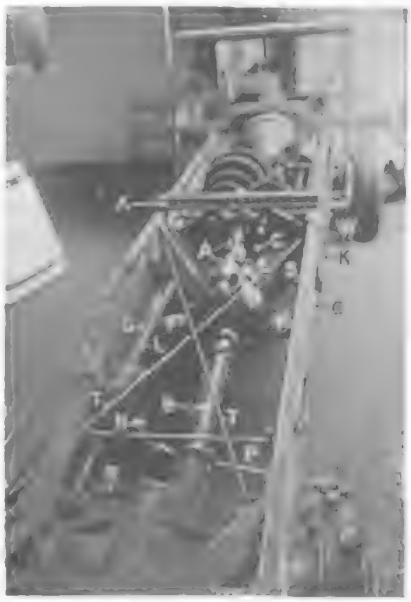
In the previous description of the truck the method of driving to each wheel through universal point within the wheel hub was shown, as was the construction of the wheels, each being formed of wedge-shaped blocks of wood that do the double duty of serving as spokes and acting as tires. The shafts within the axles casing for driving each of the road wheels revolve on roller bearings and have the usual connections at their inner ends with the differential wheels. Each road wheel is carried on ball-bearings, the balls ¾-inch in diameter and contained in hardened steel cups and cones. Special arrangements are made for lubricating all running parts by packing in oil where possible and fitting large oil cups in other places.

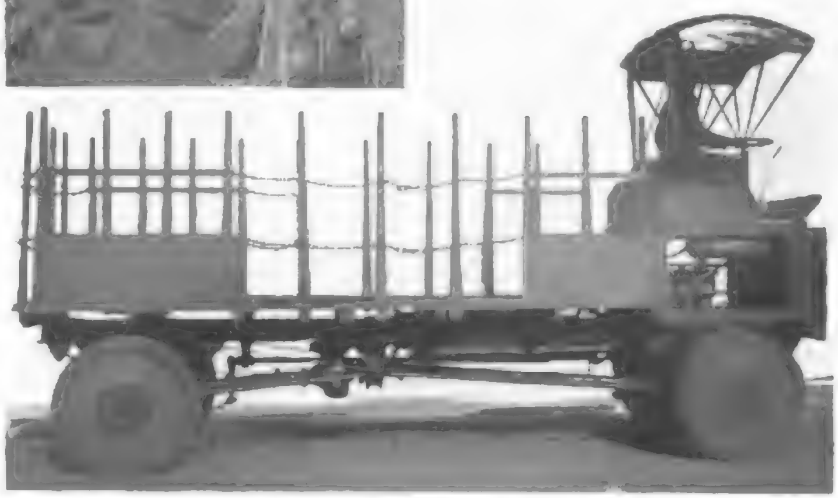
The frame work of the new shaft drive production is made to withstand the heaviest service, the main frame being of cold rolled ship channel steel, in one piece, being bent into shape at the corners and reinforced by heavy corner brace plates. The motor and gear box are carried on a three-point sub-frame, the rear support of which is on a cross piece resting on the top of the main frame pieces and at its center forming a support for the apex of an inverted V piece W in carrying the rear of the sub-frame. Bodies of different designs are furnished according to the requirements of the case. All brakes used are connected direct on the wheel hubs so that in case a break in the transmitting parts occurred the brakes would still be intact and sufficient to hold the machine with load on any grade.

VAN PROVES ITS WORTH

Those interested in commercial cars in England are still talking of the non-stop feat of a 16 horsepower Lacre delivery van, which was driven from Glasgow, Scotland, to London, a distance of 420 miles, in 30 hours, averaging 14 miles an hour. The gasoline consumption was 27 gallons, working out at 15½ miles per gallon. Three quarts of lubricating oil were used and the weight of the van, carrying three people and their baggage, was over 2 tons. It rained 23 out of the 30 hours and the roads in consequence were decidedly heavy. The first speed was used only twice and then on account of darkness. The engine only stopped once on the entire trip. That was when the fan belt jumped its pulley, 30 seconds being required to replace it. This was the only blot on the record and prevented an absolute non-stop trip being made.

CHASSIS OF THE FOUR-WHEEL DRIVE





COMPLETED 5-TON FOUR-WHEEL DRIVE TRUCK ON THE ROAD

It was not a new car that was used, the vehicle having covered several thousand miles in England and Wales on demonstrating trips. The start was made from the Albion company's works at Scotstoun at 7 o'clock Saturday morning, two drivers and an observer making up the crew, the drivers relieving each other at the wheel. The route followed was the one taken by the cars in the Scottish Automobile Club's 1904 reliability trial and carried the van through Hamilton, Douglas Mill and Beattock to Carlisle, thence by way of Kendal and Leeds to London. It was raining when the car started, but the crew expected to get outside the storm belt in short order. Going at 14 miles an hour, Carlisle was reached at 2:07 p. m., with the rain still coming down. The van did not seem to mind the weather conditions, though, and plugged merrily along through the slush, reaching Penrith at 3:30 p. m.

Ahead of the demonstrators was the climb over Shap, which, however, did not slow them, the ascent being made on top and second speed. As they got over this obstacle, darkness overtook them and two large paraffin lamps were lit. They proved inadequate, however, and had it not been for the fact that it was not pitch dark overhead, the driver would have had his troubles keeping the road. It was within 5 miles of Leeds that the fan belt slipped off, but this was soon repaired and the journey resumed, Leeds being reached at 11:30 p. m. This was the halfway point and as the van was moving along without a skip no further trouble was anticipated, and as it turned out, none was encountered.

Doncaster, Tuxford and Grantham were passed in the order named, the last named place being reached at 5:25 a. m. At Stamford the rain let up and besides this the travelers had plenty of light to guide them. Under these favorable conditions, they pushed forward rapidly and at Biggleswade, which was reached at 9:50 a. m., a telegram was forwarded to London informing the Lacre people of the approach of the van. The rest of the trip was all fun, the machine attracting attention because of its travel-stained condition. It was exactly 2 minutes after 1 p. m. when the Lacre company's London headquarters were reached and the weary 30-hour run ended.

RATHER EXPENSIVE

A service of electric automobile cabs, under the management of a German company, began operations in Buenos Ayres, Argentine Republic, on Oct. 1. The cabs are all supplied with taxometers, and the fare is 21½ cents for the first 1300 yards or a fraction thereof, and 4½ cents for every 350 yards thereafter.

Digitized by Google

Commercial Stepping Stones

A Californian's Home-Made Tractor

In Coal Business—A large 5-ton coal truck has been sold to the Hartwell Coal Co., of Chicago, Ill., by the Synnestvedt Machine Co. The truck has a working radius of 30 miles and a carrying capacity of 6 tons of hard coal.

Buenos Ayres' 400—Automobiles have become very popular in Buenos Ayres, Argentine Republic, and are having a large sale. From the registration numbers it would appear that there are about 400 cars in use in that city, not to speak of the large number to be found in other parts of the republic. Most of the cars are of French make; next in order come cars from the United States. A few English automobiles are seen in Buenos Ayres. The cars range in size from the heavy trucks to runabouts for physicians' use.

The End Near—That a horse bus will soon be as much of a curiosity in old London as the Roman chariot, is the way an enthusiastic motor bus manufacturer comments on the invasion of the world's metropolis by self-propelled vehicles. There are at present 3,500 horse buses running in the city and in less than 1 year, 150 motor buses have been produced. It is claimed that 1,000 motor buses would carry more passengers than the 3,500 horse ones. Each motor bus carries thirty-four passengers against twenty-six carried by horse ones. Besides the advantage of numbers, the greatest advantage of the motor bus is in the lack of noise and the greater speed resulting in less congestion at corners and in the busy districts.

Truck Tug of War—Playing tug of war with motor trucks was a pastime enjoyed by a few residents of New Haven, Conn., recently when a pair of heavy trucks met on one of the residential streets and one of the drivers challenged the other to a pulling match. The challenging driver had an Atlas truck rated at 24 horsepower and the other an air-cooled Knox truck of 20 horsepower. In the first trial the 1-inch rope uniting the rear axles of the contestants was snapped immediately upon the power being turned on, but more ropes were soon obtained and a second attempt made. This time the Atlas got the better start but the sturdy Knox had reserve power and started towing the Atlas after it, which lasted for 35 yards when the Atlas driver shouted enough and withdrew from the crowd.

Indians Start Line—Some of the Indians of the Rosebud reservation have bought touring cars, which they will operate through the reservation on a regular tariff and schedule for the benefit of visitors.

Test Order—After an exhaustive test the Oldsmobile Co., of New York, has made delivery of a commercial wagon to the Rankin Delivery Co., which will probably add others to its stock for delivery work in New Jersey and Connecticut. The wagons in question have a capacity of 1½ tons load.

Farmer Tests Motor—The agricultural motor, the much-talked-of and much-experimented feature of the gasoline engine in Europe at the present time, is interesting the farming community in America and already one agriculturist, in the person of Arthur Miller, of Aukum, Cal., has succeeded in coupling a two-cylinder marine type of water-cooled gasoline engine to an improvised wagon with good results. As the two illustrations show, the machine is crude to the extreme but with a weight of 4,500 pounds the maker claims it can haul a load of 3,000 pounds and draw as much more on an attached trailer. The motor carried in front is coupled to the ordinary wagon wheels, 4 feet 10 inches high each and fitted with narrow steel tires. The transmission used gives three forward speeds and one reverse and a double set of brakes operate on front and rear wheels, a lever near the steering wheel serving to apply each. The length of the wagon without trailer is 21 feet, the carrying space on each being 12 feet in length and 4 feet wide. The axles have a clearance of 17 inches in the lowest point.

Ground for Motor Truck Plant—The Packard Motor Car Co. during the past week purchased 6 acres of ground in Detroit immediately joining its present factory, which covers 6 acres, thus giving it a total holding of 12 acres on Grand boulevard. The intention is to erect upon this newly acquired ground a complete plant for the manufacture of its commercial vehicles. The company has been forced into this move by the call for motor trucks. During the 8 months that it has had its 1½-ton motor truck on the market it has met with marked success. To help meet the demand it was necessary to have a great deal more room; in fact, an entirely new factory, so that the company can devote the whole of its present plant to the manufacture of touring cars.

Oakland Awakens—The police and fire commissioners of Oakland, Cal., are considering the advisability of purchasing an automobile patrol wagon, owing to the increasing business of the police department and the long distances to be covered in some of the runs. When the matter was taken up at the meeting of the board recently Mayor Mott expressed himself in favor of an automobile patrol wagon, owing to the speed which could be made on long runs in cases of emergency, and the other commissioners expressed themselves as being of the same mind. Secretary Facett was instructed to correspond with the manufacturers of automobiles for the purpose of obtaining information as to style, cost, etc., when the board will again take up the subject.

Carries a Load and Hauls a Trailer as Well

American Motor League

OFFICERS

ISAAC B. POTTER, President, Potter Building, New York.
CHARLES E. DURYEA, First Vice-Pres., Reading, Pa.
JOHN A. HAWKINS, Second Vice-President, Pittsburg, Pa.
FRANK A. EGAN, Secretary, 152 Nassau St., New York.
FREDERICK B. HILL, Treasurer, 32 Bedford St., Boston.

National Headquarters Vanderbilt Building, New York

THIS LEAGUE
Is Now Collecting Route Information

covering all automobile routes in the important states and will publish road books for motor car users as fast as complete information is received. The A. M. L. is the only organization engaged in this work, and it invites the co-operation of all persons interested. For full information and membership blanks address American Motor League, Vanderbilt Building, New York City.

IE LEAGUE'S CONSULS

The A. M. L. has now about 600 cons in different parts of the United States l there is need of many more. Each con- holds a certificate of appointment. Apcations for appointment of consuls are sidered in the light of a pledge of good rk, and appointments are bestowed where dence of such work is supplied to the retary. The following named members 'e been appointed consuls in their rective localities since the last announcent: George L. Hailman, Pittsburg, Pa.; nes M. Horner, Edgewood Park, Pa.; E. Carter, Allegheny, Pa.; Alfred W. rris, Saginaw, Mich.

INUAL MEETING

The annual meeting of league members l take place in the city of New York inning on Monday, January 15, and end- on Saturday, January 20, 1906. A gen- l notice of this meeting will be pubed from time to time, and personal ice will be sent to each member of the anization. A hall will be engaged at a venient point so that members whose e is limited will have an opportunity to nd the meeting and visit the automobile ws at the same time. At these meetings ninations will be received and preliminsteps taken to elect officers and repreatives to compose boards of officers for t of the important states in the east the nominations thus made will be subted—probably by mail vote—for the apval of members in the different states. ommendations will also be received for appointment of working committees in erent departments of league work. Sepadays and hours will be set apart for different states so as to insure at each ting as full an attendance as possible. annual meeting ought to bring out a attendance of members of the Ameri- Motor League.

DUCED RAILROAD FARES

he Trunk Line Association, passenger rtment, has granted the league's apation for reduced rates to persons who nd these meetings, and it is important all conditions be complied with. The nk Line Association includes the Grand nk Railway, New York Central Hudson r Railroad, West Shore Railroad, New k, Ontario and Western Railway, Erie road, Delaware, Lackawanna & West- Railroad, Lehigh Valley Railroad, ral Railroad of New Jersey, Philahia & Reading Railway, Pennnia Railroad, Baltimore & Ohio Rail- and Chesapeake & Ohio Railway. It xpected that similar arrangements will be concluded with all associations east of the Rocky mountains. Commissioner Farmer of the Trunk Line Association has prescribed the following conditions which must be strictly complied with:

1—All persons from points within this territory, who pay full first-class fare of 75 cents or upwards, going to the meeting, shall be returned at one-third of the highest limited fare by the route traveled, on the usual certificate.

2—Certificates must be obtained from the ticket agent at starting points, or the nearest station issuing through tickets to New York, and to be valid for reduction of return fares must be endorsed by the secretary of the league and by a special agent of the Trunk Line Association, who will attend for that purpose on January 15, 16, 17, 18, 19 and 20, 1906. As members arrive these certificates should be deposited with the secretary.

3—Tickets at full fare for the going journey may be secured, under this arrangement, as early as Thursday, January 11, 1906, but not later than Wednesday, January 17. It is therefore of the highest importance that these dates be borne in mind.

4—In purchasing a ticket for New York the member should ask the ticket agent for a certificate and explain to him that he is going to New York to attend the meeting of the American Motor League. Certificates are kept at all principal railroad stations, and if not kept at the station where the member resides the agent will inform the member where they can be obtained. The member can then purchase a local ticket to the larger station and there obtain a certificate and through ticket.

5—A member holding a properly validated certificate may purchase his return ticket at the reduced rate at any time up to and including Wednesday, January 24, 1906.

6—Certificates issued under this arrangement are not transferable.

IMPORTANT NOTICE

These reduced rates have no connection whatever with the automobile shows. The meetings are held during show week to accommodate many members who are unable to come to New York twice during the same month. The railroad associations have refused to grant reduced rates in aid of mere industrial or mercantile exhibitions, like automobile shows, and will grant these rates only to associations holding conventions at stated times.

It will be important that every member attending these meetings should bring with him his membership card. On presentation of this card with the railroad certificate the secretary will be saved the trouble and delay of searching the membership roll to find whether or not that particular membership is unexpired.

MEMBERSHIP

Persons wishing to join the league and to enjoy the benefit of these reduced rates should immediately send names and addresses, plainly written, with 1 year's dues, $2, for each applicant. The railroad associations have notified the league that their agents will recognize the certificates of only those persons whose names appear upon the membership roll of the league. These reduced rates are granted to league members only.

RENEWALS

Each membership terminates 1 year from the date of joining. The date when each membership expires is recorded on the membership card held by the member. These dates are also entered in the league membership roll. Members are joining from week to week, and it follows that memberships expire in the same manner. Renewals will be received during the week of this meeting and persons thus renewing will be entitled to all membership benefits.

FINALLY

Remember that any person coming to New York within the dates mentioned may obtain a railroad certificate from the agent at the home town; but these certificates will be entirely worthless unless endorsed by the secretary of the league at New York. This endorsement will be written only upon certificates held by these members in good standing. If further information is required it may be had by addressing F. A. Egan, secretary, Vanderbilt building, New York city.

WINTON

Save Half The Work

of running a car by having a new Winton MODEL K, simplest and most easily operated car on the market.

To illustrate: Let's consider a single instance. The Diagram shows a narrow street. The car has traveled the dotted line (on the high speed gear) and the driver finds it Necessary to Turn Around. The street is not wide enough for a loop turn, and so the driver must Back and Turn in the direction of the long arrows.

With a Sliding Gear transmission that single change in direction requires the driver to make **NINE** Different and Distinct Movements with **hand and foot.**

Exactly the same turn is made by the WINTON (which has the **individual Clutch Transmission**) in **FIVE** Movements of the **hand alone.**

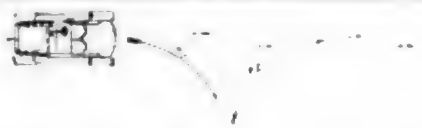
Here are the comparative lists:

SLIDING GEAR. (High gear engaged.)	WINTON TRANSMISSION (High gear engaged.)
1—Throw out clutch (foot).	1—Throw out high gear (hand).
2—Slide through intermediate, and low, into reverse gear (hand).	2—Throw in reverse gear (hand).
3—Let in clutch (foot).	3—With hand still on reverse lever, pull lever toward seat, throwing in low gear (hand).
4—Throw out clutch (foot).	4—Throw out low gear (hand).
5—Slide into low gear (hand)	5—Throw in high gear (hand).
6—Let in clutch (foot).	
7—Throw out clutch (foot).	
8—Slide through intermediate, into high gear (hand).	
9—Let in clutch (foot).	

And note this: On the Winton you can make an **instantaneous change** from reverse to low gear (or vice versa), **without throwing a foot clutch,** moving a hand lever and again letting in the foot clutch. Just **one move of the hand does it all.**

Also note that on the Winton an **instantaneous change** can be made from high gear to **Emergency brake** by a single forward thrust of **one** lever. **That's a great protection in a pinch.**

IS IT ANY WONDER THAT MANY MOTORISTS BUY THE WINTON FOR ITS SIMPLE CLUTCH SYSTEM ALONE?



Winton clutches run always in oil and take hold gently. **NO** jar, clash, bang, shock or breakage.

Winton gears of steel mesh with gears of bronze. **NO** steel against steel.

THE EASILY OPERATED WINTON MODEL K. Four-cylinder, vertical, 30-horsepower motor. Plenty of reserve power. Twin springs. Shooting Gear. Sure ignition and carburetion. Pneumatic speed control. $2,500, f. o. b. Cleveland.

The Upton American car. Specialized Equipment Delineator.

The Winton Motor Carriage Co.

FRANKLIN

What Light Weight Means

Speed, enjoyment, money in your pocket—all result from the light-weight construction of Franklin cars.

The same power carries them faster than it would a heavy car. They are easier on fuel, oil, repairs and immensely easier on tires—the most galling expense of all.

The given weights of Franklin cars are not estimates. They are actual weights. Put some of the so-called "twelve to eighteen hundred" pound cars on the scales and see the beam kick at "2000."

With Franklin cars the light construction also means strength. The highest-grade, toughest, nickel steel, aluminum and similar high-test expensive materials are used—each for its appropriate part and service; without regard to cost.

Franklin construction, beside that of heavy-built cars, is like the modern steel-frame building beside the old-fashioned granite and stone.

We can build roomier, lighter, and, at the same time, stronger, than heavy built cars could be for the same money.

Franklins cost 50 per cent more per pound to build than other cars.

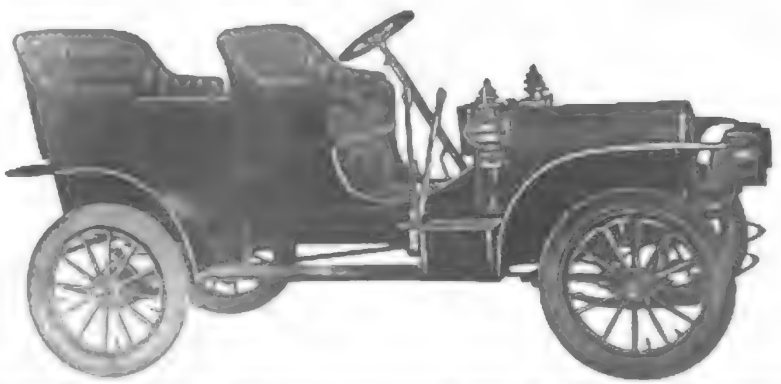
Their price is higher than for many cars of their respective types, but their cost is lower than any others for what they do.

Cost means more than price. Franklins not only give better service, but they save far more money than the difference in price.

Franklins are the most economical cars a man can own.

4 Models for 1906 ... Write for the book

H. H. FRANKLIN MFG. CO., Syracuse, N. Y., *M. A. L. A. M.*



Type G

4-Cylinder Light Touring Car

Air cooled. Shaft-drive. Sliding-gear transmission. Three speeds and reverse. New and perfect disc clutch. Force-feed oiler on the dash. Four or five passengers. Side doors. 88-inch wheel base. 18 "Franklin horse-power." 2 300 pounds. 45 miles per hour. $2,800, f. o. b. factory.

Full head and tail-light equipment.

This car combines more things that most motorists want than any other car ever made—speed; easy riding; roominess; side-doors; simple operation; economy;—first, last and all the time.

Most everybody wants this car. Probably you want it.

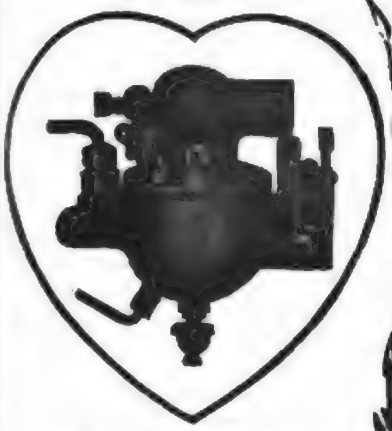
TIME TO HOWL

THE HEART



OF THE AUTOMOBILE

The SCHEBLER Carburetor

Not only claimed but Proved to be the

STANDARD OF THE WORLD

HERE'S WHY

During the World's Record travels of a 1906 National STOCK CAR at Indianapolis, Nov. 16-17, in which 1 coo miles were covered in 21 hours, 58 minutes and 4-5 seconds, and 1,094 3-16 miles accomplished in the even 24 hours, hundreds of miles were reeled off with scarcely the variation of a second to the time of each.

THAT CAR WAS EQUIPPED WITH A

Schebler Carburetor

NOT ONCE during that marvelous record drive did the carburetor cause the delay of a second's time.

NEVER A SKIP
NEVER A MISS
NEVER A FALTER

A carburetor that gives a perfect mixture at all engine speeds, regardless of weather conditions is truly

"THE HEART OF THE AUTOMOBILE"

Is it any wonder that eighty-three of the largest marine and automobile engine builders in the United States and Canada are equipping their motors with the SCHEBLER? :: WHY DON'T YOU?

Digitized by Google

In our last week's ad. we commented on the amount of advertising discussion that was

going on regarding the relative economy of air-cooled versus water-cooled cars in their consumption of gasoline and oil. We mentioned five other sources of expense concerning which the average purchaser is far more interested. They were Tire Expense, Repair Expense, Cost of Overhauling, and Loss through Depreciation, all for 5,000 miles, which is a year's riding for most people.

¶ Four-cylinder cars that are only driven on good roads are not especially costly as regards Tires, Repairs, and Overhauling, so owners of this class may consider some of our statements exaggerated. The man who has attempted a thousand mile country trip in other four-cylinder cars than a Stevens-Duryea, however, will usually find his expenses for these three items to total up between 60c and $1.00 a mile. In some cases where the roads are hard clay and rutty, the big tires when squeezed into these ruts, wear out so fast as to form the larger part of this expense. In other cases where the roads are uneven, unless mechanism in the form of a unit Power Plant Supported on Three Points, the twisting that the whole car gets loosens up the bolts and nuts, opens the joints in the body, and cuts out the bearings all through the Power Plant. As no four-cylinder car except the Stevens-Duryea is really accessible, the cost of new parts and the labor bills for putting them in, totals up to such an amount as to appear incredible except to the men who has been there.

¶ The Stevens-Duryea is very much the lightest weight four-cylinder car of its type made anywhere; despite this apparent paradox, we state without any hedging whatsoever, that the Stevens-Duryea, owing to its Unit Power Plant supported on three points, can be driven with perfect impunity over roads so rough as to be ruinous to cars not so built, and that owing to its light weight, it is possible to use tires small enough to fit in most ruts without injury.

¶ Three amateur owners of Stevens-Duryea cars have made such trips this past season. One ran from Massachusetts to Minnesota, 3,000 miles (including side trips) on $6.00 for repairs to broken springs, and the cost of one casing cut on a bottle. This trip was made last July, and the car has **never been in the repair shop to date.**

¶ Another has run some seven thousand miles, including a trip from Illinois to Massachusetts **and back**; he has not spent a cent for tires and less than $12.00 for repairs. His mileage has all been on country roads; he has traveled a thousand miles or more since his eastern trip, and has never been "in the shop." **All of his tires are good for a second year.**

¶ A Third Owner has made over ten thousand miles in Illinois, Wisconsin, and Iowa. He blew up two casings after they had done over 9,000 miles. He has been in two accidents, yet his total expense for tires and repairs is less than $150.00.

¶ As to loss through depreciation, a man who takes the time to make a list of all the various makes of four-cylinder cars put on the market during 1905, with their present status noted, will find that the Stevens-Duryea has the highest percentage value second hand of any. He will also find that of all the fifty or more different makes of four-cylinder cars put out in the spring of 1905, the Stevens-Duryea is the only one that has withstood a season's use without developing enough defects to make a "New Model" necessary for 1906.

¶ We are preparing a Booklet containing considerable information and data along these lines, including names and further particulars of the three owners above referred to. If you wish a copy, please ask for Book No. 3.

THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

has arrived and is now on exhibition at our showrooms. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. Equal to any car, built in any country at any price. Make and break spark. Sims-Bosch Magneto. Bevel gear drive. Continental Tires. Aluminum bodies.

MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order?

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.

OLDSMOBILE Palace Touring Car. Model "8." Price $2,250. It is only necessary to enumerate the different features of our Palace Touring Car to convince the man who knows automobiles of the sound judgment and thorough experience upon which its construction is based. To convince the most skeptical of its touring qualities, a practical demonstration is irresistible. In every line, at every point it is "there with the goods."

The four-cylinder vertical water-cooled motor easily develops 24 to 26 horsepower. Cylinders 4¼ inch bore by 4¾ inch stroke. All pistons are carefully ground and "run in" with a belt to insure accurate fit. The silent running qualities of the car are made possible by the perfect working of the motor, the careful adjustment of all parts and the muffler arranged longitudinally beneath the side of the car. The steering is through a worm and nut mechanism and has been thoroughly tested, and every possible weakness strengthened in order to insure absolute safety in this all-important part. A few of the other features are the careful balancing of parts, transmissoin, brakes, bevel gear drive, axles, etc. We invite your further inquiry.

Model "B," price $650, is our familiar Standard runabout with various new features. Speaking of the runabout, did you notice the record one of these machines made in the economy test of the New York Motor Club? Although it did not win on gasoline consumption because it was not run through the test at a very moderate rate of speed, purely for the purpose of cutting down the consumption of gasoline, it did make the best showing of any car in the matter of repairs, and demonstrated its ability to cover country roads under a load of four people at a good average speed. There was not a breakage of any part during the trip of 682 miles, and the car was universally commented upon as being the car which was always ready to start every morning with a turn of the crank. We would like to have you investigate this further.

The Oldsmobile exhibit at the Lewis & Clark Exposition was awarded a gold medal, the only award made an automobile exhibit by the Exposition authorities.

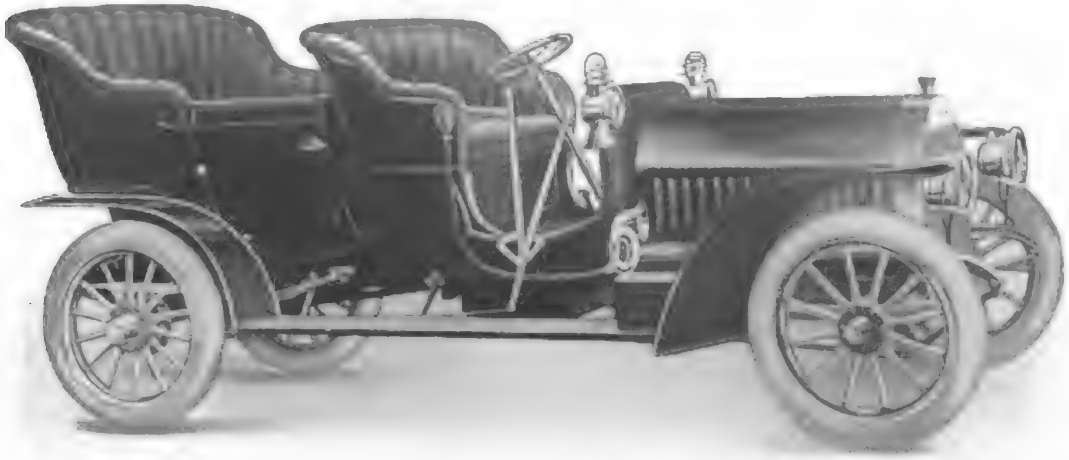
Wayne

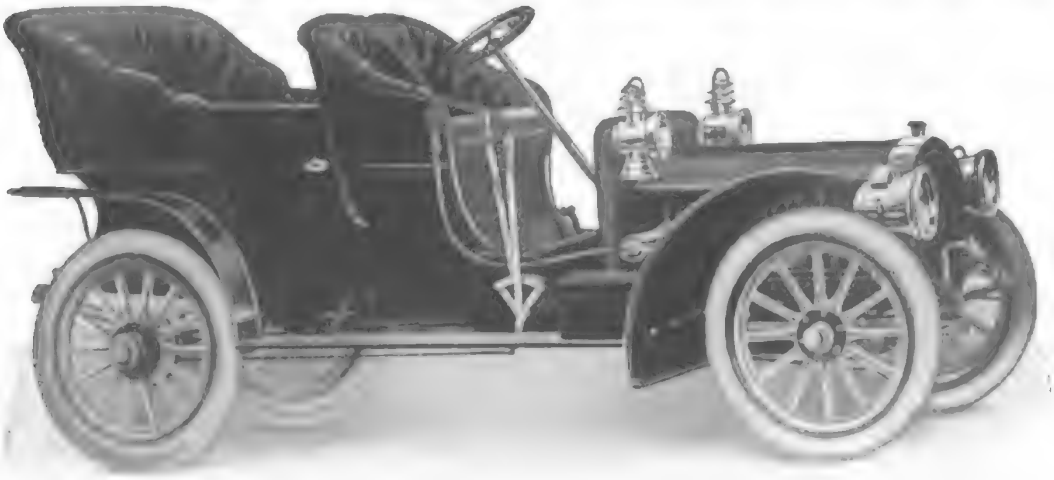
An Introduction to the Wayne Cars of 1906

The appreciation accorded our cars last year warrants us in greatly increasing our capacity and in placing before the automobile trade improved types of Wayne cars. The four models we now present are the result of mature experience. They are not new and untried experiments. Each car is a distinct type of Wayne design and construction and each model has been built with a view to supplying the varied demand for high grade machines. In the Wayne cars of 1906 the automobilist will be sure to find a car suited to his needs.



Wayne Model F $3500

MOTOR, 4 cylinder vertical, cylinders 5½ x 5 cast in pairs. Cylinders and pistons ground. Engine develops by brake test 50 H. P. Water Cooled. IGNITION, jump spark with quad coil and storage battery. TRANSMISSION, sliding gear with three speeds forward and reverse. Hess-Bright ball bearings throughout. REAR AXLE, shaft drive floating type. FRONT AXLE, I beam drop forged, one piece, nickel steel. WHEEL BASE, 114 inches. TIRES, 34 x 4½. EQUIPMENT, includes all necessary tools of the best quality, 2 side lamps, 2 acetylene head lights with generator, tail lamp and tube horn.

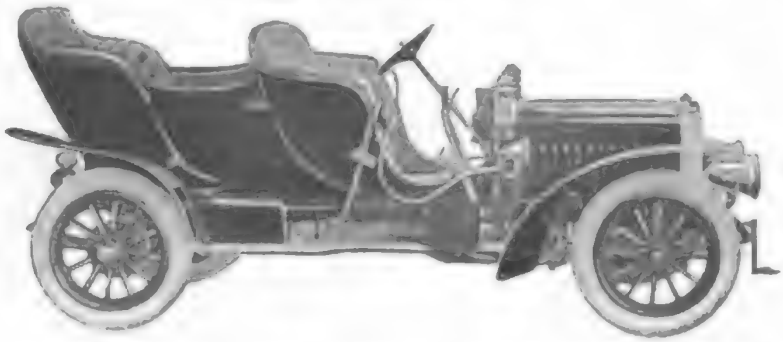


Wayne Model K $2500

MOTOR, 4 cylinder vertical, cylinders 4½ x 5 cast in pairs and water cooled. Engine develops by brake test 35 H.P. Cylinders and pistons ground. IGNITION, same as Model F. TRANSMISSION and axles same type as Model F. TIRES, 32 x 4. EQUIPMENT, same as Model F.

Digitized by Google

The Queen



One of Our Three New Models

MOTOR—4-Cylinder—26-28-H.P.
DRIVE—Shaft Bevel Gear.
FRAME—Pressed Steel.
WHEELS—32 x 4.
WHEEL BASE—101 inches.
TRANSMISSION—Sliding Gear.
FRONT AXLE—Solid-forged.
GROUND PARTS—All Cylinders, Pistons, Piston Ring, Crank Shaft, Valves, Universal Coupling and Transmission Shafts.
EQUIPMENT—Five Lamps, Horn, Tools and Storage Battery.

We also have an 18-H.P., Two-cylinder Touring Car with Detachable Side door Tonneau, listing at $1,100—and a Runabout 12-H.P. at $800.

REO Five Prizes Out of Seven

Touring Car
16 horse-power, 1600 pounds, 90-inch wheel base, five passengers, side-door detachable tonneau. Speed, 35 miles per hour. **$1250.**

Think of a sixteen horse-power car carrying its load 682 miles in six days at a total cost of $2.93 per passenger.

The REO Bus did this in the New York Motor Club's great six-day Economy Test, with exactly the same motor as in the REO Touring Car shown above—thus winning the National Trophy and two other prizes.

The REO four-seated Runabout shown below (price, $675), carried four passengers, 682 miles for $3.38 per passenger, winning the First Prize Gold Medal for all cars under $1500, and one other prize.

The Same REO

We did not have to change REO cars for 1906. They were right in 1905.

They were not an experiment, full of uncertainties and wasteful expense—to us and to you. They were the mature result of 20 years' successful experience in motor building; conceived and perfected by one of the foremost automobile inventors of the world.

The perfected positive oiler, short-contact commutator and more attractive bodies of this season's model, sharpen their efficiency and heighten their pleasure and convenience.

But in principle, design and construction REO cars were thoroughly right from the first and are right now.

Write for the Reo book which tells why

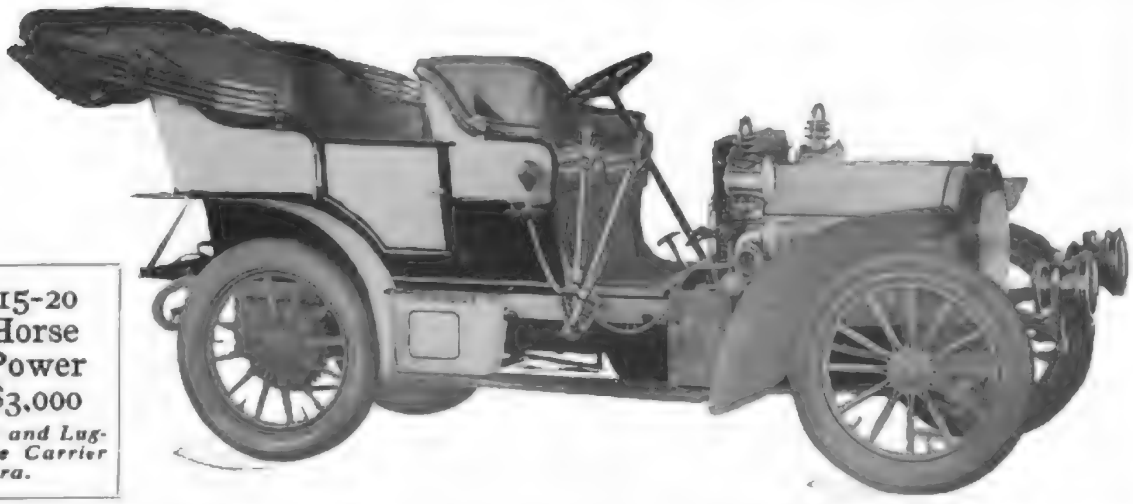
"EASILY THE BEST BUILT CAR IN AMERICA"

WE ANNOUNCE TWO NEW STYLES FOR 1906

A 15-20 H. P. Car, $3,000 A 30-35 H. P. Car, $5,000

both with complete touring equipment. These models are almost identical in design, contain the same carefully selected material, and are constructed with equal care throughout,—the result of years of careful and consistent manufacture of the standard type of four-cylinder touring car.

Locomobiles are fully equal in mechanical details and running qualities to the best imported cars, but are especially designed for American roads.



15-20 Horse Power $3,000

Top and Luggage Carrier Extra.

SPECIFICATIONS OF 1906 MODELS

TYPE "E" LOCOMOBILE, 15-20 H. P.

Price, **$3,000** ready for touring.
Equipment, 5 brass lamps, horn, tire, carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
Body, double side entrance, seating 5; fitted with top irons; color and striping optional; top and luggage carrier extra.
Motor, 4-cylinder, 3¾" bore, 4½" stroke.
Lubricator, large mechanical lubricator.
Carbureter, automatic, with balanced throttle valve.
Governor, centrifugal type, prompt and positive in action.
Ignition, make and break with iridium contacts.
Magneto, low tension, our own design and manufacture.
Aluminum Pan, placed underneath the machinery.
Clutch, cone type with ample surface.
Transmission, 3 forward speeds and reverse.
Drive, double side chains.
Double Universal Joint, between clutch and transmission.
Running Brake, double acting type, metal to metal surfaces.
Emergency Brakes, internal expansion type, metal to metal.
Combined Brake and Sprocket Drum, bolted to each rear wheel spoke.
Axles, "I" section hand-welded axles.
Tires, 32"x4" on all four wheels.
Wheel Base, 93".

TYPE "H" LOCOMOBILE, 30-35 H. P.

Price, **$5,000** ready for touring.

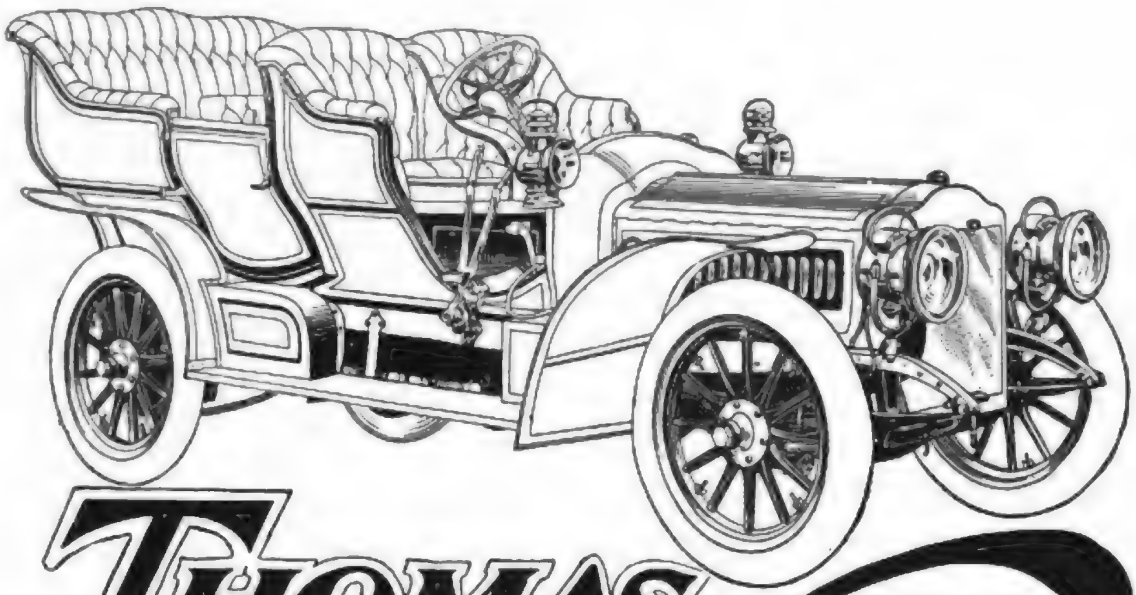
"Every stock car guaranteed to show sixty miles an hour before leaving the shops." E. R. THOMAS.



THOMAS

Can any praise of ours compare with the eloquent testimony concerning the 1906 Thomas contained in this remarkable affidavit?

Buffalo, New York, November 10, 1905.

This is to Certify, That we, the undersigned, this day rode at the rate of 60 miles per hour with five passengers over average roads, maintaining a speed continuously in regular stock model 1906 Thomas touring car, and went up a 14 per cent grade with five people on the high speed and on very bad roads increasing the speed all the way up the hill until we reached 40 miles per hour at the top.

The car is exceedingly smooth and quiet in operation, and the clutch is extraordinarily sweet and effective.

This is the only American built stock car that within our knowledge has made 60 miles per hour on ordinary roads, even without passengers.

THOMAS

Can any praise of ours compare with the eloquent testimony concerning the 1906 Thomas contained in this remarkable affidavit?

This is to Certify, That we the undersigned saw Jay Gould in the run of 40 miles per hour with five passengers (our average rate), maintaining a speed consistently in regular stock model 1906 Thomas touring car and went up a 4.6 per cent grade with five persons in the high speed and on very bad roads increasing the speed all the way up the hill until we reached 40 miles per hour at the top.

The car is exceedingly smooth and quiet in operation and the power is extraordinarily clean and effective.

This is the only American built stock car that within our knowledge has made 40 miles per hour on ordinary roads, even without passengers.

An Investigation of Goodrich Tires

Mr. E. Shirts, cashier of the Citizens' State Bank, Noblesville, Ind., after using a set of Goodrich Tires through the year of 1904 and all of 1905 up to date, without a repair of any kind, decided to take off the tires for examination just to satisfy his curiosity. **All he found was Goodrich Rubber and Goodrich Fabric perfectly united and looking just as good as new.** His letter:

"In the spring of 1904 I purchased a Cadillac automobile, Model B, equipped with **Goodrich Tires, 3x30 inches.** I used those tires all the season of 1904 and all of this season without a repair of any kind, not a single puncture, and the tires look as good as new, with the exception that the treads are flattened down some. I have had such remarkable success with them that a few weeks ago I took the front ones off to see what they were made of, and found them in perfect condition, not even rim-rusted.

"I have driven my car every day that was fit to be out with my family and have kept them busy both seasons and my experience with them has been one round of pleasure."

THE BAILEY "WON'T SLIP" TIRE. Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, skewing or skidding. :: ::

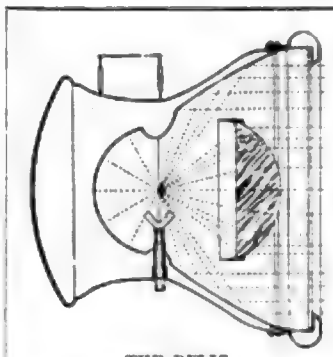
CERTAINLY!

THE WORLD DO MOVE But Sometimes It Moves In a Very Small Orbit

FOR EXAMPLE



THE RELIC.
Theoretical Efficiency, 80 per cent.
Actual Efficiency, 5 per cent.

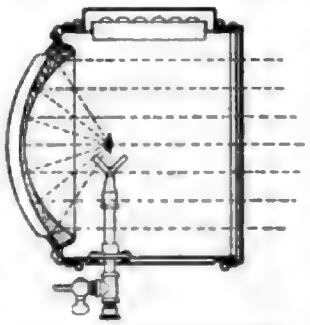
Here is a Searchlight which we used to make many years ago. We call it the Relic.

Theoretically it utilizes nearly every ray from its source of light.

Practically, in the presence of burning acetylene, the spun copper, silver plated reflector cannot be kept bright or even clean, and it absorbs most of the light instead of reflecting it. We discarded the Relic ten years ago, because of its ridiculously low efficiency compared with the Rushmore Navy Standard (short focus) Lens Mirror which we have since used.

The patents under which we manufactured the Relic have since expired, and it has been resurrected by some of the other fellows as the latest ever.

When you compare "Lamps" compare them as we did—in the dark—and see that their flames are the same size.



RUSHMORE NAVY STANDARD.
Theoretical Efficiency, 80 per cent.
Actual Efficiency, 40 per cent.

Volier Horns

¶ The *reeds* are what stick most horn makers. Successful metal mixtures and tempering processes for horn reeds are the secrets of a very few men. The non-corrosive, vibratory metal reeds in genuine Volier Horns, which are unaffected by weather and which keep their tone indefinitely, are a feature which alone make Volier Horns superior to any other horns offered in America; *but,* in addition, there is the matter of

¶ The *bulbs.* In ordinary horns the bulbs are steam cured. They split and crack from use and vibration. In Volier Horns the bulbs are *chemically* cured — another secret process. The *chemical* curing makes Volier bulbs soft, pliable and tough. Volier bulbs do *not* split or crack.

¶ Horn fashions are set by the Volier, which we exclusively import from France. Witness the "Dragon" horn craze this season, founded on the Volier "Dragon."

¶ We can now give you illustrations and quotations on the 1906 Volier styles.

Volier "Courier"

SOLE AMERICAN DISTRIBUTORS

CADILLAC SALABILITY

The following letter was recently received from the Wm. Galloway Co., one of the principal Cadillac dealers in the state of Iowa.

WATERLOO, IOWA, Nov. 6, 1905.
Cadillac Motor Car Co., Detroit, Mich.

Gentlemen—We have just wound up our automobile season and in this connection wish to say that the trade has gone way beyond our expectations. The facts of the case are, we got all the trade there was in the town and around here.

Now, as I tell my customers it is not because they are buying machines from us that we are doing such a big business. It is simply the machine. The Cadillac automobile is *right.* You have struck the happy medium. The trouble with the average man who buys an automobile is that he is misled and thinks unless he buys a car with two cylinders and rated at from 16 to 40 horsepower he will not get a satisfactory machine. This is exactly where he is mistaken. I was mistaken myself in this same way because when I first got the automobile fever no man could make me believe anything was right but a double cylinder, but my mind has been changed and changed radically since I have handled the Cadillac.

What more does a man want than an automobile that will take him any place he wants to go, faster than he cares to ride, and will positively handle mud, sand and roads in a manner that machines of three times the horse power cannot touch? This is exactly our experience with the Cadillac automobile. We sold twenty carloads of them this year with not one single dissatisfied customer, and fully expect to sell 120 machines this coming season, but will only place our order for 50 as a starter.

I will tell you what sells Cadillac automobiles. First, it is the men who own Cadillacs telling their friends, and second, the machine itself. I consider it the most valuable automobile agency in America without a single exception.

Very truly yours,
THE WILLIAM GALLOWAY CO.
Dictated by
Wm. Galloway.

MICHELIN

Tires of the Highest Class

Mr. Wilbern sends the following unsolicited testimonial:

Cincinnati, O., Nov. 3, 1905.

MR. E. D. WINANS, Sec'y & Gen'l Manager, Michelin Tire Co. of New York.

Dear Sir:—Thirty thousand miles on Michelin tires, covering twelve countries in Europe, above the clouds in Switzerland, below the sea in Holland, from bull fights in Spain to chicken fights in England, down historic Rhine, and back again to the "land of grind organ and Monks." I have bought all kinds of tires, every known make; but the Michelin are the best, last the longest.

With pleasure I can recommend them to all tourists. Will tour again next spring and summer in Norway, Sweden, England, Ireland and Scotland, and will wear nothing but MICHELIN tires on my 40 H. P. Hotchkiss.

Very truly,
(Signed) Edward V. Wilbern.

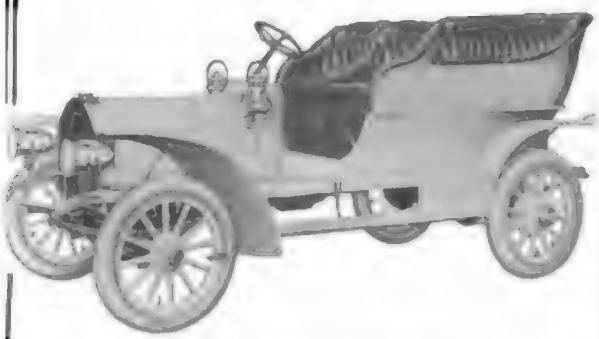
Stoddard-Dayton

MODEL D



"AGAIN—as good as it looks."

The car that strikes the ideal medium between exorbitant frills and cheap unworthiness.

This year's model **Stoddard-Dayton** Touring Car represents the highest practical attainment in the art of automobile construction—all the time-tried and proven features of excellence retained, and only "improvements that **improve**" added.

As experienced, reputable manufacturers we have done our best, and the **results prove it.**

The **Stoddard-Dayton leads in sales**—because its worth is **not** upon **paper,** but **in the car.**

—Because—one machine sells another.

—Because—the makers back up the **agent,** and back up the **purchaser,** with a guarantee that works out as splendidly as it promises.

The handsomest car of all—standard finish, pearl gray with tan upholstering, other colors optional with purchaser.

The **Stoddard-Dayton** Model D 5-passenger Touring Car has a special type of 4½x5 in. 4-cylinder motor; water-cooled; frame of hot-rolled, high carbon, pressed steel, sliding gear transmission; three speeds and reverse, selective type, speeds can be changed instantly without clashing or friction; practically noiseless; entire transmission on roller bearings; mechanical lubrication; 30 to 35 horse power. Proportion of power to weight—one horse power to every sixty pounds. **$2250.**

Write for our new catalog, fully describing the Stoddard-Dayton Touring Car, Runabout and Limousine for 1906.

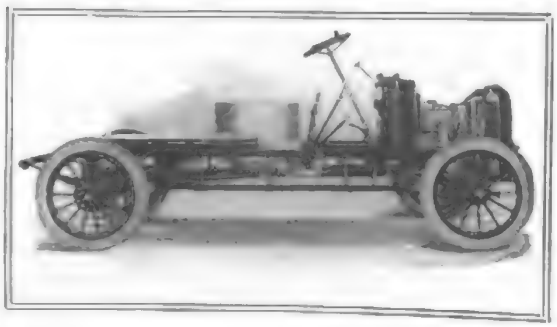
DAYTON, OHIO

THE INCOMPARABLE WHITE

The Car for Service



Above is shown the chassis of the Model "F" White car which we are now delivering with touring car, runabout, limousine, victoria and landaulet bodies.

Steam power, as utilized in the White car, possesses unique advantages. There is absolutely no noise, no odor, no vibration and the speed of the car is controlled entirely by throttle. There is an ever-present reserve of power which is often found most useful.

The White steam generator is totally unlike any other steam-making device ever designed. To illustrate the radical difference, we might point out that in our generator the water is at the top and the steam at the bottom. In every other type of boiler the steam is at the top and the water at the bottom. The safety, simplicity and reliability of the system is demonstrated by the performance of the thousands of White cars now in use.

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

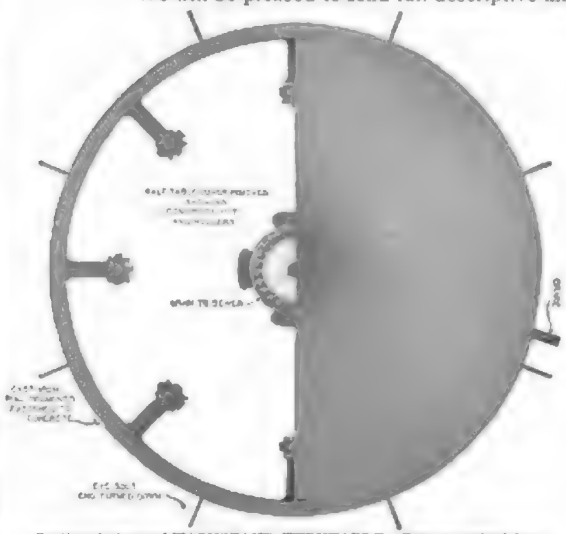
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.



Sectional views of WASHSTAND-TURNTABLE. Patent applied for.

No More Freezing Troubles

You won't have the slightest bother with the circulating system of your motor-car in the coldest weather if you use

No-Mor Auto-Freeze

One charge lasts all winter and keeps the water from freezing even when the thermometer registers 10 degrees below zero.

Makes it unnecessary to keep your car in a heated barn, and you don't need to be afraid to take it out at any time.

You can let the car stand as long as you want to without the water freezing and without danger of the water pipes bursting.

No-Mor Auto-Freeze is already dissolved and doesn't clog the circulating system. Doesn't injure the mechanism in any way.

75 cents a gallon at dealers' or f.o.b. Cleveland, Ohio. **Sold only in 5 and 10-gallon cans.**

CHEMIST'S REPORT

The General Laboratory Co.
Chemists,
125 Quebec Street, Cleveland, O.

We have examined and tested No-Mor Auto Freeze and find that it will not corrode brass, aluminum, copper, galvanized iron or solder, and that it will remain fluid at 10 degrees below zero Fahrenheit. Another good feature of the product of this formula is that it will not crystalize out, hence no danger of clogging the circulating system.

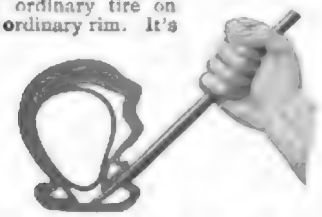
Why Goodyear Auto Tires Won't Creep

DID you ever try to force an inch tube over an inch and a quarter bar—or to put a pair of No. 7 gloves on a No. 8 hand?

You wouldn't be so foolish, would you?

But that's to all intents and purposes what the Automobile Man has to do every time he puts an ordinary tire on an ordinary rim. It's

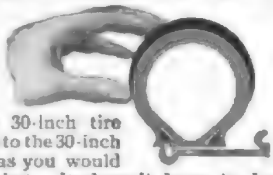


about as hard work as breaking into a bank, and he goes at it the same way, with a "jimmy" and other burglar's tools. Because a 30-inch wheel (for example) is really *31 inches* in diameter, when you consider the flange. So a 30-inch tire has to be forced over a 31-inch rim every time you put on a tire, or take it off.

It's a heart breaking job, even for a strong man, and it takes from half an hour to an hour each time you do it.

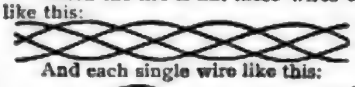
And after you have removed such a tire a few times, the base of the tire becomes stretched, and the fabric (used to strengthen it) becomes broken in places, until this tie becomes 31 inches in diameter instead of 30, a full inch larger that the face of your wheel. So you have to bolt it down, or it will creep, tear the valve out and cause all kinds of trouble. And even then you have to keep it pumped up continually as hard as it will stand.

Now the Goodyear Detachable Auto Tire can't creep, because, in the first place, it doesn't have to be *forced* on (if you use the Goodyear Universal Rim). The 30-inch tire slides right on to the 30-inch rim as easily as you would put on your hat. It doesn't have to be pried over a 31-inch flange.



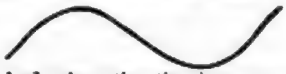
And next, at the first stroke of the pump, the tire begins to grip the rim like grim death, because there is a mesh or tape of piano wire vulcanized clear around the tire on each side of the base.

When the tire is flat these wires are like this:



And each single wire like this:

The instant you begin to pump, this wire begins to shorten like this:



And when the tire is pumped up hard, the wire mesh is like this:

If you put a Goodyear Auto Tire on a wood rim, and pump it up hard, the pressure will be so great that the base will squeeze a ridge in the wood.

So the Goodyear Auto Tire need be only *half* inflated, and it will still have a firmer grip on the rim than it is possible to secure with plates and bolts. This, however, is only *just one* of the good points of this trouble-saving tire.

You will find other points in our "Good News Book." It is vitally interesting to every manufacturer, dealer or user, for it shows the way to perfect relief from Tire Troubles. It's FREE. Ask for it.

THE Compound WINS

Outclassing all Touring Cars regardless of price, in the New York Motor Club's Six-day National Economy Test, Oct. 30—Nov. 4.

Total Cost of Carrying Five Passengers $18.63

The motor went through the test without the slightest adjustment, proving conclusively that we have brought the compounding of a gasoline motor to a high state of perfection.

700 Miles Using But 43½ Gallons of Gasoline

Compound No. 6, driven by F. C. Carter, covered the entire distance at a cost of $3.73 per passenger, and negotiated all hills easily, including the famous Nelson's Hill on the road to Albany.

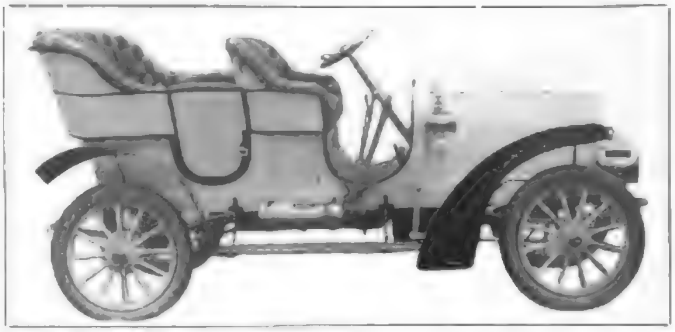
AIR-COOLED

The Quality Car



Conspicuous in automobile construction by virtue of its beautiful design, great power, speed, ease of carriage, simplicity of manipulation and accessibility. It embraces 4-cylinder vertical motor, 4¼x4¼-inch bore and stroke, shaft drive, 3 speeds and reverse, sliding gear transmission, 32-inch wheels, 4-inch tires, 104-inch wheel base, beautiful cast aluminum curved dash, sight feed precision oiler, cast aluminum hood front and fan, luxurious upholstering, rear seat 40 inches (measure the other cars), irreversible steering gear, I beam front axle, ball bearings in front and roller bearings in rear axles, altogether comprising a car the equal of which we believe does not exist at the price.

Write for new Catalogue P

PREMIER MOTOR MFG. CO.

INDIANAPOLIS, U. S. A.

MEMBER AMERICAN MOTOR CAR ASSOCIATION

HAYNES

EXCLUSIVE FEATURES THAT MAKE IT THE BEST AUTOMOBILE

MODEL R. FOUR-CYLINDER TOURING CAR

Roller bearing vertical engines. Cylinders cast separately 5⅛x6 inches. 50 H. P. Sliding gear transmission with exclusive device which prevents possibility of burring or stripping gears, and permits suddenly changing from high to lower speeds without releasing Master Clutch. Positive cooling system operated at very little cost of power. Individual and special lubrication. Carburetor our own make, assures perfect mixture in all temperatures and in all climatic conditions. No springs. Master Clutch has no leather or other wearable surfaces. Takes hold easily and gradually without jerking.

Shaft drive. Exclusive universal joints that do away with wear to pins so common to other joints. One piece nickel steel rear axle with beveled sprocket gear, driven by roller pinion; thrust eliminated, friction reduced, noiseless all in a bath of oil. Roller bearing throughout. 108-inch wheel base. 50-inch tonneau with ample room for two chairs. Six to sixty miles an hour on high gear. Weight 2,750 lbs. Price, $3,500 f. o. b. Kokomo. Full head and tail light equipment. Horn and tools.

Every important feature of the 1906 HAYNES—roller bearing engines, Master Clutch, transmission, universal joints, rear axle, sprocket and roller pinion is exclusive with and found only on the HAYNES. Every detail has been developed in the HAYNES FACTORY and with exact reference to every other part. There is perfect harmony through the entire mechanism. This is the reason why in the HAYNES car there is less than 10 per cent loss of power between the engine and rear tires. It is the reason why its cost of maintenance, upkeep, and operation are so remarkably low and why for 14 years the HAYNES has had the acknowledged reputation of being pre-eminently THE car of quality.

Its cylinders are extra large. They hold compression and give power. The transmission device never allows the momentum of the fast moving car to be thrown against the power of the engine with its consequent strain to the entire mechanism, frame and tires so common with all other types of transmission. No danger of stripping bevel gears or of gearing climbing out of casing, which constituted the only objection offered to large shaft-driven cars.

Roller bearings give noiseless operation. Large flexible springs insure riding ease and long life to tires. Simplicity of control, all parts immediately accessible. Honestly built. Body of cast aluminum. Grey curled hair. Hand buffed leather upholstering. All materials—metal or wood—are tested for strength and flexibility at double severest road requirement.

These are SOME reasons why the HAYNES is the BEST. Others are given in our catalogue No. 10, sent prepaid upon request.

E. P BLAKE CO.

69-73 HUDBURY STREET

Nov. 9, 1905.

Jackson Automobile Co.,

Jackson, Mich.

Gentlemen:-

We are sending you today under separate cover a photograph of a "Jackson" car that that has been run this season over 10,000 miles by the odometer. We really believe it would pay you to get this into the Trade Journals if the expense is not too much.

You wrote us sometime ago that you would have either the Model "C" or "D" made with detachable tonneau with fish-tail deck. Have you as yet decided which model you will have in this way? If so, kindly write us the price of machine without the tonneau. We believe it would be advisable to have the cheaper car with detachable tonneau.

Yours respectfully,

E. P. BLAKE COMPANY,

Per E. P. Blake

Mgr.

Pic. 298-B.

P. S. The tires on this car are Diamond detachable. The two forward rims have never been touched and the two rear tires have been retreaded once. This car is owned and driven by Mr. W. H. Bates, Brockton, Mass.

THE accompanying letter and picture explain WHY every agent we had on our list for 1905 has contracted for Jacksons for 1906; ¶ *Why* every "Jackson" driver is an advertisement; ¶ *Why* you, if you have the auto fever, should buy the Jackson; ¶ *Why* the Jackson has the world's record for five miles on a circular track for two-cylinder cars; ¶ *Why* the Jackson won second in the non-stop run from Chicago to St. Paul.

THREE MODELS:

MODEL "C" $1250.00, 20-24 H. P.
MODEL "D" $1500.00, 20-24 H. P.
MODEL "G" $2500.00, 40-45 H. P.

A "Rough Roads" Picture

We don't show the road; we prefer to show the reasons for the rough-road supremacy of

THE MARMON

"A Mechanical Masterpiece"

To any other car on earth an obstacle even less than a foot high would mean a vicious jolt to the passengers and a ruinous, binding, twisting strain to every part of the mechanism. A series of rocks, bumps, ruts and crossings means constant strain. But with the Marmon it's different. Over the roughest roads, the power plant and rear axle are always in alignment. And over any road, rough or smooth, the Marmon has a freedom from jar, jolt or vibration that is unknown in any other car. This is all due to an exclusive patented Marmon feature.

Double Three-Point Suspension

Cast aluminum body on one frame, power plant on another frame, each frame suspended on three pivotal points. Eliminates the ruinous strain inevitable in the rigid suspension of all other cars. Means greater efficiency and less wear on all parts, tires included. Four cylinders, air-cooled. A carefully constructed, high-grade proposition for those who want nothing but the best.

Galesburg, Ill.

The Expected Revolution Has Come

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should not buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the two cycle two cylinder Elmore engine. Understand—the two cycle two cylinder Elmore engine produces two impulses every time the flywheel turns. As you know, the two cylinder four cycle furnishes only one impulse every fourth time the flywheel turns. In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

THE ELMORE MFG. CO., 804 Amanda Street CLYDE, OHIO

MOLINE for 1906

Model "A" 30-36 H. P. $2500.00

Model "C" 18-20 H. P. $1750.00

Both the above have four cylinder vertical, water cooled motors. Cylinders cast in pairs. Valves all mechanical and interchangeable. Pressed steel frames. Three speeds forward and reverse. Sliding gear transmissions. Mechanical oilers. Storage cells for ignition.

Model "G" 16 H. P. $1000.00

Double cylinder opposed motor under body with single chain drive. Planetary transmission, no internal gears. Engine bearings of liberal dimensions and easily adjustable. Mechanical oiler. New design of water pump. Double side entrance detachable tonneau body.

All three Models have cylinders, pistons and piston rings accurately ground to size.

All three Models have double side entrance bodies with divided front seats.

All three Models have mechanical oilers that force oil direct to the bearings—not force it part way and then let it drop the rest of the way.

All three Models are top notch value for the money. AND WE CAN TAKE CARE OF ONLY A FEW MORE DEALERS.

"SOOT-PROOF" WINS

Five Prizes Were Awarded to the Cars Using "Soot-Proof" Plugs

The "McMurtry" Prize for the car having the least ignition trouble was awarded to a Reo using "Soot-Proof" Plugs. These cars covered a distance of 700 miles during the National Economy Test of the New York Motor Club, October 30 to November 4, 1905.

These cars had absolutely no spark plug troubles, and the original plugs were used throughout the entire run. Thus again has the "Soot-Proof" Plug demonstrated its superiority, reliability and economy.

Automobile Knowledge

means

Money in Your Pocket

We are the only school that provides complete, practical, *money-earning* and *money-saving* training by mail in operating, repairing, constructing, and designing every kind of motor vehicle and motor boat.

We have special courses for *owners*, shop and factory *employees*, *chauffeurs*, *motor boat* and *motorcycle users*, and *others*.

There are only two ways of learning anything. One is slowly and tediously to gain the experience yourself; the other (and better) way is to take advantage of the experience of others.

Though we offer you the long, hard-learned, thorough experience of experts who have done prominent work in the development of the new vehicle, we offer this experience in such form that to teach it to you will take only a few minutes and cost only a few cents each day—*the few minutes and the few cents that you ordinarily waste.*

Our instruction has been prepared and is conducted by well-known men, of long experience and proved ability both in automobile engineering and correspondence instruction. It is strongly endorsed by *prominent manufacturers, club* and *association officials, racing men, trade-paper editors*, and others whose standing in the automobile field lends authority to what they say.

In the automobile industry, the demand for competent men is so great that ability, no matter how acquired, is considered above "pull" and length of service. This makes it easy for an ambitious man to qualify quickly for good wages and prompt advancement.

For further information, send us your name on the accompanying coupon. This will cost you only a moment of time and a postage stamp, which will be well spent for interesting and convincing literature.

"Shock Eliminator"

On Good Roads

They allow you to use and enjoy the full elasticity of **Easy Flexible Springs. Observe** we say "full elasticity."

On Bad, Dangerous Roads

They control the too violent spring play, **BOTH UP AND DOWN. Observe** we say "both up and down." They transfer the load and strain from the springs to the axles. They prevent spring distortion and breakage. They lessen the wear and tear on tires.

There Are No Adjustments

This should interest you because: It adds to your comfort and safety. It effects a direct saving on "up-keep." Write for full particulars.

"THE SIMPLE CAR"

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

THE OSCAR LEAR AUTOMOBILE CO.
Automobiles
Corner Fourth and Gay Streets

Columbus, Ohio, September 5, 1905.

The Steel Ball Co., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6-day endurance and economy run at Long Branch. In a run of 3,202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of all this we fully realize and its help in getting this record for our FRAYER-MILLER car. Yours truly,
THE OSCAR LEAR AUTOMOBILE CO.

THE COIL THAT DOES THE TRICK

In the Climb to the Clouds

Chas. Soules, driving a Pope-Toledo fully equipped Touring Car, made the ascent in 29:37 2-5. This is considered a most wonderful performance. Besides

SPLITDORF COILS

were winners in nearly every event. Ask the Glidden Tourists how they like the Splitdorf Coil. Seventy-five per cent of the cars on the tour were equipped with them.

HERE IS DR. PARKER'S LETTER:

Mr. C. F. Splitdorf. June 24th, 1905.
Dear Sir: I feel that in the recent 200 mile contest my success, in a large degree, was due to your coil. It seems to me that your latest is superior to anything in use to date. I tell my automobile friends to give me a SPLITDORF for reliability every time. Very truly, C. B. Parker.

THE HAM GOLD BLAST AUTO LAMPS
"THE LAMPS THAT LIGHT THE ROAD"

MR. MANUFACTURER:
Don't close your lamp contract for 1906 until you look over our line. We have no competition in light giving and burning qualities, and our lamps will surely interest you.

MR. DEALER:
Isn't it worth something to sell your customers lamps that will not only satisfy them, but will bring them back to tell you what a fine light they give, how steadily they burn in the strongest winds and over the roughest roads, and what a good fellow you are for selling them good lamps. They'll tell their friends about it, too.

MR. AUTOMOBILIST:
Are you discouraged with the oil lamp proposition? If you are, we know you haven't tried the

HAM COLD BLAST AUTO LAMPS
because they are a delight to the most critical. They are strongly built, handsome in appearance, give a powerful light, and are always reliable, as they are wind proof and will not jar out. Never smoke, consequently the interior is always bright and clear, and there is no odor.

ELDREDGE ELECTRIC MANUFACTURING CO

Springfield, Mass.

The "Breech-Block" Plug

The Plug With a Handle

To take out your watch or open a *Breech-Block* requires just the same time, same tools, same effort and one twist cleans the entire porcelain to the whiteness of snow.

To remove the porcelain only, loosen the clamping nut and it drops out of the holder, and the gaskets of copper asbestos with it. No digging!

It is *asbested* inside and out. *Highly polished* and [illegible] between the [illegible] points and not between one point and the shell. Its points are protected.

Porcelains are kept forever and so perfectly glazed that soot cannot stick to them. Their threads are cut to perfection, and every particle of the idea of cheapness is left out of them.

Postpaid, Anywhere, $2.50. Booklet free. Made by

EARL CANEDY, 2002 West Ave., CHICAGO HEIGHTS, ILL.

Digitized by Google

See Its Graceful Lines

Our General Service Wrench is just the wrench you want for your 1906 kit. Light, long, strong and handy. It is drop forged from the best bar steel, and case-hardened. Five sizes. Have you asked for for 40-page machine wrench booklet?

THE BILLINGS & SPENCER CO.

If You Are a Judge of Good Plugs

so much the better, but if you are not, it really does not matter, for you've only to try a "Never-Miss" to realize that

NEVER-MISS
Spark Plugs

are the perfection of ignition. Mica (Plugs) Porcelain. They are the one plug that satisfies. They take and bring you back. The 1906 Never-Miss (patent applied for) is the best. Any size, any car, any where, $1.50 and worth it. Coils, Battery Connections and Chain Tools. Just get acquainted with Never-Miss. The acquaintance will be lasting, our word for it. 1 Doz. Battery Connections free with 2 Plugs. Fully guaranteed. Write today. The longer you wait the more good spark plug enjoyment do you "Miss." See the point?

Never-Miss Spark Plug Co., Lansing, Michigan

There was a time when a regular and reliable ignition was a problem. This problem is solved today by the **HERZ TIMER**. We have made and sold over 70,000 of these instruments last year, to the most prominent manufacturers in this country, as well as in Europe, and are making now four distinctly new models for four of the leading manufacturers in America. The reason for this success: It's Tool Steel vs. Tool Steel, best Sheffield grade obtainable; **Sticking Vibrators** absolutely impossible; running packed with grease; built like a watch, tool maker's work throughout. We make 18 models and fit any make of motor. State make of your motor when ordering.

AGENTS WANTED—For our automobile and marine engines. Spark plugs, 50c and $1, direct to consumer. Coils, carburetors and all supplies at corresponding prices. Columbus Screw & Machine Co., Columbus, O.

1905 Model 6 C curve dash Olds; new paint and tires; just as good as new and looks it; top with it. K., care MOTOR AGE.

FOR SALE—One 40 H. P., 1905, up to date Thomas Flyer. Has had the best of care and is as good as new. Extension top, glass front, 6 fine lamps, including 3 in swivel searchlight. Prestolite tank and Jones speedometer. Speak quick. Barclay Auto Co., 248-50 Third Ave. S., Minneapolis, Minn.

FOR SALE—10 H. P. transmission, $30. A. M. Symonds, 901 N. Fairfield Ave., Chicago, Ill.

FOR SALE—Seven horsepower runabout, in perfect order; cheap. T. E. Luts, Galion, O.

Experienced Supt. and Factory Manager,

Nine years building successful cars; one, two and four cylinder; is open for engagement. Many of his innovations of the past are standard on cars of today.

Address, "ENERGY," Motor Age.

FAIR EXCHANGE

CASH for your Scrap AUTO and Carriage TIRES.

H. E. LAUN, 90 Metropolitan Block, Chicago

KINGSTON CARBURETORS

1905 model, 1 inch inlet, absolutely new; $4.75 each. Cash with order.

HOLLEY BROS. CO.

661-673 Beaubien St. DETROIT, MICH.

Wanted Names of Automobile Owners that would rather see their tires being pumped up than do the pumping. Our Tom Tire Pump fits on any Standard Machine and is worked by the motor, easily attached, well tested out, all enclosed and very satisfactory. Get acquainted with it. It is something that you will like. Agents wanted.

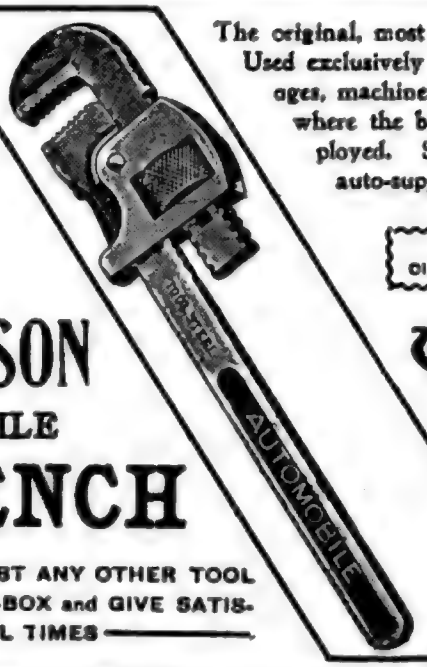
NYBERG AUTOMOBILE WORKS, CHICAGO, ILL.

Fully described in Horseless Age, Feb. 1; Automobile Review, Feb. 4.

Digitized by Google

When your Auto isn't just right, use the

STILLSON AUTOMOBILE WRENCH



The original, most efficient and durable. Used exclusively in all up-to-date garages, machine shops and all places where the best mechanics are employed. Sold by all leading auto-supply jobbers and dealers.

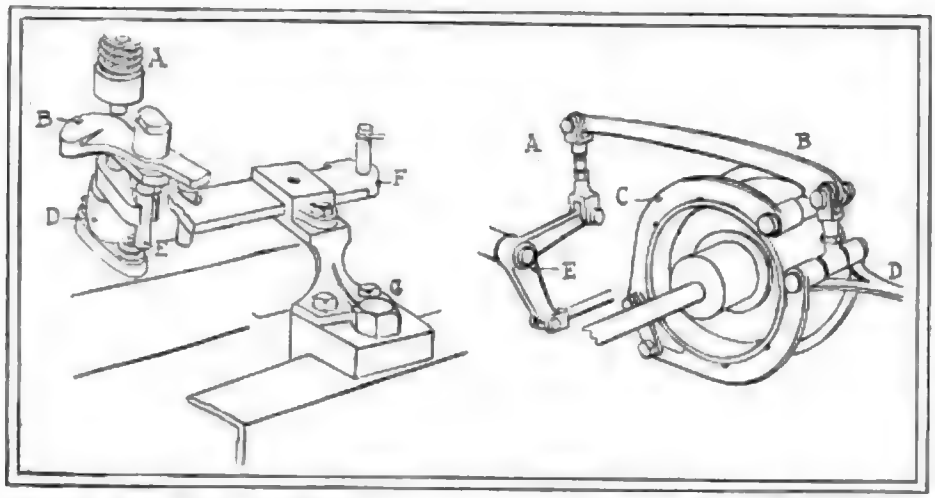
NEW IDEAS GARNERED AT OLYMPIA SHOW



HORSICK INLET VALVE CONTROLLER

ENFIELD PROPELLER SHAFT BRAKE

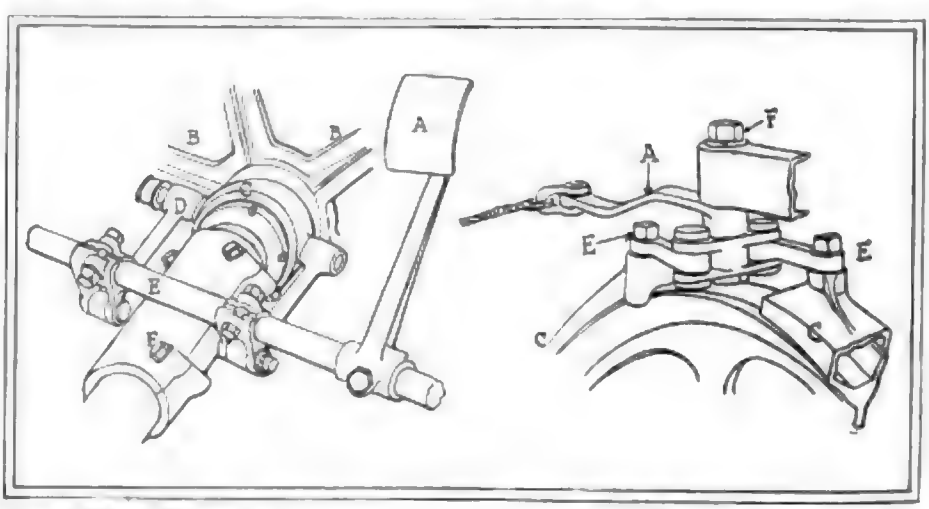
important feature of Olympia to everybody concerned—that is, the fall in prices. These, it may be pointed out, are not so general as it would appear on the face of matters. The majority of firms have not adopted what we may consider the more sensible form of giving improved construction and larger engine powers for the price charged last season, but those firms who have not or do not intend to make any serious alteration in their cars have come down generally to the extent of about 18 or 20 per cent. When firms like the Daimler and Panhard & Levassor do this, it is a lead that others will have extreme difficulty in refusing to take. Reputations to a large extent control prices, no matter what the particular developments in construction may effect. Smaller makers, however, have found it necessary to raise their prices. This has been no doubt the result of too sanguine reduction last year. The Coventry Humber car, which last year sold for $1,125, has been slightly increased in power for 1906 and now sells at $1,350, and similarly with many others.

Smokelessness and silence are two points which are usually dealt with together in discussing a motor car, although the matters with which they are connected and from which they arise are scarcely linked together. Smokelessness arises, as we all know, from excess of lubrication; noise may arise from insufficient muffling of the exhaust, worn car wheels, rattling chains or a too flimsy construction in frame work of the car. Since the emission of smoke is now an offense against traffic laws, the question of lubrication has been very thoroughly overhauled, especially in the larger cars. Heretofore the manufacturer of this type simply assured himself that he was sufficiently lubricating his engine and incidentally every other part as well, and the emission of smoke as a result did not concern him, and as a consequence some cars, and very high-priced ones, too, have been grave offenders in this form of nuisance, but reformation has come almost at a bound. In some, while still maintaining what is recognized as an excess of lubrication overflow, arrangements are provided by which this excess is taken away and returned, after being filtered, to the lubrication tank. By thus preserving the lubricant in the crank chamber at a constant and known level, the entrance of surplus oil into the cylinders is practically prevented. But as has been pointed out in a previous paragraph, on show matters, the automatic form of lubrication which became so universal last year was found to have its drawbacks quite apart from the matter of smoke creation. Consequently, there has been a distinct reversion to simpler forms requiring, it is true, more care and attention from the chauffeur, but nothing that might not be expected from a more general knowledge of the requirements and necessities of the modern motor car. This has enabled designers to clear away a large number of pipes which wandered through, as a rule, from the dashboard all over the engine and through the frame. In some cases, while a number of these lubrications leads are retained, provision is also made for hand lubrication. It is also noticeable that greater attention has been made to secure oil-retention in such parts as are usually described as oil-retaining. Consequently the cleanliness of the car has been greatly improved to the benefit of its owners and those friends whom he may visit and of the garages it may be stored in. Most of the pressure systems still rely upon the exhaust, but this will probably be dispensed with in the near future as it has been found, especially in small cars, to work its way into the lubricant and the lubricator glasses, thinning the oil and steaming the glasses. A positive pump with regulated flow is the proper system, it is contended.

In the matter of silence, the comparative abandonment of the chain drive is certainly the most outstanding feature. Chains, when even slightly worn, rattle, and cause an irritating vibration in small cars. In the larger vehicles, chain cases will be general, the chain being retained, principally because of the difficulty of conveying high powers through the central bevel drive. A more accurate conception of the functions of the silencer has also led to better designs in this part. The expansion chamber is not, as used to be the case, carried straight away to the back of the car, but is, generally speaking, placed as conveniently near to the exhaust ports as possible, and from there a tube of generous diameter conveys the expanded exhaust to the rear of the car. There is, it is claimed, an inertia in this method which helps to relieve back pressure in the cylinder as well as to secure the noiselessness so much desired. Providing a direct drive on the top of the gear is also a minor aid toward this, but in the properly designed car this is little more than a talking point for the salesmen's use.

In the matter of steering gear the chief effort has been directed toward providing adjustment for wear in the worm gear. In some of these great ingenuity has been displayed and there is no doubt that with ball-bearing steering the modern car is an easily controlled vehicle in comparison with the model of even a few years ago. In some cars a steering link connection has been brought behind the front axle in order to preserve it from injuries, as it is found that the front axle in this case serves the purpose of a guard. It is still evident that this is one of the weak parts of the car. Steering gear failures, especially in heavy or large vehicles, are too frequent and we may look for some very important improvements in this matter in the future as a result of the show.

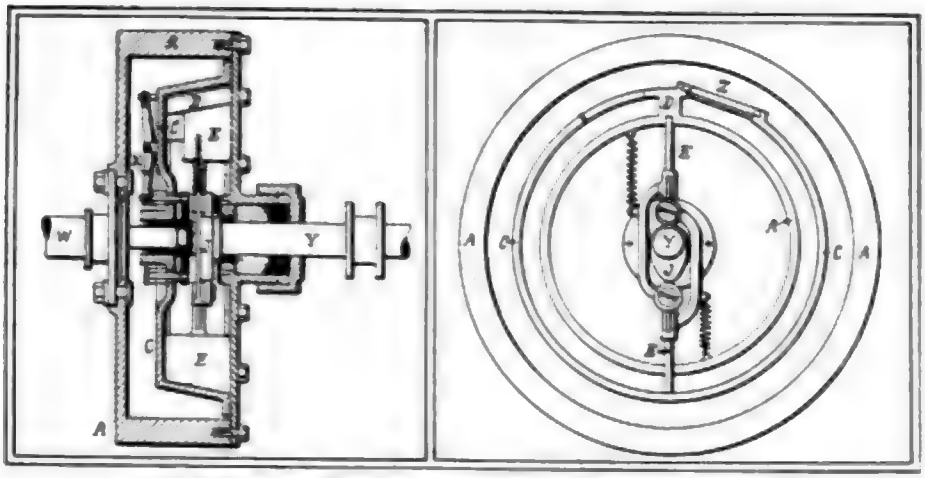
Ordinary high-tension ignition seems clearly destined to be superseded by the magneto. There is no doubt that the motorist desires to be independent in every possible way, and the magneto system naturally makes him independent of his accumulator-charging stand, but the whole matter is yet in a rather undecided condition, although some manufacturers brush



MINERVA CLUTCH MECHANISM

BRAKE ON THORNYCROFT CAR

Digitized by Google



CROSS SECTION AND PLAN OF SPARKS-BOOTHBY HYDRAULIC CLUTCH

it aside with the assumption that the high-tension magneto solves the situation. But there are some who still pin their faith to the low-tension system, and do not even attempt of a variation in the timing—the Arrol-Johnston, for instance. Still, the high-tension magneto is considerably the more popular and is to be seen on almost every car above $7,500 in price as a standard. It is usually provided with ordinary high-tension, either as a reserve or an alterative form of ignition. The single coil with high-tension distributor enables this to be done simply and neatly. Of high-tension magneto systems there are quite a number; notably the Bosse-Michel, Gianoli, Simms-Bosch, Rankin-Kennedy. Each has this point of novelty, each claims to be superior, but all seem to give equal satisfaction.

The inlet valve on the Horbick car is arranged with a swinging wedge-plate B, which passes under the valve stem A and is operated by a sliding bar F, controlled from the steering wheel. The wedge-plate swings upon a stud C, underneath which is a guide E. When the sliding bar F is moved it swings the wedge-plate under the valve stem and the valve cam tappet D strikes the wedge-plate, thereby raising the valve stem. The wedge-plate is held in place by a lever on the steering wheel and the thickness of the plate itself varies the lift of the valve. The entire mechanism is supported by a frame bracket G bolted to the motor.

A powerful brake is fitted to the gear shaft extension on the Royal Enfield. On the shaft is a heavy, wide-faced drum of generous diameter. The operating lever B is connected to the foot pedal by means of a rod and a bell crank E, so as to give it a downward pull. Between the bell crank and the lever is a turn-buckle A for taking up slack.

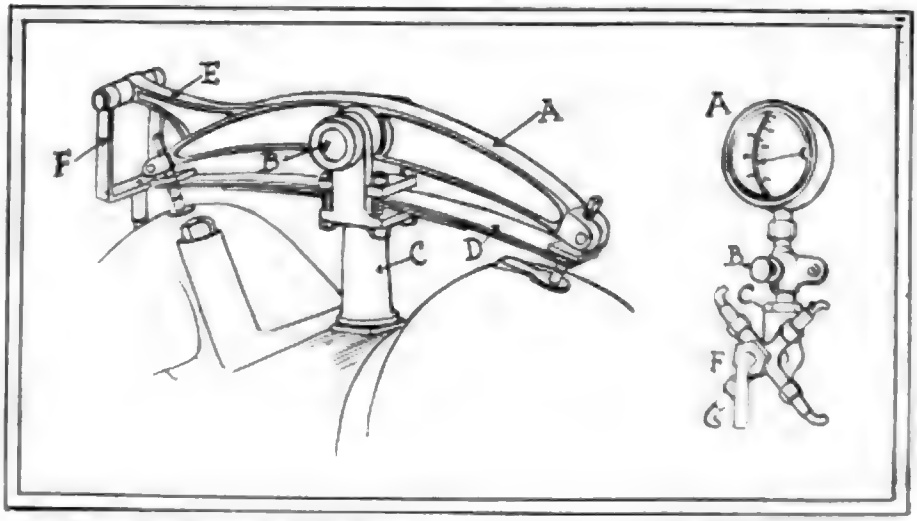
Decidedly novel is the clutch-operating scheme on the Minerva car. The pedal lever A is connected with the rocking shaft E in the usual manner, but the clutch collar C is moved by trunions D D, which are connected to clamps on the rocking shaft. The webs B of the flywheel are shown in the illustration. The clutch spring is covered by a housing F, which is held in place by four studs E.

On the Morgan car—a debutante in the hands of a big London coach-building house—is a novel clutch. It is the Sparks-Boothby. It is called a hydraulic clutch, but in reality it is an oil-power device, as oil substitutes water in its application to motor car construction. Like the disk types, it admits of careless use without injury, but it is neither as simple nor as cheap to construct. A circular cylinder or annulus is formed at the rim of the flywheel A, which is the driving member, and the pallets E, which fit this annular chamber and act as pistons, are really part of the driven member of the clutch C. A stop D forms a partition of the circular part of the annulus, and a valve Z is so constructed to allow the oil to circulate around the stop D, and is controlled by the movement of the clutch pedal. So, supposing the whole of the flywheel casing to be filled with oil, which would of course include the annulus, if the driving member A is rotated, the driven member C must also rotate, as the oil which fills the annulus cannot pass either the pallet E or the stop D and valve Z until the valve is opened by depressing the foot pedal. But upon the valve Z being opened the oil is allowed to freely circulate, and no power is transmitted. As the pallets E approach the stop D they are automatically and alternately removed by the cam J from the circular part of the annulus, thus avoiding collision with the stop D. A free clutch is assured by allowing the driven member C to be pushed out of contact with the driving member A by a further movement of the clutch pedal after the valve Z is fully opened. There are two types of this clutch. Type A has the valve which controls the amount of slip operated from the exterior of the flywheel face. In type B the valve is within the case, and is operated by the small lever X through the shaft Y being pushed towards the interior of the case by means of the clutch pedal. In either case when the valve Z is fully opened the inner member is pushed out of contact and allowed to run free. As the requisite amount of slip is determined by the orifice permitted at the valve Z through which the oil must pass, it is clear that slip can be allowed to any extent, as oil cannot be injured by simply being passed through an orifice.

A somewhat novel scheme is introduced in the 1906 Fiat for actuating valves. This is a tappet in the form of a walking beam A which is carried on a stud B supported by a standard C between two cylinders. Beneath the stud and over the main portion of the standard a flat four-leaved spring D is clamped, the ends coming in contact with adjusting screws in the end of the walking beam. On one end of the walking beam is a lug E, to which is attached a link F connecting the push rod.

The emergency brake on the Thorneycroft car is substantially and simply constructed. The ends of the band C are connected by links E to a cross arm made integral with the operating lever A, to which is attached the cable running to the hand lever on the side of the car. The cross arm turns on a stud F locked to the brake carrier.

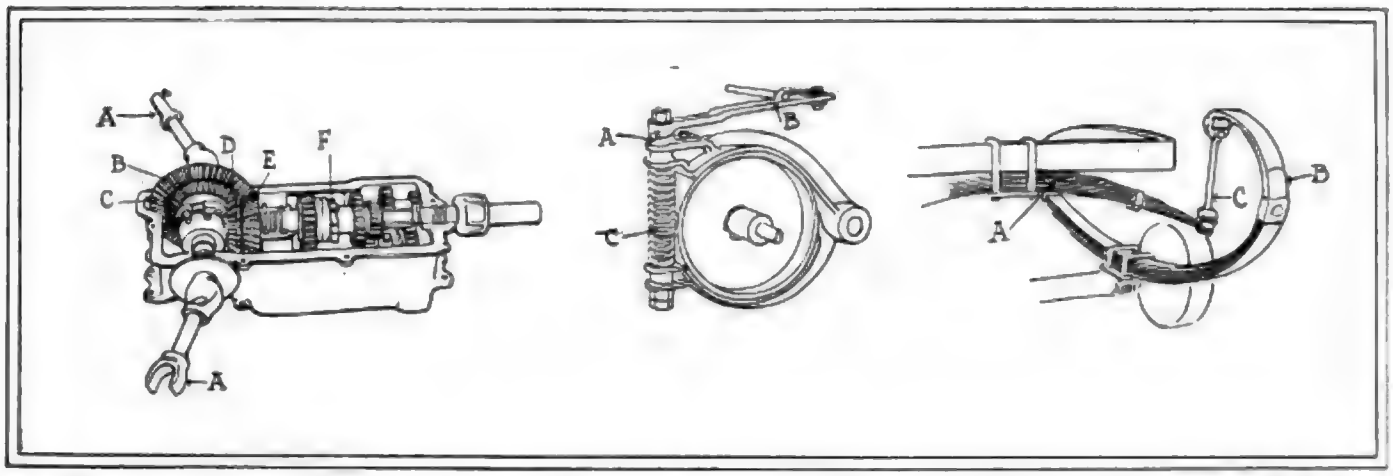
When an engine begins to lose power the difficulty of locating the fault is often so great that it is generally not attempted until the run is finished. The usual practice when a fault in the engine is suspected is to cut out one or more cylinders by preventing the ignition of the charge, and thus by a process of elimination to eventually arrive at the fact that a cylinder is either not working at all or is developing little power. The Gibson power indicator provides a handy means for reading the pressures developed by any particular cylinder while actually performing its work. The apparatus consists of a pressure gauge A, combined with a non-return valve D, a leak screw B, a drain cock E, and a cock F,



VALVE TAPPET AND SPRINGS ON FIAT MOTOR

GIBSON POWER INDICATOR

Digitized by Google

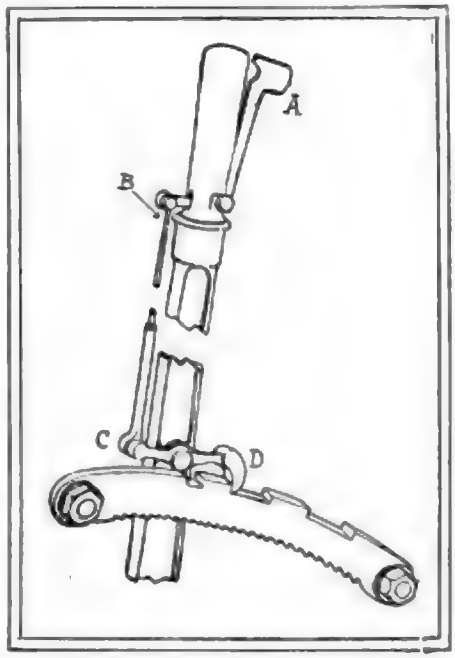


PILAIN GEAR AND DIFFERENTIAL — VAUXHALL BRAKE SCHEME — C SPRINGS ON C. G. V. CAR

with connections corresponding in number to the number of engine cylinders. A small bore copper tube is carried from the compression plug hole of each cylinder to one of these connections. If the cock F is turned so as to connect any one cylinder with the indicator, then any pressure produced in that cylinder will cause a small quantity of gas to register on the gauge, which registration remains. If the leak screw B is released further pressure developed within the cylinder will be reproduced on the gauge. If the ignition in any cylinder is not perfect the action of the finger will be erratic, rising a considerable distance and slowly returning to compression pressure, then again rising and so on, whereas if perfect the beat of the finger will be quite regular. If ignition does not occur at all the pressure registered by the finger will be that of compression only. If pre-ignition is occurring the pressure shown will be considerably higher than normal, accompanied by knocking. If the valves or piston rings are leaking the pressures developed will be regular, but not as high as usual. If the inlet valves are stuck shut the indication will be a very low pressure, less than normal compression. If the exhaust valve is stuck open the indicator will remain at zero.

One of the cars at Olympia which attracted considerable attention, particularly from colonial exporters and traders whose customers lie amongst the professional classes, was the Adams-Hewitt 9-10-horsepower car. This is regarded by some judges as being the most promising type of motor vehicle for our colonial markets, and for that reason may interest the American trade. To start with, it is clearly a copy of the American design which finds such popular utterance in the Cadillac and Oldsmobile cars. It is, however, distinctly of British manufacture. The works of the Adams-Hewitt Mfg. Co., which markets it, are at Bedford, about 40 miles north of London. The wheel base of the car is 6 feet 8 inches and the wheel gauge 4 feet 2 inches. The body springing plan is of the Cadillac design, but we here prefer to call it the Lanchester, since it was on that car the design was first exploited. The car body, engine, etc., are mounted on an ordinary channel steel frame, which in turn is mounted on longitudinal laminated springs running from axle to axle. The engine is a single cylinder horizontal, with a bore and stroke of 4¾ inches and 6 inches, with mechanically operated valves, situated on one side, both very accessible and each interchangeable with the other. The engine runs at 1,000 revolutions. Water cooling is positive gear pump with water tank containing sufficient capacity for a 60-mile run and radiator placed below the frame of car points, which seem to catch the colonial buyer, at least.

A very massive flywheel 22 inches in dinmeter is set at the right hand side of the crank chamber. To the right of it is the chain sprocket, which drives direct on to the differential gear on the back axle. A planetary two-speed gear is adopted and the operation of which is entirely controlled by pedals. In the planetary there are five gear wheels of external cut and always in mesh, the whole being enclosed in an oil-tight cast iron circular box of about 12 inches in diameter, 5 inches in width. The speed control is extremely simple. Three pedals are provided. Each pedal is connected with a brake drum on the planetary gear corresponding to the gear desired. By pressing one pedal forward, the first speed is obtained. By releasing that and pressing another the high speed is obtained. The third pedal acts as a brake up to a certain point—at which the car has come to rest—then the reverse gear is put into operation by further pressure on the pedal.



DE DION LEVER AND QUADRANT

One of the most inspected cars was the Pilain, in which several novel ideas were disclosed. The engine of 20 horsepower had a power transmission to the driving wheels similar to that which has been in use on the smallest of the de Dion cars. A countershaft with universal joints formed with the differential gear conveys power from the gear box to internally toothed pinions fixed to the hubs of the driving wheels, the car itself having two solid axles. This transmission is not quite a novelty, although its application to an engine of such power constitutes a radical departure, but it is in the gear box which the most remarkable portion of the Pilain is to be found. In this a direct drive is provided on second and third speeds, the latter being the top speed. This is secured by mounting two concentric bevel pinions C and B on the differential bevel pinions D and E, the gear shaft running on ball bearings. The operation of these is very ingenious and apparently substantially worked out. One of the parallel bevel pinions D takes up the drive for the top speed and the other E takes up the drive for the second speed, the sliding speed pinion having two dog clutches, one on its forward face and the other on its outside circumference. When the third speed pinions are in engagement the outer dog clutch engages with the shaft of the forward of the two bevel pinions E, which transmits the drive through the larger of the two bevels B on the differential shaft. The same sliding pinion thrown further in disengages from the one bevel pinion, and the dog clutch on its face enters into and engages with the clutch on the rearmost bevel pinion D on the gear shaft, which has been up to this running idle. This now transmits the drive to the inner of the two concentric bevels C on the differential shaft, consequently the drive is again direct and at a higher rate of speed at the road wheels.

The new de Dion change speed lever motor is like no other on the market. The operating lever has a simple fore-and-aft motion, but it is provided with a trip action which makes very easy changes and prevents

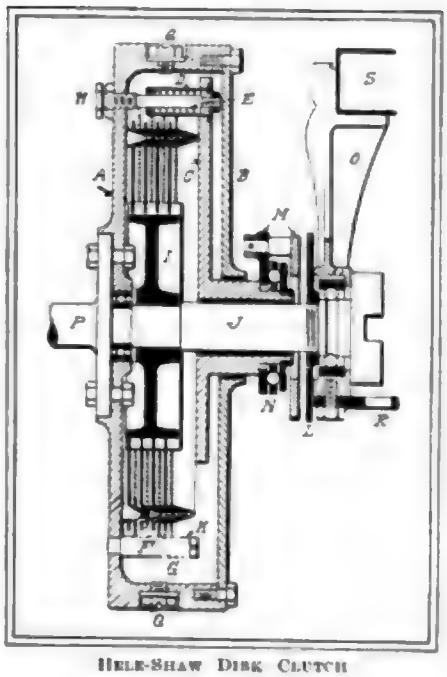
Digitized by Google

careless or maladroit handling. A spring hand grip lever A through the trip D prevents any change speed motion until it is forced by being pressed into the change speed lever handle. As soon as the trip is out of any of the notches the lever can be moved to the required gear notch in the quadrant. Q corresponds to the reverse gear. The N end of the next notch finds the gears out of engagement and to put in the first speed it is only necessary to pull forward the lever until the trip catches against the forward end of the notch. Similarly when in the third notch at the forward end the second gear is at work and when pulled back to the other end of the notch the high gear is in train.

A departure from ordinary methods in brake construction is found in the Vauxhall. The brake drum is attached to the countershaft in the usual manner and the bands are connected by means of a bolt C passing through the spring, which serves to spread the bands when not in action. One end of the bolt is made with a ratched-faced bearing A, with a corresponding section on the end of the brake lever B, which is connected with a rod running to the foot pedal. A slight movement of the pedal operating the lever brings the two ratchet-faced sections into action, which causes the brake bands to clamp over the drums.

As previously stated, there is some inclination to return to the use of C springs, particularly for continental use. A C. G. V. chassis is shown which has C springs and a transverse spring A supporting the frame of the car at the rear. The ends of the transverse spring and the ends of the C springs B are connected by a long rod C with double spring shackles and means for taking up any settlement in the springs themselves. This car is fitted with internal expanding brakes and the steering wheel is on the left side, with the controlling levers in the center of the driver's sent.

The flexible joint to fore-and-aft ends of the propeller shaft on the Legros & Knowles cars are novel. Fitting over square ends of the driving and driven shafts are two armed forgings, and set at right angles to them are bridge pieces bolted to the propeller shaft by flanged couplings. Between these forgings are introduced three spring steel plates and two cross coupling rods, secured together by rivets and grouped so that the first plate has two opposite corners fixed to the first forging and its other two corners to the first coupling rod. The second plate is similarly held to the front coupling rod and at its other opposing corners to the second coupling rod. The third plate is similarly disposed between the second coupling rod and the other forging. By this form of construction power can be transmitted through all three plates in sequence, each plate being free to bend to any torsional force. This freedom of motion in the three plates, alternating at right angles in each, provides the necessary universal motion. There is nothing but purely molecular friction engendered and so little of that that the life of the joint must be practically indefinite.



Hele-Shaw Disk Clutch

The Hele-Shaw clutch is the most popular form of disk clutch among British designers and is used by some continental motor car manufacturers as well. It consists of two series of thin steel plates of V-section, one-half being attached to the driver and the other half to the driven member of the clutch, the two series alternating. When frictional contact is established the whole revolves as one mass, transmitting the engine power to the gear shafts. The plates run in oil and the flexibility of the clutch—which permits of the most careless use without jar or strain on the gears—is due to the oil getting between the disks and having to be forced out before complete frictional contact can be established. In the illustration P is the end of the engine crankshaft, to which is bolted the flywheel A. A series of studs K in the wheel engage with notches in the set of plates F. These are in frictional contact with an alternate set G. Notches in these latter engage with projections on the wheel I, which is fixed to the driven shaft J. The sets of plates are kept in contact with each other by the springs E acting on the bearing plate C. The clutch is released by the push pedal acting through the ball race N, and so drawing out the plate C. Small bent springs arranged around the edges of the plates F help to free them from each other. When the clutch is fully released the disk L is brought into frictional contact with the surface of the part M, ensuring the quick stoppage of the shaft J should such be necessary. The springs E can be tightened, increasing the driving power of the clutch by drawing back the screws H, care being taken to do this equally all round.

On the Argyll car there is a somewhat novel scheme for adjusting the pedal levers used in operating the clutch and brakes. The lever A itself is made in two parts with a toothed sector B for adjusting the angle and length of the pedal push. The lower end of the combination C is held in place by a stud D, and a lock nut, which is loosened when adjustment is made by moving the loose end of the combination lever so that the teeth on the inner side thereof mesh with those in the sector. It is in a manner similar in operation to the link motion used in locomotives.

The Humber people have a neat way of protecting the universal joint on the propeller shaft of their Coventry car. The gear shaft is keyed to an extension in the form of a flange A, which connects with a large band-like piece B on the end of which is one section of the universal joint C. This large band is made for the purpose of carrying an aluminum cap D, which is bolted to it and covers the joint. The propeller shaft E projects through a large opening at the other end of the cover and over this is a plate F with a hole sufficiently large to permit the shaft to revolve. In the cover is a hole G so that the universal joint may be oiled.

MOTOR AGE

309 Michigan Avenue
CHICAGO

Published every Thursday by the Trade Press Co. N. H. Van Sicklen Manager. Telephone Harrison 4410

Member National Association of Automobile Manufacturers, Chicago Trade Press Association and Official Organ of the American Motor League

Subscription two dollars per year. Foreign subscription four dollars. The Western News Co. of Chicago and its branches supply newsdealers. Entered at the Chicago postoffice as second class matter

A SIMPLE REMEDY FOR MOTORPHOBIA

MOTOR AGE has repeatedly shown that motorphobia exists to an alarming extent in the city of Chicago; even the existence of the winter months has not altered matters to any appreciable extent. Supplementing the howl of press and public about excessive speed, a wise judge has informed a grand jury that a motorist responsible for the death of a pedestrian could be deemed guilty of manslaughter and has charged the jury to look into such cases.

This state of affairs has been brought about chiefly by the attitude of some of the daily papers, which have shown an unreasonable amount of bias, with extreme care taken in misstatement of facts in many cases. There are, and there always will be, careless and reckless motorists, but the person who walks the streets of Chicago cannot be impressed with the idea that automobilists in general are in any manner guilty of heedlessness, recklessness or carelessness.

The biased impressions that exist in Chicago and elsewhere have been allowed to grow because of a lack on the part of the automobilists and automobile clubs in making effort to counteract these impressions. There is much that could be done by automobilists to remove these impressions.

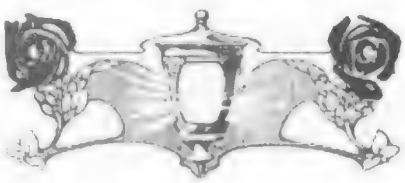
The papers of Chicago which howl the most are quite as guilty of infractions of the law as are some of the reckless automobilists of whom they complain. The American on Thanksgiving day employed a prominent retail automobile tradesman to use his fastest car to carry papers containing the result of the football game to Marshall field, some 7 miles away, before the crowd could leave the grounds. It is told that the automobile in the service of this member of the motorphobia press tore down Michigan avenue at such speed as to absolutely sweep the roadway free from dust. Another paper, the Chicago Tribune, the most rabid motorphobist of all, employs a chauffeur to drive a car in its own service. But it has never told to this day that its own chauffeur was arrested and fined for breaking the speed ordinance.

The papers that howl against the automobile have not vented their spite on the traction companies which permit their monster cars to run at frightful speeds over the public highways. They have not editorially complained about a car which, a week ago, while running over 20 miles an hour in the downtown district, crushed the life out of a woman. They have not editorially demanded that drivers of horse-drawn vehicles be licensed and their vehicles numbered and that they be compelled to keep awake while on their vehicles. They did not seriously complain when a hose cart loaded with firemen dashed into a farmer's rig while the farmer was asleep on his seat and the horse was taking its own course. There are other things they have not told, and while all this has been going on the motorists and those interested in the automobile trade have made no attempt to remedy matters or to change the impressions that are being formed in the minds of the people.

It may not be generally known that according to section 1443 of the municipal code of the city of Chicago "it is unlawful for any owner or driver of any automobile, truck, dray, cart, carriage, bicycle, motor cycle or other wheeled vehicle to use the streets of the city of Chicago without having displayed—until daybreak after the hour of 8 p. m. during the period commencing April 1 and ending October 31 and until daybreak after 6 p. m. during the period commencing March 1 and until March 31—one or more lights." Here is an ordinance that has never been enforced, except against automobiles, since the days of the popularity of cycling, notwithstanding the fact that it is positively dangerous to even operate an automobile on the public highways at night because of the absence of lights on other vehicles. The Chicago Automobile Club and the motorists have made no effort to secure the enforcement of this ordinance in full.

The motorphobia press has said nothing of the miserable streets that Chicago owns; it has said nothing about the lack of traffic regulations on the streets, but it has seemingly vented its spite upon the hundreds of automobilists who are innocent, as well as the few who are guilty. The Chicago Automobile Club is supposedly a representative affair. Since a year ago, when the attempt was made to secure the passage of a state law governing the use of automobiles, the organization has made little effort to provide anything that could be consistently construed as being beneficial to the automobile community.

Every case which has been before the courts has been defeated in some manner, chiefly on technical grounds, which would indicate either a lack of knowledge or a lack of study on the part of those handling the legal end, for the courts themselves have intimated that the laws and ordinances which now are supposed to regulate automobiles are more or less illegal and unconstitutional. It would seem to the ordinary mortal that an organization of motorists should, after its several defeats, begin to realize its own lack of ability and its own apparent self-satisfied position.



Would it not have been wise to have secured legal talent of great experience to cope with that which the great municipal corporation of Chicago naturally secures in cases of this kind? If motorists would even now make an effort to have the ordinance above referred to enforced much of the howl against automobiles would soon die away and there would be no need for a court to talk of manslaughter. Furthermore, automobiling would be considerably benefitted were this and other similar organizations to assert themselves to the extent of disciplining their own members, as they have promised and threatened to do many times.

In this connection it may be said that the retail tradesman guilty of sweeping the streets of Chicago for the benefit of a motorphobia press is a member of the Chicago Automobile Club and should be the first to feel the heavy hand of the organization if it is sincere in its efforts to suppress the heedless and the reckless. It cannot be supposed that a club would be guilty of overlooking such an act. A fine, even if the maximum, would be of no effect, simply because the amount of the fine probably would not anywhere nearly equal the amount paid for the use of the automobile on the occasion referred to. If the clubs can conscientiously permit members to violate laws in this manner, if they can conscientiously permit authorities to religiously rub it into automobilists, then these organizations are by no means representative and are not entitled to consideration on the part of the motorist.

An automobile club is not like the cycling club of old—it lacks competition. When cycling was in its infancy clubs were formed all over the country, the clubs banded together and when their rights were trampled on the clubs simply stood up and howled and demanded and then secured what they wanted. At times they were compelled to resort to mass meetings to help along the cause, but they got there. The automobile clubs might pattern after the cycling clubs of the '90s.

It will require a few years more of abuse to arouse motorists to the sense of duty they owe to themselves and to their neighbors. When they have been sufficiently abused and unjustly condemned they will wake up and attempt to change things that ought to be changed now. To wait is to permit dangerous precedents to be firmly established. There is a demand *now* for sharp and decisive action on the part of *every* motorist and *every* motoring organization. This must come soon and the sooner the better; it is imperative if motoring is to exist, if it is to be enjoyed, if it is to be brought successfully into the commercial field.

A Florida Enchantment is no longer a book—it is a reality.

⁂

What a business Aladdin could do if he were modernized enough to cry "new cars for old" instead of lamps!

⁂

One more combination of letters to struggle with—P. A. T. A., meaning the Philadelphia Automobile Trade Association.

⁂

New Jersey ditches are undoubtedly one step in advance of Chicago's bump the bumps, but they certainly make this twentieth century resemble in a way the days of the Spanish inquisition.

⁂

Scorching through the city streets to catch a crowd at a football game is fine business from the standpoint of enterprise, but hardly consistent with the editorial views of a daily newspaper, Mr. Hearst.

⁂

Instead of the "charger impatiently champing his bit" it is the motor car "throbbing like an ulcerated tooth," according to one English show writer. He must be the same chap who writes about "luridly leaping flames" in describing a fire in an American city.

⁂

General Greeley, chief of the United States signal service, is a convert to motoring. There should be no reason to complain of the weather from this time on, with such a distinguished ally on the automobilists' side. Glidden would better get the general to act as weathermaker for next year's tour when the weather is the chief consideration.

⁂

Out Chicago way they have discovered that all is not gold that glitters. Actually a motorist has been found who was unable to pay a fine for scorching. Some magistrates evidently imagine such a person never existed, judging from the loose and careless way they impose pocketbook-wrecking fines. When some of these justices and policemen discover that the motorist is only mortal after all and that the man at the wheel is no Cræsus, then we may expect sane legislation.

A. G. Vanderbilt, gossips say, is building a car capable of doing 152 miles an hour. If this speed is developed the next thing in line will be a machine that will get there before it starts. That'll be going some.

The Week

Rumor from Detroit says certain members of American Motor Car Manufacturers' Association are organizing a tire manufacturing company.

Oscar Hedstrom, on Indian motor cycle, smashes 25-mile road record, doing distance in 32 minutes 24 2-5 seconds.

Philadelphians practically decide to hold their show in National export exposition building, March 3 to 10.

England announces tire test for next spring, experiments of pneumatics and solids being included in plans.

Henry Souther, A. L. A. M. metallurgical engineer, outlines plan of campaign to learn steel secrets.

New Jersey motorphobists plan ditches instead of bump the bumps to stop scorchers.

Aerocar Co. announces its plans for construction of air-cooled cars in Detroit.

George E. Bradbeer, in Premier runabout, wins hill climb at Riverside, Cal.

Senator Morgan plans extension of southern circuit into Cuba; racing gossip.

Monarch Automobile Co., of Aurora, Ill., placed in receiver's hands.

Transcontinental Tourist Megargel checks in at Los Angeles, Cal.

Motorphobia can be cured, but the only way to do it is to stop scorching.

⁂

Football having climbed to a rear seat, motoring will now have to put on goggles and face the glare of the calcium.

⁂

With the Philadelphia motorists caught by the conflicting state and city laws, it is evidently a case of if you do you don't.

⁂

Talking of $7,000,000 worth of business at the Olympia show makes one suspect Ernest Terah Hooley is again loose in the land.

⁂

One might imagine that Ponce de Leon's fountain of youth has been discovered gurgling out of the sands of Florida if the rush for accommodations at Ormond can be taken as a criterion.

⁂

John Bull can strut around from November 25 to December 8 with the proud satisfaction that he has promoted the greatest automobile exhibition ever held. In passing it might be mentioned that the Paris salon starts December 8.

⁂

It isn't so many miles from Pittsburg to Syracuse, as far as distance is concerned, but in time the two towns are a full century apart, as is shown by the fact that a country like near Pittsburg is fighting the wide tire law, while around Syracuse the farmers are working to have a wide tire law put on the books and enforced. Just such instances as this show how some sections learn sense quicker than others. Mr. Farmer should make a run for the band wagon.

⁂

England's proposed tire test strikes the American as one of the most sensible things ever attempted in the motoring line in that country. Anything that will help the man of moderate means enjoy the sport should receive hearty support from the trade and if perchance something is done to bring out a solid tire that will hit it off right for the poor chap, so much the better for the game as well as for the car manufacturer.

MOTORISTS CAN SECURE GOOD ROADS

If the good roads movement is to grow, work among the farmers is absolutely necessary; there must be a campaign of education. The value of the farm lands in the United States is $6,133,000,000, the value of crops to be moved each year is not less than $4,707,000,000. Practically all of this must be moved to some extent over public highways. In addition, the value of horses is figured at about $1,222,000,000; so the farmer is not so badly off as one might suppose.

The government has proved that a single horse can haul on a good macadam road 6,700 pounds; that on a dirt road it can haul but 3,300 pounds. In other words, a farmer must keep two horses to do the work one could do on good roads. It costs the farmers $946,414,665 to move their products; on good roads it would cost about 40 per cent of this. The farmer might save 60 per cent were he wise.

Yet, with these figures staring him in the face he is opposed to good roads simply because he fears automobilists will enjoy a ride over the highways he has improved. In New York state 100 miles of road can be built under the state aid plan so that the man who owns a $3,000 farm will pay only about a single dollar as direct tax and not over 25 or 50 cents as his share of the state's proportion taken from the general taxes.

If the automobilist will acquaint himself with a few such facts and will take the trouble to talk to farmers whenever opportunity offers, converts will be made gradually and the opposition on the part of the farmer will be eliminated. It is up to the automobilist to secure good roads in this way.

CIRCUIT IS GOING INTO CUBA

Senator Morgan, Reassured by Appropriation of $5,000 by Havana Council, Plans Extension of Southern Racing—Great Interest Displayed in Ormond Meet

New York, Dec. 4—That Senator Morgan's southern circuit will be extended to Cuba now seems assured. A brief press cable brings the all-essential news that the Havana municipal council has appropriated $5,000 toward the promotion of the Cuban tournament. It may now be explained that the insiders, while sure that Morgan's luck and hustle would pull the affair through somehow, have known for some time that the running of the meet was entirely dependent on the Havana council making a liberal appropriation for it. The somewhat disturbed political situation in Cuba did not give much encouragement that such action would be taken unless strong pressure was brought to bear. Morgan, when the cable came, was about to get a move on himself to this end, as he did last year when he obtained the government permission for the use of the military road, which the Havana automobilists themselves had failed to secure. It must be understood that Senor Conill, who is still in this country, had told the senator that he must not depend on him for a guarantee of the expenses, a big deficit having been on the shoulders of the club last year, amounting to several thousand dollars, the profit from the grand stand having been far short of meeting the cost of the race.

Senator Morgan will now proceed at once to get out his entry blanks. The distance of the race has been extended to 200 miles. This will necessitate four trips over the 50-mile course between Arroyn Arenas and San Cristobal unless the projected road be built, affording a loop and enabling the race to be made a continuous run instead of a 50-mile relay affair. How perfectly the race was managed, how well the course was policed by the rural guard, and what a magnificent stretch of smooth highway comprised the course was told fully by the writer in Motor Age's story of the initial event published last February.

With the floral parade taking place on Sunday, February 4, the tour of the island the 3 days following and the gymkhana on Friday or Saturday with the big race on Sunday, February 11, and the sprint race on Monday, February 12, it will mean but a fortnight added to the week at Ormond and assure racing men and race followers getting back to New York or Chicago by February 15.

The program of the sprint races, which will be run on the military road between Guanajay and San Cristobal, where there are the best stretches of racing ground, will probably consist of races at a mile and 1, 5 and 20 kilometers.

Already the participation of Lancia and Fletcher with the Fiats, Foxhall P. Keene with the Mercedes, Walter White with one and perhaps both of the White steamers, and one of the Darracq Vanderbilt race cars seems practically assured. Senor Conill has leased a Clement-Bayard racer from the French factory to represent him in the Havana cup race, which Carricaburu won for him last year with a Mercedes. Other Florida entrants are pretty sure to extend their campaign to Cuba.

It is stated on authority usually well informed that there is no doubt now of the participation of W. K. Vanderbilt, Jr., in the Florida races, while his name continues to be connected with the proposed Darracq 2-miles-a-minute candidate. Another story has it that he may be the pilot of the great Mercedes racer, which Clinton R. Mabley says the Connstadt factory is building for the Ormond-Daytona meet. The young millionaire made his 39 seconds mile in 1904 with a Mercedes and was naturally considerably cut up last January that the same make failed to bring to him the record-cutting that fell to others at that time.

A. C. Newby, president of the National Automobile Co., confirms the report that Carl Fisher will drive a 60-horsepower six-cylinder National in Florida. Mr. Newby, while hardly expecting victory in the sprint races up to 5 miles, is confident the National had a more than even chance for the 30-mile American car championship and will give a good account of itself against the foreigners in the 100-mile race for the Minneapolis cup. Indianapolis, by the way, is also to give a cup, which will probably be the prize in the American championship contest. George Robertson, who piloted the Christie in the Vanderbilt trial, is named as the probable driver of the six-cylinder Premier which was not completed in time for the elimination trials for the American team.

J. Howard Johnson and William F. Hogan, both members of the club and residents of Paris, will represent the Automobile Club of America at the coming international conference of clubs, which will be held in Paris beginning December 11. At this conference the question of the future international road racing is likely to be settled. The chances are that the Vanderbilt cup will be returned to the A. A. A. for competition in this country.

What will be done about the Bennett cup is harder guessing. Few believe, however, that it will pass into a mere touring trophy. If France be unwilling to promote a race for it, the logical and just procedure would seem to be to offer the contest to the other clubs in the international union in the order of their finish in the last race. France still has a hug for the promotion of a grand prize race next year in which its own cars shall have a 3 to 1 or some other preposterous representation based on a claim of that preponderance in motor car manufacture.

Henry L. Bowden, of Boston, who scored 32⅘ seconds for the mile with his double-engine Mercedes freak at the beach last January, is out of the motor car racing game for good. The two engines of that car he put in his motor boat. Now he offers for sale his remaining fast machine, Flying Dutchman I, the Mercedes which Basle drove so successfully on the track. This machine was offered as a substitute for the Dinsmore Mercedes in the Vanderbilt cup race, but technicalities prevented its acceptance. It was fitted with new cylinders and a new gear box and generally tuned up. Mr. Bowden thinks it ought to hold its own with the best machines at Ormond, but at the meet he will be missing as a competitor for the first time in 3 years, though he may be a spectator and later participate in the motor boat races at Palm Beach.

Senator Morgan is also considering a still further extension of his southern circuit. At a conference Saturday with H. E. Bemis, manager of the Colonial and Victoria hotels at Nassau, N. H., who will have charge of the Continental hotel at Pablo-Atlantic beach, near Jacksonville, Fla., when it opens on March 15, the suggestion of Mr. Bemis that a 3-day meet be held on this beach April 4-6, was well received by the senator. Of the availability of this beach as a race course much in its favor has been written, embodying Morgan's inspection and Walter Christie's trial of it.

Morgan argues that, following the Cuban carnival, it would make a fitting finale to the winter's racing. It is possible, though, that the meet may not even be the wind-up. E. H. R. Green has written Morgan asking him to get up a tournament for Galveston beach also. The senator is inclined to take the latter proposition to follow the Pablo meet.

The story that Alfred Vanderbilt is having built for the Florida meet a great American racing creation is persistently printed and is backed by one who is usually well informed on racing matters. The car, they say, is to be 250-horsepower.

Francis Richard, a French engineer, who recently placed a new carburetor on the market, is named as the designer. It is said the machine has eight cylinders, with shaft drive, a wheel base of 116 inches, a standard guage, and 10 inches clearance. There will be nothing of the freak about it. The various parts have been manufactured in shops in New York, Jersey City and Newark and the assembling is being done in this city, it is said. Paul Sartori, who will drive it, will take it to Florida early in January for practice and tuning up for the Ormond and Cuban meets.

M. J. Rothschild, of Audinau & Co., who returned from Paris Saturday, says he understood there that Henry Fournier himself was coming over to drive the Itala car in Florida and that the Renault people were to be represented by Sisz. The news here is that Hemery, who has apologized and been let off with a fine, will be reinstated by the French and Italian clubs and come over to drive a Darracq on the southern circuit.

A. L. Kull, the local representative of the Wayne Automobile Co., tells of the strong play to be made by him for racing honors at Ormond with the Wayne. The campaigners are to go to Florida in a special car furnished by the Seaboard Air Line, which will be sidetracked and used as a home during the meet. A strong bid

Digitized by Google

for the American championship will be made by a 50-horsepower car. A 40-horsepower racer will be entered for the middleweight events. Deacon Holmes will do the driving. Both of these cars are expected to arrive here next week and will be on exhibition until they are sent to Florida for the beach races.

L. H. Palmer, of the Long Island Automobile Club, will send to Florida the two 60-horsepower Matheson cars owned and entered by him for the American eliminating trials. Wally Owen is to be pilot in all but the amateur events, in which Mr. Palmer will take the wheel.

QUAKERS UP AGAINST IT

Philadelphia, Pa., Dec. 4—Unless an amicable adjustment is made before New Year's day, any man who drives an automobile in Philadelphia on that day will be arrested. This is because of a clash of city and state officials over the construction of the new automobile law. The state law requires that on and after New Year's day, 1906, there shall be exhibited on all motor vehicles two state licence tags. No other tags of any kind must be shown. The city ordinance provides that all motor vehicles must display the city's blue and yellow tag. If this tag is not shown, the ordinance directs the arrest of the offender. If it is shown, the state law directs the arrest of the offender. Automobilists, when they saw confusion looming up, went to the state attorney general, who told them that city laws did not count. Then they went to the city solicitor, and he told them that the attorney general was wrong, that no motor vehicles would be allowed in Philadelphia without the city number. The city solicitor did not protest against other numbers, however. He was willing to compromise, to let any car carry the state tag on an equality with the city tag. He did not even object to half a dozen other tags. But he insisted on the yellow and blue label. But the attorney general refuses to compromise.

PARIS SHOW PLANS

Paris, Nov. 25—Every indication points to the Paris salon being the finest exhibition of automobiles ever attempted, despite the pronounced success of England's Olympia show, which has just ended. It is true many of the leading French makers displayed their 1906 goods across the channel, but this is not expected to take any of the wind out of the sails of the salon, for the reason that all the new things were not uncovered in England. Anyway, there is only one Paris show and everyone has been saving up for this big event. Even at this early date, with the show not starting until December 8, the management is busily engaged preparing for opening its doors. It is safe to predict that there will be no unfinished exhibits at the salon and right on the dot every maker will be ready at the scheduled time.

A record attendance is looked for. The American delegation will be a strong one, while from England, Germany, Austria and other continental countries will come the automobile enthusiasts, all eager to see the latest thing for 1906. A special automobile bus service will be installed which will run to the Grand Palais.

MAY MAKE TIRES, TOO

Strong Rumor that Independents Will Go Into the Rubber Game On Their Own Account

Detroit, Mich., Dec. 6—Special telegram—From statements from an indisputable authority, the New York correspondent of MOTOR AGE, now in this city, is able to confirm positively the report that certain members of the American Motor Car Manufacturers' Association are organizing a tire manufacturing company. The promoters of the scheme have gone so far as to secure a factory and contract for machinery, and state that the production of tires will actually begin early in January. Several leading independent makers have already subscribed to the stock and other members will be given the same privilege. The plan of stock distribution is intended to be proportionate to the respective outputs of the subscribers, who are to be restricted to A. M. C. M. A. members. There is no intention of cutting the established prices—the whole idea is a coöperative one, in which the benefits arising are to be derived from the dividends earned and the assurance of securing an adequate and prompt supply of tires.

The scheme has been under way for some time and was thoroughly discussed and approved at the meeting of the executive committee of the independents held in New York 10 days ago.

In reference to the report that the licensed association members had in mind the formation of a similar company, George H. Day said last Saturday, in reply to questions put by the writer: "This is as big news to me as it will be to the public. If our members have any such intention I have heard nothing of it."

One of the reasons advanced for the formation of a tire-making concern by the automobile makers is the alleged combination of all the manufacturers of tires with one or two exceptions is so close as not only to name prices but to limit the outputs of the factories as well. The story as told in the east is that the Rubber Goods Manufacturing Co., which includes the Hartford, Dunlop, Morgan & Wright, and G & J concerns, will make 33 per cent of the $9,000,000 worth of tires which the tire makers will put out; the Diamond, 23 per cent; the Goodrich, 23 per cent; Fiske, 9 per cent; International, 6 per cent, and Goodyear, 6 per cent. This allotment is based on the previous year's business, and a $10,000 fine is paid if the rule is broken.

It is further alleged that the allotment is made by the month and that if a tire concern is allotted $45,000 worth of business for a month, and its sales amount to $60,000, 40 per cent of the $15,000 excess must be paid to the pool; also that makers are fined for cutting prices in any way, and for giving away tires on any pretext whatever.

It is not anticipated that the formation of the new company will be the means of causing a tire price war, which might be welcomed by the purchasing public. It has been pointed out that this would be a fatal step to any concern making it, for price-cutting would probably be the cause of cheapening tire construction, whereas today the endeavor of all makers has been and is to improve the quality of the goods they manufacture. Such action would mean the downfall of the American tire business, if not the American automobile business, and would be the means of letting in foreign goods. There is little danger of this from either side, however.

DITCHES INSTEAD OF BUMPS

New York, Dec. 5.—Jersey automobilists are somewhat grouchy over the latest proposition advanced by the farmer contingent for the prevention of overspeeding in the wilds of the cranberry and trust state. The project has the bump the bump scheme of Chicago beaten a mile or so. The farmers have an idea that not enough of the speeders have been brought to justice and they have devised a scheme which they think will act both as a deterrent and a punishment. The plan consists of the construction of gutters across the highway, 1 mile apart, so formed that if the machine is running at a high rate of speed, it will be overturned, or, in other words, they want to ditch the car. Assemblyman Scovil has been asked by the Magnolia farmers to get an amendment tacked on the speed law whereby these ditches can be built. Take the White Horse pike for example. By building ditches 1 mile apart, the farmer constables could keep tab on the machines. They would know that a machine must slow down at a certain point, and then the matter of arrest would be easy. And then, it is argued, the ditches would deter the speeders for fear of accidents.

PREMIER WINS HILL CLIMB

Los Angeles, Cal., Dec. 1—The hill-climbing contest on the Box Spring canyon grade, near Riverside, Thanksgiving day, for automobiles costing less than $1,650, drew a small crowd. The course was about 4 miles long, and the surface good. The grade averaged less than 8 per cent and there were no steep places. All the cars made the whole distance on high speed. Bradbeer, with a Premier runabout, won the climb, his time of 6 minutes 43⅗ seconds, being best. The times were as follows: George E. Bradbeer, Premier runabout, 6:43⅗; W. K. Cowan, Rambler surrey, 7:01; Harris Hanshue, Reo touring car, 7:08; Ralph C. Hamlin, Franklin runabout, 7:32⅖; Clarence Smith, Maxwell touring car, 8:02⅖; W. L. Moreland, Tourist runabout, 8:15; D. Ferguson, four-cylinder Moline, 8:17; W. J. Burt, Reliance, with body on, 8:28⅗.

SPEEDWAY RUMOR AGAIN

New York, Dec. 5—It is now declared that the great Barnegat speedway is assured. The new track will give a 30-mile speeding course and include a 3-mile circuit for track contests. The new speedway will be 3 miles south of Tom's run, 11 miles below Lakewood. A club house and garage will be built and 1,000 members sought. The New Jersey Automobile Speedway Association, of which Jason Waters, of Atlantic City, is president, has been formed to put through the project.

BUSINESS IN RUSSIA

Automobile Conditions in Czar's Domains Shown in Federal Report—Possible Chance

Washington, D. C., Dec. 4—Reports received by one of the federal departments show natural conditions in Russia are both favorable and unfavorable to the automobile trade. The favorable ones are found in the absence of many hills and the long distances over level stretches. The unfavorable are in the long winters, the intense cold, and the absence of romantic places or scenery to attract tourists. The people and public officials do not favor this method of traveling for they are poor sportsmen. The Russians apparently have little skill in handling complicated machinery, hence the inability to get chauffeurs at reasonable terms. The country people are often bitter enemies of the automobilists, the roads of the Russian empire are often wretched, and the network of ways far from what it might be and what it will have to be before the great Russian empire can count on a successful industrial career.

In the cities it is different. There everything favors the automobile. The slowness with which street railways are built forces many families to keep carriages. These will doubtless turn to automobiles. The only serious obstacle to a rapid development of the automobile trade in the large cities is based on police supervision and regulation. Now that a great change has come over Russia's police and other policies, trade in automobiles may develop unmolested. Each of the different cities, however, has its own way of handling the automobile traffic. St. Petersburg and Moscow long since recognized the automobile as a necessity, hence their regulations are comparatively liberal. Riga and other cities have been rather severe. In those places certain streets may not be traversed by automobiles. Applications in writing for permission to use an automobile must be made and the car must be subject to expert investigation by the authorities.

Up to date Russia, including Poland, the Caucasus, and Finland, has from 1,200 to 1,500 automobiles, among them many of the lighter kind. Besides these there are about 1,500 motor cycles. Manufacturers interested in discovering the actual conditions governing automobiles and the automobile business in Russia will do well to go over the ground carefully in every large city from St. Petersburg and Moscow down to the smallest place in which sales are to be sought. The farther the empire emerges from a mere agricultural country to a position among the industrial and commercial countries the automobile business is bound to grow. The men who own the mines and forests will want automobiles, for in the long run they will be found far superior to horses, for these latter call for great care and entail enormous expense to their owners.

No one has done much about building motor cars in Russia. A St. Petersburg firm that built motor boats tried its hand at the automobile, while another firm is now doing what it can to manufacture cars in imitation of a well-known American make, also one resembling a well-known German type of car.

The peculiar needs of Russia in regard to automobiles have never been met. The comparatively great success of the American cars has been attributed to cheapness, abundance of supply, skillful advertising, etc. Simplicity of construction and driving are the prime requisites. Great speed is not required because of the danger from bad roads. Low speeds are wanted because of the steep hills and bad places that require the cars to go slow. The springs must be stronger and longer than they usually are in other countries.

California Oiled Road

Megargel's Arrival at Los Angeles
A Southern California Road

IN NO FEAR OF DESERT

Megargel to Find Out for Himself If the Great American Wastes Can Be Crossed in Car

Los Angeles, Cal., Nov. 29—The Reo Mountaineer, of New York, arrived in town Tuesday noon, after a pleasant trip down from San Francisco, with the exception of some pretty heavy showers on the last 2 days, which made driving a little more difficult than when dry. California is certainly an ideal state for motoring and both Fassett and myself are so pleased with its well-kept oil roads that without doubt we shall invade the state again by motor in the near future, though possibly not together.

All day today I have been planning out a return route across the dreaded sands of New Mexico and Arizona—a course that I have been informed time and time again is impractical, but always by someone who has never tested it himself to find out. I'm going to find out and in another month I will be in a position to tell the automobile fraternity whether or not these sandy wastes now known as the Great American desert and crossable for automobilists. Candidly, I think they are and that the tales of hardships are much exaggerated.

Just before leaving Frisco I ran across my old friend Whitman, the record holder, still driving the Franklin with which he did it in. A good photograph of the Franklin and the Reo Mountaineer, both cars the battle-scarred champions of transcontinental trips, was taken at Frisco just prior to our departure from that city. Upon arriving at Los Angeles one of the first persons I ran across was Billy Chadeayne, who has just crossed the continent on his Thomas Auto-bi. He is secretary and treasurer of the Auto-Bi Co., of Buffalo, and it was like being home to run around Los Angeles with him.

When we arrived in Los Angeles our Reo car was so covered with mud that it was hardly recognizable, for California produces some mire after a 2 days' rain, but then this mud, so much talked of by the Californians as doby was not to be compared with the Nebraska product of the same name, nor with Iowa and Illinois gumbo. It was hard wheeling on some of the grades, where the mud was 2 or possibly 3 inches deep, but there was no sinking in up to the side steps, nor occasion to utilize the faithful windlass.

Los Angeles, the greatest city for automobiles for its size in the world, has not been over-estimated and its importance to the industry seems to be recognized by every manufacturer. It is indeed an unheard of machine that is not well represented here. L. T. Shettler, the Reo agent, boasts of some 200 Reos sold here this year that are now in use on the city streets and he is at the present time at work on one of the handsomest garages in the country—an edifice that would shine in New York city were it there.

We heard much about the grades over the mountains on the run from Frisco to

Digitized by Google

Los Angeles. While it is true the road ran over some extremely high mountains, the grade had been made so gradual and the general surface of the road was so good that most of the grades could readily be traveled on the high speed. Our grad-ometer never registered over 12 per cent on the entire run, while the majority of the grades seldom are over 7 per cent. The turns in the road, however, were decidedly sharp and on some of the hills, automobilists were warned by signs that the state law forbade a speed of more than 4 miles an hour. These notices were signed by the road commissioner.

We ran through several bunches of cowboys struggling with obstinate cattle. In one case the Reo Mountaineer was held up for nearly an hour, awaiting the removal of a huge steer which had been roped and thrown across the road. Immediately upon regaining his feet he would charge first one horseman and then another. Several times he charged the automobile, but was always brought up with a jerk when he reached the end of the several lariats that held him. Finally, with two ropes dragging him and another rope behind, which kept him from charging the ponies ahead, he was hurried up the road, one horseman riding behind spurring him and at the same time twisting his tail.

Since our arrival here we have listened to all kinds of stories about the old Santa Fe trail across New Mexico and Arizona. It seems to be the general opinion that an automobile cannot tour these two states, although I have been told that if we run along the railroad ties we may be able to get through the sand deserts. Water is said to be anywhere from 5 to 100 miles apart, but with every confidence in the Reo Mountaineer's ability to conquer everything ahead of it we shall push on toward the latter part of the week and expect to make New York city in time for the two automobile shows.

We heard much about the grades over the mountains on the run from Frisco to Los Angeles. While it is true the road ran over some extremely high mountains, the grade had been made so gradual and the general surface of the road was so good that most of the grades could readily be traveled on the high speed. Our grad-ometer never registered over 12 per cent on the entire run, while the majority of the grades seldom are over 7 per cent. The turns in the road, however, were decidedly sharp and on some of the hills, automobilists were warned by signs that the state law forbade a speed of more than 4 miles an hour. These notices were signed by the road commissioner.

The Spanish names of the towns passed through between San Francisco and Los Angeles in many cases were hard to pronounce. It was also a difficult matter upon numerous occasions to secure information as to the best roads, as Spanish is spoken by fully one-fourth of the people encountered in this region. Among the towns passed through having Spanish names were: San Jose, San Juan, Nativadad, Gonzalez, San Lucas, San Ardo, San Miguel, Pas Robles, Santa Margaritta and San Luis Obispe.—PERCY F. MEGARGEL.

RUNABOUTS IN A TEST

De Dion Makes Best Showing of the Lot at the End of Third Day of Paris Trial

Paris, Nov. 25—Half of the journey of the runabouts competing in the 6-day test was completed last night, with the de Dion the most prominent candidate for

CORMIER IN A DE DION

BARDIN PASSING THROUGH GAILLON
RENONCE IN A GREGOIRE

the honors. Thirteen cars started in the trial last Saturday and their work has been closely watched by those who claim there is a great future for the light machines. The tour is over highways near the metropolis and embraces 772½ miles and 125 miles are covered each day. The roads are giving the severest test to the cars in the way of grades, poor going and other difficulties. The cars are rated, in the summing up of points, as to their ability to keep as close as possible to the 15½ miles an hour schedule. A car which falls behind this pace for any reason is penalized 5 points to the kilometer on each stage of the day's trip, but this can be made up by good work later.

On the first day the test was over a 125-mile route from a Paris garage, the Darracq, to Mantes, thence to Vernon, to Virage, to Gaillon, then back to Vernon and then back to Mantes. It resulted in victory for the three de Dion-Bouton cars, the Lacoste-Battmann machine and two Gregoire runabouts, which succeeded in getting in without a penalization against them. The cars covered the 125 miles of muddy, rain and snow-soaked road at an average speed of 20 miles an hour. The cars were equipped with 8-horsepower motors and none of them weighed over 1,210 pounds. The three de Dions were one-cylinder machines and were fitted with Dunlop tires and shaft drive, as was also the Lacoste and two Gregoire machines. Out of the thirteen entered only two broke down and returned to the starting place. One was a Hugot, which experienced trouble at the start and went only a few kilometers. The other was a Lacoste, driven by Gallet.

The cars returned to the starting place, the first ones in 2 hours 37 minutes 4 seconds. They were the three de Dions. The Lacoste-Battmann got in in 3 hours 5 minutes and the two Gregoires in 3 hours 6 minutes and 3 hours 11 minutes respectively, No. 2 leading No. 1 by 5 minutes. Gregoire No. 3 was penalized in the first and second stages and took seventh place. The Vulpes, driven by Barriaux, was penalized 340 points, the Thomas Lacoste 350, the Deemeester 390, and the Gladiator 790. The Gallet Lacoste and the Hugot had quit the competition earlier.

The second day's run produced practically the same results as to finishes as the first, while the third showed several reversals of form. The de Dion, Lacoste and Gregoire cars still led with no marks against them. The de Dion, driven by Cormier, was first, the Lacoste second and the Gregoire third.

Several of the cars, notably the Vulpes, driven by Barriaux, had reduced the penalizations. Barriaux was in fourth place, with only 65 points against him, as opposed to the 95 which he incurred the first day in the first and second stages of the journey. The tour, which was made each day over the same route, was covered in practically the same time. The successful de Dion car covered the morning stage of the third day, 75 miles, in 3 hours and 15 minutes at an average speed of 22 miles per hour.

At some stages of the journey the little 8-horsepower machine reached an average of 31 miles an hour. Seven of the entrants the third day incurred no penalizations.

At the end of the third day the penalizations were as follows: Cormier, de Dion; Gachet, Lacoste-Battmann; Renonce, Gregoire, 0; Barriaux, Vulpes, 65; Bardin, de Dion, 195; L. de Dion, de Dion, 195; Tavenaux, Gregoire, 240; Thomas, Lacoste-Battmann, 320; Rochay, Lacoste-Battmann, 350; de Bosch, Gregoire, 1,165.

ROOM FOR ALL TO SHOW

Main Floor of Philadelphia's Exposition Larger than Madison Square or the Coliseum

Philadelphia, Pa., Dec. 4—At a meeting of the Philadelphia Automobile Trade Association last week it was practically decided to secure the old National export exposition building, in West Philadelphia, for the annual show. An application has been forwarded to the national association for a sanction for March 3 to 10, and there is every reason to believe it will be granted. President A. E. Maltby has appointed a show committee consisting of W. C. Barrows, of the Pennsylvania Electric Vehicle Co.; W. F. Smith, manager of the local Rambler branch house; W. J. Foss, of the Foss-Hughes Motor Car Co., Pierce-Arrow, Cadillac and Baker; John A. Wister, of the Gawthrop & Wister, Yale, and Percy L. Neel, manager of the Quaker City Automobile Co., Pope-Toledo and Franklin.

The show building, which was the main structure of the export exposition, is amply large to comfortably accommodate all applicants for space, and all on the ground floor. Indeed, the main floor area is larger than that of the Madison Square garden in New York or the Coliseum in Chicago, while on the second floor in the front of the building are numerous rooms for offices, etc. The P. A. T. A. has promoted several previous shows, and has experienced the disadvantages of holding such exhibitions in small buildings. Last winter, for instance, the First Regiment armory was selected, and so inadequate was the floor space that not a few big concerns absolutely refused to accept the small sections offered them, and held individual shows in their several establishments. Despite the fact that all the exhibits were cramped, the corridors and company rooms were so blocked with cars, launches, accessories, etc., as to make it quite uncomfortable for visitors. This year it was decided that the advantages of sufficient space far outweighed the disadvantage of location of the export exposition building, which, after all, is no farther from the geographical center of the city than is the Second Regiment armory, in which the 1904 show was held. It is well lighted and heated and well equipped for electrical displays. Besides, exhibits shipped by rail can be run direct to the east doors of the building, which is but a few feet from the tracks of the Philadelphia, Baltimore & Washington Railroad, a Pennsylvania line. This will be a great convenience to out-of-town exhibitors, as it will enable them to effect quick installation and get away. An idea of the capacity of the building may be had from the statement that it was selected by the local Republican convention committee when McKinley was nominated for the presidency the second time.

At the annual meeting of the Philadelphia Automobile Trade Association, which will be held at the Hotel Hanover tomorrow night, officers will be elected to serve for the ensuing year. At last week's meeting the following nominations were made: For president, A. E. Maltby, of the Winton Motor Carriage Co.; vice president, W. F. Smith, of the Rambler company; secretary and treasurer, Manager Morse, of the Locomobile company; for members of the board of directors, W. F. Smith, Rambler; L. E. Hoffman, Ford; Samuel Cohen, Reo; Percy L. Neel, Pope-Toledo and Franklin.

An idea of the ease of access of the export exposition building to the center of the city is had from the fact that it is directly across the street from Franklin field, the University of Pennsylvania's stadium, where 25,000 football people are frequently handled in jig time by the Rapid Transit Co. and the Pennsylvania Railroad, the latter having a station within 100 yards of the entrance. The actual distance of the show building from the city hall is about 1½ miles.

NEW DETROIT CONCERN

Detroit, Mich., Dec. 4—Every effort is being made by the Aerocar Co. to complete its factory in time to turn out a model of its air-cooled car for the New York show. It is less than 30 days since the idea of organizing a company struck Alex Y. Malcomson, treasurer, director and a large stockholder in the Ford Motor Co., and with his customary hustle he proceeded to put his ideas into execution. Contracts for the construction of a factory on the block intersecting the Michigan Central Belt line were let. It is to be over 400 feet in length and when completed will occupy nearly the entire block. Such rapid progress has been made that the power plant is now almost under room and it is expected the plant will be running early in January, the contract calling for the building to be completed in 40 days. M. O. Reeves, vice-president and general manager of the Reeves Pulley Co. and the Reeves Machine Co., of Columbus, Ind., is the inventor and maker of the air-cooled motor which will be used. It is four-cycle and made in two sizes, with the cooling fan in front. Mr. Malcomson, a wholesale and retail coal dealer with establishments in Toledo and Detroit, is at the head of the new company. Walter G. Morley, formerly with the Olds people, is purchasing agent and advertising manager. The mechanical superintendent is E. J. O'Hagen, who comes with over 7 years' experience with the Winton company. C. Pfahler, a graduate of the Technical university of Berlin, is chief draughtsman and H. H. Thorpe, sales agent, occupied a similar position with the Franklin company.

COTTA SCORES A POINT

Chicago, Dec. 1—Charles Cotta, of Rockford, Ill., scored a point in the suit brought against him in the United States circuit court by the Four-Wheel Drive Wagon Co., of Milwaukee. The Milwaukee concern filed a bill for specific performance, but Cotta entered a demurrer which was sustained by Judge Kohlsaat. The case came up Wednesday. According to Cotta's version he and H. Theodore Hanson, the promoter of the Milwaukee company, entered into a contract some time ago, but Mr. Hanson recently violated the same. Hence, when the Milwaukee company sued to recover a license from Cotta, it was overruled on the grounds that it had failed to carry out its part of the contract.

TO PEER INTO FUTURE

Steel Commission to Visit Europe to Study Experimental Alloys and Plan a Campaign

New York, Dec. 4—The organized campaign instituted by the Association of Licensed Automobile Manufacturers for the mutual benefit of the trade in regard to the establishment of a standard for steel for the mills is now in the hands of Henry Souther, metallurgical engineer in charge of the experimental laboratory of the mechanical branch of the A. L. A., who declares that the investigation to be conducted abroad by the steel companies in the interests of the automobile manufacturers is for the purpose of studying experimental alloys and that they intend getting a line on the future. Mr. Souther declares Americans are going to win by team work, where their European rivals had to find out what they know of steel through individual competition. Speaking of the foreign mission, Mr. Souther said:

"The object of their mission seems to have been a bit misunderstood. They are going abroad to study experimental alloys and not to adopt anything now in use. That is an old story to us. They are not to investigate what is commercial today but what may become commercial in the years to come. French experimenters have compounded certain alloys in an experimental way. Their object is to find out if any are better, and if so, commercially. We Americans have been using for 15 years in projectiles and armor plate chrome nickel steels that have not been excelled in the world. The same alloys have come to the front in automobile manufacture. Our steel makers have learned that nothing is too good for the American manufacturer.

"Our importation of foreign steel is comparatively insignificant—some Jessop steel for tools, some Syrian steel and a little of the French malleable nickel alloys for valves and scientific instruments. Some foreign steel has been used in our automobiles for the reason that European makers have been willing to make small quantities. The Europeans have used good steel in their motor cars. This comes from racing, which has taught them that the best steel must be used. We have had the same advantage, though, first from a proper following of their experience, and, second, from the strenuous demands for strength and durability incident to our bad American roads.

"Into my laboratory have come samples of both foreign and American steel and I have yet to see any foreign steel that has excelled ours of the same grade, and I have yet to see any foreign steel being used commercially that its counterpart has not also been commercially used here. For 2 or 3 years makers of our highest grade cars have been using these finest qualities of steel.

"We are following the lead of the government in its manufacture of projectiles and armor plate, and of the bridge builders and other users of the highest grades of steel in seeking by experiment the best for the purpose. We are standardizing.

Digitized by Google

We are trying to determine the best steel for each particular part. But this is only tentative and may be changed by the result of development and experiment.

"We know now what is the best from experience, in so far as other industries go by experience. We are adopting standards, so that we can ask for something definite for each part. Some of our members have had the advantage of such specifications. Now the mechanical branch of our association seeks to give this advantage to all. The inspection will be as rigid as that of the government, and will be made at our laboratory in Hartford, where we have counterparts of government testing machines and a force of chemical and physical experts. Members are sending samples of their purchases to the laboratory which are thoroughly tested and put through the various operations of forging, annealing, hardening and tempering to determine their quality and fitness. The best of steel may be ruined by ignorant treatment, so we are getting out a set of standard instructions. We see what a member has bought and tell him how to handle it. We determine by our tests what is best for him to buy. Steel may be ruined by overheating, by forging at improper temperatures, and by hardening improperly. Every different grade of steel requires different handling.

"The strength of steel is measured and expressed by pounds per square inch. There are four grades. Low carbon steel will show a tensile strength of 60,000 pounds with an elastic limit of 40,000 pounds. The next grade, high-class carbon, shows 85,000 pounds tensile strength and 55,000 pounds elastic limit. Nickel steel annealed gives 85,000 pounds tensile strength and 60,000 pounds elastic limit. With special treatment its showing will be 100,000 and 70,000, respectively.

"The chrome nickel steels are the highest grades and will test at 90,000 and 65,000 pounds annealed and 250,000 and 150,000 with special heat treatment. The maximum commercial limit that has been reached in chrome nickel steel is 275,000 pounds tensile strength and 183,000 elastic limit. And let me tell you that no automobile engine in use has the power to strip gears made of this grade of steel."

MONARCH COMPANY FAILS

Chicago, Dec. 2—J. O. Mason was yesterday appointed as receiver for the Monarch Automobile Co., of Aurora, Ill., by Judge Bethea, of the United States district court, his bond being fixed at $15,000. The liabilities of the company may reach $75,000, while the assets are reported to be in the neighborhood of $20,000. The bankruptcy petition alleges that the assets of the company have been in the possession of Sheriff Burke at Aurora since November 29.

Creditors upon whose petition the company was thrown into bankruptcy are T. W. Williams, of Indianapolis; the Cartier-Chapman Co., of Ludington, Mich., and the Hartsburg & Hawksley Co., of North Aurora. The claims amount to $1,570. According to one of the stockholders the action was occasioned by an attachment suit, begun by A. B. Boucher, one of the organizers of the company, for money claimed to be due him.

PLANS BIG TIRE TEST

English Automobile Club Schedules Novel Contest for Spring —Hint of French Scandal

London, Nov. 25—The English automobile club proposes to hold a tire trial early in the spring for the purpose of testing the comparative excellencies of various tires on the market. The distance is tentatively fixed at 4,000 miles, and both solid and pneumatic tires will be divided into four classes—those designed for light cars, i. e., a running weight of not less than 1,500 pounds; those designed for medium cars, i. e., a running weight of about 1 ton; those for touring cars, i. e., a running weight of 3,000 pounds, and those for heavy power cars, with a running weight of about 4,500 pounds. No device will be permitted to be attached to the tire to aid and strengthen it or save it from any road stress, but a separate class will be formed for devices of this character. Not the least interesting feature of this trial is the separate classes opened to test solid rubber tires with minimum carrying weights of 1,500, 3,000, 6,000 and 14,000 pounds, respectively. This latter class is certain to attract a considerable amount of attention. With all their improvements—and they are many—pneumatic tires are still a heavy expense to the small car proprietor, and there are many motorists who would welcome a really good solid tire which would save them from that expense. The weakness of the solid rubber tire is that while at slow speeds and on good surfaces it performs its work efficiently, when the car is properly sprung for tires of that type, but as soon as speed rises to the neighborhood of 20 miles an hour, or roads become rough, the comfort of the passengers and the longevity of the engine and the running gear are sadly impaired. The solid tire motor car is a thing of the future, and until it comes the motor for the man of moderate means will remain unexploited. The commercial vehicle, too, has to be exploited on the solid tire, and the automobile club will do a great service to the industry if it helps to solve that problem.

A scandal is said to have arisen in France in connection with the official returns of one of the official timekeepers of the French automobile club, which has ended in the suspension of the official in question, and which has attracted considerable attention on this side on account of the issues involved. Owing to the impossibility of permitting cars to start off the mark together, the timekeeper in all important automobile contests practically has the decision of such contest in his keeping; and to such an extent has confidence in the probity of these high officials been held that they have been entrusted with their duties almost without supervision—certainly without that jealous supervision which was exercised when the British automobile club held the Bennett race in Ireland, and checkers were appointed by the various countries engaged. The result of that confidence, and the laxity it engendered, is the charges of improper returns, which have caused little less than consternation amongst the sporting automobilists in France. The wildest rumors are current regarding the issues involved, but as the case is subjudice nothing can be made public. In any event, it is to be hoped that the incident will lead to official and independent supervision of these matters in future. When it is remembered that $500,000 worth of business has often hinged on the mere winning or losing of a hill-climb or a record-breaking contest in France, it is not, perhaps, to be wondered at that anxious and unscrupulous traders should adopt the surest way to secure the business.

ARGUES ON ALCOHOL

New York, Dec. 5—Following the discourse of Whidden Graham before the Automobile Club of America last week, on "Alcohol as a Motor Fuel," there has been considerable discussion in the trade, locally, as to its real value for such purposes. Mr. Graham is an enthusiast on the use of denaturized alcohol which he believes, with duty removed, will largely take the place of gasoline as a fuel. The arguments in favor of alcohol, he says, are: Its cleanliness, its safety and its freedom from disagreeable odors. He called attention to the steady growth in the consumption of gasoline, through it being used so extensively for motor fuel, and hinted that this might ultimately result in a scarcity so marked as to cause an inordinate price. In fact, he said that since the coming of the motor car and boat the price had gradually risen from 6 cents to 20, 25 and in some instances 30 cents a gallon. On the other hand, denaturized alcohol, which is unfit for drinking purposes, were the tax removed, could be sold at a fair profit for 18 or 20 cents a gallon.

On the other hand, a number of people who have experimented with alcohol, among them M. André Massanet, general manager of the Panhard branch, declare that there are grave difficulties connected with its use. It is said that the same amount of horsepower cannot be developed with an equal amount of fuel, also that much heavier lubrication is required with alcohol than with gasoline. It is said, besides, that there is a certain amount of water in alcohol which rusts the cylinders and valves; and also that it is impossible to thoroughly strain alcohol so as to avoid dirt. Another argument advanced against the use of alcohol is that it is much more amenable to atmospheric conditions.

NEW MOTOR CYCLE MARK

New York, Dec. 2—A 25-mile handicap road race run over the Coney Island boulevard today resulted in new competition road records for motor cycles. F. P. Baker, of the Brooklyn Motor Cycle Club, on a 1¾-horsepower Indian, won, his time being 38 minutes 17⅖ seconds. Oscar Heilstrom, of Springfield, Mass., on a 3-horsepower double cylinder Indian, a scratch man, covered the course in 32 minutes 24⅗ seconds, lowering the record of 34 minutes 21 seconds for 25 miles, made by George H. Curtis, in Waltham, Mass., on August 9 last. There were nineteen starters, eleven of whom finished the race.

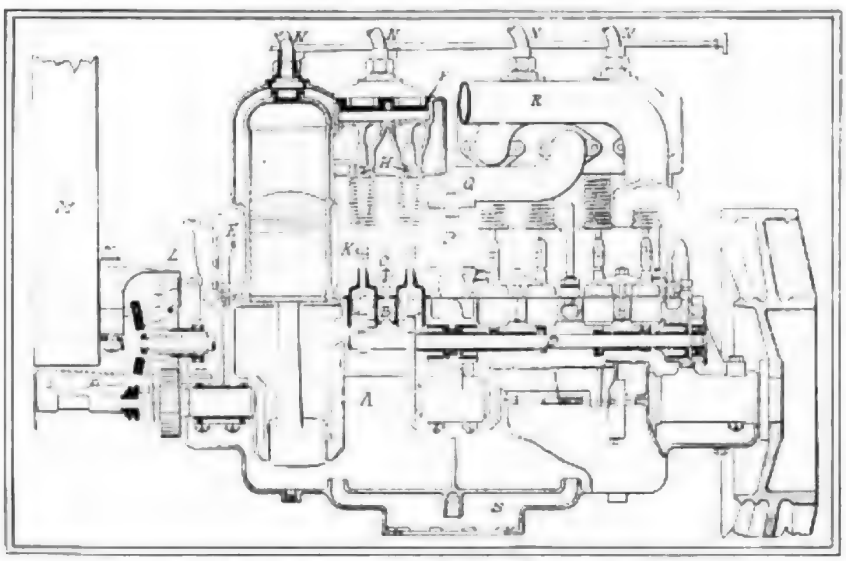
Three Columbia Models for 1906

Columbia 24-28-Horsepower Car

THREE Columbia models comprise the 1906 line of motor cars manufactured by the Electric Vehicle Co., of Hartford, Conn. Two of these are models of the present season that are being carried over, and the third is a new product from bonnet to tail light. Of the retained models mark XLVII, a 40-45 horsepowered car, is offered in much of its 1905 form, such additional features as the new style of lathe made crankshaft, as well as new material in the gear sets and many of the bearings. Besides these are a new carburetor, Mercedes type of hood and other body changes, making the model appear practically in new feathers. Mark XLIV, an 18-horsepower machine with an opposed motor carried crosswise beneath the hood and shaft drive, is among those listed for next season. The new model, a 24-28-horsepower car, with accommodation for four passengers and for five in an emergency, has many novelties in Columbia construction. Among these are noted make-and-break low-tension ignition with current from magneto; valves placed side by side in the bottom of ports on the left side of the motor, fly wheel spokes serving as a fan, three-speed sliding gear set, shaft drive and floating type of rear axle. I-section front axles are features of this car as well as of the large touring machine. This new machine, mark XLV, has a 98-inch wheel base, clearance of almost 10 inches, weighs 2,250 pounds and is further featured by the use of semi-elliptic springs in front and rear, and a three-point suspension for both the motor and the gear box. In all models roller bearings are used on the road wheels and in the rear axles, special babbitt carries the crankshaft and phosphor bronze is used in the gear boxes.

Model XLVI exhibits in its motor many features new in Columbia construction, but practically all of which are along the lines of standard practice. The four cylinders are cast in pairs, each pair being an integral casting with valve ports on the left in which are placed side by side the mechanical valves operated by vertical push rods from a single camshaft. The cylinder rating of 24 to 28 horsepower is based on a normal crankshaft speed of 900 revolutions per minute, but the motor has a range of speeds between 150 and 1,800 revolutions. The bore and stroke are 4 and 4½ inches, respectively. Aluminum is used in both parts of the crank case, the top part of which carries the three crankshaft bearings. The bottom portion with a special oil reservoir S, serves only in connection with the splash system of oiling. Three-point suspension of the case is one of the motor features. In this support scheme the side pieces of the frame are offset, to eliminate subframe pieces and the motor is carried directly on a steel cross piece and the main side channels. A new departure is noted in the crankshaft used, which, besides being made from a special carbon and nickel steel, is not drop forged, but made from a slab of cold metal. The general contour of the shaft is first hogged out, after which it is placed on a lathe and machined to a finish and finely ground to give as perfect a balance as it is possible to secure. The maker claims for this shaft freedom from welding such as is often used in forgings, and the complete manufacture of it without the heating process used in forging, in which the quality of the metal is claimed to often be destroyed. The cost of production is several times that of a drop forged shaft. This shaft, as well as the connecting rods, is fitted with babbitted bearings, the babbitt resting on a grid of bronze within the journal. In the camshaft and wrist pins plain bronze is used.



Intake Side, Columbia Mark XLVI, 24-28 Horsepower Motor

The valve disposition in ports on the left is new with this concern, in that both sets are in the bottom of the ports and operated by a vertical lift instead of the lever motion within the crank case, as used on the present large car and on the last year's models. Valve stems and heads are integral forgings, made from special steel. The former work in the long sleeves H screwed into the bottom of the ports and the push rods work in sleeves B resting in openings in the top of the case and held therein by the yokes C, a construction permitting of quick removal of the rod and to facilitate valve removal small lugs are cast on the cylinder sides so that a lever can rest thereon for raising the seating of the valve spring while removing the pin that retains the seat in position. On the top of the push rod is the adjusting nut K for varying the valve lift. Cams on the shaft D are arranged in pairs.

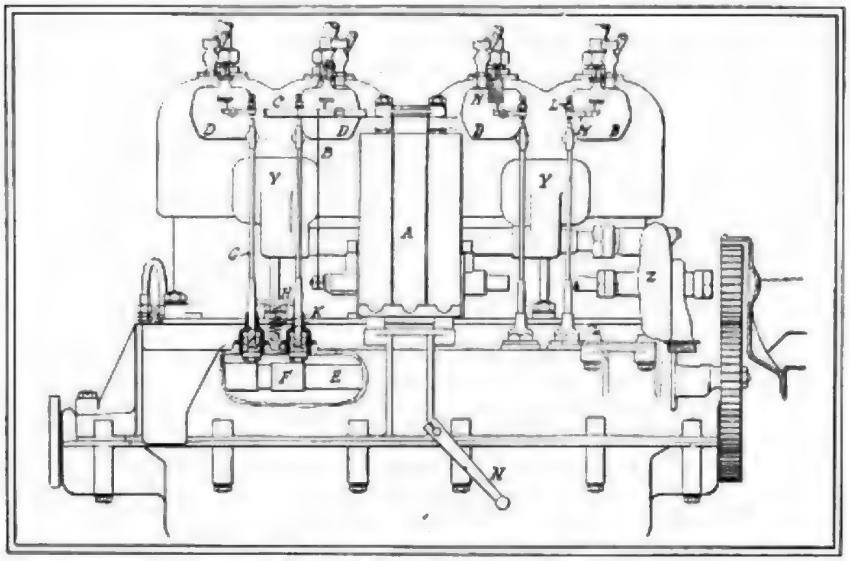
Exceptional simplicity is found in the disposition of the carbureter and in the intake and exhaust piping, the former, Q, carrying the carbureter P shown in outline and connecting by a single arm with

Digitized by Google

the pairs of cylinders and the latter B, carried above it is a horizontal tubing with a branch to each exhaust valve. Either set of valves can be removed through the screw caps F in the tops of the valves.

The carbureter is perhaps the most interesting feature of the motor in that it is entirely new and one that has under test increased the motor power considerably. It is of the float-feed aspirating type and has not any springs in its construction. There is not a needle, and what is more peculiar, no place for adjustment. The gasoline enters at the right and meets the primary air supply coming through a 1-inch pipe, drawing its supply from between the cylinders, but if desirable in cold weather a jacketed piping can be used for heating the incoming air. For increased speed additional air is supplied through an auxiliary opening at the bottom of the carbureter which consists of a series of small ports opened and closed by a sliding vertical barrel containing corresponding ports, which moves up and down as the motor requires more or less gas. This barrel is made of the required size and weight to offer the proper resistance to the suction of the motor as speed increases so as to rise slowly and open ports and then to drop back easily of its own weight immediately the motor speed decreases. The throttle is of the barrel type placed horizontally in the mixing chamber where the pipe to the motor leaves and it performs a throttling function. It is not in any way connected with the governor on the motor, but is actuated by a foot pedal on the toe board. A hand lever on a fixed quadrant on the steering column fixes and determines the speed which the governor is to maintain, the governor controlling a by-pass valve which it mechanically raises and lowers as the governor balls throw in or out.

Besides the new carbureter is the fitting of a low tension scheme of ignition with current supplied from a gear driven magneto A shown in the ignition side view of the motor. A single wire B conducts the current from the magneto armature to the bus bar C which has connections with the stationary electrode within the combustion chamber. A separate ignition cam shaft E with large cams F serves to

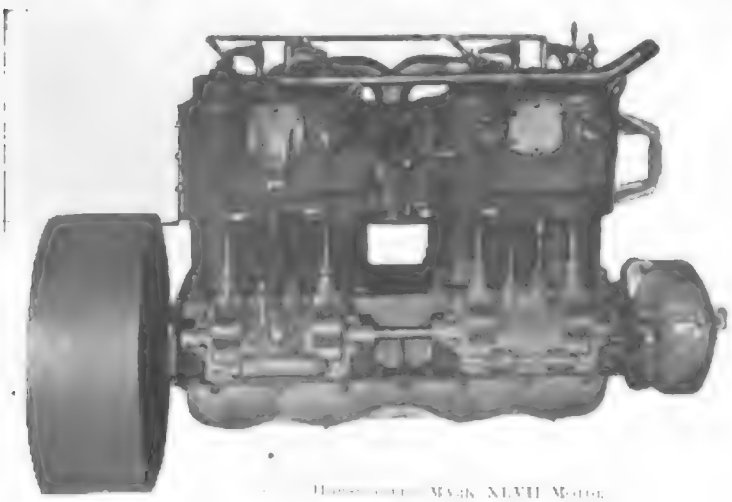


IGNITION SIDE MARK XLVI COLUMBIA MOTOR

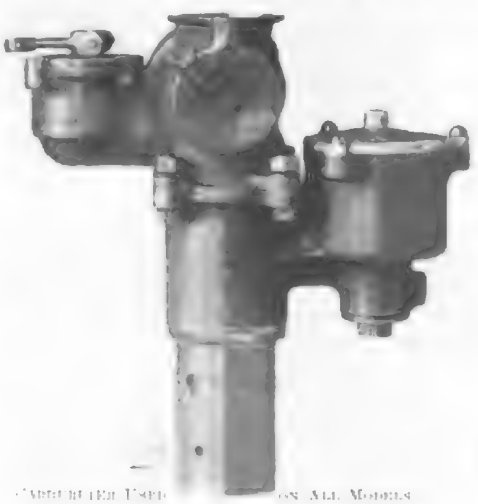
operate the make-and-break mechanism, which consists of a horizontal arm M carried on the igniter plate D. There is on one end of the arm an adjusting screw L against which works the head of the push rod G which is raised from the cam shaft and lowered through the use of coil spring K and a spring arm H, each end of which works in a slot in the push rod, one spring thus sufficing for both rods instead of the usual construction of a separate coil spring surrounding each rod. On the igniter plate a coil spring N serves to hold the movable electrode carried on the arm within the combustion chamber away from the stationary one so that no current flows. When the push rod G goes up the outer end of lever M is raised against the tension of the spring N and the two electrodes within the combustion chamber are brought together so that the circuit is completed and a current starts flowing. As soon as the revolution of the cam F permits of the push rod dropping the spring N separates the electrodes by raising the inner end of lever M. When the two electrodes separate the current tends to bridge the gap between them and leaps in the form of a short and very hot spark. In advancing or retarding the spark the cam shaft E is moved to the front or rear by the lever N connected to it through yoke and collar and as the cam F is not of the same size throughout, the timing of the spark is advanced or retarded.

Integral water jackets are used in cooling the cylinders, the jacket for each pair receiving its supply from the pump Z, gear-driven, and carried on the front of the motor through the openings Y. From the jackets water passes to the top of the radiator M through openings N in each cylinder head.

Lubrication is by continued oil circulation sustained by a rotary oil pump gear driven off the cam shaft. This pump with a capacity of 15 pounds pressure, forces oil from a reservoir S in the base of the crank case through a conduit which leads to the main crankshaft bearings, the camshaft bearings and the valve push rod guides. The oil in falling from these bearings into the crankcase is maintained at a fixed level by dams around the overflow pipes and in flooding these dams it overflows and returns to the reservoir S. Connecting rods are splash-lubricated by scoops and

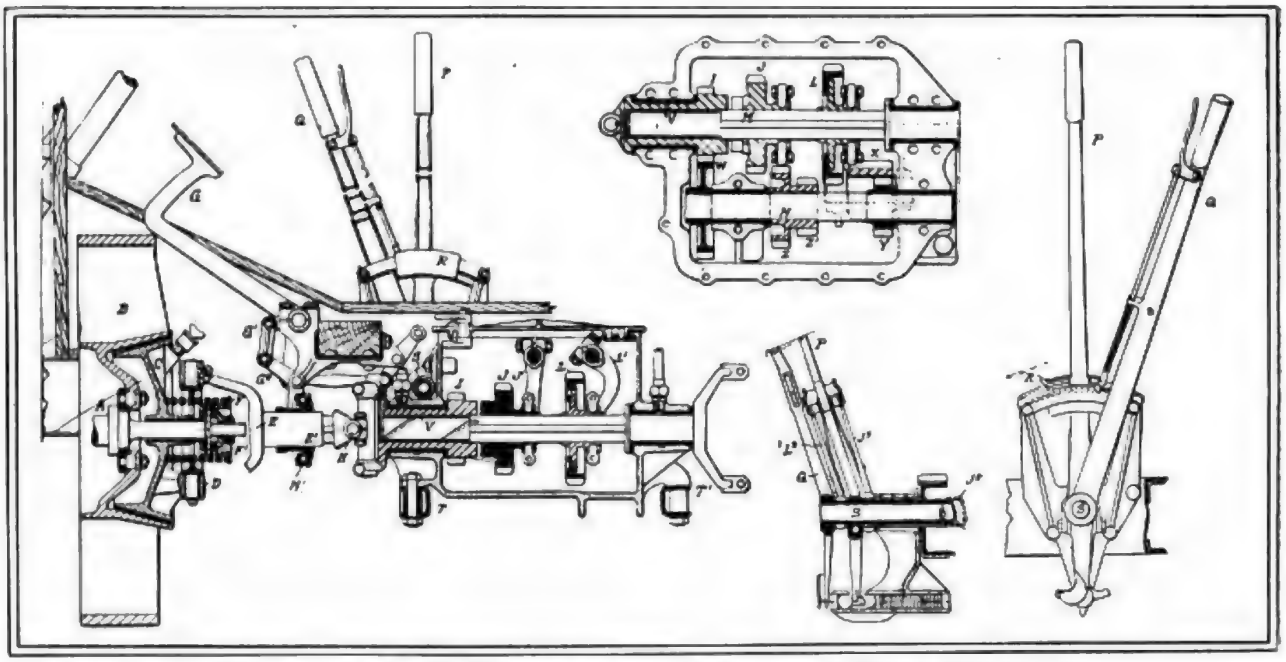


MARK XLVII MOTOR



CARBURETER USED ON ALL MODELS

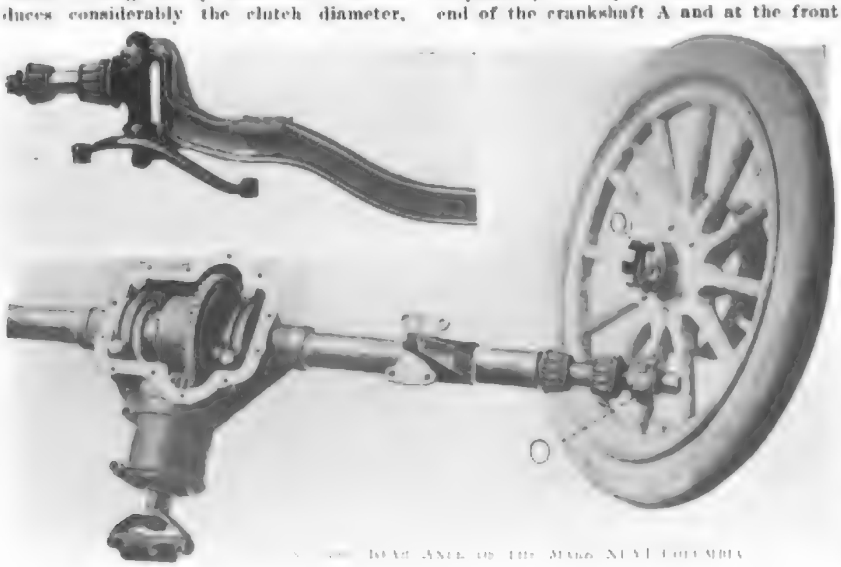
Digitized by Google



CLUTCH SIDE AND TOP SECTIONS OF GEAR BOX AND LEVER CONSTRUCTION IN COLUMBIA MARK XLVI CAR

the connecting rods work in diaphragms across the lower ends of the cylinders, preventing an excess of oil in them with the danger of fouling the make-and-break mechanism. An auxiliary oil tank with a capacity for 400 miles is hung to the frame of the car from which oil is piped to the crank case reservoir, from which it is distributed to the motor as before.

Columbia mark XLVI consists of four units: the motor one, gear set two, telescopic propeller shaft three and rear axle drive four, with cardan joints uniting the four units so that poor alignment between the motor and the rear axle is readily taken up. The clutch constituting the first part of the transmitting system is a small, external leather-faced cone one, with the male part C fitting within the fly wheel B, made with fan-like blades for drawing hot gases off from around the motor. Using the fly wheel as a fan reduces considerably the clutch diameter, which is compensated for by the extra wide friction faces of the two parts. Friction is further assisted by using small brass shoes in the leather facing, the shoes causing an easy and gradual engagement. A bearing for the male part C is furnished in the continuation of the crankshaft A, a suitable bushing being inserted. Rigid with the male part is the ring part D which at its periphery carries the cone-shaped covering E with its sleeve E1 which is a sliding fit over the short shaft K in turn united by universal joint with the hollow gear shaft V. This shaft has its bearing in the front of the gear case, and is made integral with the gear I, its rear end forming a bearing for the main shaft M of the gear set. Within the clutch casing E is the clutch spring resting at the rear on the cup-shaped piece F bearing against a ball thrust bearing held in place by the cap F1 screwed on to the end of the crankshaft A and at the front bearing directly on the part C of the clutch. The spring normally holds the clutch engaged and for disengagement the pedal G on being depressed works through the link connection G1 to the bell crank G2, the lower arm of the latter working with the clutch yoke H, which, with its race of end thrust balls, carries the sleeve E1 to the rear, withdrawing the male portion C.



REAR AXLE OF THE MARK XLVI COLUMBIA

Three-point suspension can be considered a novelty with the Columbia concern in the design of this model. In carrying the gear box on this system one support T at the center of the front end carries that part on a cross piece of the main frame and on a similar cross piece the rear end takes two supports, one at either corner, one of these being shown at T1. The case has the main shaft M and countershaft N in the same horizontal plane and it is divided in line with the bearings. In both shafts a special chrome-nickel steel is used, the elastic limit of which is placed by the maker at 135,000 pounds to the square inch and the tensile strength of which is 225,000 pounds to the square inch. Both shafts revolve on long phosphor bronze bearings supplied with oil from four individual oil cups, the cups carried at the right side of the car beneath the frame side piece.

Three speeds and one reverse are given, in the obtaining of which two sliding units are used. Both of these, J and L, are carried on the squared main shaft M, the former on the front end of the shaft, when moved to the front, locks with gear I for direct drive and when meshed with gear Z gives intermediate speed. For slow speed the shifting unit L is engaged with gear Z1 on the countershaft and in reversing this unit is moved back, engaging with the idler X, made with extra wide face, double the width of the other gears within the case, so that it can mesh with gear L on the main shaft and Y on the countershaft at the same time. When driving on direct

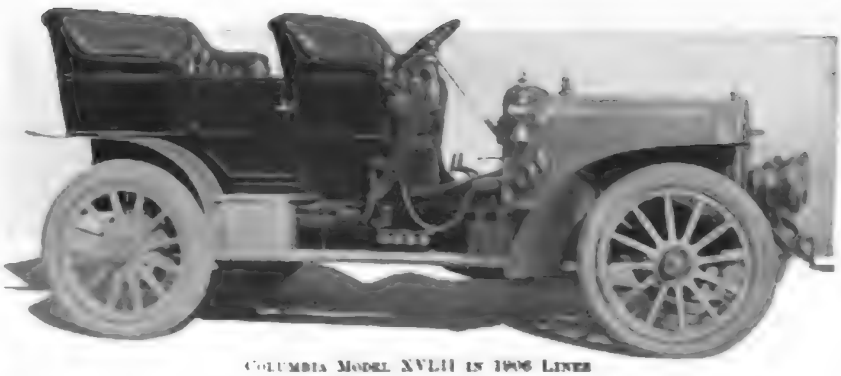
Digitized by Google

speed the countershaft revolves, the large gear W being in constant mesh with the small gear I on the sleeve V.

The movement of the sliding units J and L is through a single side lever P working in a double slotted quadrant R. This lever is pivoted on the shaft S which extends across the main frame with a bearing in each side piece and to it is keyed the emergency brake lever Q. In the cross section illustration it can be seen that the change speed lever P works between two short arms J3 and L3, each with a short lug at its upper end. These lugs are made to fit a slot in the lever so that moving the lever to the right or left locks it with them. The arms are fitted with a flat spring to hold them away from the lever P. The arm L3 is carried on a sleeve surrounding the brake lever rod S. Surrounding this sleeve is another sleeve J2 to which is connected the arm, J3. The inner end of the first sleeve connects by rods with the curved arm L1 within the gear box, which is yoked to the shifting unit L. In a similar manner the sleeve J2 is connected through the arm J1 with the sliding gear J. In moving the arms L3 and J3 the lever P is moved to the right or left when it locks with the arms. When moved to the front or rear it carries the arms with it. On the bottom of the lever is a depending arm with sector resting between a pair of balls one held against the sector by a coil spring. When the lever P is opposite the gate in the quadrant this spring will tend to hold it in the gate in a neutral position, so that the lever is always ready for any of the four speeds.

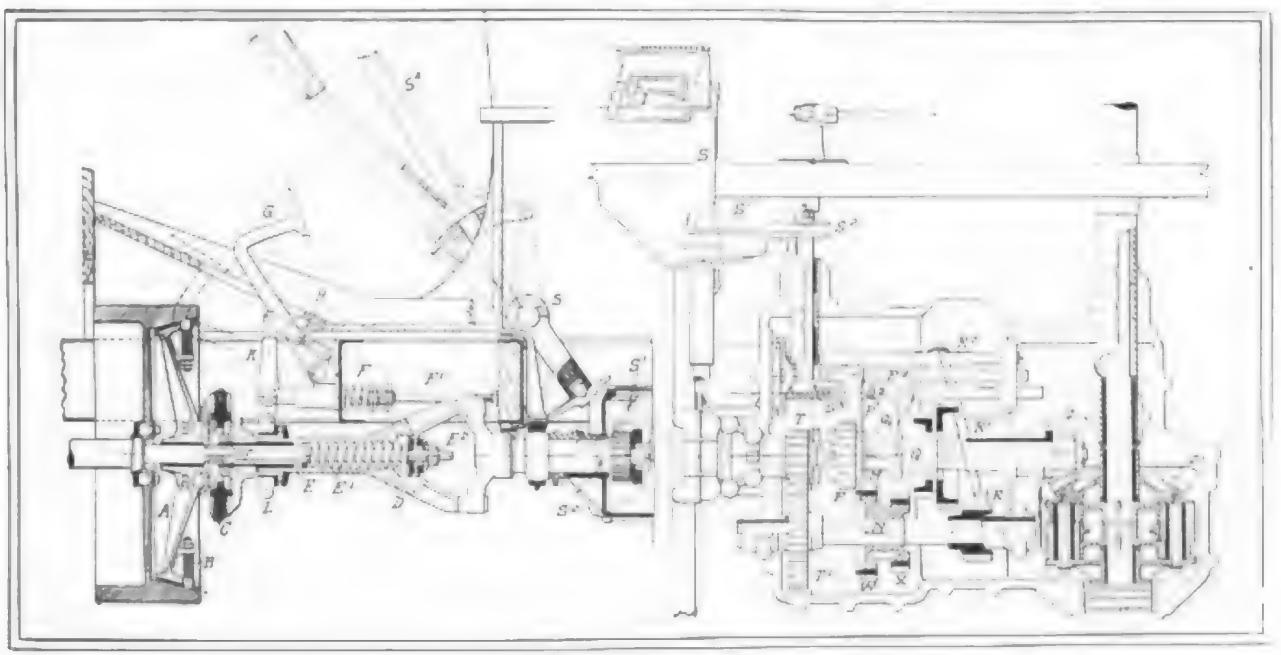
The telescope shaft coupling the gear box with the live rear axle is of typical construction throughout and has the pinion on its rear end contained in a housing, forming a part of that for the spur gear differential. Accessibility to the gears is made possible by splitting the housing horizontally above the bearings, the top part being above the axle bearings. The axle drive shafts are carried within a tubular housing, which carries all of the weight of the car, the drive shafts only being subjected to driving strain. The housing sleeves extend through the hubs of the road wheels and carry a couple of cages of roller bearings on which the wheel revolves. On the outer end of each drive shaft is a heavy cap O with large teeth or dogs which mesh with similar dogs on the outer face O1 of the steel hub of the road wheel, thereby locking the wheel with the shaft. A suitable hub cap covers the interlocking teeth on the hub and shaft and holds the wheel in position. Within all parts of this axle except where end thrust is reckoned with, Timken roller bearings are used, the end thrust bearing being of the Hess-Bright ball type.

Hubs of the rear wheels carry the regular and emergency brakes, the former being external bands tightened on the cast steel drums through a pedal and the later of the expanding type work within the drums and take the form of cast steel shoes forced against the interior of the drum in the usual manner and connected with the lever at the driver's right by rocker shaft and steel wire cables. The brake drums are bolted to the wheel hubs.



COLUMBIA MODEL XVLII IN 1906 LINES

Mark XLVII, the present large touring car, retains its present style of motor which consists of two pairs of 5 by 5-inch cylinders, giving its rating at a crankshaft speed of 800 revolutions with a flexibility ranging between 150 and 1,500 revolution. Valve actuation is the same as this year, the inlets being in the top of the ports and opened by vertical push rods with arms resting on the tops of the valve stems. Within the crankcase is a cam lever which pulls the push rod down, but in the case of the exhausts a similar lever serves to raise the push rod, thus opening the valves which are located in the bottom of the valve ports. The breech-lock method of retaining the spark plugs is still in vogue and the commutator is driven off the camshaft. Jump spark ignition, with current from storage cells, conducted through a four-vibrator coil carried on the dash, is retained. The body lines are slightly altered by a hollow metal dash, a Mercedes bonnet and the placing of the emergency brake lever further back and beside the change speed lever. Both brakes are still interconnected with the clutch. The rear body lines are much the same except that the seat arms



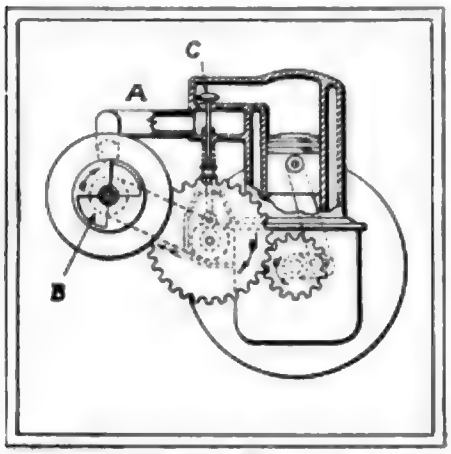
CLUTCH AND GEAR BOX ASSEMBLY IN 40-45 HORSEPOWER COLUMBIA CAR

Digitized by Google

are lower. The diameter of the road wheels is increased to 36 inches.

The transmission of power from the motor fly wheel to the rear hubs in the big Columbia car remains practically the same as at present with the exception of the placing of a universal joint between the clutch and gear box, to take up any differences of alignment between the crank and gear shafts and in the increasing of the bearings within the case. Contrary to the practice followed by many, the maker has not adopted ball bearings within the case, long plain journals with a bronze lining being used. A four-speed and reverse gear set with double chain drive to the road wheels, remains.

Two springs are used in engaging the cone clutch used in this model. Unlike



WEISS MUFFLER, VALVE IN END

in the new car, the clutch diameter is practically the same as that of the fly wheel. For ease in engaging, the male portion A carries the brass shoes within the leather lining, each being forced outward by the springs shown at B. The double spring scheme consists of the main spring E1 within the sleeve-like housing D which has spreading arms to connect with a short shaft to the gear case. The spring is retained on a small shaft E2 by a ball thrust against which it bears and in the front it rests on a sleeve bearing upon the collar E on the sleeve D. The second spring F, a much smaller one, is carried on the rod F1 fastened at the back end to a cross piece of the frame and in front pivoted to the arm K connected with the clutch pedal through the adjustable arm H and the pedal G. A downward movement of the pedal carries the arm H to the front and with it the top part of the arm K, the bottom portion traveling slightly to the rear. With the first pressure on the pedal the spring F is compressed and then the forward end of the rod F1 acts as a pivot, a further movement of the pedal carrying the thrust collar L to the rear and withdrawing the clutch part A. While this is the action of the spring in engaging, its important part is played when the clutch is engaging, it then serving to resist the quick forward movement of the main spring and so correspondingly retards engagement with a similar lack of jerk being transmitted to the gear set and road wheels.

Within the gear box new chrome-nickel gears of wide face have been fitted. The tensile and elastic strength of these gears are the same as in the smaller model. In getting the five speeds—four ahead and a reverse—three sliding units, all carried on the squared main shaft M are used. Each sliding unit has not to pass through gears in going from one speed to another, making it possible to drop from direct drive to reverse or into any of the forward speeds. One lever gives the five speeds, working in a three-slot quadrant I, the middle slot being for first and second speeds ahead, the inside one for third speed and direct drive and the outside slot for reversing. Should direct drive be needed the unit P is moved to the front, locking with the gear T on the shaft from the clutch, the gear being moved through the arm P1, in turn attached at its outer end to the shafting rod P2. In direct drive the rod P2 must be carried to the front which is done by having the front end on top made as a toothed rack in which meshes a pinion S3 carried on a cross arm with a bearing in the side of the gear box. This carries on its outer end the flanged sector S2. With this sector meshes a rack S1 on the bottom of the change speed lever S4. This lever has a long bearing in the sleeve S carried crosswise on the main frame pieces, so that if the lever is placed in the central slot of the quadrant the sleeve S is carried with it, as is the sector S2 and the pinion S3, so that the pinion T slides into the rack on shaft P2 and as it is rotated carries the rod to the front or rear, thus shifting the gear P.

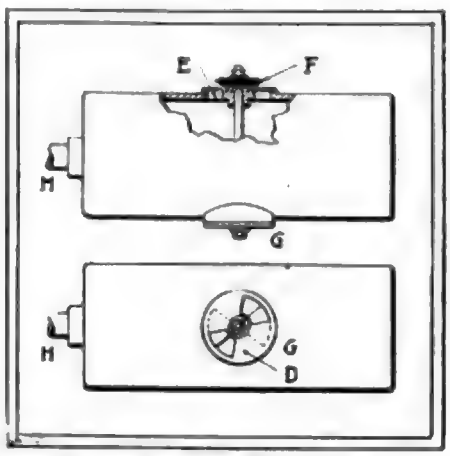
A backward movement of the shifting rod P2 meshes the gear P with gear W on the countershaft for third speed ahead. For second and slow speeds the unit Q with its two gears is moved to the front and rear, respectively, its front and rear gear meshing with corresponding gears on the countershaft. In reversing the idler R on a shaft in the bottom of the case is moved by the arm R1 connected with the shifting rod R2. Both shifting rods R2 and Q2 are made with racks on their forward ends and with these can be meshed the pinion T the same as on direct drive. A locking device is attached which prevents more than one of the shifting rods P2 R2 and Q2 being moved at the same time. In the rear part of the gear box is the spur gear differential carried on the jackshaft with its sprockets for side chain drive. The bevel pinion Z on the main shaft as well as the large bevel Z1 on the differential are protected from end thrust by races of ball bearings.

In the running gear nickel axles are used in front as rear, both being of I-section, and having integral spring seatings. Full elliptic springs carry the rear of the frame, as at present, and long semi-elliptics support the front. Four-inch tires encircle the front wheels and 4½-inch sizes are used on the driving wheels.

WEISS MUFFLER

A novelty in muffler construction has been brought out by L. T. Weiss, of Brooklyn, N. Y., valves in it being opened and closed regularly with relation to the exhaust valve in the motor, the valves in the muffler being operated directly from the camshaft. The muffler is a large cylindrical chamber without baffle plates, perforated tubes, metal partitions or other regular muffler features inside, there being nothing but one large chamber into which the exhaust gases pass direct from the motor through very large exhaust piping. The muffler capacity is generally five times that of the cylinder capacity of the motor. In attaching it to a vertical motor the connections are as shown in the combined motor and muffler illustration, where the exhaust pipe A enters the top of the muffler near the center, the muffler being carried lengthwise. In the muffler end is the rotary valve belt driven from the camshaft, through which the gases pass to the atmosphere. The valve is so timed that it is closed when the exhaust valve from the cylinder opens, thus allowing the exhausted gases to expand within the chamber. As soon as the motor exhaust valve closes the valve B out of the muffler is opened and the expanded gases are given free passage out. The inventor in this arrangement claims to do away with back pressure by having a chamber five times the cylinder capacity for the hot gases to expand and cool in, there not being any dividing plates within the chamber to hinder the expansion. Silence is obtained by confining the gases in this manner and then, when partly cooled, letting them gradually exit. The exit valve takes the form of a double ventilator in the center of the muffler end, there being a pair of fan-like openings and revolving fan-like metal blades for covering the openings and for revolving. The former is a small wheel on the fan hub, connected by round belt with the camshaft.

Where the car design does not permit



WEISS MUFFLER, VALVE IN SIDE

of this arrangement the exhaust from the motor can be made to enter at either of the muffler ends and the exit valve placed in the center of the sides at D and G with the motor in either case connected at H. In this design the valve openings can be seen at E and the wheel for driving from the camshaft shown at F, which can be either on the top or lower side of the chamber. The pipings from the motor are generally twice the diameter of the exhaust valve, so that as free movement as can be is given the heated gases.

The manufacturer has had this muffler under constant test on different makes of cars for several months and claims that back pressure is not found, that the gases quickly cool and expand in the chamber and that the valve action is reliable.

A SMACKING QUESTION

Place Unknown—Editor MOTOR AGE—I own an automobile; heretofore I kept a horse and buggy. The old custom was that when a man took a young woman out driving he could collect a kiss as toll for each bridge he crossed. Does this custom hold with the automobile? A man used to get one kiss per bridge on a one-horse-and-buggy proposition. Can he now collect as many kisses for a bridge as his machine has horsepower?—ANXIOUS READER.

An answer to this question required such delicate handling that it was deemd best on the part of the editorial department to submit the case to the young women employed by MOTOR AGE and to abide by their decision. When the letter was read and a vote taken there was no indecision about the matter; it was a unanimous vote in the affirmative, with the suggestion added that it was not only permissible but highly desirable that the operator of the automobile should secure all the smacks he possibly could. Possibly the young women's decision was based upon a little Minnesota episode a year ago. In this case a motorist drove his machine into a livery barn for the night. The liveryman admired the machine and the owner of the automobile, being a well satisfied person, boosted the car's power from 12 to 24 horsepower. The liveryman said nothing, but continued his laudations of the motor car. In the morning, when the automobilist asked for his bill, he was confronted with a $12 charge, the liveryman explaining that he always charged 50 cents for keeping one horse and as this was a 24-horsepower car the bill would be $12.

ROLLERS ON PUSH RODS

Fort Wayne, Ind.—Editor MOTOR AGE—The majority of the cars on which I have had to do a little repairing are fitted with small rollers on the bottom of the push rods which operate the mechanical valves. The cams strike upon these rollers when working the valves. Some motors, however, have push rods with curved shoes on the bottom instead of the rollers, the degree of the curve being found by experiment. Which of the two constructions is better and what are the advantages and disadvantages? In either case why is the camshaft not placed directly beneath the push rod?—A. T.

The roller type is now considered preferable, as in this construction the friction is reduced to a minimum. The roller on its down stroke leaves the high point of the cam, allowing the valve to seat at a higher rate of speed than when opening, thus permitting the valve to seat immediately after the inspiration stroke of the piston. The curved shoe undoubtedly permits a more gradual descent of the valve, although the closing of the valve can be done in the same time as in the roller type. There are various reasons why the camshaft is not placed directly under the valve stem; for instance, the space required for the camshaft bearings may be farther from the center of the cylinder than the inlet valves, which are placed as near the center of the cylinder as possible to obtain the full force of the explosion over the piston.

FREEZING OF GENERATORS

West Salem, Wis.—Editor MOTOR AGE—Will you tell me of some way to prevent the water from freezing in the carbide generator? Is there anything that can be placed in the water to prevent its freezing without affecting the carbide?—W. L. MCELBOWNEY.

Place the carbide generator as near the exhaust pipe as possible. If not convenient to do this, run a few coils of pipe from the exhaust around the generator; or put the generator into another specially constructed can, leaving a small space all around, and introduce into this the exhaust, with an outlet on the opposite side. In some cases the heat generated by the gas is sufficient to keep the water from freezing. Experiments conducted by putting chemicals into the water have wrought havoc with the soldering in the generators.

INDEPENDENT VIBRATORS

Audubon, Ia.—Editor MOTOR AGE: Will you inform me through the Readers' Clearing House where I can obtain an independent vibrator to use on a plain jump spark coil? Also give small drawing showing how to wire it correctly.—C. L. Hoover.

MOTOR AGE respectfully refers the writer to any of the well known coil-making concerns, most of which are carrying advertisements in the columns of the MOTOR AGE.

EFFECTS OF CALCIUM CHLORIDE

Chicago, Ill.—Editor MOTOR AGE—We call your attention to the article which appeared in the November issue of the Autocar on non-freezing solution, which is about as far from the facts as any article can possibly be. The writer is correct in stating that substances dissolved in water lower the freezing point. He also implies that calcium chloride when reduced by a chemical works from a liquid to a solid and placed on sale to motor companies is a very expensive proposition, which is not the case, either here or in England, as material can be bought in 700 or 800-pound drums at 1 cent per pound. He states that calcium chloride gives off hydroflourie acid—which is muriatic acid—which is absolutely incorrect. He also speaks about the solution becoming concentrated through dryness, chemically an impossibility except where the solution is boiled, as no ordinary evaporation will allow the solution to become weaker than 24 degrees Baume, which contains about 4 pounds of calcium chloride to a gallon and is a thin solution. He states that calcium chloride will crystalize out when the solution becomes concentrated, an absolute misstatement. There is no way of crystalizing the chloride until the water is driven off by heat. It seems he recommends glycerine, which is a product containing a large amount of sulphuric acid. The inside of a can which has contained glycerine for 30 or 60 days will show that the sulphuric acid has eaten through the tin plating and has caused corrosion. That is one reason why all the railroads have thrown it out of use for switches.—JAMES H. RHODES & CO.

GASOLINE AND OIL

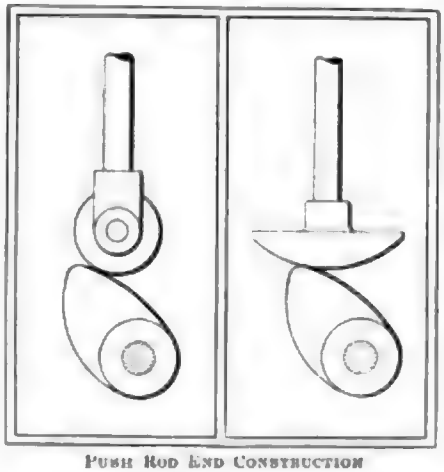
Brooklyn, Ia.—Editor MOTOR AGE—What test of gasoline is best for cold weather, 68, 74 or 88? Would it do to mix the 68 and 88, or is it better to use either one or the other separately? Would it be any help to cover the pipes that lead from the carbureter to the cylinders with asbestos to keep the cold air away and would it help to cover the carbureter? If calcium chloride is used to prevent freezing, will it leave any deposit on the cylinders or pipes of the radiator if it is filtered properly? Which is the best grease to use in the transmission—hard oil, graphite or heavy cylinder oil?—READER.

A 76 test is considered good gasoline to use for all ordinary automobile purposes. It would be advantageous to have induction pipes covered in cold weather to prevent them from freezing. Practically no deposit will be left in cylinders or pipes if calcium chloride is filtered before using. At 5 or 6 degrees below zero glycerine becomes a pasty mass, but soon liquifies after the motor has been running a few minutes. A heavy oil is preferable in the transmission, as the splashing of oil insures a good lubrication to all moving parts.

HOT AND COLD RIVETING

Nashville, Tenn.—Editor MOTOR AGE—Which is better, hot or cold riveting in the frame work of a chassis, and what are the merits advanced for each method?—G. D.

This topic was covered in MOTOR AGE in the issues of October 26 and November 9.

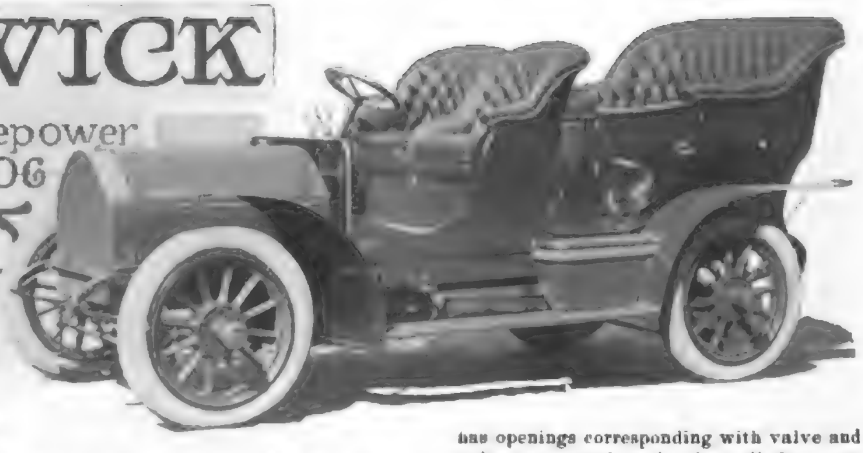


PUSH ROD END CONSTRUCTION

Digitized by Google

CHADWICK

45-50 Horsepower Car for 1906

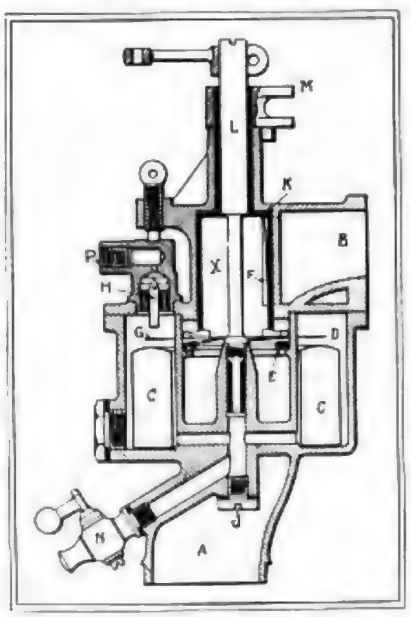


COPPER water jackets for each pair of cylinders, water governor for the carbureter throttle, compensating ball bearings in the road wheels and end bearing of the jackshaft, four-speed ahead sliding gear transmission, with a double set of bevels driving to the differential on the jackshaft in the rear of the gear box, and automatic carbureter are the leading features in the 40 to 50-horsepower Chadwick touring car for 1906. Its maker, the Fairmount Engineering Works, of Philadelphia, retains such present features as double chain drive, cone clutch and tubular suspension of the gear box. The body and running gear follow general lines in construction. Pressed steel of channel section is used throughout in the frame parts and simplicity is aimed at in dispensing with a subframe, the motor lugs being made sufficiently long to rest direct on the frame pieces. Cross members carry the gear box and other parts. Extremely long half-elliptic springs carry the body front and rear and with both sets are long Mercedes-like curved spring hangers. A further touch of the Daimler lines is in the radiator and hood. Thirty-four-inch wheels carrying 4½-inch tires are fitted front and rear, the thread is standard, the wheel base 108 inches and the weight approximately 2,700 pounds, with body equipment.

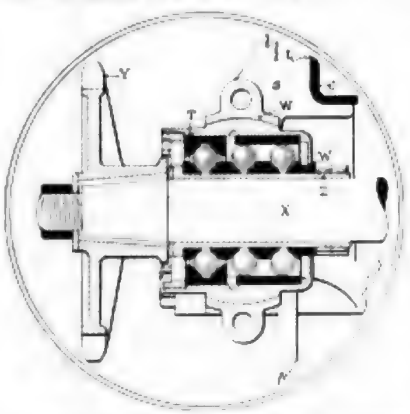
Easy body lines rule throughout; the individual front seats have fairly high backs with a rearward curve at the top; the side entrances are wide and surrounded with scroll-like design and the back of the car has a forward curve from the frame up to the bottom of the seat, when it becomes a medium rear curve ending at the top of the seat. Broad fenders, running board and straight dash are other points in the body work.

From 40 to 50 horsepower is generated by the Chadwick motor, which is of the vertical four-cylinder variety, with cylinders cast in pairs, each pair being water jacketed by a single copper jacket. The bore and stroke are 5 and 6 inches respectively. The pairs of cylinders B are made with a common base by which they are secured to the crank case. They also have a common flange C over which fits the bottom of the water jacket. The jacket takes the form of a copper water pail with straight sides. When attached it is inverted with the top resting on the flange C. To retain it in position a tight-fitting ring is slipped over the jacket and pressed over that part of the jacket enclosing the flange, thus producing a tight union. The cylinder casting is made with the inlet and exhaust valve ports of sufficient length to extend practically to the jacket walls. Similar construction is used in the valve caps E and F, through which the inlets and exhausts can be taken out. The jacket for each pair of cylinders is pressed out of a sheet of copper, being without seams or joints of any kind and has openings corresponding with valve and valve cap openings in the cylinder castings. Glands are used at the various ports in the jacket to make water-tight joints. None of the camshaft gears on the front end of the motor is enclosed within the crank case as in the smaller model, but they are made with wide faces to reduce noise. The valves are carried in separate ports at the opposite sides, the inlets at the right and exhausts opposite the push rod sleeves D are made integral with the cylinder castings. Both sets of valves are interchangeable, having a diameter of 2¼ inches and with either set the lift is 15/16 inch. Nickel is used in the exhausts and nickel steel in the intakes. The carbureter M is carried close to the motor and connects through the pipings N with the valves. On the front end is the water pump G supported on a bracket H. The water circuit is standard, the pump taking its supply from the bottom of the radiator and delivering it by way of the pipings K to the bottom of the water jackets. The exit from them is through the top to the top of the radiator. Ignition is by jump spark, with current from storage or dry cells distributed through a commutator L carried on a vertical shaft at the rear of the motor and driven by bevels off the camshaft. It is made from bronze with contact points of pure copper, fiber and mica serving in the insulation. A feature of it is that the stationary contacts are held toward the revolving one by coil springs and that any one of them can be withdrawn from the outside of the case in succession for testing cylinders.

The Chadwick carbureter is compact in every detail, is readily accessible and is constructed along the lines of modern tendencies with a ring float C within the chamber D and a spraying nozzle J in the center of the float, so that the level of gasoline in the nozzle is the same at all times as its level in the float chamber. The mixing chamber X is a vertical cylindrical space surrounded by the barrel throttle K which has a port shown at F for admitting mixture through the passage B to the cylinders. It is manipulated through the short yoke lever M with the water governor on the motor. A feature of the carbureter is that at the bottom of the mixing chamber is an automatic shutter E which works in connection with the throttle so that when the throttle is turned cutting off part of the supply to the cylinders this shutter is moved. The air pas-



CARBURETER WITH ITS RING FLOAT

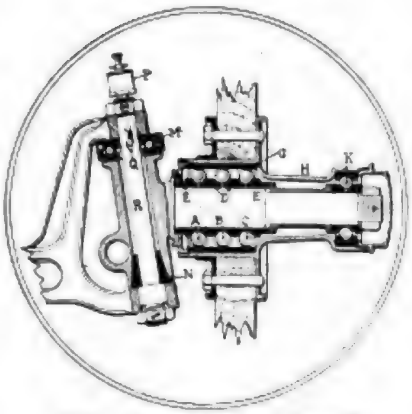


COMPENSATING BALL BEARINGS OF JACKSHAFT

Digitized by Google

age around the spraying nozzle is limited, so that the suction past the nozzle is slight. When the throttle is wide open the shutter E is also wide open, thus giving free passage to the incoming air through the passage A. When it passes the nozzle in this way it lessens the suction at the nozzle, not drawing so much gasoline out as it would if the opening was at the same size for all motor speeds. This device has the claim advanced for it by its maker that with fast motor speeds too rich mixtures are not obtained and on slow speeds a sufficient quantity of gasoline is sucked in to give a powerful stroke. The spraying nozzle J is adjustable and its top or spraying part is made so that the gasoline has to exit through openings in which the fuel passes a short sharp angle in the passage, serving to break it up and facilitate its mixing with the air. The flow through the nozzle is controlled from the top through the gasoline adjusting screw L carrying an arm for adjusting it and at its lower end resting in the head of the nozzle so that raising or lowering the screw increases or decreases the fuel flow. Gasoline enters from the fuel tank by way of the passage P, its free flow being under the control of the short pencil-like valve H, with the pointed part uppermost and fitting in the conical part of the entrance pipe. The valve normally remains open because of its own weight but is closed through the medium of a lifter rod G carried horizontally in the top of the float chamber and which when raised by the float bears upward on the valve H. A stop cock N connects by separate passage with the entrance to the spraying nozzle and through it the fuel in the nozzle and float chamber can be drained off.

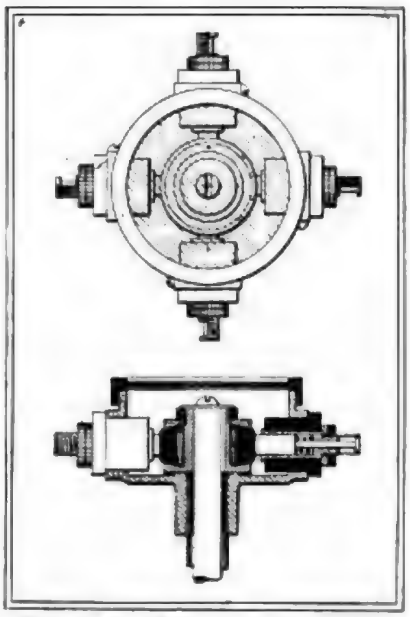
Chadwick ball bearings in the road wheels and the ends of the jackshaft are illustrated. Their peculiarity lies in the designing of the cones to accomplish a compensating action so that when the balls are slightly worn in one race the cones automatically adjust themselves. In the wheel bearings three balls races A, B and C are used and on the axle are four loosely mounted cones, two with double



BALL BEARINGS IN ROAD WHEELS

cone faces as shown at D and separating the race of balls B from the races A and C, and two end cones E with a single face for retaining the races A and C in position. All of these cones, being loose on the shaft, it is apparent that should balls in the race A become worn, the balls in the races B and C will force the cones D in the direction of the race A. The pressure on all three races is equalized as it was before the wearing took place. A steel ring or sleeve G rests within the hub H and against it all three sets of balls bear, it forming, in fact, the bearing surface of the hub. In the outer end of the hub is a single ball race K, the balls of the four-point support variety with adjustment within the hub cap. Bearings in the steering knuckle are balls on top and a plain conical bushing N at the base. The balls M in the top are protected in a dust-proof case and work between irregular shaped cups, with two bearing points in each. On the top of the knuckle axle R is an individual oiler P from which lubricant is conducted down a bore in the top part of the axle as far as the opening Q where the oil flows to the balls forming the bearing.

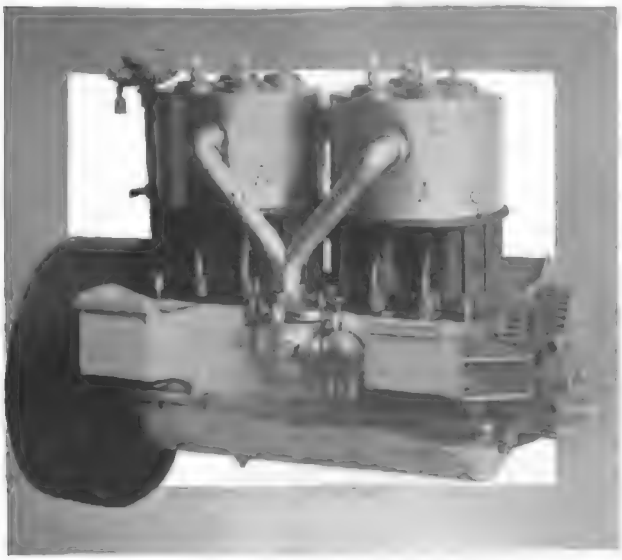
The bearings on the ends of the jackshaft, shown in another illustration, differ slightly in that the outer race of balls is



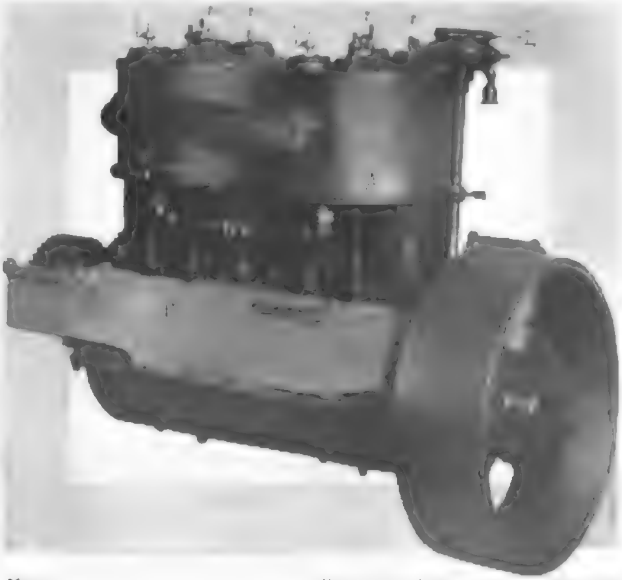
TOP AND SIDE SECTIONS OF COMMUTATOR

retained by a cup ring T, whereas the other two races bear directly on a steel sleeve within the hub. The compensating feature is used but the cones instead of resting directly on the jackshaft X, are loose on a bushing Z surrounding the shaft, the bushing screwing into the shaft housing at the inside and having a collar at its outer end for retaining the outer bearing cone in position. The sprocket Y is fitted to the shaft, with a taper and at J is shown a section of the side piece of the frame to which is attached the bracket S carrying the shaft. It can be noted that this bracket has a ball joint bearing shown at W with the case carrying the shaft bearings so that torsions of the frame do not result in misalignment of the shaft.

The water governor acting directly on the carbureter throttle is of the type used for some time on many foreign machines and has been in use for some time on Chadwick machines. It works on the



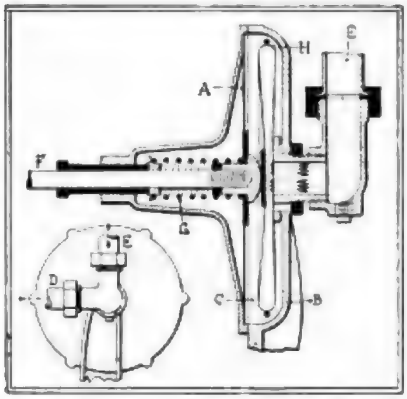
INLET SIDE SHOWING CARBURETER



CHADWICK MOTOR

EXHAUST SIDE AND COMMUTATOR

Digitized by Google



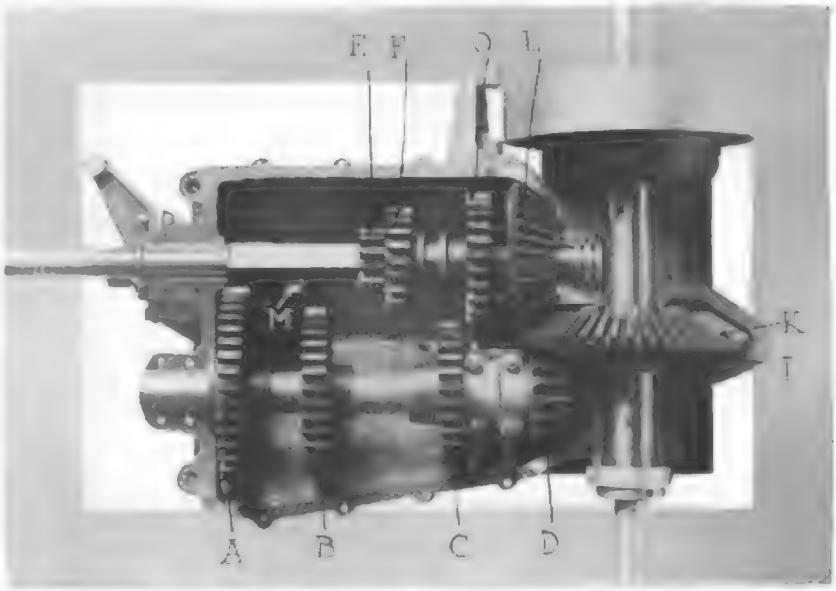
CHADWICK WATER GOVERNOR

principle that pressure in the water system is in direct proportion to the speed of the motor: With fast speed pressure is increased in one and all parts of the system; with a dropping of the speed the pressure falls. In putting this into effect the maker places a pump-like casing B in the water system, having water enter the front of it through the opening D and exit by way of E. The feature part within the casing is the light copper diaphragm A equal in diameter to that of the casing. It is so located that water pressure can only bear upon one side of it. A coil spring G on the opposite side, and surrounding the rod F, to which the diaphragm is attached, tends to resist the water pressure. This rod F connects with the carbureter throttle. At normal speeds the tension of the spring and that of the water pressure are so adjusted that the throttle allows sufficient mixtures to pass to the inlet valves but with the motor speeding the water pressure exceeds the tension of the spring and the throttle rod is moved in the direction of the spring, thus closing the throttle. On the water side of the diaphragm is a scroll spring H with a center block bearing direct on the end of the rod F and serving to keep the diaphragm in its proper position so that water cannot get on the same side of it as the coil spring.

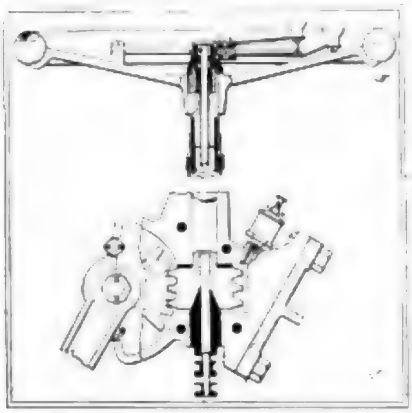
Flexible connection between the motor and the sliding gear set is by a cone clutch 17 inches in diameter with the cone constructed from aluminum and fitted with light springs placed under the forward edge of the clutch pedal to prevent a too rapid and jarring engagement. The female portion, also of aluminum, is fastened to a rocking center made from hardened steel which allows of the clutch rocking in any direction without straining the arms. All of the working parts are made from hardened steel and engagement is by yoke, with special ball bearings for taking strain off the crankshaft.

In the gear box four forward speeds and a reverse are gained, the high speed being direct. As in most side chain driven machines, the differential gearing is housed in the rear part of the case. A novelty is met with in the bevels attached to the differential. There are two, one K facing the right and meshing with a bevel pinion L on the rear end of the main shaft of the case and another backing it and constantly in mesh with a pinion D on the end of the countershaft. In this construction on direct drive the power is brought direct from the clutch-shaft, which is continued through the gear box and carries the sliding unit composed of gears E and F and also the sliding gear O. This gear O has on its rear side dental clutch teeth that are made to mesh with similar teeth on the front side of the bevel L. This bevel, it must be understood, is not on the same shaft as the gear O, but the shafts carrying the two gears abut within the gear L, which is carried on a hollow shaft for this purpose. When gears O and L are thus locked the drive is direct through the bevels L and K. The latter is on the jackshaft from which double side chains connect with the road wheels. For all other speeds the drive is first transferred from the main shaft to the countershaft, but not back again to the main shaft, the drive from the countershaft being through the bevels D and I to the jackshaft. This feature is advanced by the maker as the merit of the gear box and it is only made possible by using the double set of bevel gears to transmit to the jackshaft. To obtain first or slow speed the gear E is thrown back into mesh with gear A, the reverse pinion M being at the same time slid into the barrel which receives it, the arrangement of throwing it out being contained in the shifting rod so that there is no possibility of getting two pairs of gear in mesh at once. With gears E and A meshed the drive is through the bevels D and I to the jackshaft. In second speed gear F is meshed with B and the drive is through the bevels D and I and in third speed the gear O is meshed with C when the power is transmitted through the same set of bevels, the bevels L and K being only used in direct drive but remaining in mesh and revolving on all other speeds.

In changing speeds only one lever is required. It operates through a notched quadrant for all the forward speed, but to get the reverse the lever is brought to the normal position and then rocked inward toward the driver, making it impossible for him to accidentally reverse. The gear box is mounted on steel cross tubes in such a manner that the case is free to float with the frame, with the latter in any position. The reduction from the jackshaft to the road wheels is by sprockets with twenty-two teeth on the jackshaft and those on the rear hubs having thirty-four. Two sets of brakes are fitted. Those for regular use are carried on the jackshaft and are pedal-applied. Within drums on the rear hubs are the emergency brakes, which take the form of metal-to-metal ones, with the expanding shoes operated through toggle-joint construction and connected through an equalizer with a lever on the driver's right.



CHADWICK FOUR-SPEED GEAR SET WITH DOUBLE DIFFERENTIAL BEVELS



CHADWICK STEERING COLUMN

GARLICK PROP

The Garlick Auto Prop Co., of Paterson, N. J., is now putting on the market the Garlick prop. This device is to raise a car from the ground while not in use to relieve the wear of the tires from constant pressure on the floor. The prop is made in two styles, one of which is adjustable.

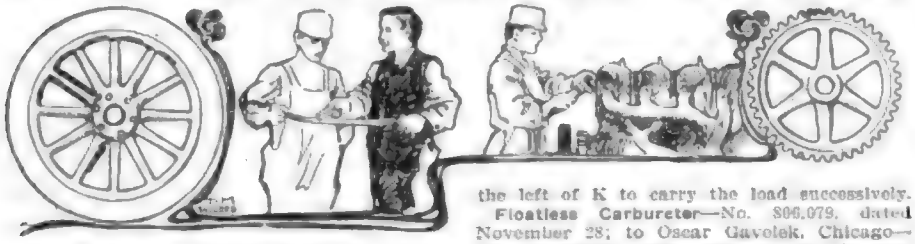
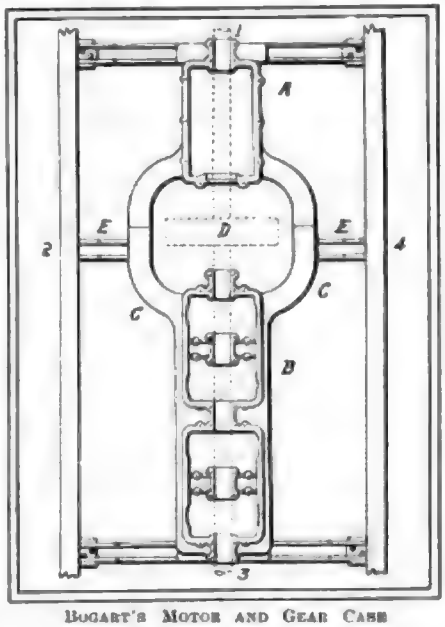
Current Automobile Patents



Motor and Gear Box Suspension—No. 805,442, dated November 28; to Fred H. Bogart, New Britain, Conn.—In order to carry the crank case and transmission gear box as a unit the inventor has the first casting A united with the casting B through a pair of curved arms C, the curvature of the arms being sufficient to allow the fly wheel B being carried between them. By this arrangement four points of suspension, 1, 2, 3 and 4, corresponding to the angles of a diamond shown by the dotted lines, are obtained. The supports 1 and 3 are direct on cross pieces of the main frame, being equidistant from the side pieces of the frame. The support points, 2 and 4, are directly on the side pieces, short dropped arms E serving as supports at the center of the curved arms C. If a line be drawn from the bearing point of the right front wheel to that of the left rear wheel and a similar line from the bearing of the left front wheel to that of the rear right, these lines will be respectively parallel to the opposite sides of the diamond, marking the support of the motor and gear case, so that in case a front wheel passes over an obstruction, the strain acts in the direction of a line passing through the center of the diamond.

Spring Road Wheel—No. 805,673, dated November 28; to George Schram, Detroit, Mich.—In his construction of a spring wheel, which is intended to serve the same purpose as pneumatic tires, the inventor has produced a wheel lacking in those clumsy features so common with most spring wheels. Each of the twelve spokes A rest within a V-shaped socket in the hub F, the bottom of the spoke being pointed at B to fit easily within the socket. In each socket is a coil spring C resting against a metal ring in the hub and with its outer end within a seating in the spoke A. It is through these springs that resiliency is obtained. On the outer end of each spoke is a cap portion D with eye hole, the eye hole part being clamped between the two parts of the wheel rim and the bolt passing through the eye hole, holding the rim parts together as well as retaining the spoke in position. A solid rubber tire E is clamped in position between the rings H, the latter being held to the wheel by cross bolts. The coil spring within the spoke K is called upon to bear the brunt of the load with the wheel in the position shown, at which time the spring in the spoke L is not carrying any of the load. As the wheel revolves, the spokes, in order to the left of K to carry the load successively.

Floatless Carbureter—No. 806,079, dated November 28; to Oscar Gavolek, Chicago—The inventor's carbureter, of the floatless type, controls the flow of gasoline into the mixing chamber by means of a check valve which closes the top of the spraying nozzle. The mixing chamber is a vertical tube, with air entering at the lower end, the mixture passing to the motor from the top. Midway



BOGART'S MOTOR AND GEAR CASE

between the top and bottom is the mixing chamber, in the center of which is the vertical spraying nozzle. Suspended from the top of the mixing chamber is the check valve. On the valve stem is a diaphragm nearly equal in diameter to that of the mixing chamber. Bearing against the top of the diaphragm is a coil spring, having a downward tension and holding the check valve within the spraying nozzle, thereby preventing the flow of gasoline. With the first motor suction, the current of air drawn through the carbureter, striking the lower surface of the diaphragm, raises it against the tension of the spring. With it is raised the check valve, thus permitting the flow of the gasoline through the spraying nozzle.

Piston Igniter—No. 805,790, dated November 28; to Benjamin G. Gilbough, Chicago—A novelty is offered in the inventor's igniter or spark plug for a gasoline engine. In most respects the igniter follows standard principles in that the spark jumps between a pair of electrodes, one, A, known as the stationary one and carried in the cylinder head, and the other, B, an oscillating member in the spark plug proper. The latter is oscillated by being pivoted to a piston C in which is a threaded portion E, through which the electrode B passes. As the gases in the cylinder expand, owing to the explosion, the pressure raises the piston C against the tension of the spring D and the portion E, being threaded, revolves with the upward movement of the piston, the revolution serving to rotate the electrode B. After the explosion the electrode is returned to its normal position by the spring D.

Live Rear Axle—No. 805,740, dated November 28; to William D. Lowe, Columbus, O.—In Lowe's rear axle construction a bevel gear differential is carried in a central housing, around which is bolted a sprocket for single chain drive from the gear box of the automobile. The differential housing consists of two parts, with flanges for receiving the axle housing, within which are the drive shafts to each wheel. The shafts, instead of being squared at the inner ends, where they carry the bevel pinions, are round and the pinions mounted loosely thereon, but at the shaft ends is a cubical block in the center of the differential. This block serves to lock the bevels with the shaft, the construction eliminating the danger of key-stripping.

I-Section Front Axle—No. 805,716, dated November 28; to Adam R. Demory, Canton, O.—The invention relates to the construction of steering knuckles on an I-section front axle for automobiles. Solid with each end of the axle is the jaw type yoke D with a bearing in each arm A and also an eye hole in each. Fitting within the bearing cavity is an adjustable bushing B, which can be locked within the bearing. The axle spindle F has on the top of its vertical but a shoulder C resting directly against the bearing. A portion of the hub extends beneath the lower jaw A for the purpose of attaching the tie rod between the knuckles as well as the rod connecting with the bottom of the steering column. The feature of the invention consists in the construction of the yokes D and the adjustable bushings B.

Friction Clutch—No. 805,550, dated November 28; to Harry W. Hill, Cleveland, O.—In the friction clutch referred to, on the rear side of the fly wheel, is a circular flange on the outer and inner face of which operate friction shoes carried on a clutch framework on an extension of the crank shaft, the framework being connected by a sleeve and sliding joint with another shaft running to the gear box. In engaging the clutch the shoes acting on either face of the fly wheel flange are moved radially by a toggle joint contrivance so that the outer shoe is carried in the direction of the hub and the inner shoe carried outward, clamping the flange between them.

E. H. Harriman Seeing Sights of Honolulu from Front Seat of White Steamer

Law Doesn't Work—An idea of the way the new Pennsylvania good roads law works—or, rather, does not work—may be had from the statement that of the 1,548 townships in the state but sixty-four applied during the present year for state aid, their allowance being $50,000 for 662 miles of road.

New Excuse—In the crusade for aprons for automobiles in Detroit, it is being claimed that oil dropping on the pavement forms a grave danger for horses, particularly animals belonging to the fire department which slip and slide on the greasy pavements. It is claimed three-fourths of the city's disabled horses are injured by falls on asphalt.

Long Island Nominees—The regular ticket put up by the nominating committee of the Long Island Automobile Club is as follows: For president, Alfred Wilmarth; vice-president, Edwin Melvan; treasurer, Charles Jerome Edwards; secretary, Walter G. Pierson; board of governors for 2 years, Frank G. Webb, G. B. Parker and John B. Mannel, Jr.

Tags Ready—State Highway Commissioner Hunter has completed the organization of the automobile division created by an act passed by the last Pennsylvania legislature and is now prepared to furnish licenses to operate motor vehicles and the necessary number tags. H. M. Cutchall, of Crawford county, is in charge of the division and will have at least one assistant. The new law becomes effective January 1 and the state licenses issued will expire on December 31 of each succeeding year.

Aid to Politicians—The Taxpayers' League, of Reading, Pa., is engaged in an anti-pass crusade, it being averred that the councilmen, by reason of having accepted annuals on the railroads, feel in duty bound to favor the latter when legislation affecting their interests come up for action. On Monday and Tuesday last a committee of the league, in two automobiles, visited every one of the thirty-two councilmen in an effort to induce them to return their passes. They landed five of them, the other twenty-seven standing pat. It required quick work, for the results of the committee's labors were to be reported at Tuesday night's meeting; but the automobiles were equal to the task, and every one of the city fathers was put on record long before nightfall.

Motor Club Ticket—The regular ticket of the New York Motor Club is as follows: President, W. J. P. Moore; vice-president, H. M. Swetland; second vice-president, R. H. Johnston; secretary, A. B. Tucker; treasurer, Frank J. Griffin; directors, W. J. Morgan, M. L. Downs, Robert W. Haff and R. G. Howell.

Means Business—The Crawford County Good Roads Association, of Ohio, held a meeting at Bucyrus last week and perfected a permanent organization. The county commissioners have provided quarters in the court house for the use of the association and monthly meetings will be held. The organization will make an effort to have the state build the proposed Cincinnati-Cleveland state model road through Crawford county.

Brag's a Good Dog—Down New York way they are telling a story on Billy Marion, of the Morgan & Wright outfit. Marion was one of the members of Dave Post's recent hunting party at his Jersey farm. Seated in the ferry house on his return awaiting a boat he was accosted by a stranger, who asked him what luck he had had. Marion put up somewhat of a brag as to his prowess with the gun. His chance friend panned out to be a game marshal and the confession cost Marion $29.30.

Buckeyes Doing Something—In response to a call issued by the Cincinnati Automobile Club, Vernon H. Burke went to Cincinnati Saturday as the representative of the Cleveland Automobile Club at a meeting to perfect an association of Ohio automobile clubs. The purpose of the state organization will be to secure legislation more advantageous to automobile operators, to improve the roads throughout the state and in general safeguard the interests of automobile owners and drivers. It is not improbable that the state headquarters of such an organization will be located in Cleveland, as this city has the largest club and the largest automobile population of any city in the state.

Complain of Road Hogs—W. E. Bartlett and W. M. Frazier, of Huntington, Ind., are complaining of the hostile spirit shown by farmers on the road to Fort Wayne. They say the rural people almost crowd them into the ditch and once or twice on a recent trip almost caused them to upset.

Just Curious, That's All—A Pittsburg citizen has entered suit in the Allegheny courts to test the legality of the wide tire order on the new macadamized roads. His contention is likely to be ruled against, for the public in general and especially the automobile public has found the roads much too valuable to be destroyed by narrow-tired wagons.

Boom in Cleveland—The Cleveland Automobile Club has been making great gains in membership since Charles Marvin took hold as permanent salaried secretary. He has more than earned his way by securing over 125 new members, bringing the membership up to more than 300. November was a banner month, twenty-two new members being admitted.

Nothing Too Good for Them—Some of the Chicago aldermen are of the opinion that each city father ought to have an automobile. Commissioner of Public Works Patterson and Alderman Snow, of the compensation committee, have talked over the idea and they decided that the solons could cover their territory much faster and more completely if they had cars.

Throw Up Sponge—President G. E. Turner, of the Automobile Club of Pittsburg, has announced that the members of the club would submit to both the state and city tax inasmuch as the test case instituted by them was decided in favor of the city of Pittsburg. The club members will take out the state license at the regular county office and also pay the city license fee the same as the present year.

Bisons' Nominations—Nominations have just been made for the annual election of the Automobile Club of Buffalo. President A. H. Knoll, being a busy man, has decided not to accept a reëlection and in his place Herbert A. Meldrum, head of one of the largest department stores in Buffalo, will be chosen. Other nominations on the official ticket, which undoubtedly will be elected, are: Vice president, F. B. Hower; secretary, Dai H. Lewis; treasurer, Charles Clifton; directors, Edward H. Butler, owner of the Buffalo Evening News; E. R. Thomas, of the Thomas Motor Co., and Seymour P. White.

Winton to Wed—Announcement is made of the engagement of Alexander Winton, of Cleveland, head of the Winton company, to Miss Belle McGlashan, of Paisley, Scotland, the old home of Mr. Winton. Mr. Winton, who is a widower, has been acquainted with Miss McGlashan for a number of years. She is a distant relative of his late wife, who met with a fatal accident by falling from a cliff into Lake Erie 2 years ago. Mr. Winton left for London several weeks ago and the only announcement made at that time was that he was to visit the English and French shows. The marriage will take place at Paisley, Scotland, December 12, after which the

The REALM of the COMMERCIAL CAR

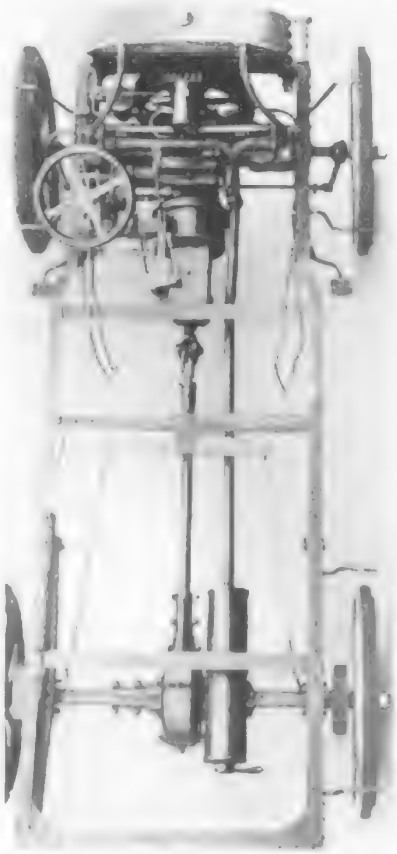
SOULES LIGHT DELIVERY WAGON

A SPEEDY light delivery car, capable of 1,500-pound loads and weighing about 2,000 pounds, is being marketed by the Soules Motor Car Co., of Grand Rapids, Mich., which is having the machines built by the Michigan Automobile Co., of Kalamazoo, Mich. Light delivery work in towns and cities is the field best suited for this little machine, which, with its high motor power and a speed range as high as 25 to 30 miles an hour with its full load capacity, should be a useful addition to concerns requiring speed in the delivery system.

In designing the machine accessibility has been aimed and in so doing the two-cylinder motor has been placed beneath the hood and the sliding gear set connected closely, so that nothing but the propeller shaft is carried beneath the load-carrying platform. Angle pieces form the chassis frame, the sides being slightly offset at the sides of the motor and tied in the center and at the rear by single pieces riveted in position and reinforced by gusset plates. One cross piece aids in carrying the rear of the gear box, another further back carries the muffler, and the back one acts as an end cross piece. The motor and gear box form an integral case of three parts, the gear box, a clutch casing and the crankcase, all three being bolted together and carried on a three-point suspension. Three-quarters elliptic springs are used front and rear, both sets being of the same dimensions, 42 inches long, 2 inches wide and formed with six leaves. The half-length top part is bolted to the frame pieces, and the free end of the bottom half is shackled by a long link directly beneath the frame pieces. The wheel base is 96 inches, tread standard and 34 by 2½-inch solid rubber tires are fitted.

Compactness has not only been sought, but accomplished in the grouping of the motor and gear box in the Soules car. The placing of the two cylinders crosswise in front and having the crankcase housing C extended to the rear to partly form the clutch case D, and this in turn connected with the gear box E, gives a design in which practically all of the power and transmitting plant is carried beneath the forward part of the wagon, so that it is comparatively easy to make examinations or repairs without disturbing the load carried. The cylinders A have on the head small integral flanges B, which, resting direct on the side pieces of the main frame, support the crankcase, and the rear end of the gear box takes its support from a special frame cross piece, which it is bolted beneath. Each cylinder has a 5¼-inch bore and 5-inch stroke, the power being obtained at normal crankshaft speed. The crankshaf Y is a double throw drop forging, with throws set at 180 degrees, and revolves on a pair of bushed bearings, one Z bolted in the front end of the crankcase and the other Z1 formed by a large disk bolted to the rear part C of the crankcase, serving as a partition between the interior of the crankcase and the compartment D enclosing the clutch. The shaft has also a short third bearing in the front end of the gear box at Y1, where it abuts the end of the main gear shaft.

The pistons are made with four eccentric flat-lap rings, three outside of the wrist pin and the fourth near the inner end of the piston, the latter acting chiefly as a lubricant distributor. Connecting rods are 10 inches from center to center and at the outer ends have bronze bushings for the hollow wrist pins but carry babbitted bearings for the crank throws, which material is also used in the two crankshaft bushings. The wrist pin diameter is 1⅛ inch, that of the crank throws 1⅝ inch and the crankshaft bearings 1¾ inch.



CHASSIS OF SOULES CAR

Both sets of valves are mechanically operated and are carried horizontally in the valve ports on the tops of the cylinder heads, so that the push rods and valve stems lie along the top sides of the cylinders. The valve heads are beveled to 45 degrees and are riveted to the stems, which work in long integral sleeves, surrounded by the springs R1 resting on seatings keyed to the valve stems. In operating the valves the camshaft T in the top part of the crankcase has its cams pinned in position. They bear upon rollers in the yoked ends S of the push rods. The arms of the yokes being on opposite sides of the camshaft, act as guides for the rods, preventing their turning, and coil springs R3 within the crankcase and surrounding the push rods serve to constantly retain the latter in contact with the cams. On the outer end of the push rods are fiber blocks R2, against which rest the ends of the valve stems. The camshaft is driven by a small pinion on the front end of the crankshaft.

One feature of accessibility must be noted in that the entire top of the crankcase is removable and when off the camshaft, push rods, push rod springs and camshaft gears are disclosed. The carbureter H is located in front at the right side and its mixture is conducted to the cylinders by a branching pipe J, and a similar pipe K conducts the exhaust to the muffler. Both pipes are retained through long yokes at either end of the cylinder, the yokes resting on the end of each pipe. Spark plugs are inserted vertically in the cylinder ends at P and water leaves each jacket through the openings Q, passing by separate pipes to the top of the radiator. From the bottom of the radiator it is drawn by gear-driven pump and forced into the bottom part of each cylinder jacket.

The timer used differs from most of its class in that in advancing and retarding the spark the high tension wires to it remain stationary. In doing this the commutator casing is made with two bronze segments embedded in it and against the outside of these segments bear stiff springs connected with the high tension wires, which terminate in insulated binding posts to which the springs are connected, so that when the casing is rotated the segments are of sufficient length to remain in constant contact with the springs from the wires.

the sweepings upward, over the head of the operator or driver, and into the box receptacle in the rear of the machine. For over a decade the inventor has worked studiously at the new street cleaning device. It was in 1892 that he conceived the idea of a street sweeper that should be worked on the same principle as an ordinary carpet sweeper, although this principle has been improved upon. Thirteen years ago he set to work constructing what proved a year later to be a crude and bulky affair. A traction steam engine was secured, and from the platform at the rear a rotary broom, pivoted from the platform and driven by a chain that connected it with the engine, crudely picked up the refuse from the street and deposited it in a dirt box further to the rear. The first experiment was beset with many discouragements, but the inventor was not dismayed. This first, as well as all subsequent experiments, was made at Fremont, O., as at that time D. June & Co. were successful builders of traction engines and boilers at that point. This first experiment was a failure in a way, but the inventor set to work to build another sweeper, securing an upright engine from the Huber Mfg. Co., at Marion, O. Then the June people put up another engine for the third experiment, and still failing to make the machine a marked success, this third machine was built.

Success did not come until Mr. Kern had built an entirely new machine and installed electric motors to furnish motive power. Whereas the new sweeping machine weighs 5 tons, and has a wheel base of 120 inches, the electric motor for driving the machine along the street is only a 5-horsepower affair. The inventor states that even a motor of that capacity is more than is actually needed. Another electric motor, developing only 2½-horsepower, operates the sweeper proper, the rotary broom, fan, etc. Willard storage batteries of forty cells and 63 amperes are used with marked success. The motors and controller were especially constructed by the Hertner Electric Co., of Cleveland, O. The motors are not unlike any other electric motor, but the controller is, as it is especially adapted for handling two motors at varying speeds.

It is planned to manufacture two sizes of the new electric sweeper, the larger one to work on wide and long thoroughfares, and the smaller machine is intended for narrow and residential streets, also for getting right up to the curbing to get all the dirt. Then by putting the smaller machine on a crowded street, and following right along in the line with other vehicles, it will sweep where white wings are unable to work because of passing vehicles which may form a continuous line. The smaller of the two sweepers has a frame 15½ feet long, over axles of different lengths, the front one being 48 inches, the rear one 66 inches. The rear wheels are 36 inches in diameter, and the front wheels are 34 inches. Turner endless tires are used, 4½-inch for the rear wheels and 4-inch for the front. The weight of the machine and the adhesiveness of the rubber tires give the sweeper a firm hold at all times. Morris single side chain drive is furnished.

The rotary broom, located directly back of the front wheels and composed of half and half of heavy steel wire and African fibre, is 40 inches long, but on the larger sweeper, the brush is 8½ feet in length. The broom is positioned at right angles with the length of the body of the machine, always being directly crosswise to the direction the motor sweeper may be going. According to the inventor's idea, more dirt can be worked up with the broom in this position than if the broom was placed diagonally across. The inventor states that crevices in pavements of all kinds can be cleaned to the depth of 1½ inches. The driver is seated at a steering wheel the same as in an automobile. To the left side, in front and above him, is the box in the dust conduit, this box containing the rotary fan. The driver always has the broom at his command, lifting or lowering the rotary part by means of a foot lever.

As the broom rotates, the dust and dirt, in fact all kinds of refuse, are greatly agitated, the rotary fan in the conduit creating a strong suction from the broom, the suction drawing the dust and dirt to the top of the machine and back to the dirt box. The box in the smaller machine —the box being 8 feet long, 4 feet wide and 6 feet high—will carry 4 cubic yards of dirt. The other sweeper is built on proportionately larger dimensions in every way. The average speed of the new electric motor sweeper is 4 miles per hour when the machine is not sweeping. When sweeping is being done, the speed is from 2½ to 3 miles per hour, all depending on how dirty the street is.

In the perfecting of such a street sweeper, one of the greatest evils and destroyers of life is done away with, as the street is thoroughly cleaned without raising any dust. The great thing about the new sweeping device is the way it works, and the protection it affords to health in the cities, where nearly all the diseases come from germs in the air, and are to a great extent largely circulated by the present day deadly sweeping machines. With the new electric sweeper there is no disease and filth scattered broadcast, but instead the whole mass is gathered into the machine. The germs are not washed into the sewers and catch-basins, either, to arise and again permeate the atmosphere.

As the inventor puts it, sprinkling is done away with. The sweepings are not gathered into wind-rows and piles, then loaded into wagons, all of which constitute two-thirds of the cost of cleaning streets. Sprinkling before sweeping softens dirt and mud is the result, a good portion of which is packed down and not removed. In the use of the Kern sweeper the street is kept so clean that wind and the passing of vehicles fail to raise any dust.

The expense of keeping the streets of a city clean by the Kern automatic sweeper, as compared with the present methods, must not be overlooked. The expense is light. It takes by the present old method ten teams, three men on that many sweepers, one man on a sprinkling wagon, twenty men in the gutter, three on dump wagons, at a total cost of $55.50, according to one conservative estimate, to clean 4 miles of streets in 9 hours, or an average of a little less than $14 for each mile. On the other hand, taking the new Kern automobile sweeper, the fuel needed for 9 hours costs $1, the operator $2.50, and 8 miles of street will have been cleaned. Allowing two men and two teams and wagons to be employed to take the refuse from the machine, allowing $6 extra for that branch of the help, and the same streets can be cleaned at a total expense of a little over $1 per mile. It usually takes an average of 35 minutes for a gang of men on the street to load a wagon with the street sweepings, but with the conveyors on the Kern sweeper, which work automatically, the wagon can be readily loaded in 10 minutes. Mr. Kern and Jacob D. Kiser, the latter being associated with Mr. Kern in the new invention, are forming a company to manufacture the machines, Congressman James H. Southard, of Ohio, also being interested.

KERN ELECTRIC STREET SWEEPER AND DIRT COLLECTOR

BRIEF BUSINESS ANNOUNCEMENTS

Syracuse, N. Y.—The Amos-Pierce Co. has taken the agency for the Royal Tourist.

Cincinnati, O.—An automobile garage has been opened at 130 East Ninth street by R. C. Crowthers.

Brooklyn, N. Y.—The garage of the Brooklyn Riding and Driving Club is nearing completion, and will shortly be opened.

Syracuse, N. Y.—The B. M. Cornwall Co., of Syracuse, N. Y., will auction off all its automobiles preparatory to going out of the automobile business.

Glen Cove, L. I.—Endeavors are being made to induce an automobile company to locate in the old plant of the Glen Cove Starch Mfg. Co. The location is an ideal one.

Mankato, Minn.—Fred Day and Otto Schwender have formed a partnership under the firm name of Schwender, Day & Co., and will open an automobile livery and garage.

Detroit, Mich.—A. Fisher, who has been engaged in the manufacture of wagons and carriages, has converted his establishment into an automobile salesroom and repair shop.

St. Louis, Mo.—The Cadillac agency has been taken by the Bagnell Automobile Co., which will open shortly on Olive street. The Cadillac was formerly represented by the Halsey Automobile Co.

Hartford, Conn.—The Winkley Co., maker of oiling devices, will shortly remove its factory to Detroit, Mich. It has added to its line the Garlius carbureter and the Eureka separator.

St. Louis, Mo.—The Colonial Automobile Co., a recently incorporated concern, has taken the agency for the Reo and Stoddard-Dayton cars. This company will be located at 3944 Olive street.

Denver, Colo.—Mr. Mathewson, of the Mathewson Automobile Co., has had plans prepared for a new garage to be built at 1622-1626 Broadway at a cost of $100,000. It is to be completed by January 1.

Gardner, Mass.—Levi H. Greenwood is to build a new automobile station which is to be run in connection with the Windsor hotel. A Worcester firm, Scovil & Wheeler, has the contract for the work.

Syracuse, N. Y.—The Franklin Autocycle Co., of Hammondsport, N. Y., has built a motor for George T. Tomlinson, of Syracuse, to be used in the new airship in which he intends to cross the continent.

Detroit, Mich.—The Standard Auto Co. announces that instead of the Detroit Motor Car Co. it will handle the Peerless. The company is located at 260 Jefferson avenue, but will be in its new place on Woodward avenue in 90 days.

Cleveland, O.—The Central Automobile Co. has been acquired by Alvin H. Smith and A. B. Weil, T. T. Long, who has been at the head of the company, having retired. The company has a large garage and salesroom at 38 Vincent street, and handles the Studebaker.

Topeka, Kan.—The Topeka Auto & Cycle Co. has taken the agency for the Mitchell car.

St. Louis, Mo.—The Parker Automobile Co. has taken the agency for the Baker car. This company also handles the Thomas and Autocar.

Fort Wayne, Ind.—A garage and automobile repair shop is to be established by Amos J. and Peter Rousscy under the name of Amos J. Rousscy & Brother.

Greenfield, Mass.—Charles F. Peck and George Parsons have sold their automobile station in Federal street, to Manley Brothers, of Brattleboro, Vt.

Pittsfield, Mass.—The new automobile factory on the site of the old satinet mill is practically completed and will be ready for occupancy about January 1. Alden Simpson is the owner of the plant.

Syracuse, N. Y.—Richard E. Kolbe, who has been connected with the Amos-Pierce Automobile Co., has leased a building at 232 East Water street, which will be fitted to be used for an automobile livery.

Louisville, Ky.—C. D. Simpson has retired from the firm of the Simpson-Strauss Automobile Co., the partnership having been dissolved. Garnett S. Zorn, John Mason Strauss and Harry S. Volz have formed a new corporation to carry on the business of the old firm. The new concern has secured the agency for the Stevens-Duryea car, and a general agency covering Kentucky, Alabama and Tennessee for the Pierce Great Arrow.

Nashville, Tenn.—J. S. Roller will handle the Reo line exclusively in this city and adjacent territory.

Topeka, Kan.—J. M. Padgett will handle the Waverley electric cars in addition to the Stevens-Duryea output.

Cincinnati, O.—The Cleveland Automobile Co. is endeavoring to secure a site for the location of an agency here.

Harvard, Ill.—The Three Manley Brothers have taken the Mitchell agency and will make the automobile business their leader.

Charlevoix, Mich.—G. G. Williams & Son have removed to New Bedford, Mass., and will open an automobile repair shop and garage.

Philadelphia, Pa.—The Diamond Motor Car Co., 2117-19-21 North Broad street, has secured the Philadelphia agency for the Jackson car.

Youngstown, O.—The Youngstown Auto and Repair Co. has been organized to handle the Reo exclusively in Mahoning and Turnbull counties.

Colorado Springs, Colo.—The 1906 agency for Franklin cars has been taken by W. J. Batchelder, president of the Anthony Motor and Manufacturing Co.

Columbus, Ga.—A charter has been granted to the Albright Mfg. Co. This company is capitalized at $14,000 and will carry on a general manufacturing and repair business.

Springfield, Mass.—The interests of the Erickson Mfg. Co. have been taken over by the Ericka Mfg. Co., which has been organized with a capital of $10,000 to push the Ericka hand soap.

Detroit, Mich.—Young & Miller, 254 Jefferson avenue, have been succeeded by Fee & Bock, Mr. Young retaining his position as manager and the company continuing to represent the Elmore.

Jersey City, N. J.—To provide for the increasing demand for W. J. Kell's honeycomb water coolers, radiators, tanks and mufflers, the plant has been removed to the new five-story building at 62 Van Winkley avenue.

New York City—The firm of L. J. Carpenter has sold for Thompson W. Decker to Harry M. Austin a four-story stable at the northeast corner of Thirty-third street and Park avenue, 50 by 100 feet. The building will be made into a garage.

Philadelphia, Pa.—F. W. Stockbridge, former manager of the Reo Philadelphia branch, has accepted the position of sales agent for the Foss-Hughes Motor Car Co., of the same city, which handles Cadillac, Pierce-Arrow and Baker electric cars.

Bridgeport, Conn.—The Wolverton Motor Works Co., of Grand Rapids, Mich., has secured an option on a tract of land on Bay street, with a frontage of 600 feet on the Bridgeport harbor. The company will establish a plant there, providing the common council will abolish two streets. The company manufactures all sizes of marine motors.

LATE INCORPORATIONS

Newark, N. J.—The Turbine & Locomotive Car Co. has been incorporated with a capital stock of $500,000. The company will manufacture engines and vehicles of all kinds.

New York City—The American Generator Co. has been incorporated to engage in the manufacture of vehicles and motors. The capital stock of the company is $100,000.

Rochester, N. Y.—The McKinley Motor Car Co. has been incorporated with a capital stock of $20,000. The company will engage in the manufacture of motor cars.

Buffalo, N. Y.—McNaughton & DuBroy have been incorporated to manufacture motors, engines and automobiles. The capital stock of the company is $10,000.

New York City—The Blackall & Baldwin Co., manufacturer of electric motors, has been incorporated with a capital stock of $50,000.

Boston, Mass.—The Penn Auto Supply Co. has been incorporated with a capital stock of $100,000. It will deal in automobile supplies.

Albany, N. Y.—The Babcock Electric Carriage Co., of Buffalo, has been incorporated with a capital stock of $100,000.

Brooklyn, N. Y.—The Private Garage has been incorporated to deal in automobiles, etc. Capital stock, $2,000.

Flint, Mich.—The Welch Motor Car Co. has certified to an increase of capital stock from $100,000 to $250,000.

Newark, N. J.—The Calvert-Zuri Auto Co., of Newark, has been incorporated with a capital stock of $20,000.

Battle Creek, Mich.—The American Motor & Cycle Co. has been incorporated, with a capital stock of $10,000.

New York City—The Triumph Motor Car Agency has been incorporated with a capital stock of $15,000.

Detroit, Mich.—The Walker Motor Car Co. has been incorporated with a capital stock of $200,000.

Among Makers and Dealers

Roof of Argyll London Branch Used for Garage Purposes

Bennett Changes—A. L. Bennett, former manager of the de Dietrich branch at Boston, is now assistant manager of the Mors Automobile Co., of New York.

Greeley Likes Motoring—General Greeley, chief of the United States signal service, is an enthusiast over automobiling since his experience driving a Thomas car while in Nome, Alaska, last August.

Tradesman Weds—Richard Harry Johnston, of New York, publicity engineer for the White Sewing Machine Co., was married last week to Miss Winifred Vaughan, daughter of Dr. and Mrs. J. A. Vaughan, of Brooklyn.

Electric Siren—Alden L. McMurtry, of New York, of Ormond timing apparatus fame, is now having his latest invention, an electric siren, manufactured. It will shortly be put on the market by the New York Motor Car Co., of which he is a stockholder and official.

Drops Providence—Wilbur C. Walker, secretary of the Pope Mfg. Co., has sold the Providence branch house effects of the company to the Shepard Co., of Providence, a large dry goods house which will maintain it as an automobile salesroom and garage. The Shepard Co. will handle the line of Columbia cars and the Pierce products.

S. & M. Branch in Paris—Smith & Mabley, of New York, importer of Mercedes, Renault and Panhard cars, and manufacturer of the Simplex, is to establish a Paris branch. L. P. MacNamara has sailed to take charge of it. As fully one-quarter of the S. & M. customers take delivery of their cars abroad the branch will be installed to look after them and assist them in shipping the cars to this country. The branch will be opened very shortly.

October Imports—According to the latest government returns ninety-five automobiles, valued at $409,841, were imported into this country during October, while during the 10 months ending with that month the number of cars imported was 390, valued at $1,475,299. During these same periods the imports of automobile parts were valued at $17,921, and $86,674, respectively.

Back in Gotham—I. H. Manning, who went to Chicago from the White branch at New York, to join Webb Jay's force, has returned and is now on the selling staff of the Franklin department of the Decauville Automobile Co.

Joyce Moves—James Joyce, formerly of the Electric Vehicle Co., has gone with the American Locomotive Co., as assistant to Albert Otto, the general manager. Mr. Joyce is a veteran of the bicycle days and is well known through his long connection with the Pope Mfg. Co.

Makes a Hit in France—The Rushmore Dynamo Works, of Plainfield, N. J., has decided to open an agency at 79 Avenue de la Grand Armee, Paris, where a stock of searchlights, generators and supplies will be carried. S. W. Rushmore will be at the Paris show, after which he will tour through France and Germany in a 60-horsepower Fiat.

Vicqueots Arrive—The Vicqueot Co., of which Hector H. Havemeyer, of the Vehicle Equipment Co., is president and Louis Caswell is manager, now located at the former de Dietrich garage, on West Forty-eighth court, New York, has received the first samples of the new Vicqueot cars. They are built at Puteaux, near Paris, at a factory now owned by Mr. Havemeyer. They appear in two models—a 40-45-horsepower and a 28-32-horsepower.

Stearns Spreading—The F. B. Stearns Co., of Cleveland, has decided that despite the fact that it erected a large addition last fall, its present quarters are still too small to take care of the demand that is now apparent. President Stearns has had plans prepared for an addition two stories high and 60 by 150 feet. Ground has already been broken. It is a rush contract and it is expected that the building will be ready for occupancy by the first of the year. It will be fitted up as testing and experimental rooms, while the upper floor will be used for storage and drafting room, converting the spaces at present occupied by the departments mentioned into an additional machine shop.

Fiat Garage Nearly Ready—Hollander & Tangeman, New York, will take possession of their new garage at Broadway and Fifty-sixth street, on December 20.

Hotel Garage—The Rickers, of Poland Springs, Me., who became wealthy through the sale of spring water and the conduct of the Springs hotel in Maine and the old Astor house in New York, are now building a mammoth garage in South Poland for the accommodation of guests at their Maine hotel.

Foreign Business Increasing—F. M. Keaton, manager of the sales department of the Pope-Toledo plant, is authority for the statement that the foreign trade for the past season was about four times what it was for the previous season. He furthermore stated that foreigners were taking about 6 per cent of the production of the Toledo plant.

Subscription Shark at Work—Complaint is made by Motor, of New York, that an unauthorized person, who has been traveling under the name of G. K. Buck, Leon Ames and Walters, has been soliciting subscriptions and classified advertising which have never been turned in. The man is described as being about 5 feet 11 inches tall, smooth shaven and with a nervous twitching of the face. Motorists are warned to beware of imposters and to telegraph Motor in case this individual turns up.

Foreign Shipments—The returns for the 10 months ending October, 1905, show that automobiles and parts to the value of $2,369,621 were shipped abroad during that period, as against a value of $1,576,877 for the first 10 months of last year and $1,311,960 for the corresponding period of 1903. Classified as to countries, the shipments during the first 10 months of this year were divided as follows: United Kingdom, $604,782; France, $254,030; Germany, $101,998; Italy, $154,325; other Europe, $222,817; British North America, $501,765; Mexico, $150,042; other West Indies and Bermuda, $124,552; South America, $48,938; British East Indies, $28,602; British Australasia, $85,548; other Asia and Oceania, $60,591; Africa, $28,737; other countries, $2,894.

Prices in Dayton—Automobile dealers in Dayton, O., have issued the following schedule of prices: Repairs, 60 cents per hour; helper, 40 cents per hour; Sunday and night work, 75 cents per hour; washing, polishing and tire work, 50 cents per hour and no charge less than 50 cents; no adjustment or small repairs less than 25 cents; towing in machine or using machine owned by garage for repairs, etc., $1 per hour for use of machine and 60 cents per hour for each man used; storage, 12 or 24 hours, 50 cents; dead storage, runabouts, $3; touring car, $5 per month; in and out storage, runabout, $5; touring car, $7 per month; storage, washing, cleaning and polishing runabout, $9; touring car, $15 per month; storage, washing, cleaning, polishing and delivering runabout, $12 per month; touring car, $18 per month; gasoline, 15 cents per gallon; 76 gasoline, 20 cents per gallon; special oil, 75 cents per

Digitized by Google

gallon; engine oil, 60 cents per gallon; transmission oil, 60 cents per gallon; renting, $3 first hour and thereafter $2.

English Ingenuity—It has remained for the British to utilize the roof of a garage for the purpose of washing cars, the Argyll, of London, having adopted this scheme.

Sail for France—Sidney B. Bowman, W. Tilford Jones and Clovis Bertrand, of the Bowman Automobile Co., New York, and Albert Champion, of Boston, were among those to sail last week for the Paris show.

Doing It Right—Manager Tate, of Douglass, Andrews & Co.'s New York headquarters, is touring New Jersey in a Berkshire car placing agencies for the firm, which has contracted for the Berkshire output.

Hartford Doings—The Palace Auto Station of Hartford, Conn., will continue to handle next season the Thomas, Locomobile, Autocar and Pope lines, which it has handled in the last two seasons, while Brown, Thomson & Co., of the same city, will sell the Stevens-Duryea, Winton, Franklin and one other car not now determined upon.

Tolerton Estate—According to the report as made by the appraisers of the estate of the late E. W. Tolerton, who was one of the principal stockholders in the Consolidated Mfg. Co., manufacturer of the Yale automobile, the deceased left an estate estimated to be worth $456,486.88, a large part of which was in the stock of various corporations.

Witherbee Move—The Witherbee Igniter Co., manufacturer of Witherbee storage batteries, has moved from 27 Thames street to larger quarters at 541 West Forty-third street, New York city. The new factory is five stories high and will have a capacity of 1,000 batteries a week for the automobile trade, while at the same time the company can carry on the manufacture of larger batteries for stationary work. The company announces it is supplying forty-five automobile and motor boat makers.

Thomas in New Factory—The new plant of the E. R. Thomas Motor Co. at Buffalo was opened for work on Wednesday, when a number of workmen were started at the benches on the first floor. The new building is not yet completed, but work is being rushed on it, and it is thought it will be in shape within a short time. It is of concrete construction and is the form of an irregular L, 190 feet by 195 feet. It is three stories in height, and, when completed, will give the company 118,000 square feet of floor space.

Export Trade Growing—The latest compilations of the government statisticians afford further evidence of the growing importance of the American automobile export trade. During October last these exports were valued at $133,988, as compared with a value of $130,891 for the corresponding month of last year. Shipments during October last were made as follows: United Kingdom, $50,136; France, $2,190; Germany, $8,162; Italy, $1,740; other Europe, $8,903; British North America, $18,715; Mexico, $13,464; other West Indies and Bermuda, $12,274; South America, $5,571; British East Indies, $3,620; British Australasia, $4,000; other Asia and Oceania, $1,315; Africa, $2,716; other countries, $2,156.

Oldsmobile Recruits—K. C. Darling, formerly with the Peerless agency, and W. J. Laster, until recently with the Homan & Schantz Co., the metropolitan agent for the Rambler and National, have joined the selling staff of the Oldsmobile Co. of New York.

Buick Opening—H. T. Koehler, of Newark, N. J., sales agent in the metropolitan district of the Buick Motor Co., has just opened a New York branch at Broadway and Fiftieth street. F. G. Benson is the local manager, though Mr. Koehler runs over from his Newark store for an hour or two each day.

In Old Riding School—The Cook & Stoddard Co., of Washington, D. C., have opened a garage in the old riding academy at Twenty-second and P streets, N. W., which it will operate in connection with its large salesrooms on Connecticut avenue. Its 1906 line will be the White, Baker, Franklin and Locomobile.

Shanks Home—Charles R. Shanks, of the Winton Motor Carriage Co., is back from his exposition tour across the continent and is now making a flying trip calling on branch stores. All of the Winton branches have received their new models and Mr. Shanks will give additional pointers and instructions as to handling them.

Fight For Office—A lively campaign is promised the members of the Buffalo Automobile Trade Association, J. A. Cramer, a prominent retail automobile dealer, and E. C. Bull, manager of the city sales department of the George N. Pierce Co., having been nominated for the presidency. For vice president W. C. Jaynes and G. H. Poppenberg are the candidates. D. H. Lewis is the sole candidate for secretary, as is John J. Gibson for treasurer, but for the three executive committee places these nominations have been made: P. W. Eigner, E. E. Denniston and one representative each from the [illegible] N. Dietz Co., the Central Motor Co., the Thomas Motor Co., the Brunn Carriage Co., and the O. K. Machine Works.

Cryder Leases Building—Cryder & Co., American representatives of the Lesti Berlee Motor Syndicate, have leased the building at the northeast corner of Park avenue and Sixty-third street, New York, for a garage.

Orders Decauvilles—E. S. Partridge, vice president of the Decauville Automobile Co. of New York, returned last week from Paris, where he secured a full line of 1906 Decauvilles for the Madison Square garden show. He attended the Olympia show in London, and brings back with him a full line of new ideas which he secured by looking over the cars on exhibition in the big hall.

Bow to the Law—M. Kirschberger & Co., of New York, manufacturers of acetylene burners, announce that since the courts have recognized the validity of burner patents they control, one prominent English firm which had been one of the chief offenders, has bowed to the law and taken out a license. Kirschberger & Co. started suit in 1900, and carried it to the court of appeals of the state of New York, which sustained the patent. Then injunctions against imitators were secured, a recent decision in Chattanooga, Tenn., granting three injunctions against the infringers.

Foreign Strike Pending—John G. Dale, of Mendel, Dale & Co., New York, comes back from Europe with a story of an impending strike in the automobile factories. "The unions have been growing strong," said Mr. Dale, "and the demand for shorter hours, with bigger wages, has almost reached the breaking point. Not alone the body builders, but the machine hands as well, are preparing for a fight that may be a severe setback to the foreign industry. Most of the makers are rushing the work so as to get as many cars as possible ready for delivery before the first of the year."

GENERAL GREELEY, OF THE UNITED STATES SIGNAL SERVICE, IN THOMAS CAR IN ALASKA

Reduced Railroad Rates

to all members of the AMERICAN MOTOR LEAGUE who travel

to the City of New York

to attend the meeting of the A. M. L.—to which all automobilists are invited—beginning Monday, January 15, and ending Saturday, Jannary 20, both dates inclusive. As this is the

Week of the Automobile Shows

our members will have an opportunity of taking part in convention work and of enjoying the gala week at the same time.

Important Notice—This redneed rate benefit is for league members only. Persons wishing to join the league and to receive this benefit should immediately send names and addresses—plainly written with 1 year's dues—$2 for each applicant. The railroad associations will not grant reduced rates in aid of an automobile show or any other purely commercial enterprise. They will recognize only those certificates which are held by league members.

Each member who comes to these meetings should bring his membership ticket. This will save the trouble and delay of searching membership records. Every expired membership should be renewed. Full printed information will be sent on request. Address

FRANKLIN

"The Motor Car of the Future"

That Franklin slogan is not an idle phrase, but a statement full of life and meaning.

It is backed by those telling facts which alone can give vitality to any claim.

The first **Franklin** four years ago had four air-cooled cylinders, and was built for power, lightness and strength, without regard to cost.

It was the first 4-cylinder car built in America—the first successful air-cooled car in the world.

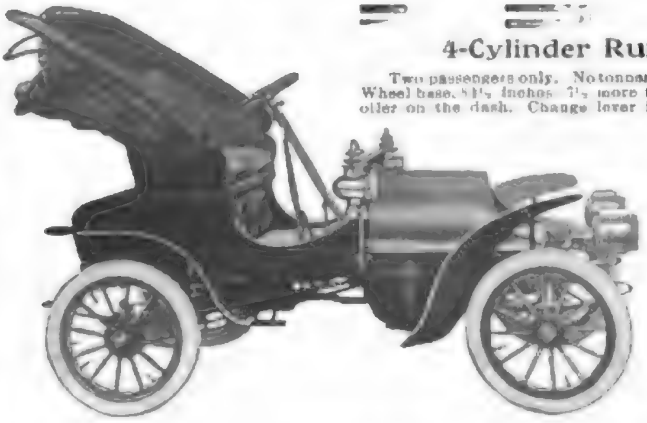
Franklin engineers were the first to perfect throttle control; the first to adopt the automatic carbureter in a four-cylinder car; the first to perfect it; the first to use automatic lubrication; the positive fan and the single intake trunk (which foreigners are now copying); the first to make and use a successful auxiliary exhaust, flexible-frame cars, the round hood and full elliptical springs without reaches.

Today the majority of manufacturers are coming around to four cylinders. Many have adopted air-cooling; many more wish they had; and all are trying to build lighter, stronger, and with better springs.

They are beginning to see —"as through a glass, darkly,"—what is plain as daylight to most thoughtful minds; that heavily constructed, complicated, cumbersome cars are not suited to American ideas nor American roads, to say nothing of American purses.

Franklin principles—multi-cylinder, air-cooled motors, light weight and the highest grade most durable construction—have proven themselves the best foundation on which to build an enduring standard type of American motor car—"The Motor Car of the Future."

And the far-advanced design and detail perfection of this season's Franklins will make them not one-year cars, but favorite and standard cars for many years to come.



Type E

4-Cylinder Runabout or Gentleman's Roadster

Two passengers only. No tonneau can be attached. 12 "Franklin horse-power." Air-cooled engine. Wheel base, 81½ inches. 3½ more than last year. Roomier, more graceful, easier riding. Force-feed oiler on the dash. Change lever inside the car and forward. Especially convenient when top is on. 1,100 pounds.

One combination ironing which will accommodate canopy, cape or victoria top and glass front. 40 miles an hour. $1,400. F. O. B. factory.

Full head- and tail-light equipment.

This is really the most economical of all runabouts. Its construction and the materials put into it equal those of any high-priced touring car. It costs 50 per cent per pound more to build than any cars except Franklins; and it gives enduring service and satisfaction at the smallest possible expense.

While a millionaire can ask nothing abler, handsomer or more luxurious; the average business or professional man, physician, salesman, superintendent or suburbanite can find no better value.

Type D

The finest, speediest, 4-cylinder Touring Car.

Type G

The new light Touring Car.

Type H

The new 6-cylinder top-notch flyer.

We exhibit in New York at Madison Square Garden, January 13-20, 1906

OLDSMOBILE

Two-passenger Two-cylinder Touring Car. Model "L" Price $2250

We have already announced in a general way our two-cylinder, two-stroke cycle car. Following we give a detailed description of this most attractive car—its smart appearance and "get in and get" qualities of which make a decision once met.

Model "L" has a marked individuality, though it approaches in general appearance the lines of several foreign machines very popular in America. The front axle is brought well forward and the rear wheels back, giving a very long wheel base and adding to the easy riding qualities of the car. The tonneau is so constructed that it is easily removable, and the broad rear luggage compartment is built for utility as well as for appearance. When thus equipped it becomes the most attractive of two-passenger or runabout outfits. The standard color will be dead gray with black trimmings and red running gear.

The engine is a two-cylinder, two-stroke cycle type, mounted at the rear of the car. The cylinders are of generous proportions and consist of bronze combustion heads with cabinet iron barrels. They are cooled by water circulated by gear pump. Ignition is by storage battery and coil or dash. Transmission is by sliding gear. Engine bearings are of the babbitt type.

Cooling is by water circulated by gear pump. Radiator is of tube construction. Ignition, dry storage battery and coil or dash. Transmission is by sliding gear. Engine bearings are of the babbitt type.

Lubrication is by splash system. The transmission is sliding gear type, three speeds forward and one reverse. The gears are of

OLDSMOBILE

special high carbon stock tempered and hardened. The control is of the selective type operated by a single lever which cannot be thrown into reverse until prawl has been lifted, a precaution against accidental jamming of gears. The clutch cone sets into fly wheel, all strains self-contained. The clutch is thrown out by foot lever and also by emergency brake lever. The transmission case is of aluminum, the lower half being removable at top. Transmission is splash lubricated from case through pockets packed with waste and screens. This precaution is taken to prevent steel chips getting in bearings. The transmission drive is through 1¼ inch shaft and Spicer dust-proof universal joints to the rear axle.

AXLES. The front axles are of our own special design, 2-inch tubing, ¼ inch wall. Steering connections have especially large bearings, all of which are equipped with "T" handled dope cups and protected by leather dust caps. The steering cross connections and steering link are adjustable, and the wheels may thus be lined up at any time. The axle is dropped in center to protect fly wheel and other parts beneath car. The rear axle is equipped with Timken Roller Bearings throughout and with brakes, etc., of our own special design.

BEVEL GEAR DRIVE. The car has bevel gear drive, the ratio of the gear being 3 to 1 for standard equipment.

BRAKES. The brakes are of the internal expanding type, with toggle set-up, either camel's hair or metal lining being used, depending upon the section of the country to which car is shipped. The brake drum is of pressed steel, 12 inches in diameter, 2-inch face. The brake on the cardan shaft at rear of transmission is operated by foot pedal, while the emergency brake upon the rear wheels is operated by hand lever. The application of emergency brake throws out clutch, disconnecting transmission from motor.

SPRINGS. The springs are made of the very best stock obtainable, and are of the half elliptic type. The front springs are 36 inches by 2 inches and the rear 48 inches by 2 inches. The long spring hangers at front and rear permit lengthened wheel base.

FRAMES. The frames are of pressed steel channel section. A sheet steel plater riveted between side and sub-frames gives pronounced bracing effect. The dust pan attached to sub-member and extending from front cross member to the rear of transmission is removable. This dust pan makes inside of car absolutely dust, mud and water proof. Both the engine and transmission are aligned upon sub-frame and all working parts may be removed without disturbing hanging of crank and transmission cases.

CARBURATION. The carbureter is built for us after our own design, and is very effective and economical of fuel. The gasoline tank has 15 gallons' capacity.

CONTROL. The steering is accomplished through a worm and nut mechanism. The nut is long and has a wearing surface babbitted so that same may be replaced at any time. The steering gear case is securely bolted between sub-frame and side member. The spark and throttle levers are placed upon steering post just beneath and at the right of 16-inch oval rim steering wheel.

MISCELLANEOUS POINTS. Wheel base 102 inches, the tread standard 55 inches, though 52 inches and 58 inches are furnished on special order. Wheels 30 inches, 10 spokes front, 12 spokes rear. Tires, 30x3½. The muffler is arranged longitudinally beneath the car and entire construction is so enclosed that very little dust is disturbed by the passing of the car. Running board, mud guard irons, instead of being riveted on, are drawn into taper sockets upon side of frame and are easily removable. The lamp brackets are adjustable for different widths of lamps. We furnish tubular horn, two acetylene lamps, a generator and three oil lamps with this car.

Further specifications sent on request.

POPE Toledo AUTOMOBILES

1906 MODEL POPE TOLEDO TYPE XII 35-40 H. P.

Price, $3500

More Power, Speed, Room, Strength — **Less** Weight, Expense, Trouble, Complication

The fastest and most powerful touring car in the world. **Type XII, Pope Toledo** marks the greatest forward step yet attained in automobile development. **Motor** has only **10 5/10 pounds of engine weight per H. P. and only 54 pounds of total weight per H. P.** and this too, without in any way sacrificing strength and wearing parts. The **Pope Toledo Carbureter** is developed to such a point of fineness, that it is self adjusting to all conditions of speed, so that with the **Spark** and **Throttle** alone, and always on the high gear, you can drive a **Pope Toledo** anywhere, taking all ordinary hills without rushing them and without shifting gears. **Transmission:** sliding gear three speeds forward and reverse, and made of the best steel obtainable. By its use we are enabled to produce not only the LIGHTEST but the STRONGEST and most efficient **Transmission** ever placed in any automobile. **Frame:** all steel of few parts, light, flexible and strong, making the car very easy to ride in. The **Pope Toledo system of brakes** is incomparable; both foot and emergency brake act on the hubs of the rear wheels; are very efficient and easily adjusted. **Design:** entirely new and original. Double side entrance, very large and roomy TONNEAU, specially easy of access. Car comfortably seats seven people.

Order now for early delivery. Price, $3500

Be sure the name **"POPE"** is on your automobile.

LOZIER

BEING TALKED ABOUT

If you are Automobile wise, you have heard much of late about

The LOZIER Car

In what is being said among your friends, at the Club and elsewhere, there is an undefinable something that must have convinced you that this is a car of real merit.

YOU HAVE NOT HEARD AN UNFAVORABLE WORD

Those who have seen the car, pronounce it a GREAT MACHINE. Those who own and drive one (and all have been owners of other high grade cars, both American and Foreign), say:

"The Finest I Ever Owned"

INFORM YOURSELF FURTHER

Deliveries of all styles, Limousines, Landaulets, Touring Cars. Prices $4,500 to $5,500.

THE LOZIER MOTOR CO., 1 Broadway, N. Y. City

Temporary salesroom at R. M. Stivers', 19 West 63d Street, for a short time, on if our building at Broadway and 58th Street is completed.

"Every stock car guaranteed to show sixty miles an hour before leaving the shops." E. R. THOMAS.

THOMAS

Can any praise of ours compare with the eloquent testimony concerning the 1906 Thomas contained in this remarkable affidavit?

Buffalo, New York, November 10, 1905.

This is to Certify, That we, the undersigned, this day rode at the rate of 60 miles per hour with five passengers over average roads, maintaining a speed continuously in regular stock model 1906 Thomas touring car, and went up a 14 per cent grade with five people on the high speed and on very bad roads increasing the speed all the way up the hill until we reached 40 miles per hour at the top.

The car is exceedingly smooth and quiet in operation, and the clutch is extraordinarily sweet and effective.

This is the only American built stock car that within our knowledge has made 60 miles per hour on ordinary roads, even without passengers.

(Signed) AUBREY H. MARTIN, Philadelphia, Pa.
C. A. COEY, Chicago, Ill.

THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

has arrived and is now on exhibition at our showrooms. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. Equal to any car, built in any country at any price. Make and break spark. Sims-Bosch Magneto. Bevel gear drive. Continental Tires. Aluminum bodies.

MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order?

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.

Volier Horns

¶ The *reeds* are what stick most horn makers. Successful metal mixtures and tempering processes for horn reeds are the secrets of a very few men. The non-corrosive, vibratory metal reeds in genuine Volier Horns, which are unaffected by weather and which keep their tone indefinitely, are a feature which alone make Volier Horns superior to any other horns offered in America; *but*, in addition, there is the matter of

¶ The *bulbs*. In ordinary horns the bulbs are steam cured. They split and crack from use and vibration. In Volier Horns the bulbs are *chemically* cured — another secret process. The *chemical* curing makes Volier bulbs soft, pliable and tough. Volier bulbs do *not* split or crack.

¶ Horn fashions are set by the Volier, which we exclusively import from France. Witness the "Dragon" horn craze this season, founded on the Volier "Dragon."

¶ We can now give you illustrations and quotations on the 1906 Volier styles.

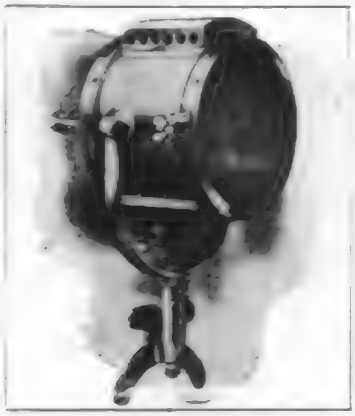
WHAT WOULD YOU THINK OF A

Carbureter

which drank a gallon of gasoline in every five miles, and wouldn't stay adjusted? You wouldn't want it as a gift, would you?



And yet you will buy a searchlight with a silver plated reflector, which reflects, maybe, 10 percent of the light from the flame, and reflects next to nothing unless you keep constantly polishing it. And you don't even polish it, because it is too much trouble. You let it tarnish, and at night you take your chances.

Is this common sense?

The Rushmore Navy Standard Searchlight has a lens mirror, scientifically ground to throw the light straight forward. It never needs polishing. Having a shorter focus than any other, it is closest to the flame and utilizes the maximum percentage of light.

For the actual illumination given, it is the cheapest lamp made.

Sent on ten days' free trial.

Rushmore Dynamo Works

PLAINFIELD, N. J.

Haynes

Exclusive Features that Appeal to Discriminating Buyers

Model "R." Four-Cylinder Touring Car

Roller bearing vertical engines. Cylinders 5¼"x6"; 50 H. P. Cast separately. Sliding gear transmission with exclusive device which prevents possibility of burring or stripping gears and permits instant change from high to lower speeds with perfect safety and without noise. Positive cooling system operated at very low cost of power. Individual and special lubrication. Carbureter, which assures perfect mixture in all temperatures and under all climatic conditions. Master Clutch that has no leather surfaces to wear. Takes hold easily and gradually without jerking. Shaft drive. Exclusive universal joints that do away with wear on pins, run in housing packed with grease. One piece nickel steel rear axle with beveled sprocket gear, driven by roller pinion; thrust eliminated, friction reduced, noiseless; all in a bath of oil. Roller bearings throughout. 108-inch wheel base. 50-inch tonneau with ample room for two folding chairs. Six to 60 miles an hour on high gear. Weight 3,750 pounds. Price $3,500, F. O. B. Kokomo. Full head and tail light equipment. Horn and tools.

Every important feature of the 1906—HAYNES—roller bearing engines, master clutch, transmission, universal joints, rear axle, sprocket and roller pinion is exclusive with and found only on the HAYNES. Every detail has been developed in the HAYNES factory and with exact reference to every other part. There is perfect harmony throughout the entire mechanism. This is the reason that in the HAYNES car there is less than 10% loss of power between the engine and rear tires. It is the reason that its cost of maintenance, upkeep and operation is so remarkably low, and that for 14 years it has had the acknowledged reputation of being a car of preëminently high quality.

Its cylinders are extra large. They hold compression perfectly and give high power. When changing gears, the transmission device never allows the momentum of the fast-moving car to be thrown against the power of the engine with its consequent strain to the entire mechanism, frame and tires, a fault common to all other types of transmission. No danger of stripping gears or of gearing climbing out of casing, which constitutes the chief objection offered to large shaft-driven cars.

Roller bearings give noiseless operation. Large flexible springs insure riding ease and long life to tires. Simplicity of control, all parts immediately accessible. Honestly built. Body of cast aluminum and wood. Grey curled hair and hand-buffed leather upholstering. All materials—metal or wood—are tested for strength and flexibility at double severest road requirements.

These are some reasons why the HAYNES gives such satisfactory service at a low rate of cost for upkeep. Others are given in our catalogue Number 11, sent prepaid upon request.

The "short" fracture shown above, while characteristic of poor oak, happens to show the fracture of poor hickory. The other fracture shows the quality of "Imperial" spokes.

Talks on Wheel Making No. 7

A bursted tire is robbed of its danger if the car is equipped with "Imperial" wheels.

Don't lull yourself into a sense of false security by imagining that all wheels rank alike. Read what the *Horseless Age* has to say on the subject:

> "As an illustration of what can be accomplished by suitably disposing material, no better example can be found than the wood wheels fitted to motor cars. No part of the car has its material subjected to stresses under a greater variety of conditions. True, there are wheels which are of no value; wheels, in fact, which have no factor of safety and are ready to collapse at the first turn; but they are not the wheels one ought to find on a car."

Collapse is usually traceable to two causes—defective material or unsound construction. And sometimes to both.

The excellence of "Imperial" wheels is based upon the perfection and refinement of orthodox methods.

The Trouble-Proof GENERATOR

that describes the RUSHMORE

In the Patented Shaking Grate, Regulating Chamber, and Safety Vent it solves the problem of a perfectly automatic portable generator.

It gives a gas supply as steady as that in your house.

It maintains the pressure undiminished till the carbide is wholly consumed.

It stops generating when you turn out the lights.

It preserves the unused carbide indefinitely without waste.

And it does all this automatically, without adjustments, and with no attention save to empty out the dry lime dust and refill with water and carbide—the work of a moment.

Just compare this with the antics of your present generator and then write us for catalog telling why the Rushmore is unique among its kind. Three sizes, holding 1¼ lbs., 2½ lbs. and 5 lbs. of carbide.

Rushmore Dynamo Works

An Investigation of Goodrich Tires

Mr. E. Shirts, cashier of the Citizens' State Bank, Noblesville, Ind., after using a set of Goodrich Tires through the year of 1904 and all of 1905 up to date, without a repair of any kind, decided to take off the tires for examination just to satisfy his curiosity. **All he found was Goodrich Rubber and Goodrich Fabric perfectly united and looking just as good as new.** His letter:

"In the spring of 1904 I purchased a Cadillac automobile, Model B, equipped with **Goodrich Tires, 3x30 inches.** I used those tires all the season of 1904 and all of this season without a repair of any kind, not a single puncture, and the tires look as good as new, with the exception that the treads are flattened down some. I have had such remarkable success with them that a few weeks ago I took the front ones off to see what they were made of, and found them in perfect condition, not even rim-rusted.

"I have driven my car every day that was fit to be out with my family and have kept them busy both seasons and my experience with them has been one round of pleasure."

THE BAILEY "WON'T SLIP" TIRE. Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, skewing or skidding. :: ::

Bargain-Hunting

applied to Motor Cars is a study of human nature.

¶ In the purchase of an Automobile, as in everything else, there are two extremes to which the buyer may go.

¶ First—Rabid Extravagance, which carries the purchaser to an exorbitant price for a 4-cylinder car.

¶ Second—Rank Economy (always the most expensive in the long run)—which takes the bargain hunter to a 4 cylinder car at a low and impossible valuation.

—THE—

Stoddard-Dayton

"Again as good as it looks"

AT $2250 IS

an honest commercial value between the two extremes.

¶ It is the right car at the right price, with the right kind of Guarantee back of it to insure your protection and absolute satisfaction.

¶ Our 1906 Catalogue is as instructive as a course of tuition with a correspondence college.

¶ It tells all there is to say and shows all there is to see about the 1906 Stoddard-Dayton line, including Touring Car, Runabout and Limousine.

¶ Write for it. It's Free.

Boston Mass Nov 4, 1905.

Jackson Automobile Co.,

Jackson, Mich.

Gentlemen -

We are sending you today under separate cover a photograph of a 'Jackson' car that has been run this season over 10,000 miles by the odometer. We really believe it would pay you to get this into the Trade Journals if the expense is not too much.

You wrote us sometime ago that you would have either the Model 'C' or 'D' made with detachable tonneau with fish-tail dash. Have you as yet decided which model you will have in this way? If so, kindly write us the price of machine without the tonneau. We believe it would be advisable to have the cheaper car with detachable tonneau.

Yours respectfully,

E. P. BLAKE COMPANY

Per E. P. Blake

Enc: 298-9

P. S. The tires on this car are Diamond detachable. The two front tires have never been touched and the two rear tires have been retreaded once. This car is owned and driven by Mr. H. H. Bates, Brockton, Mass

THE accompanying letter and picture explain WHY every agent we had on our list for 1905 has contracted for Jacksons for 1906; ¶ *Why* every "Jackson" driver is an advertisement; ¶ *Why* you, if you have the auto fever, should buy the Jackson; ¶ *Why* the Jackson has the world's record for five miles on a circular track for two-cylinder cars; ¶ *Why* the Jackson won second in the non-stop run from Chicago to St. Paul.

THREE MODELS:

MODEL "C" $1250.00, 20-24 H. P.

This AUTO TIRE has no BAD HABITS

It won't creep—it won't rim-cut—it won't come off the rim when run deflated, no tire bolts required to hold it on the rim—and you can take it off or put it back in 30 seconds, using nothing but the hands. And it's a Tire, besides, that's as resilient as a "soft" tire, and will outwear most "hard" tires.

Sounds like a fish story, doesn't it?

But it's a *fact*, nevertheless.

Barney Oldfield didn't believe it, either, but he does now.

We *showed* him—he saw with his own eyes—and now he uses the Goodyear Detachable Auto Tire with the Universal Rim in all his races.

He used this tire at the Boston meet on Sept. 9th, where he made five miles in 4:55 and a mile in :55 1-5—breaking the track record.

You ought to hear Barney's chaffeur sound the praises of the Goodyear Detachable to all who will listen to him—hear him tell how reliable it is—how it saves him time, trouble and worry and makes his position easy. He says he never thought it possible (before using the Goodyear) to embody all the good points a tire *ought* to have in one single tire.

We wish you could come with us to the factory or to one of our branch stores. Then you could see in no time for yourself just why and how these things are true. You can "see through" it all instantly when the tire is before you.

We'll try, however, to explain just *one point*, here.

Why the Goodyear Detachable Auto Tire is *Durable* and *Resilient* at the same time.

Look at the section of the Goodyear Tire in the center column. Notice the crescent shaped portion in solid black where the wear of the road comes. That's dense, firm rubber, as tough as rawhide—practically no wear out to it.

Now right underneath this is the remainder of the outer casing (shown in grey) which is made from pure para rubber, as resilient and springy as it is possible for rubber to be.

These two different kinds of rubber—the dense, tough composition, to take the wear, and the soft, elastic rubber, to make you ride easy—are made into one solid piece by a special process. You can't skin the two kinds of rubber apart with a knife. Try it if you doubt.

The dense rubber and the soft rubber together make a tire that's almost as durable as a *solid* tire, a tire difficult to puncture yet one which is as *resilient* as a man could reasonably ask

Our "Good News Book" tells more about the good points of this trouble-saving tire. You ought to get it now, for the Goodyear Detachable Auto Tire with Universal Rim will be "the only tire" next season.

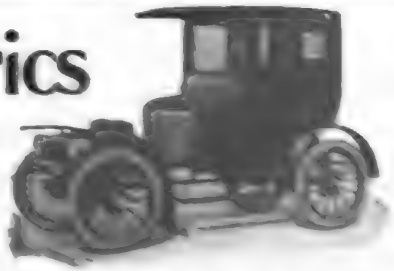
Baker Electrics



Depot Wagon

embody every possible good feature required to make them what they are so frequently called —

The Aristocrats of Motordom

Every particle of material used is the best that money can buy. The workmanship is perfect, the upholstery and exterior finish superb. All wearing parts are equipped with ball bearings, reducing friction to the minimum and insuring smooth, easy running cars. The perfect mechanical construction of BAKER ELECTRICS enables us to use fewer battery cells than any other electric vehicle, at the same time securing greater efficiency and lowering the cost of maintenance. Their beauty of finish, quiet running qualities and simplicity of operation make BAKER ELECTRICS ideal for town use.

MICHELIN

Tires of the Highest Class

Mr. Wilbern sends the following unsolicited testimonial:

Cincinnati, O., Nov. 3, 1903.

MR. E. D. WINANS, Sec'y & Gen'l Manager, Michelin Tire Co. of New York.

Dear Sir:— Thirty thousand miles on Michelin tires, covering twelve countries in Europe, above the clouds in Switzerland, below the sea in Holland, from bull fights in Spain to chicken fights in England, down historic Rhine, and back again to the "land of grind organ and Monks." I have bought all kinds of tires, every known make; but the Michelin are the best, last the **longest.**

With pleasure I can recommend them to all tourists. Will tour again next spring and summer in Norway, Sweden, England, Ireland and Scotland, and will wear nothing but MICHELIN tires on my 40 H. P. Hotchkiss.

Very truly,
(Signed) Edward V. Wilbern.

Director "Providence Savings Bank and Trust Co." Cincinnati, O.

If you want the Best, follow Mr. Wilbern and buy MICHELIN TIRES

Pantasote
LEATHER

An Ideal Material for Automobiles and Motor Boats

For Seatings — Pantasote Leather wears better than the natural hide, it contains no oils to dry out, and is impervious to weather; will not crack, peel or chip.

For Canopy and Cape Tops — Pantasote Top Materials give a handsome finish to the car, are more durable than the real hide, absolutely water, stain and grease-proof, and vastly superior to the various rubber and inferior imitations of leather, as Pantasote always remains soft and pliable, and is not affected by climatic conditions.

Northern

¶ The same practical advantages which distinguished the Northern Touring Car for 1905 will characterize the 1906 products, viz.: Quietness in operation, ease of riding and remarkable freedom from vibration and dust.

Silent Northern Touring Car, 20 h. p., 5 passengers, 4-inch tires, gas and oil lamp equipment, $1,800

¶ The Silent Northern still stands alone as the car of simplest and most compact mechanism. Its encased mechanism, three-point motor support, and 24-inch fly-wheel with fan blades cast integral have demonstrated again and again their efficiency and vital importance.

¶ Power applied direct to rear axle—only one universal joint. No belts—no chains—no gaskets. No truss rods—no strut rods—and no side levers.

1906 MODELS—Model "K" 30 h. p. Touring Car with gas and oil lamp equipment, $3,000. 20 h. p. Limousine, $2,500. 20 h. p. Touring Car with gas and oil lamp equipment, $1,800. 7 h. p. Sturdy Northern Runabout with lamp equipment, $650.

Write at once for Circular 14 containing important advance information.

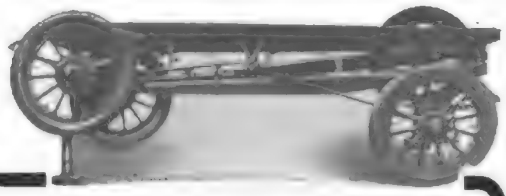
THE MARMON

"A Mechanical Masterpiece"



Front wheel and opposite rear wheel each raised over a foot.

"Only Hit the High Places"

Good old familiar automobile talk—means speed that's the next thing to flying.

But there is a time when it ceases to be a joke.

Anyone that has ever sped over country roads in a machine depending altogether on springs for its flexibility knows what "hitting the high places" means—keeps the people in the tonneau in the air, occasionally "hitting the high places" of the machine.

And what does it do to the machine of the rigid type? Does it seem reasonable that the constant pounding and inevitable twisting, binding strains are good for costly mechanism?

The picture here shown demonstrates that the running gear of the Marmon adjusts itself naturally to all road conditions. It rides into depressions and over bumps without subjecting the mechanism to binding, twisting strains. And at the same time it affords its passengers a freedom from jar, jolt or vibration—a very luxury of motion—unknown in any other car, regardless of price or prestige.

This flexibility is supplemented by full elliptic springs (which bear no driving strain), but it is primarily due to the exclusive **patented** feature,

Double Three-Point Suspension

Luxurious cast aluminum body on one frame, power plant on another frame, **each frame** suspended on three **pivotal** points. Over the roughest roads, the power plant and rear axle are maintained in perfect alignment. Rigid shaft drive (without universal couplings) and an inner driving axle that bears no weight, deliver a higher percentage of power to the wheels than is possible in any other scheme of transmission.

The natural flexibility of the Marmon conserves the strength of all parts. Its considerate treatment of the tires is a thing that Marmon owners never fail to commend.

The Marmon oiling system is unfailing; simple; has no adjustments. Starting and stopping with the engine a constant, a uniform flow of oil is forced through the hollow crank shaft directly into all the main engine bearings, crank and **piston pin** bearings. One gallon of oil runs the Marmon from 600 to 1,000 miles.

Four cylinders; air-cooled; stylish, strikingly handsome and very quiet. Replete with features that appeal instantly and forcefully to all who seek a high-grade car.

Write for Booklet No. 1 and get acquainted, at least, with the one really modern automobile.

We shall demonstrate at the Armory Show, New York.

CUMMER LUMBER COMPANY

Jacksonville, Fla 8-14-05

The Continental Caoutchouc Co.,
43 Warren St., New York, N.Y.

Gentlemen:-

I feel it is due you to give you my experience with your tires on my National 1905 touring car.

During the month of July I ran this car 1600 miles on a tour which took me through New Jersey, and over the 1905 Glidden Cup Route through New England. I was not a participant in the Touring Contest, but simply selected this route as it appealed to me. During this run I had but one puncture, caused by a nail; and, with this exception, the tires were not pumped up on the entire run, and are apparently in as good condition as when I started. The car was fully loaded at all times, and on several days was driven through very muddy roads.

I take pleasure in stating that I am highly pleased with the results secured from your tires, and I feel under great obligations to Mr. Fred. E. Gilbert of this City, who handles your goods, for advising the use of Continental Tires on my car.

This letter is all the more sincere from the fact that it was not solicited by you in any way.

Yours very truly,

N. B. Cummer

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

THE OSCAR LEAR AUTOMOBILE CO.
Automobiles
Corner Fourth and Gay Streets

Columbus, Ohio, September 5, 1905.

The Steel Ball Co., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6-day endurance and economy run at Long Branch. In a run of 3,202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of all this we fully realize and its help in getting this record for our FRAYER-MILLER car.

Yours truly,
THE OSCAR LEAR AUTOMOBILE CO.

Digitized by Google

The Expected Revolution Has Come

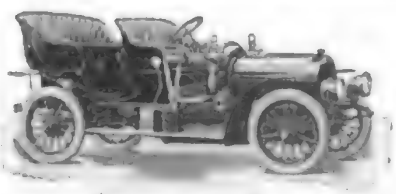
If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should not buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the two cycle two cylinder Elmore engine. Understand—the two cycle two cylinder Elmore engine produces two impulses every time the flywheel turns. As you know, the two cylinder four cycle furnishes only one impulse every fourth time the flywheel turns. In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

THE ELMORE MFG. CO., 504 Amanda Street CLYDE, OHIO



THE 1906 ROYAL TOURIST. MODEL G.

Perfect Satisfaction, Never Breaking

HOTEL TOURAINE
BOSTON

July 3d, 1905.

BRAMPTON BROS., LTD.,

Dear Sirs—It is a pleasure for me to say that the chains made by you and used on the world's tour have given perfect satisfaction, never breaking. They have carried us over New Zealand's mountains, the bad roads of Australia, and through many countries. The set sent you herewith has been used for 8,000 miles.

Very truly yours, (Signed) CHAS. J. GLIDDEN.

Weight of car, baggage and passengers, 4200 lbs.

1906 CARS

Do you want this kind of chain on your 1906 car? You can have it if you ask the manufacturer to fit the Brampton chain to your car and with no extra expense to you or the manufacturer. All standard sizes in stock to fit American and Foreign cars.

Catalogue mailed on request.

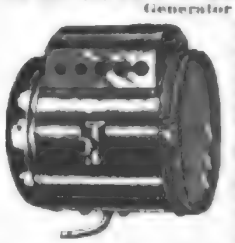
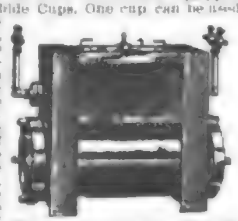
COLUMBIA SEARCH LIGHTS AND GENERATORS

Generator No. 3—Capacity 54 oz.



Will supply from one to six burners. Equipped with two Carbide Cups. One cup can be used on from one to six burners, keeping the other in reserve, or both cups can be used at the same time. When large quantities of carbide are used in the generator, considerable heat is evolved, and it is desirable to keep the generator as cool as possible



We guarantee our Generators to be better than most, and as good, if not better, than any.

Models: A 5-in. Mirror Lens. B 6-in. Mirror Lens. C 7-in. Mirror Lens. D 8-in. Mirror Lens. With Adjustable Burners

"SOOT-PROOF" WINS

Five Prizes Were Awarded to the Cars Using "Soot-Proof" Plugs

The "McMurtry" Prize for the car having the least ignition trouble was awarded to a Reo using "Soot-Proof" Plugs. These cars covered a distance of 700 miles during the National Economy Test of the New York Motor Club, October 30 to November 4, 1905.

These cars had absolutely no spark plug troubles, and the original plugs were used throughout the entire run. Thus again has the "Soot-Proof" Plug demonstrated its superiority, reliability and economy.

"SOOT-PROOF" in Name and Fact
Non-short-circuiting Self-cleaning

GARFORD
AUTOMOBILE PARTS

For the present we are obliged to abstain from soliciting orders for touring car parts described in Circulars 12 and 13. We cannot accept further orders for these parts without impairing our ability to meet the late season requirements of customers already booked. It is a vicious commercial policy which openly encourages buyers to expect products which it is privately known they cannot obtain.

We can, however, supply Steering Gears, Brakes and other parts for Power Wagons of all sizes. They are described in Circulars 2, 3, 5, 10 and 11.

The "Breech-Block" Plug

The Plug With a Handle

To take out your watch or open a *Breech-Block* requires just the same time, same tools, same effort, and one twist cleans the entire porcelain to the whiteness of snow.

To remove the porcelain only, loosen the clamping nut and it drops out of its holder, and the gaskets of copper drop with it. No digging!

It is nickeled inside and out. *Highly polished* and *dust-proof*. Sparks between two *adjustable* points and not between one point and the *shell*. Its points are *protected*.

Porcelains are *hand turned* and so perfectly glazed that soot cannot *stick* to them. Their threads are cut to perfection, and every particle of the film of cheapness is left out of them.

Postpaid, Anywhere, $2.50. Booklet free. Made by

EARL CANEDY, 2002 West Ave., CHICAGO HEIGHTS, ILL.

VOL. VIII NO. 24 CHICAGO, DECEMBER 14, 1905 $2.00 Per Year

AUTUMN RAMBLE THROUGH PENNSYLVANIA

NOVEMBER in Pennsylvania is noted for its semi-occasional days when all nature seems to be at peace, when winds are lulled, skies are clear, temperature Junish and the faint haze which o'erspreads hill and valley is often accentuated by the scattered forest fires peculiar to the season. Were it not for the numerous evidences on every hand that the sturdy husbandman has garnered his crops and has everything snug for approaching winter, one might well imagine it an exceptional day in early summer; but the trees are almost entirely stripped of their summer raiment, which, shriveled and brown, has been cast back on the bosom of old Mother Earth, whence it came. Such a day at such a season almost invariably gives one the impression of a calm before a storm—indeed, the next day is likely to be of the typical November variety, with a chilly rain and howling winds to chill all enthusiasm.

It is an ideal season for 1-day trips and it was on such an Indian summer day that a party left home in Philadelphia for a ramble to the north—with no especial objective point and, stowed away in the tonneau, a comfortable-looking and capacious hamper, prepared by the women, which made the oftentimes important question of dinner a negligible quantity. It is a comfort to know that one is not to be hampered by the demands of the inner man—or woman—and the meal schedules of rural Bonfaces, who are prone to adhere too closely to the time-table, regardless of the wants of belated automobilists.

As the travelers swept north on magnificent Broad street, the Quaker city's crack highway—14 miles long and asphalted nearly the entire distance—even the sturdy Rambler seemed to have imbibed some of the enthusiasm inspired by the perfect day, for it bounded ahead at a pace which on more

A DASH DOWN INTO RUSH VALLEY

than one occasion brought forth a warning wave of the hand from the gasping law minions who stood on the shady sidewalks, lazily swinging their clubs and doubtless deploring their haste in changing their underwear.

The foxy Quaker city automobilist, in taking a trip, always considers how he may avoid the omnipresent toll-gate—if not entirely, at least in part. At its northern end Broad street debouches into the old York road, where, in a swift-moving car, the toll-gates seem almost as numerous as the trolley poles which line either side of the splendid highway. Those in the know always side-step as much of this and any other toll road as they can. Therefore a detour via Cayuga street and Wayne avenue to Washington lane was decided on, and in a few minutes the ramblers were in the heart of historic Germantown, with its pre-revolutionary stone mansions and its high hedges. There's something about Germantown that reminds one of rural England. Indeed, a sizable proportion of its present population can trace their ancestry back to the tight little isle. The detour cost the turnpike company two tolls and as the car flashed across the old York road at Ogontz the members of the party mentally thumbed their noses and wiggled their fingers at the unsuspecting toll-taker in the little yellow house in the distance. While on the matter of toll-gates a little tip to the tyro is in order. Invariably on approaching a gate which is situated on a down grade—and many of them are—it is prudent to have something happen to the brakes, and when the toll-gate keeper comes out of his house, with his hand extended in his matter-of-fact way, to be busily engaged in trying to get the car under control. Everybody does it—indeed, one almost imagines that the toll-taker at a down-grade gate expects it, for after a shout and jotting down the license number—if he can get a glimpse of it in the dust and rush—he saunters back to his chair and his paper, confident of getting you on the return trip. But of course a different route is taken for the return trip, and when one travels again in that direction he usually relies on repeating the trick—and usually gets away with it, unless he meets at the gate another vehicle whose bucolic owner is paying toll and swapping neighborhood gossip with the keeper. Of course, on an up grade one usually pays—unless the hill is a short one which can be rushed.

Crossing the old York road at Ogontz, which, by the way, derived its present name from the country seat of Jay Cooke, a financier of note during the rebellion, and which in days agone bore the euphonious title of Shoemakersville, the quakers sped on through the crisp brown leaves, past pretty Rydal and Meadow Brook, with its golf links and handsome hunt club house, till they swung into the old Second street pike at the top of Hallowell's Hill. By the way, there is a certain enjoyment, which one cannot exactly explain, to be derived listening to the zip! zip! zip! the wheels make in crushing down a bunch of dry

Digitized by Google

ALONG THE DELAWARE AND LEHIGH CANAL NEAR ERWINA—A PICTURESQUE BIT OF SCENERY

leaves in the road. Who can explain it? A psychologist could get four or five sticksfuls out of such a pregnant subject as that.

From the top of Hallowell's hill one gets a birdseye view of the Huntingdon valley, one of the most fertile agricultural sections of eastern Pennsylvania. As far as the eye can see are fields of various shades of brown, checker-boarding the prospect, every other one, apparently, dotted with shocks of corn. From such a height the Indian summer haze becomes apparent even to the casual observer. Far off, the foothills of the Blue mountains are clothed with its misty indistinctness almost to the point of obliteration. But while the tourists commented on it they had dropped down to the floor of the valley, over the bridge across Pennypack creek and up the opposite slope past Bethayres station on the Reading's Bound Brook route between Philadelphia and New York. It is a rather stiff climb and a long one, but the Rambler took it on the high speed without a murmur. Passing the ancient Lady Washington inn, the oldest hostelry on the pike and famous for having entertained within its four walls in days agone many men and women famous in state and nation, the top of the grade was reached, where by turning to look over the road it was just possible to distinguish through the haze old Billy Penn on the top of the city hall, just 15 miles away.

The route traveled was a famous stamping ground for cyclists in the last decade of the nineteenth century—sounds a long while ago, doesn't it? and leads to one of the old-fashioned inns where the wheelmen were wont to congregate in the '90s the Sorrel Horse. The road forks immediately in front of this famous caravansary, and there was some discussion as to which should be taken. To the left lies Hatboro, to the right Southampton. The city folk had often been in Hatboro, but once in Southampton—to the right, then. And over the fair to good road they make good time up hill and down dale through Southampton and Cornell, and in a quarter of an hour reach the Richboro and Pineville pike at the first-named place. Northward they went and ere long, after mounting a short but steep grade, the wide expanse of Rush valley burst into view, and as they descended the hill under brakes they saw trouble ahead. A four-horse team was drawing a loaded hay wagon up the long hill, and as the leaders caught sight of the motorists sliding rapidly down upon them they began to act like real circus horses. They stood on their hind legs and waved their front ones in the air. The motorists stopped and the camera man took advantage of the opportunity to snap off the scene. The driver jumped from his seat and shouting to the people in the car to stay where they were, he unhitched the two leaders and took them to the rear of his load, where he tied them securely. Returning to the two wheelers he stood at their heads and shouted, "Come on!" Releasing the brakes the car slid slowly and noiselessly past and as it swung around the turn beyond the travelers looked back and saw him putting his team in shape for the long pull to the crest.

This Richboro and Pineville pike is such an up-and-down affair that the Philadelphians had great bad luck at the toll-gates, their brakes getting out of order with such persistency as to save two dimes in the coin of the realm. Who says there is not a silver lining to every cloud? Half-way to Pineville the old covered bridge over the Neshaming came into view.

At Pineville the pike veers to the westward in order to avoid Buckingham mountain, which is quite the highest ground in

BEAUTIFUL PHILLIPS' MILLS, WITH ART SCHOOL AMONG TREES AT RIGHT

Digitized by Google

ENTERING NEW HOPE OVER THE SMOOTH DOYLESTOWN AND NEW HOPE PIKE

ucks county, and, the mountain having een left to the rear, the party crossed La-aska creek, and climbed up to Centreville, Buckingham, where the Pineville pike de-ouches into the Doylestown and New Hope ke. Here another council of war was held d the route question discussed in all its earings. Finally some one mentioned din-r—it was then 11:30—and the camera man ttled the matter by averring that he knew e best place in Bucks county to spread the nch for the party.

"To the right then," he said, and once ore the car was under way and headed to-ard the Delaware, 8 miles away, passing Centreville one of the numerous inns here General Washington slept overnight d the hostelry was over 25 years old when happened!

Through Greenville, or Holicong, the road winds through a country which fairly teems with reminders of the redskins' presence there over 100 years ago. Almost every hill, creek and village has an Indian name in addition to its English one, and in the majority of instances the former is the more sweet-sounding. Beyond Holicong the ramblers again, after a downward rush through the sweet-smelling country, crossed Lahaska creek, which follows the road around the base of Buckingham mountain—or perhaps it was the road that did the following. Lahaska, a pretty little village, lies just beyond. Its name, which of course is of Indian origin, is variously rendered in the old records—Lehoskuk, Lehaskee and Laskuk—and means big mountain—referring, of course, to Buckingham mountain, the highest ground in this section for miles around.

Beyond Lahaska the road begins to drop gradually, and the city people had not progressed far before the camera fiend, pointing to the left, said: "There's the place!" And under his direction the Rambler was guided under the trees as near as possible to one of the biggest springs it has ever been the writer's fortune to see. Aquetong spring—also called Ingham's spring—is 15 feet deep and provides a sufficient volume of water to feed a lake covering 17 acres. It's cool, limpid water doubtless quenched the thirst of the red man 100 years ago as it does that of the automobilist nowadays. It is often mentioned in the old records, and many an Indian campfire has doubtless been reflected from its cool depths. A peculiar feature of Aquetong spring is that it has a subterranean connection with a spring at Deer park, several miles away across the hills. It is a common practice to drop a chip, with one's name written on it, in Deer park spring, and in 3 days or thereabouts it can be found floating in Aquetong spring.

It was at this picturesque and historic spot that the party discussed its cold ham, chicken and other solids and liquids which the automobilist feminine knows so well how to prepare. And all hands were willing to admit that when he proposed the lunching-place the camerist knew what he was talking about.

In a very few minutes after the sightseers started they came to Aquetong lake, which is formed by the overflow from Aquetong spring. Then came the Doylestown and New Hope pike, and almost before they knew it they had surmounted the last rise separating them from the Delaware and the autumn beauties of the famous valley lay spread out at their feet. Below in the foreground lay New Hope, which is famed in history as the place where Washington's ragged army crossed the Delaware on its way from its winter quarters at Valley Forge, in pursuit of the British army under Lord Howe, which had just evacuated

LAKE COVERING 17 ACRES, FED BY COOL, LIMPID WATER FROM AQUETONG SPRING

Philadelphia and was retreating toward the Hudson. It was called Coryell's ferry in those old revolutionary days, and Lambertville, on the Jersey side, wasn't even thought of then. A grist mill on the Pennsylvania side was later named Hope Mills, and when it burned down and a new and larger one was built the owner named it New Hope Mills, the little town which gathered around the mill and the tavern being eventually named New Hope. .

From the top of the long grade back of New Hope a charming view of the Delaware valley for 20 miles in either direction is had and the travelers bowled down the grade and through the quaint town without a halt, turning left into the river road alongside the Delaware and Lehigh canal, which parallels the river for miles. The road hugs the canal like a brother, crossing to the river side from time to time as the rocky promontories intrude too closely upon the bank and returning when the cliffs retreat.

Following the river road Phillips' mill, which once performed the usual function of grinding the neighboring farmers' grain into flour and meal, was soon reached. Several years ago it and the accompanying dwelling were acquired by an artist who spent a wad of money and transformed the place into an art school, where students may study art and enjoy an outing at one and the same time. It is quite a popular resort in summer, and nature furnishes opportunities galore here for the students to study her charms.

Just above Phillips' mill the road passes through Centre Bridge, and still farther west—for the river just here runs almost due east and west—the party astonished the Lumbervillers by spinning through their quaint little canal town at a 20-mile clip. Soon they arrived at Point Pleasant, where the Delaware resumes its general north-and-south direction. At this place the romantic Tohichon empties into the Delaware, and the scene presented by the charming little village as the farthest end of the covered bridge was reached on this warm and still November afternoon—its comfortable homes straggling along the Pennsylvania shore against the high spruce and laurel-clad hills of almost perpindicular rock—will hold a place in the memories of the tourists.

So they contented themselves with enjoying the scenery on the fly, zip-zipping through the dry leaves as they passed under the still partly-clad trees, and crossing and recrossing the canal as the cliffs encroach on the road and force it to the farther side. The camera man reminded his friends just here that on such a day the river road is preferable to the hot and hilly pike, 4 miles to the west and running almost parallel with the river.

About 8 miles from Point Pleasant is Uhlertown. Here it is possible to cross the Delaware to Frenchtown, N. J., and get somewhat better roads up to Milford, but the ramblers decided to stick to the river road on account of the scenic beauties the Pennsylvania side afforded, not to mention the fact that in this weather the road is rated from fair to good. Uhlertown should really be called Moyertown—a man named Moyer bought the whole town outright a few years ago for $15,000—but Uhlertown it has been for half a century, and the natives in these country towns are a little set in their ways, and Uhlertown it remains. These little bits of history in passing are handed out gratuitously by the camera fiend who, it appears, had bicycled through this territory some years ago.

Just above Uhlertown the Delaware describes about 150 degrees of a circle, forcing its way through some foothills that very nearly approach the mountain stage. At Lodi, Bridgeton and Upper Black's eddy—Point Pleasant, about 13 miles back, was at one time called Lower Black's eddy—the cliffs close to the left become more prominent and seemingly closer to the road the farther they advance, shutting off the sunlight. At Narrowville—a straggling village in which it is possible only in certain places to squeeze a house between the road and the cliff—the rocky heights so encroach on the road that in places it is just about wide enough for one vehicle to comfortably amble along. This bit of road through the narrows costs the county and township authorities quite a pretty penny every year. After a heavy rainstorm the road is always badly washed—not alone in the usual way, but also from veritable cataracts from the cliffs above. It appears that the natural drainage is not sufficient to carry off the surface water into the gullies and gorges here and there in the cliffs, and as the slope is riverward, in many places the water drains directly over the edge of the cliff onto the road, from 250 to 300 feet below. It may well be imagined that in wet weather this road is impassable and that deep holes are worn in the many places where the oftentimes formidable, if temporary, cataracts have done business.

Beyond Narrowville the prospect opens out somewhat, and once more the tourists were out in the sunlight. The driver had been looking at his watch and taking a squint at the sun every now and then; but the camera man, who has packed up his kit for the day—having run out of plates—called his attention to the fact that "there's to be a three-quarter moon tonight, and there's no need of worrying about getting home before dark." He had hardly uttered the words when the right front tire went flat with a spiteful hiss. An ordinary wire-nail of commerce, bent almost v-shape, had punctured both shoe and inner tube. That nail cost many, many minutes before the party reached home. It was indeed fortunate that there was a moon and that the night was clear.

At Kintnersville they left the Delaware to swing once more into its north-and-south course and headed for home by way of the pike. After such a long stretch of level road as the route along the river gave them they rather welcomed the ups-and-downs afforded by the pike between Easton and Philadelphia. Indeed, it almost seemed as if there were no levels—they were going either up or down hill constantly—a pleasant sensation and one that was enjoyed.

A turn to the right here would have headed the travelers toward Easton, the

AQUETONG SPRING, 15 FEET DEEP

Digitized by Google

Water Gap and the Poconos. That would have meant a trip of 2 or more days. With the conditions ideal, it was with regret that the turn to the left was made and the home run finished. But the intention is to do the gap and the Poconos some day. The Monroe and Pike county roads are famous, not alone as well-made and well-kept highways, but as affording the lover of beautiful scenery unlimited opportunities of enjoyment. That entire region is the summer playground of tens of thousands of Philadelphians, and even in winter the all-year class of the hundreds of resorts are fairly well patronized.

It is an almost constant climb until they reached Ferndale, where they took the left fork to Revere and then followed a good dirt road to Ottsville—a country dotted at frequent intervals with pre-revolutionary farm houses and inns, one of the latter, the Harrow, having, of course, been honored by an overnight stay of the father of his country. It is indeed a modern hostelry in this section of the country which has not put up the immortal George for at least 1 night. It would appear that G. W. spent a great deal of his time going about the country doing 1-night stunts at the various caravansaries within 100 miles of Philadelphia in all directions. There are so many of them that he could not possibly have stayed more than 1 night in each and attend to his presidential duties at the capital. What a boon an 18-horsepower automobile like ours would have been to George in those days! All our ancient highways would now be dotted with roadside pumps labeled: "Here G. W. stopped and filled his radiator," with roadside stores bearing the legend: "G. W. bought 1 gallon of gasoline here on June 16, 1779," etc. Besides, with an automobile George could have seen to it that not one of the inn-keeping gentry was overlooked—not only near Philadelphia, but along the entire coast from Portland to Jacksonville.

That wire nail had cost so much time that the shades of night were falling fast as through Tohickon park they passed. The park is laid out on the banks of the same picturesque Tohickon, which they passed early in the afternoon at Point Pleasant,

Bridge Across the Neshaming at Rush Valley

where it empties into the Delaware. They hurried on to Pipersville, 35 miles from home, where the driver decided to make a lasting job of the tire. This would take some time and as the culinary ability of the cook there had been piped off to the camera man some time before, and all hands had full-fledged automobile appetites, it was decided to give the Pipersville boniface an opportunity to make good. That he didn't was the consensus of opinion after the travelers had all been tucked in and were bowling down the pike Philadelphiaward under the mellow beams of three-parts-full Luna. It was almost ideal.

A word on the meal problem. It's getting to be a serious thing—this taking the say-so of somebody who heard somebody else tell Jones that he heard Smith say that the Bungtown hotel puts up good fodder. It ought to be more definite. The national governing body of automobilists should make it its business to inquire into the merits of and select official hostelries in various sections of the country. Some bucolic innkeepers are prone to clap on a 50 or 75 per cent increase on automobilists on the theory that anyone wealthy enough to travel in a motor vehicle has money to burn.

What with the headlights and the rays of the moon there was nothing to prevent the driver from burning up the road with as much confidence as if it had been mid-day. And he did. There were no coppers to fear—just yet, for the motorists were still in Bucks county—and they fairly flew up hill and down dale, through Plumsteadville, Danboro and Dyerstown, slowing up as they reached Doylestown—doing 11 miles in about 25 minutes. Then swinging into the Doylestown pike they kept on without a stop—keeping a good lookout meanwhile at bridges for the trolley cars, which ran at the side of the road. These bridges are in almost every instance several feet narrower than the road, and as the trolley tracks cover fully half the space on all of them, careful work is necessary on the part of automobilists, especially at night.

At Bridge Point they cross the Big Neshaming, an Indian name meaning "two streams making one," and 4 miles farther along pass over the Little Neshaming gleaming in the moonlight like a silver ribbon. Then follows quaint and quiet Horsham, with its quaker meeting house gleaming among the trees back from the road, and in a few minutes more they slid down the hill into Willow Grove, which at this time of the year gives little evidence of the fact that in the summer season it is one of the most popular suburban pleasure resorts in the country.

No better idea of the power of money, judiciously expended, to change a landscape, can be had anywhere in this country than at Willow Grove. Ten years ago it was lonely farm land, but blessed with a good location. The Philadelphia Rapid Transit Co. saw the possibilities, spent $100,000 in transforming the corn and grain-fields into a pleasure park, where the world's famous bands and orchestras may be heard during the summer months, and now nearly 10,000,000 fares are collected during each season by the transportation companies in getting crowds to and from Willow Grove.

Now they were on the old York road—with its toll-gates and its ambushes—and careful driving was necessary. The route is well lighted now all the way into town, not alone by fair Luna, but by hundreds of electric lights as well. So on they went through Abington, coasting down the long hill to Noble, then up again to Jenkintown, and down and up, down and up again, past Ogontz, where they crossed the present road on the outward journey in the morning, Milestown and Branchtown, under the Reading bridge at Logan and then out into Broad street, where the asphalt seemed unusually smooth after more than a 100-mile journey over all sorts of roads. One of the joys of making this trip at such a time is that one imagines he is getting the best of Jack Frost and encroaching on old winter's preserves. But it is an ideal tour and one that can be enjoyed in fall weather.

A Picturesque Picnic Spot

THE CRY FOR MORE AND ITS RESULT

MORE power, more speed, more seating accommodations, more length in the wheel base, more flexibility of motor control, more brake efficiency, more positive lubrication, more cooling surface in the radiators and the dozen other mores for which owners of automobiles have been crying this year are being served for the coming season by most of the big motor car builders. The maker who does not include such in the sum total of his 1906 machine will find his stands at the coming exhibitions somewhat deserted, whereas his competitors' spaces will be the magnets of the show. The craving for excellence and supremacy in the mind of man is so dominant that in his selection of a motor car only the best and the one coming closest to his conception of a perfect machine will suffice. The automobile builder is wise in giving what is desired, providing those wants are in harmony with accepted engineering principles.

But why more power and more speed when rural municipalities are insisting on lower speed limits and city authorities are urging the police to enforce speed regulations, to say nothing of their contemplating new and more binding ordinances? Why guarantee every machine to travel 60 miles an hour on average roads when the law says 20 is enough? Why increase cylinder capacity in order to make racing monsters out of the pleasure cars?

The answer to all is—satisfaction. With most owners it is not what they want the machine to do during ordinary travels, but what it can do when an emergency arises and power—perchance speed, too—is needed. The athlete does not require the maximum muscular development for football practice, but the maximum is frequently not sufficient when the final match with a dangerous competitor comes. The ordinary horse can trot along with the fastest track king on the park drives, but is hopelessly vanquished in the race.

So the pleasure automobile, although not designed to make records on the beach, must have ample power for the steepest hill, the muddiest road and the deepest sand. The strength of a chain is measured by its weakest link and the value of the motor car, not by what it can do on the boulevard, but what it can do on the poor country road, on the muddy hill, or through continuous miles of sand. It is for the fulfillment of these requirements that the owner has raised his ceaseless cry of "more," which he will continue to utter until a machine is produced that can truthfully be termed a perfect machine in the worst weather and on the worst roads.

The cry has not been raised in order to turn the highways into race tracks—though some may use them for such purposes—but to secure a machine capable of successfully negotiating any road encountered, in the east, the west, the north or the south, without injury to itself when traveling under full load.

The majority of the cries for more have been heeded. Tonneau capacity is now placed at five instead of three; instead of additional hinged seats, permanent revolving or lift seats with comfortable back supports are provided. Not the least interesting point in this connection is that the latter do not interfere with the entrance or in any manner crowd the passengers. This increased seating has resulted in a car in which the owner, his friends and the chauffeur can travel in comfort.

Greater wheel base has been served scantily by many builders for next year. The present average of from 100 to 108 inches has proved sufficient for general use on American roads. This length seems sufficient to give easy riding over ordinary surfaces at high speed, at the same time giving liberal access to the rear seat. The longer wheel bases, ranging between 110 and 120 inches, are used extensively abroad, but it must be remembered that the billiard table roads of France and England are more suited to such measurements than the ordinary American turnpike. Excessive wheel bases besides calling for greater skill in car control require additional weight, each pound of which adds its quota in tire expense and fuel supply, as well as a general strain on the machine.

Brake efficiency cannot be overestimated. Readers of MOTOR AGE are familiar with incidents occurring resulting in serious accidents where emergency brakes have failed to work. It is in guarding against such repetitions and making the car capable of traveling the hilliest parts of the land that this increase has been made, and few points of improvement are more welcomed. If automobile drivers will accustom themselves to more frequent use of the emergency brakes the loss of presence of mind, when cool judgment is demanded will be less frequent and accidents oftener avoided.

Tire diameters are slightly on the increase, particularly those fitted to medium powered machines, whereas with the biggest touring machines this year's measurements, in most cases, remain in spite of the additional power and weight included. There is a reason for this. Tire makers are improving the quality of materials and the methods of manufacture, thereby making the 4 or 5-inch tire for 1906 capable of withstanding greater service than the 1905 tires of similar diameter.

All in all, the cry for more on the part of the owner is justified and it is complimentary to American builders that the cry has been heeded. May the things that are added not be abused; they will be needed, and then and only then will their full value be appreciated.

MR. MUNSEY'S OBSERVATIONS IN EUROPE

FRANK A. MUNSEY, the magazine publisher, visited Europe and studied the effects the motor car is producing on the continent. He found that France, where the roads are like boulevards, attracts tourists from all over the continent and from America.

He found the way to see Europe is by means of the automobile, not alone because of the good roads, but from the point of independence, convenience, speed, and other advantages which the motor car offers. He found also that many Americans of wealth go to Europe and purchase cars there, rather than ship American cars abroad. He found that Americans spend fortunes each year in automobiling—for cars, for supplies, for hotel accommodations, and for other necessities, to say nothing of luxuries.

Mr. Munsey knows what American roads are—he has told in his magazine what they are—and, knowing the American roads, he has taken the trouble to ascertain what the effect would be were America to have roads such as Napoleon built in France. He found that hundreds of Americans who now pass several months each year in France touring, and who have bought motor cars of foreign make, would stay at home and buy American cars and tour America if America had good roads.

He found that the vast sums of money that go to the makers of automobiles, to the railroads, to the hotelkeepers, to the servants, to the shopkeepers, to the cabmen and to sundry other people in France, amounting in the aggregate to millions, would stay in America and be of benefit to Americans.

All of which illustrates the necessity for the railroads, the hotelkeepers, the resort people, the newspapers and the motor car manufacturers of this country banding together to help along a good cause—good for the pocketbook, good for the reputation of the country, good for the farmer, good for prosperity and good for American citizenship.

Mr. Munsey is not interested in the sale of automobiles, but he is far-seeing enough to realize that it will pay to keep Americans at home and to turn the money now sent to Europe each year into the building of a road system in our own country and in the purchase of automobiles made in America and by Americans.

It might be suggested to some people that it is the bit goose that flutters.

If the Florida meet is not a success it will not be because of a lack of cars, if press agents' words can be relied upon.

That man Pennington reminds one of the sun in winter—he gets around in the automobile game once in a while.

There has been so much talk about 1906 cars that when January 1 comes look out the new year is not called 1907.

Nobody ever seriously supposed the French meant what they said about giving up running the Bennett or Vanderbilt road races. The whole story was too much of a joke to be true.

While some makers are apparently dropping prices, others are boosting them; while some claim to never have made a cent, others are declaring dividends. Now the public can figure it out any way it likes and with almost any degree of satisfaction.

Iowa is coming to the front for good roads. The Fayette County Agricultural Society has decided to offer prizes for the best kept ½-mile stretches of roads in the county during 1906. The agricultural societies are setting an example even for the automobilists. It is 2 to 1 that the Fayette county farmers are not motorphobists.

T W

Independents' tire company, the Ajax Standard Rubber Co., already organized, the plant to be at foot of East One Hundred and Sixth street, New York; Horace de Lisser, organizer.

Percy Megargel covers worst part of the Great American desert.

Nowadays in the automobile business father and all the other members of the family are working.

The loss of the Pyrenees cup by theft was too much even for somebody to suggest that it was taken for advertising effects.

While announcement has been made of the route for the Glidden tour for 1906 nobody has heard much of a howl about any Chicago-St. Paul tour.

The fellow who has just made a machine to travel on land, water or ice, overlooked a bet by not making it capable of doing a little act among the clouds.

If the motorist buys one each of all the new things he sees at the forthcoming shows he will have to secure two or three extra automobiles to carry around the goods.

Even if Congressman Morrell's bill to provide for federal control of automobiles is defeated there will be some consolation in the fact that the government has taken notice of the motor car, which it never has heretofore.

Is it to be supposed that the success of the licensed or the independent show in New York depends upon which secures the patronage of the four hundred? The four hundred did not save the Salon des Importateurs, however.

RISE, YE MOTORING HOSTS, AND FIGHT

AT LAST the federal government is to take up the automobile in the matter of regulations, Congressman Morrell, of Pennsylvania having introduced a bill providing that the interstate commerce commission be empowered to examine drivers of automobiles and issue licenses to those who wish to travel in different states.

The worst part of the bill, outside of the fact that it is rank class legislation, is that each operator of an automobile must pay a fee of $50 for each 3 years, the term for which a license is proposed to be issued if he tours any.

If there is anything that will effectually kill off touring, and consequently the work for good roads, it will be the passage of such a bill. If the automobile associations, the clubs, and motorists in general permit this bill to become a law by being passed by the house and senate and to be signed by the president, they alone will be the sufferers and will have nobody to blame but themselves.

This, too, is something over which the manufacturers and the manufacturers' associations can well afford to assert themselves—it must not be passed!

A year or so ago Congressman Grosvenor, of Ohio, sought to have all classes of motorboats from the dinky little 15-footer gasoline craft to the sea-going ship brought under federal inspection and license. It was a dangerous thing for the motor boat men and the motor boat makers. Not a single motor boat maker shirked his duty; he went out to kill this proposed legislation and killed it. One did not wait for the other—each got busy and constituted himself a committee to take up the matter with owners and through them with congressmen all over the country. Thousands of petitions were sent to members of congress and boat makers appeared before the committee to which the bill was referred to give the committee the information the makers knew it did not possess. The result was the bill never got past the committee.

Work to kill off this new bill should be started immediately, else inactivity will be taken to indicate that it is not objectionable to the automobile fraternity and its passage may become a fact.

Outside the fact that it is rank class legislation, that the license fee is excessive and probably illegal, there is some probability such a license is in violation of state rights. It is illegal and unjust for the federal and state governments to exact license fees from nobody but the automobilists.

If this bill passes and it is held each state has the right to regulate its own automobile affairs, each and every state may exact from each automobilist who dares to enter a state a license fee, so that if an automobilist desires to tour through every state in the union he will have to have forty-four state licenses when the two new states are admitted and the federal tag as well.

Forty five tags on a car!

Pay a license fee of from $75 to $200 a year!!

This whole matter may be taken as a joke, but it is too serious on which to take chances.

WANTS A TOURING TAX

Representative Morrell Introduces Bill Into House Proposing Radical Legislation

Washington, D. C., Dec. 9—Automobile tourists throughout the country will be subjected to all sorts of inconveniences if a bill to regulate the operation of automobiles and other motor vehicles between the states, introduced in congress this week by Representative Morrell, of Pennsylvania, is enacted into law. The bill, which was referred to the house committee on interstate and foreign commerce for action, provides that on and after January 1, 1907, it shall be unlawful for any person owning or operating an automobile, whether the motive power of the same be electricity, steam, gasoline, or other source of energy, to operate the same for business or pleasure along the public highways of any state, territory, or dependency of the United States, or of the District of Columbia, so as to pass from one state into another state, territory, etc., without first undergoing a special technical examination as to his ability and power to manage, control and direct automobiles with precision and safety, and obtaining a license or permit to operate automobiles between the states from the regular constituted authorities of the United States, as set out in the following section:

"That the interstate commerce commission of the United States shall have power to conduct the examination prescribed in this act, under such rules and regulations as may be required, and shall appoint a technical expert to test the personal fitness, practical ability and mechanical knowledge of any applicant, owner, or operator of any automobile or other motor vehicle as aforesaid, at such times and places as it may determine. Said technical expert shall be certified by the civil service commission of the United States to the interstate commerce commission, and shall receive a salary of $1,200 per annum and $4 per diem for expenses while absent from Washington in the necessary discharge of his duties."

The bill then goes on to prescribe that every owner or operator of any automobile passing a satisfactory examination before the technical expert shall be licensed by the interstate commerce commission to operate automobiles between the states and territories, District of Columbia and the states, or vice versa. Such license will be good for 3 years from the date of its issue and may not be renewed without examination. Every automobilist passing the required examination shall, before receiving his license or permit, pay into the treasury of the United States the sum of $50. Whenever it appears that any automobilist licensed under the proposed law has been convicted on several occasions in any federal, state, or municipal court of violating the proposed law, or any state or municipal law governing automobiles, the interstate commerce commission shall, after proper notification, cancel and revoke the license of said automobilist and shall not reissue the same. Any automobilist violating the provisions of the proposed law will be subject to a fine of not less than $500 nor more than $1,000, to be recovered in any district court of the United States in the district where the violation occurred. The proposed law is to take effect from and after its passage.

Thousands of automobilists throughout the country will undoubtedly rise and fight this obnoxious legislation to the last ditch. The enactment of the Morrell bill would not only cause tourists to have to pay $50 into the government's strong box, but they would be subjected to many annoyances at the hands of the technical expert, whose rule would be supreme. Representative Morrell is going to have a pretty hard time getting his bill enacted into law, particularly as many members of congress are enthusiastic automobilists. It is class legislation of the rankest kind, Washingtonians think.

Following the lead of Representative Morrell, it is reported that State Senator Clagett will introduce a bill during the coming session of the Maryland legislature to levy a tax of $50 on all automobiles used in Prince George county, Maryland. It is said Senator Clagett has been prompted to take this step because of the numerous complaints made by farmers in the county that their horses have been scared by passing automobilists. Washington automobilists view with alarm this new agitation to put a tax on them, as the runs to Hyattsville, Bladensburg, and other points in Prince George county are popular with them. If the Clagett bill is introduced in the legislature it will be bitterly fought, not only by the automobilists of Washington and Maryland, but by the hotel and business men of the county, who think such a measure would be a step in the direction of retarding progress.

QUAKER DATES NAMED

Philadelphia, Pa., Dec. 11.—At the annual meeting of the Philadelphia Automobile Trade Association, at the Hotel Hanover, the following officers were elected to serve during the next year: President, A. E. Maltby, Winton; vice-president, Gilbert S. Smith, Motor Shop; secretary and treasurer, I. J. Morse, Locomobile. The board of directors will consist of the foregoing officials and W. F. Smith, Rambler, and Daniel Cohen, Reo. Besides the annual election the main business of the meeting was the selection of the date for the annual show, which will be held in the south pavilion of the national export exposition, in West Philadelphia, February 24 to March 3. The managership of the show was accepted by Chester I. Campbell, of Boston.

MAXWELL CHICAGO PLANT

New York, Dec. 12—The Maxwell-Briscoe Motor Co., of Tarrytown, has made its announcement regarding its Chicago plant. The company states it has secured a building which will give 60,000 square feet of floor space. It runs from Seventy-third to Seventy-fourth streets at Grand Crossing. The new plant will have a capacity of 1,500 machines. The method of the Maxwell-Briscoe company will be to ship the parts from its eastern factories at Tarrytown and Pawtucket and have them assembled for the western trade at Chicago. The move was made on account of the heavy railroad rates.

VANDALS SPOIL A TEST

Nails Sprinkled Along Route of French Runabout Trials Delay Naming Winner

Paris, Dec. 1—Contestants who took part in the runabout test organized by L'Auto will have to wait several days before they find out who won the event. On the final day's run vandals scattered tacks and bent nails over the course and so many punctures resulted that the test was stopped at Mantes with many of the machines on flat tires. The officials then decided to appeal to the Automobile Club of France and are now awaiting the decision of the committee which has taken the matter in charge.

When the Automobile Club of France has been consulted the final awards will be made. If the final day's part run is not ruled out of the contest victory will rest with Barriaux, in a Vulpes, who finished first in spite of five punctures. If the final day is ruled out, Gachet and his Lacoste-Battmann, leading the seven contestants at the end of the fifth day, will be the winner of the event.

The 5 days finished without any reversals in form except one—that of Renonce in his Gregoire, whose tires punctured on the morning of the semi-final day of the run and gave him so much trouble throughout the day that he reached the goal with 350 points penalization against him. The handicap was too great for him to overcome, although he had completed 4 days without a black mark against him.

On the final day's run nine contestants started, but owing to the road being sprinkled with nails every tire was punctured and several of the machines dragged into Mantes hours late, with all the tires flat.

The 770 miles of the course were practically covered in remarkable time by the little machines when the horsepower, weather and other details are taken into consideration. Seldom is a car equal to 6 days' consecutive traveling over muddy and snow-covered roads, 75 miles each day, without a break or serious mishap. The cars were put into an enclosure each evening after the run and only absolutely necessary repairs were allowed to be made by the drivers. No cleaning of engines or other work tending to make the next day's run easier was permitted.

Awaiting the decision of the A. C. F. the standing in the test is as follows:

Final day counted: 1, Barriaux, Vulpes; 2, Lionel de Dion, de Dion; 3, Cormier, de Dion; 4, Gachet, Lacoste-Battmann; 5, Bardin, de Dion; 6, Taveneaux, Grégoire; 7, Rochay, Lacoste-Battmann; 8, Thomas, Lacoste-Battmann; 9, Renoncé, Grégoire.

Final day not counted: 1, Gachet, Lacoste-Battmann; 2, Cormier, de Dion; 3, Barriaux, Vulpes; 4, Lionel de Dion, de Dion; 5, Bardin, de Dion; 6, Thomas, Lacoste-Battmann; 7, Taveneaux, Grégoire; 8, Rochay, Lacoste-Battmann; 9, Renoncé, Grégoire.

On Monday last the speed trials were held at Chanteloup. These consisted of a 1 kilometer flying start on the level, a kilometer flying start uphill, and a standing, starting,

Digitized by Google

and stopping test of 500 meters. In the flying kilometer L. de Dion made the best time, being clocked in 1 minute 40 seconds. In the flying start, uphill, kilometer, it was Barriaux, in a Vulpes, who carried off the honors in 4 minutes 5⅘ seconds. Gachet, in a Lacoste and Battmann, starred in the 500 meters standing start and stop, doing the stunt in 57⅘ seconds. In the final summing up, each competitor being penalized one point for every ⅛ second over the best time in each trial, L. de Dion was first, with 86 points' penalization. Gachet was second, with 127; Barriaux third with 176, Cormier fourth with 209, Bardin fifth with 366, Thomas sixth with 437, Rochay seventh with 488, Tavenaux eighth with 844, and Renonce ninth with 1,307.

The Automobile Club of France has decided to adopt the suggestion of the Marquis de Dion which was first noted at the close of the last Bennett race. This was to substitute for racing events a grand continental tour which would form a great reliability contest. The provisional conditions which have been issued, state that the course will be of something over 3,100 miles, mapped out to include portions of France, Belgium, Germany, Austria and Italy. The halting places will be made, more or less, the scenes of public exhibitions of the competing cars and a general sort of international fraternization. The jury to decide the awards at the finish is to be made up of an international selection of judges nominated by the competing clubs. Each stage is to consist of from 186 to 248 miles per day. There are to be four classes of competitors, each of which will be judged distinctly and separately. These classes are distinguished by weight of body, seating capacity and total diameter of cylinders. The lowest class is intended to comprise vehicles capable of maintaining an 18-mile per hour average speed, and the total piston area of the engine must not be greater than 86.59 square centimeters—which in the case of a single-cylinder car would be equivalent to a bore of 7.4 inches. This car must have a two-seated body, weighing not less than 1,651 pounds.

The second class is supposed to be able to maintain an average speed of 22 miles per hour, and the piston area is limited to 226.19 square centimeters, which might represent a two-cylinder car of 4⅘-inch bore; a double phaeton body must be fitted here weighing not less than 440 pounds. The third class is supposed to run at a speed of 25 miles per hour. The piston surface is limited to 346.36 square centimeters, or equal to a four-cylinder engine with a bore of 4⅕ inches. The body weight, three seats being insisted upon, must weigh not less than 825 pounds. The fourth and highest class of all, is supposed to be able to maintain an average speed of 28 miles per hour, piston area in this case to be limited to 430.92 square centimeters, or equal to a four-cylinder engine of about 5½-inch bore. A six-seated limousine is insisted upon, the total weight of which must be not less than 1,116 pounds.

It is said at present that the automobile clubs of Germany, Italy and Austria are favorably disposed, and will take part in this grand tour of Europe.

BIG GATE AT OLYMPIA

Figures Show That 129,372 People Attended Recent English Show —Pyrenees Cup Stolen

London, Nov. 30—Aftermath of the recent Olympia show demonstrates that in point of attendance at any rate the late exhibition exceeded any previous affair of its kind ever held in England, the official figures on the attendance claiming 129,372 for the 6 days, a mark which far exceeds the Chicago show of last winter, when 103,000 people were said to have passed through the gates. Chicago, too, had 7 days—one more than Olympia, but zero weather offset this advantage. This 129,372 also exceeds the gate at the show held in Olympia hall last February, when 125,272 people were checked in. As was the case at the last affair, the attendance on Wednesday was the largest, being 25,404 as compared with 23,112 of the first show. Following is a table showing the attendance at this and the previous show:

	Second 1905 show	First 1905 show
Monday	18,532	16,846
Tuesday	20,578	20,216
Wednesday	25,404	23,112
Thursday	18,240	20,734
Friday	21,568	21,484
Saturday	25,000	22,880
Totals	129,372	125,272

Statisticians, too, have been at work on the value census of all cars, chassis, etc., at Olympia and the figures of H. Hewitt Griffin indicate that the last show total was beaten only by a narrow margin. The average car value was just a shade over $3,000 and nine countries exhibited, the British-made goods representing 55.177 per cent as compared with 44.823 per cent of all the others combined. England, of course, ranks first with cars valued at $756,985. France was next with $403,510. Germany was third with $114,175, Scotland fourth with $76,750, Belgium was fifth with $47,250, America sixth with $41,825, Italy seventh with $41,720, Switzerland eighth with $24,500 and Holland ninth and last with $6,300. As compared with the previous show, the late exhibition only had $16,9150 more.

The Pyrenees cup, the trophy won by M. Sorel in France's big tour last August and valued at $5,000, was stolen the last day of the Olympia show and so far no trace of the massive silver affair has been discovered. It is feared the thieves have melted it up, which will make it necessary for the de Dietrich company to replace it, as it was a challenge cup which was exhibited at the de Dietrich stand by Charles Jarrott & Letts, who have offered $250 for information leading to its recovery. The trophy represented an allegorical figure seated in a car, with the right hand resting on the steering wheel. It measured 2½ feet in length and was about 2 feet high. The robbery is thought to have occurred early in the morning. A night watchman who had been engaged especially to guard the cup absented himself a few minutes and when he returned the cup was gone. The theory is that the trophy was smuggled out of the building in sacks carrying the litter swept up by the cleaners. As the trophy was so big that one man would have all he wanted to do to carry it, the mystery is only intensified. It was thought possible that the cup might be smuggled across the channel, so all the boats were watched, but the thieves were clever enough to stay in London until the hue and cry died down.

AIMS OF CREDIT ASSOCIATION

New York, Dec. 9—Secretary Franz Neilson, of the recently organized Automobile Trade Credit Association, formed for coöperative collection, protection and detection, with some sixty representative firms on its books, has sent out to members and prospective members a brief outline of what the association has done. He announces the election of seven directors as follows: F. J. Alvin, manager American Electrical Novelty & Mfg. Co., New York; L. C. Burnet, Truffault-Hartford Suspension Co., New York; E. J. Willis, president E. J. Willis & Co., New York; George W. Nock, individual dealer, Philadelphia; James E. Murray, manager New York Sporting Goods Co., New York; L. L. Hale, Sibley & Pitman, New York; Carl Kaufman, treasurer Motor Car Equipment Co., New York; Harry B. Mirick, treasurer National Electric Supply Co., Washington, D. C. Immediately following the general meetings the board of directors convened and elected F. J. Alvin president of the association, L. C. Burnet treasurer and Franz Neilson secretary and counsel. The election of four vice-presidents was temporarily deferred.

"Briefly outlined," says Secretary Neilson, "the by-laws provide that the association shall aid in the collection of accounts, collect and disseminate information concerning the standing of customers, protect against unjust and unlawful claims and exactions, settle differences between its members and between members and customers and promote a more cordial feeling between those engaged in the trade."

SHOW PEACE AT CLEVELAND

Cleveland, O., Dec. 11—All chances of any interference with the proposed local show of the Cleveland Automobile Dealers' Association by T. C. Whitcomb, the independent dealer who held an option on Central armory and who threatened to hold a show of his own, have entirely disappeared. The dealers and Mr. Whitcomb have patched up differences and he has joined the association and will help boom the show. This not only brings in his large line, but those of several other dealers who have been outside the ranks of the association and who have been holding off to see what Whitcomb would do. With peace in the ranks, the dealers are now working to make this the biggest local show ever held and the prospects of carrying out this plan look most encouraging. The ground floor space at the Central armory is much larger than at the old Gray's armory where previous shows have been held, and in addition it is the intention to utilize the balcony which has never been possible at Gray's armory. Material and supply dealers will have the balcony spaces, while the ground floor will be devoted to automobiles.

IS NOW IN THE DESERT

Percy Megargel Tackles Herculean Task of Crossing Great American Wastes in Motor Car

Needles, Cal., Dec. 13—Special telegram—The Reo Mountaineer has now crossed the worst part of the desert and is headed for home. We ran out of gasoline at Peach Springs, and before a supply could be secured a loss of 24 hours had been occasioned.—PERCY F. MEGARGEL.

San Bernardino, Cal., Dec. 6—After a week of the most careful inquiry, during which time I have been in almost constant consultation with ranchmen, railroaders and automobilists, I have decided to tackle the Great American desert, or such portions of it as lay alongside the tracks of the Santa Fe railroad, with an occasional cut off. It is a comparatively easy matter to follow a route that someone else has laid out and swear at the party who laid it out if things are not as easy as pictured, but it is quite another matter to lay out your own route over a country never traveled by automobile.

Pretty nearly everyone with whom I talk say it is out of the question to attempt to drive a motor car across the Great American desert, as even wagons and horses find it impassable. We may be obliged to turn back and await spring before we cross the Sierra Nevadas in northern California, but I have great hopes of the Reo Mountaineer again doing the supposed impossible and carry Fassett and myself across the desert sands, so long the terror of automobilists.

In addition to my sand tires I have added two very heavy pieces of canvas, each measuring 15 by 7 feet. I have added a new and longer cable to my windlass equipment, have lightened my load by sending even my wearing apparel by express, but have clung to our sleeping blankets and have added a good 2 weeks' provisions to our grub box. Two days without food in crossing the Cascades in Oregon left an impresison that will not be forgotten in a hurry.

My schedule as arranged at present calls for: Needles, Cal., December 9; Flagstaff, Ariz., December 14; Gallup, N. M., December 17; Trinidad, Colo., December 24; Tribune, Kan., December 26; Kansas City, Mo., December 30; St. Louis, Mo., January 3; Indianapolis, Ind., January 4; Columbus, O., January 5; Wheeling, W. Va., January 6; Pittsburg, Pa., January 7; Philadelphia, January 10, and New York, January 11. This would be almost record-breaking time and the chances are that the Reo Mountaineer will be several weeks behind the schedule, especially if deep snow is encountered in the high mountain passes, as must be expected at this time of the year.

This California weather is all that it is said to be. Last Sunday afternoon I went in the Pacific for a swim at Huntington beach, a few miles out of town. The water, while somewhat cool, was delicious and my swimming was not particularly disturbed by the presence of several seals which shared the ocean with the bathers at Huntington beach. The little animals were almost tame and were not the least frightened by the presence of the surf bathers.

There are few eastern manufacturers who realize the automobile situation at Los Angeles. Here it is in the midst of winter, yet every road is in perfect condition and the motorists of this region motor 12 months in the year. Some enthusiasts do this in the east, but here the weather is like June all the year around. If manufacturers fully understood the conditions prevailing out here they would send their first 1906 models this way instead of to the eastern cities, for half the population of Los Angeles are eastern moneyed people here for the winter, and the car they like best here will undoubtedly be the car they purchase in the east.

While there are several automobile publications published in the west—one at Denver, another at San Francisco and another at Los Angeles—the circulation of MOTOR AGE appears to be general and book stores that keep only one or two automobile papers invariably include MOTOR AGE. The majority of automobilists whom I have met on the coast are perfectly familiar with every move the Reo Mountaineer has made since leaving New York last August, thanks to MOTOR AGE, while not a few followed out my adventures in the Pathfinder, as recorded last summer by Mr. Harrison, of our party. The Reo agencies especially appreciate this and frequently I find pasted up on the windows or walls of the local agency pages from MOTOR AGE, picturing out our trip across the continent.—PERCY F. MEGARGEL.

ENGINEERS' SCHOOL OPENED

New York, Dec. 12—The New York school of automobile engineers began its sessions for the season yesterday with day and night classes. There were fifty-four students on the books at the beginning of the year. The school is located at 146 West Fifty-sixth street. In addition to the regular engineers' class, day and night sections, an owners' class opened today. The night students will have 3 hours of instruction, and their session will last 15 weeks, while the day students, having 8 hours' a day, will complete the required course in 8 weeks. Only 6 weeks, however, will be spent in the class rooms, for it is proposed to devote the fifth week to practical work with the car. Professor C. E. Lucke, of Columbia university, the director of the school, has outlined the method of instruction under ten general heads. They are: Classroom instruction by lectures and recitation; instruction on emergency repairs in a shop; transmission of power changes and tire repairs; ignition systems, including all jump and touch sparks; testing of fuel oils and lamp materials; work on engines and power generators; instruction on a complete machine set on rollers so that operaters may be taught to control the machine easily; instruction in taking apart a complete machine and putting it together; track work with a car where all steering and control problems will be encountered; road instruction, both by day and night. Great enthusiasm is being displayed in motoring circles over this school, which has attracted a particularly bright looking lot of students.

CALL IT A GOLD MINE

English Promoters Point Out Money-Making Possibilities of London Cab Service

London, Dec. 2—Two more public motor vehicle prospectuses are out this morning representing in all an appeal for nearly $1,000,000. In one, the proposal is to place twenty cabs on the streets of oLndon, fitted with four-cylinder 20-horsepower engines, with an epicyclic type of speed gear and landaulet body. The only inducement offered to the public to subscribe to this undertaking is an estimate of the profits. It is shown that each cab may be expected to produce $50 per week net earnings. Against this depreciation is set down at 20 percent. The manufacturers of the cabs have agreed to maintain them in proper running order and condition for an inclusive charge of $500 per cab per annum; the tire contractors—who appear to be the well-known Continental Tire Co. of Hanover—have similarly agreed for a period of 5 years to keep the tires in full repair for $225 per annum. Gasoline, lubrication, etc., are set down at $285, drivers and cleaners $465, and insurance against loss of profits through temporary disablement of car, $145 per cab per annum. These last three items therefore are the only fluctuating charges and amount to $179 per cab. This would show a net profit of $895 per cab per annum, and of course it is only necessary to perform the usual multiplication of cabs to secure boundless wealth. The names of the directors do not include anybody connected with the motor business, but it is said that the money is practically underwritten, and that the Ford Motor Co. is the particular firm which has secured the contract for these vehicles.

The other is a somewhat similar appeal, but the engines in this instance are to be fitted to the Unic car, which is practically a Georges-Richard chassis sold in this country under the title of the Unic. The estimate of the running of 100 cabs for a year is put down at $185 per cab, tires at $250 per cab, insurance at $60 per cab, maintenance at $250 per cab; depreciation is put down at about 17 per cent and other charges would total up to $150 per cab, which would mean an estimated outlay of $1135 per vehicle, against which it is expected that the cabs will each earn $2625 per year with a cost in driver's wages of $655. The usual mathematical calculation will again result in dividends sufficient to allure the most exacting.

FRANKLIN WINS CASE

Syracuse, N. Y., Dec. 11—Supreme Court Justice William S. Andrews Saturday decided the suit in the New York Automobile Co., which was brought against the H. H. Franklin Mfg. Co., of this city, in favor of the Franklin company. The New York Automobile Co., which was composed of A. R. Peck, E. I. White and other Syracuse capitalists, brought an action against the Franklin company to recover $100,000, alleging that the latter concern had hired its engineer and stolen the models of a four-cylinder air-cooled motor which they

Digitized by Google

had paid their engineer, John Wilkinson, to develop. Justice Scripture, before whom the suit was originally brought, granted an injunction prohibiting the Franklin company from paying any dividends until the suit was decided. The title of the action was the New York Automobile Co. against Herbert H. Franklin, Alexander T. Brown, John Wilkinson and the H. H. Franklin Mfg. Co. Justice Andrews, in a carefully prepared opinion, goes into the matter from the start. The plaintiffs asked that the defendants be enjoined from making and selling an automobile and from using any of the designs and inventions of John Wilkinson. On this Judge Andrews said:

"No such relief as asked in this action can be granted. Mr. Wilkinson as an employe of the plaintiff had, under the circumstances, a right to leave its service when he did. Concededly he had no right to take with him any of its tangible property such as the model, the patterns, the drawings; and he did not. Possibly he had no right to use any designs which he might remember; and this he did not do. But he, as well as everyone else, had a right to plan and use a four-cylinder air-cooling engine. His experience, his skill, his unmatured thoughts and designs were his own. That they had been gained at the expense of the plaintiff certainly gave the latter no legal right to them. If it had possessed any unpublished inventions which Mr. Wilkinson was not using, another question would arise. But it had not. All it possessed on June 30 was an unperfected model of an engine and this it still has."

EXHIBIT OF AIR SHIPS

New York, Dec. 12—The announcement by the Automobile Club of America that the Sixty-ninth Regiment armory will have an exhibition of balloons and flying machines has caused some excitement. Opinions vary as to the advisability of the club's branching out in the line of aerial navigation. In some quarters the news evokes only ridicule, while others are inclined to believe that the move is a good one. The exhibit is to be arranged under the direction of the recently formed Aero Club of America, which is practically an offshoot of the Automobile Club of America. The entire gymnasium of the armory, with a floor area of nearly 5,000 square feet, is to be devoted to aeronautic vessels. There will be balloons, aeroplanes, box kites and other forms of air ships, including the models of the most famous air vessels of Europe and America. Models of ships driven by Santos-Dumont, Roy Knabenshue and other successful aeronauts already are assured. Various types of motors suitable for air travel also will be exhibited.

MAY RIVAL VANDERBILT

New York, Dec. 12—Indications are that the 200-mile Cuban road race will be a rival to the Vanderbilt affair, for such drivers as Albert Clement, Walter White, Walter Christie, Sisz, Jenatzy, Fletcher, and Earp are expected to compete, to say nothing of other foreign and American speed merchants. Senator Morgan has about completed his plans for the Cuban invasion, the appropriation of $5,000 by the Havana council settling all doubts of the race.

LARGEST SHOW OF ALL

Paris Salon Opens and President Loubet Inspects Leading Makes—Some Features

New York, Dec. 13—Special telegram—Mail accounts of the opening of the French automobile show last Friday in the Grand Palais, Paris, are just at hand and only bear out the expectations of those who have been fortunate enough to have attended previous affairs in the French metropolis—that it is the greatest exhibition of automobiles and accessories ever promoted—a mart where maker, designer and owner meet on an equal footing to see the very latest in automobile fashions.

The exhibition was opened in the usual manner by President Loubet, who makes it a custom to travel the circuit of the show each year and see for himself just what progress his countrymen have made in the manufacture of automobiles.

This time the president of France was hauled to the show in a horse-drawn vehicle and he made a bee-line for the Richard-Brasier stand, where Brasier and Thery were holding court. The president handed out a few lines of jolly to the two motoring celebrities, inspected the car that won the Bennett cup, then resumed his tour, stopping at the Delahaye, Renault, Gobron, Panhard, Bollee, Fiat and Darracq booths. This done the president astonished everyone by expressing a desire to inspect the Mercedes. This took him into German territory and he chinned away with M. Charley until that individual was grinning with as much glee as he would have shown if he had been given half a dozen crosses of the Legion of Honor. From the show proper President Loubet went through the motor boat section in the Serree de la Ville.

As for the show itself, the reports say that one was impressed by the similarity of design in all the leading makes, the Mercedes type being so popular that it was a task indeed to distinguish the make of a car unless one could get a front view and tell by the radiator. Italy was a most important factor in the show, the enterprise shown by its manufacturers, the many mechanical features of its cars and especially the success of the Fiat and Itala in the road races of the past summer forcing France to shove over and allow its rival room on the throne. This was in marked contrast to Germany, which was unevenly represented. Of course the Mercedes was the cynosure of all eyes, but the other makes from the fatherland, being comparatively unknown, were not much in evidence.

Italy's ideas—some of them—have evidently been grabbed by its rivals. The large-sized radiators and capacious pumps first prominent on cars of Italian manufacture, were noticed on other makes. All makers have evidently given the subject of lubrication considerable thought and study, for on all sides were seen the force-feed system with a positive mechanical drive. Among the recent converts to this way of thinking are the Mercedes people, who now employ a mechanical pump for the distribution of oil. Their pressure system is now only used to force the oil from the tank on the side of the chassis into the reservoirs on the dash. Another thing noticeable is the absence of the belt-driven pump on the leading makes.

On the new models of the Mors, Brasier, Renault and others it is noticed that automatic starting devices are used. The prize offered by Henry Deutshe for the most practical method of starting the engine from the driver's seat has evidently stirred up the inventors to the profit of the maker. President Loubet was particularly impressed with this improvement.

Automobiles were not the whole thing at the show, the display of motor boats, air ships and commercial trucks being particularly large and impressing.

TIRE COMPANY NOW FORMED

New York, Dec. 13—Special telegram—MOTOR AGE is now able and at liberty to add further and more definite particulars as to its story last week of the outline of the move of the A. M. C. M. A. to secure exclusively to its members a supply of tires outside of the pool, form a company, in which its members should have a chance to become stockholders and so practically secure rebates on the present tire price, which is to be maintained.

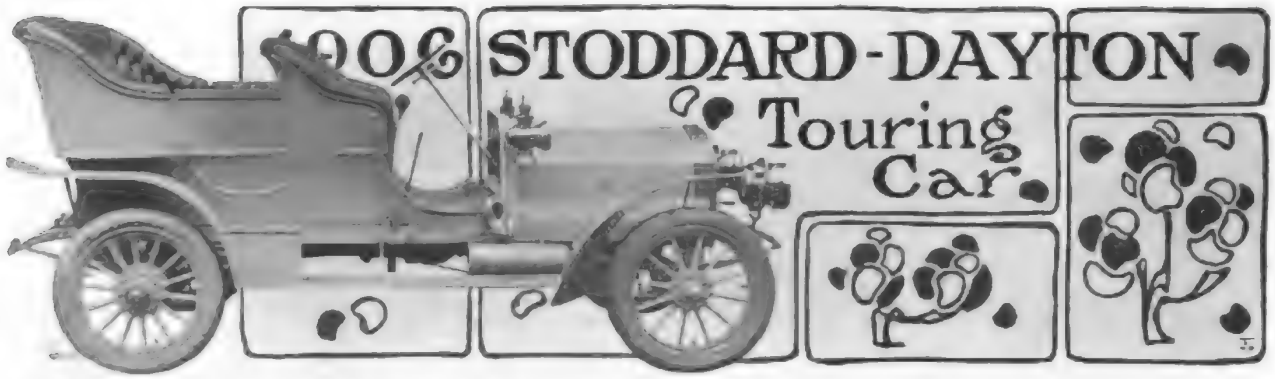
The company in question, the Ajax Standard Rubber Co., has already been formed with a capital stock of $100,000. Horace de Lisser, former sales manager of the International Automobile & Vehicle Tire Co., is the organizer and has ample financial backing outside of any stock that may be subscribed by members of the A. C. M. C. M. A., according to the plan outlined in last week's MOTOR AGE. A big factory has been leased at the foot of East One Hundred and Sixth street, New York, machinery is being installed and it is expected that deliveries of the finished product will begin on January 1. Already the crude rubber is being worked at a rubber plant. The making of the tires will be under the direction of the former superintendent of the International company, who knows the formula and is well acquainted with the process.

Roger B. McMullen, general manager of the A. M. C. M. A.; James Couzens, of the Ford Motor Co.; Benjamin Briscoe, of the Maxwell-Briscoe Motor Co., and A. C. Newby, of the National Motor Vehicle Co., have been actively associated with Mr. de Lisser in the promotion of this important independent project.

COLONEL POPE WORKING

New York, Dec. 11—Colonel Albert A. Pope's pet scheme for a New York-Chicago highway, has come to the surface again. The New York and Chicago Road Association has sent out an appeal to the public to assist in urging the completion of the national highway. The route leads from New York city up the east side of the Hudson to Rhinebeck, thence through Ulster, Delaware, Broome, Chenango, Tioga, Chemung, Allegany, Cattaraugus and Chautauqua counties to Erie, Pa., thence it follows the lake shore to Toledo, and on to Chicago. About 160 miles of the road in New York is completed; some stretches are already improved and work has been started on other portions. It is expected that this appeal sent out by the association will do a world of good, for there is great enthusiasm shown in the states along the route.

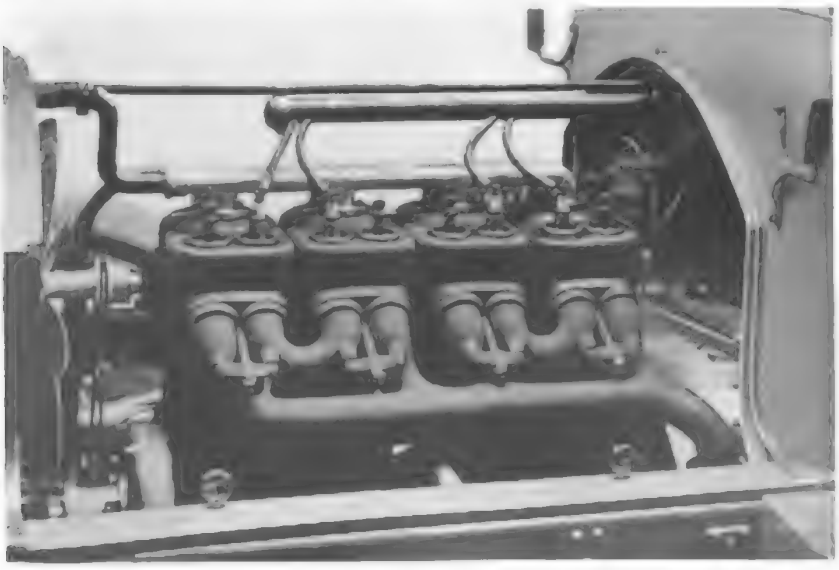
Digitized by Google



TWO four-cylinder cars, a runabout and a five-passenger touring car, comprise next year's line of the Dayton Motor Car Co., of Dayton, O. The former, not yet announced by its maker, will possess as features cylinders with 3½-inch bore and stroke, three speed and reverse selective type of sliding gear, and shaft final drive. In the touring car, which will naturally take the place of this year's machine, many notable changes are introduced. The present motor with 25 horsepower, the cylinders of which have 4 by 4-inch measurement, has been replaced by one with 4½ by 5-inch cylinders, rated at 30 to 35 horsepower, and this year's common type of sliding gear set is replaced by one of the selective type, giving the same number of speeds, but with changes effected through a side lever instead of from the steering pillar. Timken roller bearings are used in the road wheels, transmission set, propeller shaft and rear axle, the latter being of the floating type. The general increase in size has occasioned a wheel base 7 inches longer than formerly, being now 103 inches; 32-inch wheels are still used, but the tire diameter has been increased to 4 inches; the weight of the machine is approximately 2,100 pounds.

Channel steel constitutes the entire main frame and subframe. The former has its side pieces parallel throughout, carries long curved Mercedes spring hangers at the rear and the usual short forged hangers in front. The subframe is made up of a pair of channel pieces slightly lower than the main pieces and carried on cross pieces in front and rear, with intermediate side braces. Gusset plates are used throughout. A spring suspension of four long semi-elliptics remains. This year the rear springs are 50 inches long and 2 inches wide and the front 40 inches in length. The former are swung outside of the frame members and at their front ends are not shackled but carried on the ends of a sleeve on a cross rod of the frame. At the back they are shackled to a rod extending across the frame through both spring hangers. As at present the front axle is of I-section with Elliott type of steering knuckles integral with it and the spring seating in the form of clips surrounding the axle and the springs clipped thereto. Case-hardened steel bushing are used in the steering knuckles.

A Rutenber motor is used, and aside from the increase in the bore and stroke few changes are noted. One is a new design for the inlet and exhaust pipes from the valves, the former now being inside the latter, permitting the Schebler carbureter being carried closer to the crankcase, as well as having the hot exhaust piping further removed from the cylinders. In connecting each set with the valve openings gaskets are eliminated. The valve opening is slightly coned, as is that of the pipe, and between the two is placed a short bronze sleeve with the ends coned to fit into the valve and pipe openings. When the latter are closed together the bronze sleeve is entirely concealed between them. The pipe is held to the cylinders by yokes and bolts. Other features are the placing of the pump, shown at the left in front, slightly closer to the radiator and carrying it in a separate casing readily detachable from the motor; the carrying of the high-tension wires to the spark plugs within a tubing supported by a rod from the top of the dash to the radiator top and the conducting of a separate oil lead to the commutator casing, still carried on the top of a vertical shaft at the rear of the cylinders. A six-feed oiler is now carried on the right side of the motor and has two leads to the end crankshaft bearings and others to the crankcase. The pump is driven from the commutator shaft by an eccentric and rocker arm. Six individual pumps are used, each pump in circuit with a separate lead and adjustable so that any flow of lubricant can be had in each lead. On each piston is a wide oil groove near the bottom for distributing oil over the cylinder walls, and over the connecting rod bearings are oil cups for collecting the splash. The wrist pins are made hollow and pinned to the piston journals and in lubricating oil flows through them to the center, where oil holes connect with the bronze bushings. Babbitt on a bronze ground is used in all of the crankshaft bearings, but plain bronze is adopted in the camshaft bearings.



INLET AND EXHAUST SIDE 1906 STODDARD-DAYTON MOTOR

It is in the transmission of power from the motor that the real innovations in the car are encountered. The clutch remains much as it is and is of the external cone type with the flywheel B carried on an integral flange on the crankshaft and the latter with a continuation A forming a bearing for the male portion C of the clutch. This part is bolted to the clutch hub D1 bearing directly on the crankshaft continuation, serving only as a bearing, and to the hollow portion D, through which it is connected to the driveshaft M in the gear box. In retaining the clutch spring E in position the usual end-thrust ball bearings are placed behind a ring against the back end of the spring and in retaining the ring in place a hollow screw F with curved flange resting against the spring ring is used. This screw F enters the end of the crankshaft and

Digitized by Google

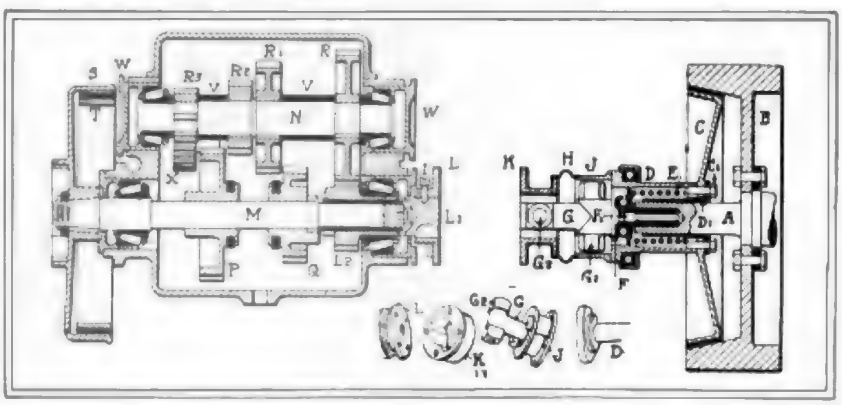
within it is a small screw F1 that also enters it and the crankshaft, thereby serving as a lock nut. The universal joint coupling the clutch with the gear box is novel because the clutch can be removed without dismounting the gear box or the motor. Three main parts comprise the joint. Two of these, J and K, are alike and are ring-like pieces with a flange at one end to be bolted to, in the case of one, the clutch sleeve D and in the other to the disk L on the front end of the shaft L1 in the gear box. Each piece is made with a cross slot to receive an end of the link G forming the cross of the joint, which has on either end cross parts G1 and G2, one being at right angles to the other and each made with rollers at the end. A short leather housing H encloses the only exposed portion of the joint.

In the gear box the mainshaft is in the bottom of the case and the countershaft N directly above it. Both gear case ends are bored to receive the bronze bearing cages W and in the top is a large inspection plate. Both sliding units P and Q work on the squared mainshaft M which has its forward bearing in the hollow end of the clutchshaft L1 and integral with this shaft is the gear L2 constantly in mesh with a large gear R on the countershaft, which revolves on all speeds. Gears on the countershaft are retained by double Woodruff keys placed at quarters and the gears are maintained in position by spacing tubes V between them. By using two sliding members it is not necessary to pass through gears and is further possible to drop from high speed to reverse or low speed. In driving direct the sliding gear Q made with dental clutch teeth on the forward end, is locked through similar teeth on the rear end of the clutchshaft gear L2, the drive then being along the shaft M. For all other speeds power is first carried to the countershaft through gears L2 and R and then back to the mainshaft through the pair Q and R1 on second speed, P and R2 on slow speed and through P and R3, together with the idler X, on the reverse. In shifting the two gears P and Q one lever Y, shown in the rear view of the chassis, is used. This works in a double slotted quadrant between a pair of short arms, one at its left side and the other at its right. One arm is attached to an outer sleeve and the other to an inner sleeve and the sleeves are in turn connected at their inner ends with the two sliding rods D and C, which enter the front end of the gear box. One of these rods is connected with the sliding gear Q and the other with the gear P within the case. When the lever Y is in the position shown in the gate in the quadrant, the short arms are held against it by flat springs. On each arm is a pair of lugs, one at either side of the lever Y. When the lever is pushed sidewise into the inner slot it is locked with one arm and if moved to the forward position of the slot gives slow speed ahead. The back position in the slot gives the reverse. When the lever Y is in the outer slot it locks with the outer arm connecting with the sliding gear Q and when moved forward in this slot gives direct drive and second speed when moved back. The gear box

Operating Levers on the New Stoddard-Dayton Car

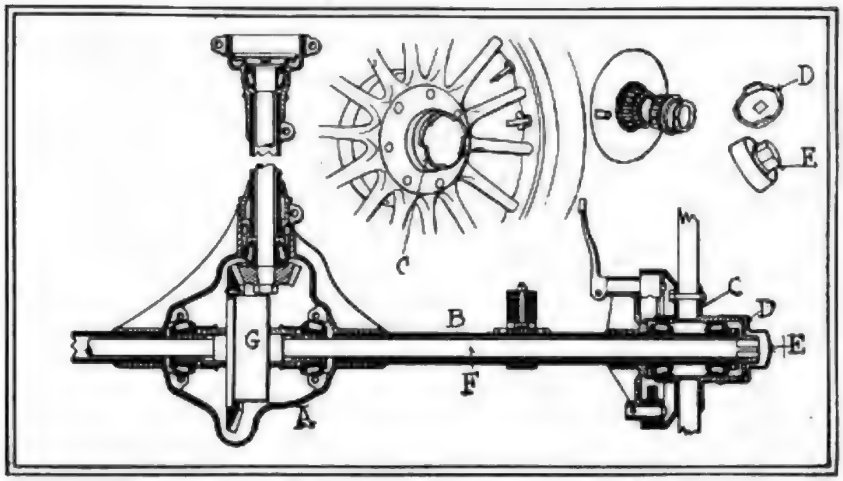
is a heavily-made aluminum housing with four arms resting directly on the subframe. The casing and the motor, as well as all the operating parts of the machine, are protected by a metal apron extending from the front to the rear of the gear box. This apron is made small and snug by using sheet metal plates between the main and subframe pieces and having only the apron extend between the subframe pieces.

On the rear end of the shaft leaving the gear box is keyed the regular brake drum S. This brake like the emergency on the rear hubs is of the expanding shoe variety, the shoe T being supported on a carrier on the gear case housing and provided with a covering of camel hair fabric. Double coil springs serve to keep the shoe off the drum when not engaged. This brake is applied by the right pedal, the connections with the shoe being through a chain, wheel and lever, with a cam for expanding the shoe. The brake is interconnected with the clutch, releasing the latter when the brake is applied. The clutch is in turn interconnected with the throttle, so that the application of either regular or emergency brakes throws out the clutch and throttles the motor. The emergency brake shoes are interchangeable with that used on the regular brake and are expanded by a cam movement connected with the brake lever at the driver's right, the lever when the brakes are not applied standing vertically at the right of the seat and not interfering with entrance to the front seat. The interlocking system between either brakes and the clutch is simple. The clutch pedal H is carried on a short shaft and connects with the clutch through the rod and lever H1, the lever being on a cross shaft with arms for carrying the yoke for the clutch. The emergency brake lever shaft carries on its inner end the two-arm lever K, the top arm of which is connected with the brakes and the under one through a rod E with the clutch shifting rod, so that in applying the brakes the lever when carried to the front moves the under arm of the lever K to the rear, withdrawing the clutch, and the clutch when withdrawn acts through the arm J and rod I with the throttle, closing it. From the rod I the other throttle connection with the small lever on the steering column can be noticed. The foot brake being on the same shaft as the clutch pedal is interconnected by a short lug on the brake sleeves so that when the pedal is pushed ahead this lug locks with the sleeve on the clutch pedal, thereby carrying it forward also, but per-



Stoddard-Dayton Gear Case, Flexible Coupling and Clutch

Digitized by Google



CONSTRUCTION OF STODDARD-DAYTON FLOATING REAR AXLE

mitting of the clutch pedal being carried forward for disengaging the clutch without applying the brake.

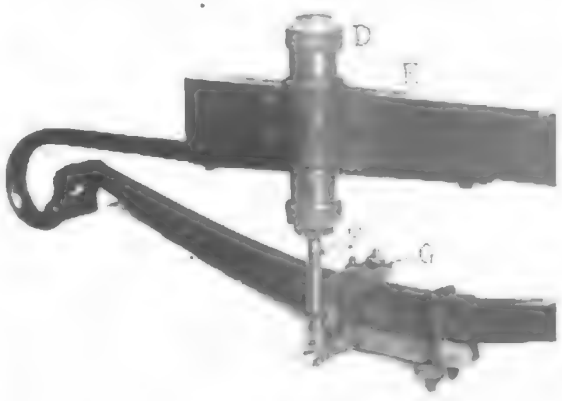
The propeller shaft to the rear axle is housed within a casing acting as a torsion rod between the gear box and the axle and for removing the strain off the shaft when running. The front end of the housing forms a covering for the universal joint in the shaft, the housing proper being mounted in a ring, the outer part being spherical and located within a similar socket attached to a cross piece of the main frame and the joint being of the sliding variety cares for irregularities owing to spring depressions. In the rear axle the differential housing A is split horizontally above the drive shafts, the top part being readily removable for inspection purposes. The drive shafts F simply rotate the road wheels, not being called upon to carry any of the car's weight, it being protected by having the axle casing B extend through the hub of the wheel and the Timken roller bearings being carried between this housing and the wheel hub C. In locking the drive shaft F with the wheel hub, the shafts which are squared where they enter the spur gear differential G are also squared to receive the lock nuts D, these nuts having jaw teeth for interlocking with others on the outsides of the wheel hubs D. Over these are placed the hub caps E. By this construction the entire drive shafts can be withdrawn from the housing by simply taking off the hub caps, removing the clutch caps D and then the differential can be lifted out through the opening in the top if the housing. The construction of the rear brakes is shown, the brake drum being bolted to the wheel hub and the shoe carrier supported direct to the axle housing. The differential housing is strengthened by webs across the front angle spaces and by having the housing sleeves long.

Stoddard-Dayton bodies for 1906 bear strong resemblance to the present style, being, of course, larger. Accommodation for five is furnished, the tonneau seating three and its floor is made sloping, rising toward the front and beneath it is a tire carrying compartment in which an outer casing and several air chambers can be stored. The gasoline tank is placed beneath the front seat and a tool box is made within the step to the rear seat. The dash is made in one piece instead of three, as formerly, and on it is mounted the four vibrator coil. Considerable difference is found owing to the change speed lever rising from the footboard within the body. Hood design remains the same, the upholstering is in full leather heavily tufted and the standard color, Stoddard-Dayton pearl gray, remains.

A new muffler has been added in the cooling system, the present one of horizontal tubes giving place to one with twenty vertical flat tubes connecting between upper and lower water tanks. The tubes are separated by a double set of zigzag flanges giving the appearance of a honeycomb construction.

TAKES UP THE SHOCK

Anti-shock absorbers for automobiles, that a few years ago were a novelty on any motor car are today counted upon as the ordinary equipment of many machines. The early styles of these devices were all constructed on the friction principle consisting generally of a pair of friction disks held firmly face to face by bolts or screws and one of the disks attached to the axle of bottom half of the spring and the other secured to the vehicle frame. Of late the air cushion device has been receiving most attention and of late a new one has been brought out. This device is made by the Sheddan Mfg. Co., of Baltimore, Md., and consists of an air chamber D enclosed at both ends and secured to the side piece A of the car frame by a bracket E. Within this chamber is a double-acting piston made rigid with the piston rod F. This rod is in turn pivoted at its lower end to a stud projecting from the bracket G attached to the vehicle spring. The action of the piston and the air cushions is simple. When the car drops into a rut or gutter in place of its going down with a sudden jar it is eased down by the air chamber D being forced down on the air cushion above the piston and when the car rises out of the rut or strikes an obstruction the frame portion is prevented from rising by the air cushion beneath the piston. Both ends of the chamber D are airtight so that the piston attached to the rod F is constantly working up and down between a pair of air cushions, one of which is compressed whenever the other is expanded, and vice versa.



SHOCK ABSORBER OF SHEDDAN MFG. CO.

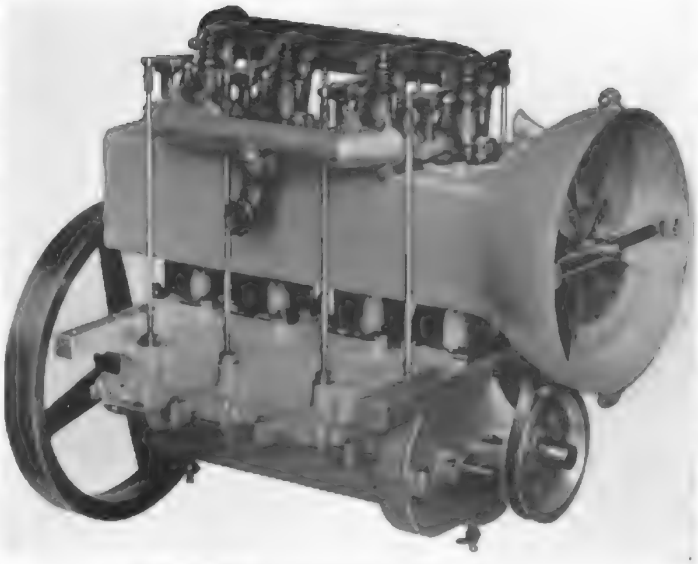
NEW TREBERT MOTOR

The Trebert Gas Engine Co., of Rochester, N. Y., has added to its regular list of gasoline engines for automobiles an air-cooled type, in which cooling is accomplished by the use of fins inserted in the sides of the cylinders, and then enclosing the entire cylinder in an aluminum housing and forcing an air draught through this housing and consequently around the cylinder walls by means of a rotary fan carried in front of the motor. The air blast from the fan to each of the cylinders is conducted through a large aluminum blow pipe carried along the left side of the cylinders, with a branch going to each cylinder. The branch to each cylinder enters the aluminum housing for the cylinder so that the air current is directed around the entire casting. The heated gases exit from the bottom of the cylinder housings and pass out through the bottom of the car bonnet or back through the flywheel, which is made with small spokes, giving free exit to these gases. The blower construction is shown in the illustration and the front end of it is enlarged to carry the fan which is driven by a flat belt from the end of the crankshaft. This location gives the fan a speed equal to that of the crankshaft and insures a strong air blast directed to each of the cylinders. The top part of each cylinder wall is fluted vertically, these being for containing aluminum fins used in conducting the heat from the cylinder walls. Each fin or rather each pair of fins is made by taking an oblong sheet of aluminum and folding it lengthwise in the center, leaving a hollow round portion in the fold. This rounded part is inserted in the flute. After folding the sheet is pushed into a toothed form, the parallel wings extending from the fold the same as the teeth in a comb extend from the back. After this the wings are twisted

Digitized by Google

as to extend transversely from the central portion and at right angles to it.

Aside from the cooling scheme few interesting points are met with in the motor. Both sets of valves, mechanically operated, are located side by side in the cylinder heads, recourse being had to a pair of camshafts one in either side of the crankcase and valve actuation from these through pushrods and overhead rocker arms, one end of the rocker arm being pivoted to the top of the push rod and the other resting on the valve stem head. The bore and stroke are 3½ and 4 inches respectively and the rating is 16 horsepower. A crankshaft speed range between 150 and 1,800 revolutions per minute is claimed. Simple intake piping from the carbureter as well a s exhaust piping to the muffler is used, and the latter is noticeable in that it is of large diameter and well removed from the cylinders, thereby keeping the heat away from them. Splash lubrication is used.



NEW THEBERT AIR-COOLED FOUR-CYLINDER MOTOR

USING BALANCED THROTTLE

Wheeler & Schebler, Indianapolis, Ind., makers of the Schebler carbureter, are retaining their carbureter for the coming season in much the same form as it has been used this season with the exception of a few improvements, among which is the use of a balanced throttle for those motors using a governor for caring for the throttle valve. This throttle consists of a drum A sliding horizontally within the casing part X. One end of the drum, that next to the carbureter nozzle, is open and the other one closed so that with the drum occupying a position close to the carbureter casing proper the passage to the motor by the opening C is closed. In the opposite end of the drum A are slotted openings, one of which can be noted at J, and through these the mixture escapes to the motor. The balancing feature of the throttle consists in having the casing X near the slotted end of the drum made slightly larger than the drum diameter as shown at L so that when the drum is drawn by the rod B to the position shown in the illustration the mixture commences escaping to the motor. Ordinarily, as the pipe C connects from the upper side of the casing X, the tendency would be for the escaping mixture to pull the drum toward the top part of the casing, causing it to bind and slide stiffly, thereby not being as sensitive as it should to the speed of the motor. To avoid this binding the increased diameter at L which surrounds that end of the drum has been used and now the mixture instead of passing out of the slots at the top side of the drum passes out through them, all around the drum head and exists by way of the surrounding opening L to the entrance of the passage C.

In the other details of the carbureter few changes are encountered. The air supply is still located at D, with a spring controlled valve F, always partially but never entirely obstructing the passage. On slow speeds the valve remains almost closed, but with each increase in motor suction it opens, thereby permitting more air to pass the angularly placed spraying nozzle G located in the elbow of the mixing passage and exactly in the center of the ring-shaped float K. External adjustment of the nozzle is by the finger lever M and at the base of the float chamber is a stop cock N for draining off the gasoline supply. The control of fuel from the gasoline tank in the car remains the same, the pencil-shaped valve H serving to open and close the passage. This valve rests on an arm S, the inner end of which is attached by screw to the bottom of the float, so that the valve varies with the level of gasoline in the chamber.

VERTICAL MOTOR IN ELMORE

One of the attractions at the coming shows will be the new five-passenger Elmore touring car in which is placed a vertical four-cylinder, two-cycle water-cooled motor. Its maker, the Elmore Mfg. Co., of Clyde, O., has previously made machines with the horizontal type of motor with never more than two cylinders and the bringing out of a large touring car shows that the company's faith in the two-cycle proposition is increasing and that the vertical two-cycle motor is ready to take its place in the field of automobile construction. The motor with its bore and stroke of 4½ and 4 inches respectively has a rating of 35 horsepower and couples through a Mercedes type of ring clutch with a sliding gear set giving three forward speeds and one reverse. Final drive is by propeller shaft. An Elmore carbureter, fashioned along Krebs lines, is used, lubrication is by a Hill oiler, roller contact is used in the commutator and standard control features are found. In the running gear tubular axle construction with Hyatt roller bearings is used, the wheel base measures 104 inches, tire measurements are 34 by 4 inches in front and rear and pressed steel exists in all parts of the frame construction. The body is a graceful production having Napier lines visible in many places except in the Mors type of hood. Side entrances are wide, a straight dash carries several of the small parts and a running sideboard connects the front and rear fenders. The other Elmore model is a 24-horsepower, horizontal cylindered machine. In it the power transmission is through a planetary gear set and shaft to the rear axle. Many changes are noted in its construction over the present model.

CRAWFORD'S LEADER

A five-passenger touring car with a 24-28-horsepower four-cylinder motor will be the leading model of the Crawford Automobile Co., Hagerstown, Md., for the coming season. This machine is vastly different from the present five-passenger machine of the firm in that the cylinders have a measurement of 4½ inches bore and stroke. A new gear set operating on the selective principle and giving three forward speeds replaces the present individual clutch type, but final drive through a pair of side chains connecting the sprockets on the end of the jackshaft with those on the rear hubs remains. Six inches have been added to the wheel base, its present measurement being 100 inches. The road wheels have been increased to 34 inches and 3½-inch tires fitted. Ball bearings are features of the transmission set and jackshaft as well as with the road wheels. Good baggage-carrying space is provided in the body, there being several compartments for such.

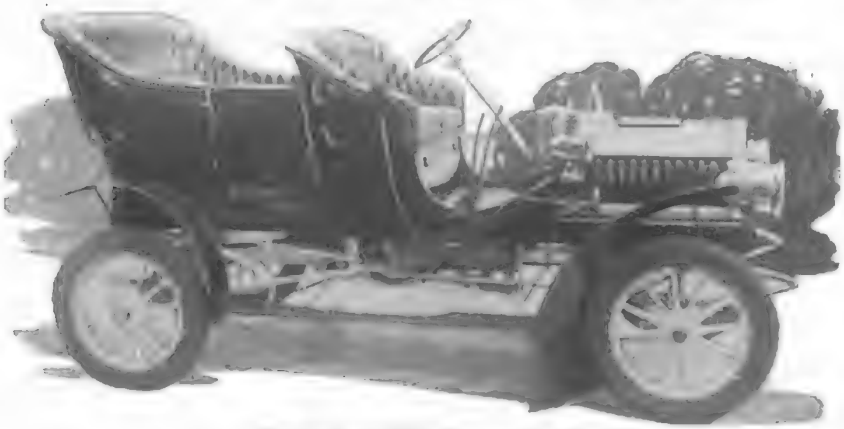
LOGAN LINE FOR NEXT YEAR



THE 1906 LOGAN FIVE-PASSENGER CAR

BOTH air and water-cooled motors will be used on Logan machines to be built by the Logan Construction Co., of Chillicothe, O., during the coming season. Two large pleasure cars with accommodations for four and five passengers, are fitted with the Logan two-cylinder opposed motor carried beneath the body. The other pleasure vehicle, a two-passenger runabout has an opposed air-cooled motor carried crosswise beneath the bonnet. It is connected by a combination of shaft and single chain drive, whereas single-chain drive from the engine shaft is used on the two water-cooled machines. The water-cooled cars are known as models G and H, the former having cylinders with a bore and stroke of 4¾ and 5 inches, with a rating of 20 horsepower, and the latter with a rating of 30 horsepower, its cylinders having 5½ by 6-inch measurements. The air-cooled model, rated at 10 horsepower, is known as style F. In all three models a sliding gear set giving two speeds ahead with direct drive is used. Final drive through a single chain remains a feature on all types. Model G has a 90-inch wheel base, 30 by 3½-inch tires and weighs 1,655 pounds. In model H the wheel base measures 100 inches, the wheels are 32 inches with 4-inch tires and the weight approaches 2,150 pounds.

Logan frames are made of angle steel, the angles having a wall thickness of ¼ inch and the angle arms being 2½ and 1½ inches wide. All parts are riveted. Reinforcing pieces are used at the corners of the main pieces. Attached to the center of the frame on either side are peculiar shaped brackets, to which both the front and rear radius rods are attached by hinged bolts. The front and rear ends of these radius rods are fastened to the spring seating on the front and rear axles. The rear rods have turnbuckles with double threads for chain adjustment. Axles are made from steel tubing. The spring suspension is a full set of four elliptics, the rear pair being slightly the longer.

Horizontal motors are used exclusively by this concern. In the water-cooled models they are placed lengthwise beneath the body at the left side, with the sliding gear set placed so that its main shaft is in line with the crankshaft. Drive to the rear axle is direct by single chain. The motor crankcase is in three parts, making it possible to remove the mainshaft or camshaft gears without dismantling any of the engine. Each cylinder is an integral casting, the cylinders within being both ground and lapped, giving a good finish. The crankshaft is an open hearth drop forging, and connecting rods are also drop forgings, with bronze bushings at the piston ends. Inlet valves are made 1⅜ inches in diameter, the same as the exhausts, and are automatically operated. Mechanical oilers are used, the drive for them being through rachet and tappet from the camshaft. Other motor facts are jump spark ignition with current from duplicate sets of dry or storage cells, float feed carbureter and cooling aided by a gear driven pump. The radiator is of the tube variety with fins surrounding each tube. From it the circulation is to the pump and thence to the bottom of the water jackets.

Compactness characterizes the sliding gear set case, which takes its supports from a couple of cross pieces of the main frame, these pieces also carrying the front and rear cylinders. A contracting band clutch serves as a flexible connection between the crankshaft and gear set and between the two is a sprocket for the chain drive. The clutch construction is standard. On the motor flywheel is a cast flange, around which bears a steel band, lined with Gandy belting. The ends of the band are attached to a pair or fingers pivoted near the middle. By forcing a cone between the bottom ends, to which rollers are attached, the clutch band is tightened. On the top forward speed drive is direct, no gears being in mesh, in which case the sprocket for the chain drive revolves at the same speed as the crankshaft. On slow speed and reverse a counter shaft is brought into use, a sliding gear serving to communicate power between the main and counter shafts. All speeds are gained by one side lever, the gears being so interlocked that changes in speed cannot be made without first disengaging the clutch, which, by the way, is operated by a side lever. A slight forward movement of this lever, after the clutch is disengaged, applies a brake on the transmission gear. The rear axle is of Weston-Mott construction and is fitted throughout with Hyatt roller bearings. The chain sprocket surrounds a spur gear differential and on either side of the latter is a Raymond double-acting band brake. Both are applied by pedal, the regular brake being located on the transmission.

Both cars have representative 1906 bodies, being featured by false hoods with radiators forming the front of them, wide side entrances, large fenders connected by running boards and heavy full leather upholstering. Straight dashes are used. On the inclined steering column below the wheel are throttle and spark levers, each working on separate quadrants. The body lines are easy, the rear seat being slightly higher than the front one and very wide. Model G has divided front seats and a detachable rear one.

Using an air-cooled two-cylinder motor in its 10 horsepower runabout can be looked upon as one of the leading 1906 features of this company, in that both air cooling as well as runabout construction are new with it. The runabout, model F, is typical of all cars of the light class weighing 900 pounds, having a 90-inch wheel base, 28 by 3-inch tires and standard tread. The frame is a simple rectangle of angle steel with the motor, gear box and jackshaft carried on cross pieces. Spring suspension is by a set of four full elliptics, those in front being 30 inches long and those in rear 36 inches. Both seats are attached in standard form. Steel tubing of medium gauge forms the front axle, the Lemoine type of steering knuckles being carried in the usual form. Front wheels revolve on ball bearings, but Hyatt rollers are used throughout the back axle. Radius rods 10 inches long serve for

CHASSIS OF THE LOGAN TOURING CAR

Digitized by Google

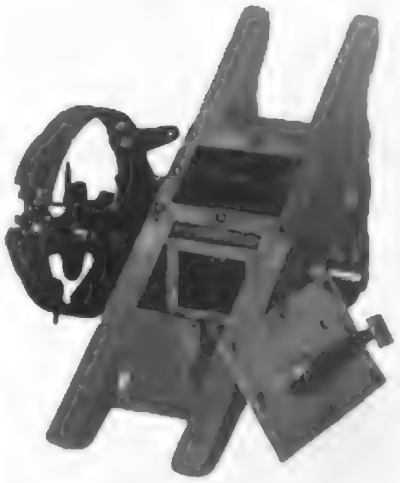
adjusting the drive chain and also in taking the strain off the road rear wheels.

Somewhat unique features combine in the motor and gear box arrangement, as well as in the final drive. The motor is of the opposed two-cylinder style, carried crosswise beneath the hood. Directly in the rear of it is the sliding gear, set with both shafts of the gear set longitudinally of the frame, being in this regard different from the water-cooled models. From the gear box a short shaft drives to a jackshaft by bevel gears. From the jackshaft a single chain connects with the live rear axle. The use of the jackshaft is imperative because of the final chain drive, as well as owing to the gear box having its shafts placed longitudinally.

Cylinder measurements — bore and stroke—of the motor are 4⅛ inches each. In cooling recourse is had to circular copper flanges, thirty-five of them being fitted over the outside of each cylinder which has its outer surface turned to receive them. Each flange has a depth of 1½ inches and they are placed as close together as possible, being not more than ¼ inch apart. The cylinders are made with the heads integral and the latter are cooled by radiating metal flanges. A novelty is shown in the copper hopper-like device on the top of the crank case, which permits of the cover on the case being left off and a screen covering taking its place, the screen allowing a free air circulation within the chamber, but preventing the escape of the lubricating oil therefrom. In addition to these cooling features an 18-inch, six blade, rotary fan is carried on the front of the crank case and is driven at crank shaft speed, being placed direct on the front end of the shaft. Fiber is used in the fan blades.

Both inlet and exhaust valves are mechanically actuated and operate vertically in ports on the front side of the cylinder heads. Each valve is contained in a separate housing bolted to a flange on the cylinder head. In opening the valves a bell-crank arrangement is furnished, one arm of the crank resting on the end of the valve stem, the other being pivoted to the end of the push rod. These rods are typical throughout, being driven from a camshaft in the top of the crank case. Ground joints are used, doing away with gaskets and other packing around the valve cages. The crank shaft is a drop forging running in a pair of end bearings each 3 inches long and having a diameter of 1½ inches. Bronze bushings are used in these as well as in the crank throws and wrist pins. Machine steel is used in the camshaft. Four close-fitting compression rings are used on the pistons. The wrist pins are made from machine steel case hardened, and the connecting rods are steel drop forgings.

Two speeds and a reverse are given by the sliding gear transmission. The main shaft is connected with the motor through an external band clutch, the diameter of which is 9 inches and the face width 1¾ inches. This clutch is the same as used on the water-cooled models. High speed is on the direct drive and on slow speed and reverse the usual counter shaft and idle pinion are used. From the rear of the case power is transmitted through a short shaft



LOGAN SLIDING GEAR SET

with a level pinion on its rear end meshing with another bevel on a sleeve on the jackshaft. This shaft remains stationary and is 1 inch in diameter, but the sleeve carrying the bevel revolves and is 9 inches long. It has a bronze bushing throughout its entire length. A ball bearing takes care of the end thrust. From this shaft to the back axle drive is by a single Diamond roller chain. Braking is by a pair of bands clamping on 6-inch drums on either side of the differential. The rear axle is of Weston-Mott construction and the steering gear of Brown-Lipe design.

A new design of Logan muffler is used on all models. This is of the cylindrical type with several concentric chambers, the gases passing from one to the other, through circles of perforations.

Body lines are typically runabout. The bonnet, with a screen front, is shaped similarly to the Premier or Franklin runabout hood of the present season. The steering column is well inclined, and from the seat the body lines descend gradually to the rear furnishing room for tools, tires and spare parts beneath it. On the dash is the usual quota of coil, oiler, switch, and other parts. Small fenders are fitted.

AUTOCAR MODELS FOR '06

Three Autocar models are announced by the Autocar Co., of Ardmore, Pa., for the 1906 season, one of which is the present runabout, flying several new feathers; the new model, a 24-horsepower five-passenger touring machine, and the third the present four-cylinder touring car, maintained in its present form. In the runabout the left side, horizontal lever steering and control features have been altered. Now a wheel steering outfit is installed on the right side with throttle and spark grip control at opposite sides of the steering wheel. A clutch pedal has been installed, and the gear shifting and emergency brakes levers placed outside of the body at the right side, making the machine operated exclusively from that side. Two horsepower have been added to the motor by increasing the bore to 4 inches, the stroke, 4 inches, remaining the same. Its rating of 12 horsepower is based on normal crankshaft speed. A mechanical oiler has been placed above the motor, taking the place of the present automatic type and 4 inches have been added to the wheel base, making that measurement 76 inches. The 24-horsepower machine is an embodiment of most of the present features and in general lines of construction follows the lines of this year's four-cylinder machine. The body, however, is hung higher and made considerably roomier with a few other features included. The cylinders have a bore and stroke of 4 and 4½ inches, the wheel base is 100 inches and Hyatt roller bearings are fitted in the gear box and rear axle. Plain bearings are used throughout in the motor.

THE 1906 LOGAN AIR-COOLED RUNABOUT

Digitized by Google

HOLDER YOUNGSTERS OF ST. LOUIS, WHO ARE EXPERT MOTORISTS

Chicago After Chauffeurs—The city of Chicago has advertised for two chauffeurs for the cars now owned by the municipality. It is demanded that they be experienced, law-abiding and without police records, the salary being $1,200 a year.

Ross to Go South—Louis Ross, the holder of the Sir Thomas Dewar trophy, has made arrangements with the Stanley people for the building of a steamer according to his own plans and specifications. This machine is all but finished. The car will be ready for its trial in about a week, and then some interesting work will be done on a secret practice course.

Youthful Drivers—St. Louis motorists have watched with interest the development into expert drivers of the young sons of J. M. Houser, president of the St. Louis Globe Democrat. The elder boy, Douglas, aged 11, guides an Autocar runabout with great skill. Chicago, too, has a youthful driver in young Nelson Morris.

Show Dates—General Manager Miles, of the National Association of Automobile Manufacturers, announces that the following shows, in addition to the national show to be held at Chicago, February 3-10, have been sanctioned by the association: Washington Automobile Dealers' Association, Inc., February 3-10; Tri-State Sportsmen's Association, Detroit, February 12-17; Cleveland Dealers' Automobile Co., February 19-24; Buffalo Automobile Trade Association, March 5-10; Boston Automobile Dealers' Association, March 10-17; Denver Automobile Show Association, a date in April to be hereafter decided upon.

Truce at Grand Rapids—The fight between the police and the automobilists at Grand Rapids, Mich., is over. After the last outbreak of the authorities the bicycle police were pulled off and the motorists can now run as fast as they like without the fear that an officer with a stop watch waits on every corner. The superior court calendar, however, shows that the cases against four hotelkeepers, one of the hotels being partially owned by Mayor Sweet, for violation of the Sunday liquor law, will be up for trial this month. These cases are said to have been brought at the instance of the automobile club in retaliation for the strenuous measures used by the authorities last summer.

To Move In—In Paris they are using the automobile to move with, it being no unusual scene to see a young couple, with the loose ends of their household which were too precious to risk in a moving van, driving through the streets in a car, which is loaded to the guards with bric-a-brac and other breakable articles.

Giant Iceboat—Commodore F. M. Underwood, of the Toledo Power Boat Club and head of the Toledo Machine & Motor Co., of Toledo, O., is working on his new iceboat, which he hopes will do a speed of 100 miles per hour. The boat will be driven by a gasoline engine, and will travel on land, water or ice.

Courtesy Pays—An Appleton, Wis., motorist has introduced an innovation in the jollying line. On the back of his car is a large sign reading "Thank you" which he displays by pulling a string when he has passed a farmer who has swung over and made room for him. In almost every case, he says, this courtesy has been acknowledged by the farmer.

In Bowden's Place—Despite all statements to the contrary, H. L. Bowden, who drove the mile in 34⅗ seconds last year, will not be a competitor at the Ormond meet this year. He will be a passive spectator, but will not race. Boston will, however, send a new claimant for speed honors to Florida in the person of J. R. Harding, a prominent Brookline man who recently purchased a 90-horsepower Mercedes, and will be on hand to test his speed.

Trophy Winners—Winners of trophies in the contests of the Long Island Automobile Club were announced last week at the annual meeting. John H. Emanuel covered 6480 miles in a White steamer and won the Mersereau mileage mug. Charles Jerome Edwards traveled in six different states in a Cadillac touring car so he got the Mackey meandering memento. Dr. C. B. Edwards won the Long Island club's economy cup with his Franklin. E. C. Kinney landed the president's cup for bringing in twenty-four new members. Officers elected were: President, Alfred Wilmarth; vice-president, Edwin Melvin; secretary, Walter G. Pierson; treasurer, Charles Jerome; governors for 2 years, Frank G. Webb, Dr. C. B. Barker and John H. Emanuel.

Good Roads Deal—At the good roads convention at Parkersburg, W. Va., December 4, all the national association officers were present. A permanent state association was formed and the work was placed under the supervision of vice-presidents for each county in the state. This is welcome news to Pittsburg motorists who have tugged long and hard to get over the country roads in that state.

Good as Cow Pony—Officer John Schiffert, of Allentown, Pa., is an up-to-date cop. One day last week a herd of thirty-five cattle escaped through a broken fence at the abattoir of Arbogast & Bastian into the country north of that town. The minion of the law, not finding a horse handy, impressed a passing automobile into service and with the aid of a lariat succeeded in corraling the entire herd within an hour and a half.

Herkomer Route—As planned now the Herkomer 1906 tour will be over the following route: The course is 1,500 kilometers in length, beginning at Frankfort-on-the-Main, thus: Frankfort to Munich, 371.7 kilometers; Munich to Linz, 240.3; Linz to Vienna, 166.6; Vienna to Vienna-Neustadt, 80.3; Vienna-Neustadt to Semmering, 47; Semmering to Bruck, 57.2; Bruck to Loeben, 15.5; Loeben to Aussee, 125.8; Aussee to Salsburg, 100.6; Salsburg to Innsbruck, 160.1; Innsbruck to Munich, 133.9 kilometers.

New Idea—The pupils at the Hackley manual training school, at Muskegon, Mich., one of the largest manual training schools in the west, are now engaged in learning how to transform bicycles into motor cycles and also the construction of gas engines for boats and automobiles. They are using machinery purchased by the board of education but are engaged in the constructing of machinery which they will install next spring. The board has purchased six sets of castings for 2½-horsepower gas engines for either stationary or marine engines. At the end of the year, if the pupils wish to own the engines, they may do so by paying for the castings.

Bay State Aggrieved—The motorists of Massachusetts feel somewhat slighted over the fact that in making out the route for the Glidden tour of next year the touring committee has seen fit to overlook that state in making out the schedule for the return. At the present time it is proposed to send the tourists from Bretton Wood to New York through Vermont, thus giving Massachusetts the go by. This, however, it is understood, has not been definitely settled upon and it is possible that the committee may decide later to send the tour over the beaten path of Massachusetts and Connecticut. It is done unquestionably on account of the experiences at Leicester on the last tour, but it is admitted by some of the tourists that there was a little fast work on that occasion even if the penalty did fall on innocent shoulders. However, that is not the question. There is reason to believe Massachusetts will next year, as it did in the last

Digitized by Google

tour, furnish a great number of entries and under those conditions it is entitled to some little consideration, it is felt. It is proposed by several of the organizations to pass a vote requesting the committee to more fully consider the claims of Massachusetts.

Delegates Appointed—At the meeting of the members of the Lucas County Good Roads Association at Toledo, O., last week, the following delegates were chosen to attend the first annual convention of the state organization to be held at Columbus January 11: J. W. Kerr, F. J. Norris, C. S. Ashley, Frank Spangler, J. H. Crawford, all of Toledo; C. W. Shoemaker, of Waterville; H. A. Taylor, of Swanton, and Thomas Crofts, of Oregon township. Another meeting will be held on January 5, at which time each delegate will appoint ten additional delegates. The state meeting will ask the legislature to provide a fund for the inauguration of the new movement in the state.

Owners Organize—The latest automobile organization in Boston is known as the Automobile Owners' Association, which has been formed to protect owners of cars from unjust arrest, and also to prevent reckless and dangerous driving. It is intended to try all complaints for alleged overspeeding, as well as to appeal such cases worthy of it. The association will provide attorneys for so doing without cost to each member in excess of the annual dues. By this means it is hoped that towns can be dissuaded from making indiscriminate arrests and deprived of the revenue which convictions in such cases produce.

Slow in Michigan—The Michigan statute regulating automobiles will soon become a dead letter unless chiefs of police and sheriffs, in whose hands the enforcing of the law lies, are more strenuous in their efforts to see that all owners are properly registered. To date there have been only 2,935, while the lowest estimates place the number of machines in the state at 5,000. The applications for licenses are coming in slowly and the number of new licenses is not greater than the number of new owners of automobiles. The law directs police and sheriffs to see that no machine runs without a license and it is likely that some steps will be taken toward determining those in the state who have not complied with the law.

Tip for Gliddenites—J. H. Morrow, manager of the International Carriage Co., at Brighton, Ont., which is about half way between Cobourg and Belleville and 90 miles from Toronto and 72 miles from Kingston, on the line of the Glidden tour for 1906, writes MOTOR AGE that he is willing to furnish information regarding the condition of the roads. He says that in July, 1904, he followed the route mapped out for the tour in Canada only he did not go to Picton through Prince Edward county, keeping close to the water all the way to Kingston and Prescott instead, having to cross on a ferry at a point some 3 miles below Picton. He declares the roads are better direct by Belleville and Napanee than the way he went to Kingston. From Kingston to Brockville there are three routes. The line from Prescott to Ottawa is declared to be a poor one, Mr. Morrow suggesting that instead of going that way the tourists travel through Morrisburg, 12 miles further on, where there is a fine stretch of macadam, while through Prescott there is a stretch of 24 miles of horrible roads.

Names, Please—W. L. Smith, 524 Penn avenue, secretary of the Automobile Club of Pittsburg, desires secretaries of all automobile clubs in Pennsylvania to communicate with him with the idea of forming a state association.

Wins Two Medals—F. C. Gates won both the trophies presented by the Cleveland Automobile Club, one for the member covering the greatest number of miles from December to December, and the other to the member completing the longest tour. Gates traveled 7,531 miles in the 12 months, 300 miles more than Charles H. Coit. W. C. Curtiss was third. Gates' longest tour was 904 miles, running from Cleveland to Indianapolis, to Chicago and then back by way of Toledo. Gates drove a Winton.

It's Different Now—It's a good thing for property owners that Pittsburg has an automobile row. Three years ago one could have bought property on Center avenue, Baum and Beatty streets, East End, for little more than half what it now costs. Since the $20,000 home of the Automobile Club of Pittsburg was completed and became the recognized center, values in that vicinity have been going up rapidly. Instead of the big liveries that used to supply the swell turnouts in the East End there are now seven large, fully equipped automobile establishments, besides two stores where automobile parts are sold—all within an easy stone's throw of the club house. The liveries were losing their business so fast that two of the big barns have been turned over this year to new automobile companies which have remodeled them for garages at a large expense. The Banker Brothers, Standard, Hiland, Central, Liberty and East Liberty companies are all within hailing distance of each other and another new firm will join the bunch early in the spring. Only one of these concerns owns its property, the Hiland, which recently bought a large site in Center avenue and is building a $25,000 garage. The other buildings are leased or were erected on ground rents.

Buffalo Show—Application blanks for space at the fourth annual Buffalo automobile show, which will be held at Convention hall the week of March 5 to 10, are ready for distribution, and can be had by applying to the manager, Dai H. Lewis, at the rooms of the Automobile Club of Buffalo, 760 Main street. The allotment of space will be made Tuesday, January 2.

Now They'll Be Good—Philadelphia's director of the department of public safety has organized a new bureau for the special protection of the public in the central section of the city. It will be made up of mounted patrolmen under the head of a police captain. The mounts will be horses, bicycles and motor cycles—no less than fifteen of the last named to be in constant use during the busiest part of the day. They are for the special purpose of enabling the cops to overhaul automobiles and other vehicles which travel faster than the legal limit. Stop-watches are to form part of the equipment of each officer, and as the sleuths have been doing mathematical stunts for the past week in order to enable them to quickly calculate speeds, many arrests along this line are expected, as orders have been issued for a strict interpretation of the mile-in-6-minutes ordinance. Indeed, quite a number have already been made of automobilists who have exceeded the limit on Broad, Chestnut, Walnut and other much-traveled streets. Each officer of the new bureau is provided with a whistle which emits a peculiar and far-reaching shriek, and if the culprit manages to get away from one the next will be waiting for him. Recent arrests have developed the fact that counterfeiting and changing of tags is being carried on quite generally, and all offenders in this respect will receive an additional dose of the law's medicine. The Quaker automobilist will hereafter be compelled to live up to his reputation as a conservator of the peace or take the consequences of his law-breaking actions.

FRENCH COUPLE USES AUTOMOBILE FOR MOVING VALUABLES

Digitized by Google

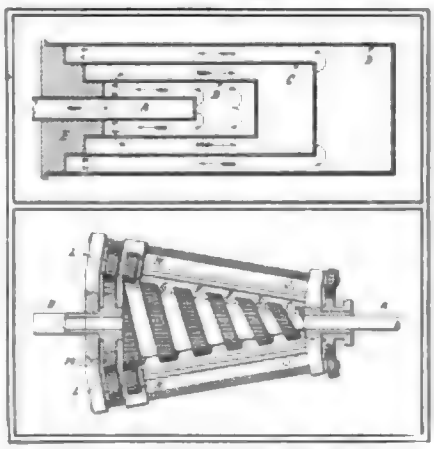
Current Automobile Patents

Sliding Gear Set—No. 806,316, dated December 5; to Charles E. Bertels, Wilkesbarre, Pa.—In this gear set of the sliding type the feature consists in having four shafts—A from the flywheel, B immediately in rear of this and connected by the clutch F and having on the other end the gear E; C a squared shaft with sliding gears H and K, and in rear the short shaft D connected to shaft C by the clutch L and having a beveled pinion for transmitting the power to the differential, which is carried in the rear part of the case. A countershaft M carries three gears Q, P and N, the last being continually in mesh with gear E on the shaft B. On direct drive the two clutches L and F are engaged simultaneously through the operating mechanism R, and the internal gear K is shifted so as to mesh with the rear half of the gear E. In this way the four shafts A, B, C and D are linked together and drive is direct to the differential. For second speed the clutches L and F remain engaged and the internal gear K which has also an outer gear face is meshed with gear P on the countershaft, the drive being through shafts A and B and gears E and N to the countershaft and from this shaft through gears P and K to the shaft C and thence through the shaft D to the differential. For slow speed gears H and Q are used and in reversing the regular idler is introduced. Both clutches L and F work together, being engaged and disengaged at the same time and the apparent object of their use is the doing away of the clutch and the flywheel of the engine.

Multi-Tube Muffler—No. 806,714, dated December 5; to John M. Porter, Parkersburg, W. Va.—Exhaust gases enter the muffler, through a piping A extending half way through the muffler, which has perforations in its inner end for the gases to enter through. The muffler proper consists of three concentric tubes, B, C and D, each secured to the common part of the casing E. Tubings B and D have both ends closed and the escape of gases from them is through small perforations near the part E of the muffler, but in the tubing C the perforations for the escaping gases are in the form of a circle in the end of the tubing. The flow of gases through the muffler is shown by the arrows, the perforations, being respectively placed in the opposite ends of the successive tubes, cause the gases to travel from end to end of each tubing and having each tube of greater diameter and length than the one within it, the gases are given sufficient expanding room.

Friction Drive—No. 806,392, dated December 5; to Zadock B. Starr, Gloversville, N. Y.—This scheme of friction drive has a few points of difference over those already used in this type of automobiles. On each end of the crankshaft of the motor D is a large friction disk A against which bears a small friction wheel E on the forward end of a longitudinal shaft which carries a similar friction wheel F on its rear end. The later wheel F works between large friction disks C and C1, both being on a shaft which carries a sprocket on its outer end for drive to the rear wheels. In driving ahead, the friction wheels F are in contact with disks B1 and C so that both rear wheels are driven in the same direction and in reversing these gears are made to contact with the disks B and C1.

PORTER'S MULTI-TUBE MUFFLER



ROSEWARNS' SPIRAL GEAR

To get different speeds ahead, arrangements are made so that the shaft carrying the gears E and F can be slid to the front or rear. When in the former position, gear E bears on the disk A near its center and is consequently driven more slowly than when it bears on the disk near its periphery, and at the same time the wheel F bears on the disk C near its periphery, driving it still more slowly. On high speed E is practically at the periphery of A and F is as near as possible to the center of C, and on slow speed their positions are reversed.

Rear Wheel Drive—No. 806,452, dated December 5; to Charles S. Bauld, Latrobe, Tasmania, Australia—In constructing a rear wheel for an automobile the inventor uses a hollow hub A with an internal race of teeth in which mesh the pinion C, carried on the bottom of the T-shaped arm B, the horizontal arms of this piece having plain rollers for contacting with a plain ring on the inside of the hub. The power is transmitted through the pinion C, thereby causing the wheel to rotate.

Spiral Change Speed Gear—No. 806,190, dated December 5; to Richard E. Rosewarns, Covington, Ky.—In this gear box, which is suitably illustrated, the shaft A connects with the motor and clutch and carries on it a spiral gear, arranged on a cone-like shaft, the spiral gear having toothed surfaces, C, D, E, F and G. The shaft B connects with the rear axle and has rigid with it the large gear M, constantly in mesh with a pair of pinions L. These pinions are on long shafts J, upon which are the sliding pinions H and K. By meshing these with the respective gears C, D, E, F or G, as many variations in speed can be obtained, the gears H and K of course being arranged to move together at all times.

Two-Tube Muffler—No. 806,715, dated December 5; to Nathan W. H. Sharpe, London, England—This muffler has two concentric tubes; one which forms the casing and an inner one of slightly less diameter and of the same length as the casing. Gases from the motor enter the inner tube at the forward end and passing through it leave it through perforations at the rear end and then pass to the forward end of the outer casing, where they are liberated through a series of perforations. The gases in passing between the inner and outer casing have their progress interrupted by eight baffle plates each filled with small perforations.

Tubular Muffler—No. 805,613, dated November 28; to Frederick S. Williams, Amsterdam, N. Y.—In designing his muffler for silencing the exhaust of a gasoline engine, the inventor makes use of a long cylindrical casing of medium diameter, within which is a nest of tubes similarly arranged to the tubing in a return pipe radiator. Hot gases first enter a central tube of a large bore and from the farther end they are conducted into a series of smaller tubes extending from one end of the muffler casing. From these they finally exit into a large chamber from which they pass to the outer air.

Rear Axle Drive—No. 805,567, dated November 28; to Thomas J. Lindsay, Indianapolis, Ind.—The inventor has so designed his differential housing that the entire differential gear can be removed through a cap in the top of the housing without withdrawing the drive shafts from the axle, connecting the differential bevels with the road wheels. He accomplishes this by constructing the housing so that the top half can be removed in line with the bearings and each drive shaft from the road wheel instead of entering the bevel of the differentials and being keyed thereto, is connected by a jaw type clutch with a short shaft made integral with the bevels, the short shaft being axially in line with the drive shafts to the wheels. The clutches permit of lifting out the whole differential gearing when the top half of the housing is removed. The jaw clutches, having their jaws at the same angle at each side of the differential, allow of this.

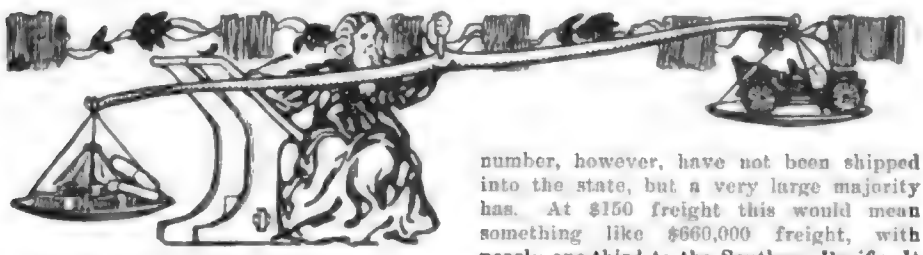
LEGAL LIGHTS AND SIDE LIGHTS



FIGHT FOR FERRY PRIVILEGE

San Francisco automobilists are exceedingly wrought up over what they term too stringent regulations regarding the automobile ferry traffic on the broad gauge boats plying between this city and Oakland. The automobile dealers have not taken kindly to the new ruling made by the Southern Pacific Co. for the transportation of the modern chariots and as a result they will seek to divert the freight trade that falls to the S. P. by way of retaliation. Some time ago they conveyed automobiles at all hours, but on October 15 new rules went into force that raised a howl from the dealers. The Northern California Automobile Dealers' Association is a new factor in the local motor firmament and evidences of its strength are already becoming apparent. The matter which this new organization is at present much taken up with is that of obtaining more just treatment at the hands of the Southern Pacific. To this end the association adopted a resolution a few days ago and the automobilists are anxiously awaiting the outcome of the fight against the railroad. The resolution is as follows:

Whereas, The Southern Pacific Railroad Co. has arbitrarily cancelled privileges heretofore granted owners and users of automobiles on its ferry boat system crossing the bay of San Francisco between the cities of San Francisco and Oakland; and

Whereas, Said owners of automobiles and dealers in same are shippers of a large amount of freight over the lines of said railroad, and such action on part of said railroad has materially interfered with the business of said owners and dealers in automobiles; be it hereby

Resolved, That the dealers in automobiles hereby agree to hereafter route all their shipments over other lines than those controlled by the Southern Pacific railroad, and under no circumstances will they permit any of their freight to be carried by said Southern Pacific railroad during the season of 1906, or longer, unless the unjust restrictions be immediately removed, and all the privileges heretofore enjoyed by said owners and dealers in automobiles be immediately restored to them.

In discussing the affair with the MOTOR AGE correspondent one of the dealers said:

"We want the Southern Pacific to make more liberal rules. As San Francisco is situated, the restricting of the ferry service means that the people will not buy automobiles if they have to continually leave the city by way of the peninsula. This makes a 100-mile trip if one wishes to go to Oakland and fails to make the ferry at times designated by the railroad people. If the Southern Pacific insists on the present rules we are going to ship our cars by other routes if we have to send them up north and bring them to the city on the steamers. Not only that, but we expect that every dealer in automobile supplies will join us in this movement. Up to the present time 4,393 automobiles have been registered at Sacramento. All of this number, however, have not been shipped into the state, but a very large majority has. At $150 freight this would mean something like $660,000 freight, with nearly one-third to the Southern Pacific. It can easily be claimed that the railroad has received over $200,000 in freight charges from the automobile trade, and it is this which we are going to try and turn into other channels if we cannot get more liberal terms in the way of transportation on the ferries. By working through the Northern California Automobile Association I think we can work to better advantage and compel the railroad to treat us fairly. With all the money the automobile trade turns over to the railroads we ought to be treated with consideration. It is a senseless thing to expect us to make such a roundabout trip to get to Oakland if we are unlucky enough to strike the wrong hours at the ferry."

QUAKERS FIGHT NEW LAW

Attorney Ira J. Williams, counsel of the Automobile Club of Philadelphia, has filed a bill in equity in common pleas court, enjoining and restraining the city from taking any action under the local automobile law on and after January 1 next. The automobile club is supported in this action by the Philadelphia Automobile Trade Association, which named a committee to co-operate with the club. The trouble seems to hinge on the question whether, in a large city, the state or municipal law is paramount. The legal officers of each insist its own law must be observed, and the automobilists are up in the air. There is quite a little wad of money involved also, the Philadelphia bureau of boiler inspection, which has been issuing local licenses, having taken in about $5,000 during the present year, charging $2 for new licenses and $1 for renewals. Under the state law charging $3 per, this amount will be materially increased in 1906, even without taking into consideration the naturally-to-be-expected large increase in the number of applicants. The legal action taken by the automobilists is a friendly one, the local authorities being as desirous of securing a legal solution of the puzzle as are the plaintiffs themselves—H. Bartol Brazier, Charles S. Wurts, Jr., and Samuel Y. Heebner, of the automobile club. The action is directed against the city of Philadelphia, John Weaver, mayor; Sheldon Potter, director of public safety; John M. Walton, city controller; John M. Lukens, chief of the bureau of boiler inspection, and Henry R. Shoch, city treasurer, and asks that they be enjoined from enforcing the ordinance of December, 1902, averring that it conflicts with, and is superseded by the act of assembly of April 19, 1905. The appellants ask for a temporary injunction, to be made permanent after a court hearing.

The state highway department has just issued a pamphlet containing the new automobile regulations. It emphasizes the fact that the operator is licensed—not the machine; that licenses cannot be transferred; that none but the regularly issued Pennsylvania tags can be legally carried on an automobile while within the boundaries of the states—the main clause around which the fight centers; that front and rear lights—the latter red, with a white side illuminating the rear tag—must be carried at night; that an operator must stop when signaled by an approaching driver; that speed in cities and boroughs must not exceed a mile in 6 minutes and outside these limits, a mile in 3 minutes, and that no borough or city has authority to fix a speed limit less than that established by the new law; that upon certification a license may be revoked for a period of 6 months upon the holder's second conviction of violating any of the provisions of the new act; and that the act applies to all forms of motor vehicles, motor cycles also coming under this heading.

TO ASK CONGRESS FOR LAW

During the coming session of congress efforts will be made by the commissioners of the District of Columbia to secure the amendment of the peace and order act of July 8, 1898, increasing from $40 to $100 the fine for carrying away the property of another without the right to do so, and also providing for imprisonment for 6 months, together with the maximum fine. Congress will also be asked to change the phraseology of the existing law so that "taking and carrying away" shall cover the movement of automobiles without the offender actually taking and carrying away the machine. These suggestions which the commissoners will make to congress are the result of a conference between Commissioner West, Judge Kimball, of the police court, and W. S. Duvall, president of the Automobile Club of Washington, and are a part of the campaign the club has inaugurated for sane legislation in regard to automobiles. The object is to secure a code of laws that will be as fair to automobilists as to pedestrians. The club is insisting on an amendment to the police regulations whereby persons guilty of tampering with automobiles, jumping in and out of cars left unguarded at the curb, manipulation of brakes or clutches, the tooting of horns, and other annoyances to which automobilists are subjected every day, be charged with disorderly conduct under the peace and order act, and subjected to a heavier fine than that now imposed. Heavier fines are also wanted for persons convicted of throwing stones and other missiles at passing automobilists. During the conference above referred to, the question of raising the speed limit for automobiles was also discussed. President Duvall set forth in detail the wishes of the club in this regard, and was informed that the subject would have due consideration by the commissioners.

Great consideration has been shown the club in the framing of these amendments.

IN THE REALM OF THE COMMERCIAL CAR

LOGAN LIGHT DELIVERY WAGON WITH AIR-COOLED MOTOR

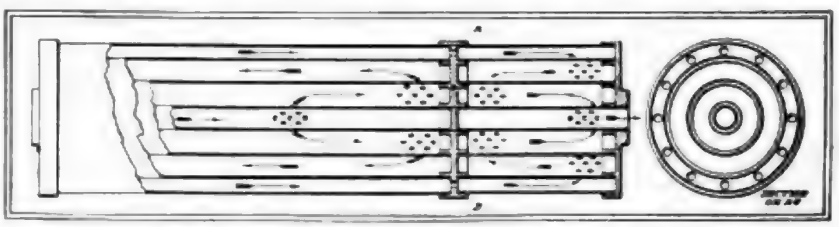
THE Logan Construction Co., of Chillicothe, O., has for the last 2 years been testing and experimenting with light delivery wagons and as a result of these efforts announces a new 10-horsepower air-cooled wagon with a load-carrying capacity of 1,500 pounds and weighing not more than 1,150 pounds. In order that the machine might be suited for a variety of light delivery work, a fairly high-speed ratio is used and a change speed set working on the sliding gear principle is installed, giving a fast and slow speed ahead and one reverse, the former ranging between 3 and 16 miles per hour. The company adopted the air-cooled motor not only because it has been proven perfectly satisfactory for the work, but because many prospective buyers are asking for such, dreading a water-cooled motor during the winter. This new machine has been under test for several months and has maneuvered with apparent ease a load 50 per cent in excess of its rating.

Most features common in placing an opposed motor crosswise beneath the bonnet are found in the design of this machine. A glance at the plan view of the chassis will reveal that the cylinders A are not placed as close to the front as usual and that a very long extension is needed on the starting crank. In the rear of the motor is a friction clutch much the same as the ordinary external band brake for coupling the motor with the sliding gear set within the case E. Perhaps the novelty of the entire construction appears in the transmission of power from the gear set to the rear axle, for instead of using shaft drive as is frequently used when a gear set is hung with its shafts parallel with the side pieces of the frame the Logan concern uses a short shaft F from the gear case, carrying on its rear end a bevel within the housing G, the bevel meshing with a similar bevel within the housing H. The latter is on a sleeve L on the stationary jackshaft K. From this sleeve the drive is by single chain to the center of the rear axle. In this design is all the advantages of a sliding gear set combined with those of single chain drive, this drive being preferred to a jackshaft extending across the entire frame and with double side chains for driving to the rear road wheels.

This power transmitting scheme calls for several cross parts in the frame construction, there being not fewer than eight pieces, as well as one light cross brace and other braces from the cross brace to the rear frame piece. The main side pieces of angle steel have a uniform wall thickness of ¼ inch and have the channel walls respectively 2½ and 1½ inches wide. To these pieces all cross parts are riveted, with gusset plates for reinforcements. In spite of the numerous cross pieces the motor is not carried directly on them but supported through a pair of longitudinal members that bear upon the cross pieces, the longitudinal pieces being dropped and having the ends of the cylinder heads resting upon them. A little additional support is gained by having bolts in the cylinder heads pass direct through the main frame side pieces. Four full elliptic springs carry the frame, the front and rear pairs being the same size, 36 inches long, 1¾ inches wide, with five leaves each. A double radius rod scheme saves both pairs from the pulling strain, leaving them to perform only a load-carrying duty. The rear pair is at the top, bolted directly beneath the frame side pieces and rests on seatings on the axles, with a radius rod connection at the front angle of the spring. This radius rod is made short, connecting with a bracket on the frame not far in advance of the front of the spring. It has a turnbuckle for adjustment. Longer radius rods protect the forward pair of springs, coupling with the frame midway of the front and rear road wheels and being attached direct to the axle inside of the spring seating.

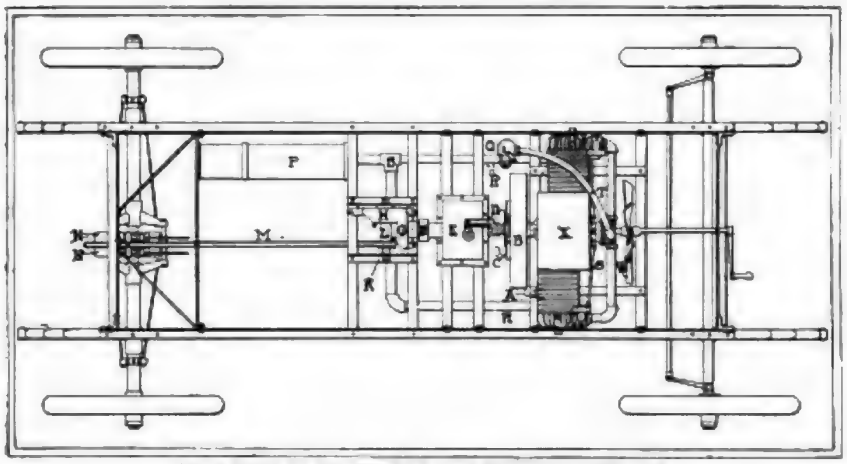
Both axles are of tubular construction, the forward being slightly dropped in the center and carrying the usual Elliott type of steering knuckles, which are connected through rack and pinion steering gear with the steering column, set at about 15 degrees from the vertical. On this column are spark and throttle control levers. The rear axle is of Weston-Mott design throughout, and is 1⅜ inches in diameter and carries a spur gear differential. The axle housings enclosing the drive shafts are fitted with roller bearings and in the center carry a pair of opposing three-arm spiders between which are placed the differential and a pair of external double-acting Raymond brakes N on either side of it. Truss rods from brackets on the axle ends aid in supporting the spiders and through them strengthen the axle. Road wheels are 32 inches in diameter and carry 2-inch solid, side-wire, Diamond tires. The tread of the machine is standard and the wheel base 86 inches.

Air-cooling in the motor is accomplished by turning the outer surfaces of the cylinders and pressing over them circular copper flanges, placed ¼ inch apart, each perforated to aid in the radiation of heat. The top of the crankcase is left open and in it is placed a hopper-like contrivance which prevents oil from the splash system of lubrication being wasted and at the same time permitting of heated gases from the interior of the case as well as from the cylinders, escaping. A rotary fan for additional cooling is carried on the front end of the crankshaft. Cylinder heads are made integral with the walls and are cooled by radiating metal flanges. Both sets of valves are mechanically operated and placed in separate cages bolted to the front side of the cylinder heads, the valve stems being vertical in each case. Bell cranks serve in transferring the power



MUFFLER USED ON LOGAN AIR-COOLED DELIVERY WAGON

Digitized by Google



PLAN VIEW OF CHASSIS OF LOGAN COMMERCIAL WAGON

from the push rods to the valve stems, one end of the crank being pivoted to the end of the push rod S and the other resting on the top of the valve stem. The camshaft is in the top part of the crankcase. A regular float feed carbureter shown in the plan illustration at Q connects through a curved pipe T, that branches in front of the crank case and connects with both inlet valves, the mixture traveling an equal distance to each pair of cylinders. Separate exhaust pipes R lead from the exhaust valve ports and unite at the union S, passing from this direct to the muffler—this piping construction is designed to keep the hot gases as far as possible from the cylinders. Jump spark ignition is used and in lubricating a pressure sight feed oiler is made use of, the oil tank being placed under the hood where the motor heat prevents its congealing in cool weather. Pressure for it is taken from the hot exhaust gases, which also aid in keeping it warm and at an even temperature. The connecting rods are fitted with ring oilers, both of the end crankshaft bearings are provided for and a separate lead enters the top part of the crankcase through the cooling hopper, it maintaining an even level within the case from which the cylinders receive a part of their supply.

A common band clutch connects the gear box with the flywheel B of the motor. On the flywheel is a broad flange shown at C and over this acts the brake or clutch band D. To the ends of the band are attached a pair of fingers, which are pivoted at their centers and by forcing a cone between the bottom arms of these the clutch band is tightened. The transmission gear works on the sliding principle, having a main and countershaft with drive on high speed direct along the former. The gear ratio is about 5 to 1. The peculiarities of the final drive have been referred to. The short jackshaft K is carried on a pair of frame pieces and is surrounded by a bronze bushed sleeve L to which is attached the bevel within the casing H and also the sprocket for the final single chain drive.

A variety of body lines are shown, some being of the low side variety to which any design of carrying compartment can be attached. Others are of the canopy top, wire-side style and a few of the enclosed type with rear entrances are shown. The control in all is the same, the features of it being steering wheel with throttle and spark levers, and besides these, speed change, clutch and braking levers and pedals. The bonnet is hinged to the front of the dash and has a screen front, but instead of the front of it being cut away toward the top it is straight and the hood perfectly plain.

In addition to this model the Logan company has ready a 2-ton water-cooled truck which is fitted with a two-cylinder opposed motor rated at 30 horsepower. The cylinder bore and stroke are 5½ and 6 inches. The general design of this machine follows that of the company's touring machines with the sliding gear set placed at the side of the motor and drive direct from a sprocket loose on the crankshaft to a jackshaft further to the rear and from the jackshaft double chains connect to the road wheels.

JUST WHAT IT COSTS

Tables showing the exact cost of operating a motor delivery wagon during the months of July, August and September have been prepared by the Joseph Horn Co., of Pittsburg, Pa. The tables were made up direct from the running book of the driver and show not only the amount of oil and gasoline required but the distances traveled, number of packages carried, number of trips made, as well as the number of those not made and a few averages on the work done. The machine that performed this work was a regular Oldsmobile delivery wagon that was delivered to the Horn company July 10 and put into commission on the following day, the period covered being from that date until October 1.

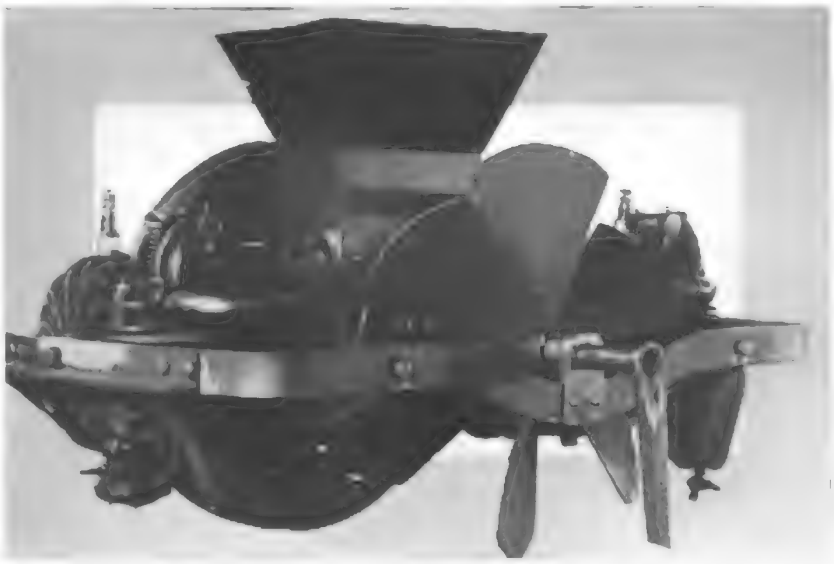
It must be understood that during the test the machine was not operated by an expert driver, but by one of the same class as is obtainable for such work. The attention and care given the wagon was as a consequence the same as any concern can give.

A glance at the tables shows that during the month of August the machine covered more miles than in July or September, but that fewer packages were delivered, due to the Horn concern changing the vehicle's route twice a week to different sections of the city where the delivery was light but the distances great. The routes traveled were among the hilliest in the Smoky city, but not on a single occasion did the wagon fail in its service. The exact duration of the following record was 65 days:

1905	Cost of material	Factory repairs at 30c an hour	Machine oil at 11c gallon	Engine oil at 17c gallon	Gasoline at 10c gallon	Total
July	$0.55	$7.00	$0.22	$0.52	$11.27	$20.56
Aug.	3.05	2.75	.22	.92	14.49	21.43
Sept.	3.92	4.62	.22	1.16	17.22	27.14
Totals	$7.52	$14.37	$0.66	$3.00	$43.98	$69.13

	Packages delivered	Miles run	Trips made	Trips lost
July	2,772	568	33	0
August	2,276	715	47	0
September	3,156	633	50	0
Totals	8,204	1,816	130	0
	Av. cost per package	Av. cost per mile		Av. cost per trip
July	$0.0074	$0.044		$0.6230
August	.0094½	.030		.4560
September	.0086	.043		.5430

Average cost per package, $0.0084; average cost per mile, $0.0380; average cost per trip, $0.5320.



TEN HORSEPOWER AIR-COOLED MOTOR IN LOGAN WAGON

Digitized by Google

Commercial Mile Stones

Used in Albany—W. W. Whitney & Co., of Albany, N. Y., have received a couple of Knox 8-10 horsepower machines for regular use. Solid rubber tires are fitted to each.

Canada in Line—A branch of the Intercolonial Railroad in Eastern Canada is to be fitted with gasoline motor cars, the passenger service on it not being sufficiently heavy to warrant the frequent running of steam trains.

As a Hose Wagon—The Howe Engine Co., of Indianapolis, Ind., has recently shipped to Hopedale, Mass., an electric hose wagon for the fire department of that city. The concern is at the present time completing a 32-horsepower gasoline motor for propelling a fire engine, which the company declares will be one of the first of its kind in this country.

In Hack Service—An Oldsmobile bus, the latest product of the Olds Motor Works, Lansing, Mich., has been placed in service by Carr & Son, proprietors of a hack line in that city. The bus is very complete in its appointments and seats twelve persons. It is entirely enclosed with curtains with windows, and the driver's seat is similarly protected. It is lighted by electricity furnished by storage batteries and heated by a system of piping from the exhaust.

Pooled Firemen—A big electric truck operated by a Cleveland brewery showed something of its power the other day when called upon by the Cleveland fire department to extricate a heavy steam fire engine which was stuck in the mud while on a run. The combined efforts of four strong horses had failed to get it out. About that time the big truck came along and the operator offered his services which were accepted with some doubts on the part of the firemen. It didn't take 2 minutes for the truck to shake the 4-ton steamer out of a foot of mud.

McCrea Plans—The McCrea Motor Truck Co., Cleveland, O., exclusive selling agent for the Champion commercial motor vehicles, made by the Champion Wagon Co., of Oswego, N. Y., is making great preparations for the trade during the coming season. This latter concern has for 1½ years been making electric trucks of different sizes. Some forty of these are now being used by the United States Express Co. and with other firms. The factory has a capacity of 400 per year, the sizes ranging between 500 pounds and 12 tons load capacity.

Tackles Big Game—It is stated that a Detroit automobile company is about to make a spread in business by putting the automobile squarely into competition with the railroad, the trolley car and the livery stable. The statement is that the concern is already preparing to work out of Detroit to the suburban towns and that if the scheme works the plan will be pushed in other sections of the state. If the company starts its system Kalamazoo will be one of the first places at which the experiment will be tried. It is expected that the populous and progressive southwestern

DAYTON PARCEL DELIVERY

part of the state will furnish the best field for experiments, the like of which have been tried in only a few sections of the United States.

Dayton Likes Them—The use of the commercial automobile in Dayton, O., is still young but so far is meeting with good results by those using light machines. Morgan & Wright's branch house and repair depot has used a light car with much satisfaction for some time. The company keeps the machine in a garage when not in use and the monthly expenses—oil, gasoline, washing, repairs and other incidentals—amount to $12 per month. The November bill amounted to $12.30. The machine is in daily use attending to the various customers of the firm and carrying freight to and from the depot, which, however, consists chiefly of goods required by the branch and others being returned to the factory. Another commercial machine used is a 1½-ton Knox wagon in the service of Brown Bros. This machine has a load-carrying capacity of 1,500 pounds and the average cost of gasoline and oil is 1 cent per mile. The wagon averages 50 to 75 miles per day and has maintained this average since June, 1904. Repairs thus far aggregate $100, which includes a pair of new solid tires for the front wheels. The rear tires show a good deal of wear but are good for another year. The business of the concern is general delivery work in which express parcels and parcels from local stores comprise the most of the load. Speed is one of the essentials of this machine and the company has found that it is owing to this particular feature of it that the work has been so successful.

C. & A. Sincere—That the Chicago & Alton Railroad is sincere in its intentions of installing motor cars of the gasoline type for suburban uses is proven by the delivery at Bloomington, Ill., of several gasoline motors intended for this service. The company hopes to use these specially in suburban work, in which sphere the electric trolley works havoc with regular railroad traffic.

Testing—As the result of 3 years' experimenting in the construction of heavy electric trucks, the Fuller Mfg. Co., of Detroit, Mich., will try out during the next few weeks a large 5-ton electric truck. A feature of it will be the using of a gasoline engine to drive a dynamo for providing current for the electric motors driving the road wheels. As soon as the demonstration shows the construction of the machine to be suitable for all classes of work a company will be organized and the manufacture of machines commenced.

In Pittsburg Fire Service—Pittsburg is soon to try an automobile chemical engine in fire fighting. The machine, which has been ordered by the Banker Bros. Co., will be a 45-horsepower Pierce chassis with extra long wheel base. It will have two 250-gallon chemical tanks, six small fire extinguishers, ladders, hose and the usual equipment of a chemical wagon. There will be room on the footboards for ten firemen and a chauffeur. The car will have sufficient capacity to fight small fires or big ones at the start and its speed, 40 to 60 miles an hour, will give it a big advantage in getting to remote suburban districts in a hurry.

MORGAN & WRIGHT'S DAYTON DELIVERY CAR

USING KEROSENE

Lansing, Mich.—Editor MOTOR AGE—Will you let me know through the columns of the Readers' Clearing House what changes must be made in the ordinary carbureter in order to use kerosene? I use a Kingston carbureter, with float in a separate chamber, and would like to know exactly what changes I would have to make in order to use kerosene. I understand that gasoline will have to be used in starting the machine and my intentions are to have the carbureter connected with the gasoline and kerosene tanks, using a switch.—H. A.

In using kerosene for a motor it is advisable to use a separate needle valve, as kerosene requires an opening of from 30 to 50 per cent over gasoline. Even though the needle valve is adjustable, this adjustment would have to be made in switching over from gasoline to kerosene. The motor can be started with kerosene if hot; if cold, gasoline must be used.

WIRING OLD BATTERIES

Hampshire, Ill.—Editor MOTOR AGE—In a dry battery for an automobile, two sets of five cells each are used. Each set is connected in series. As I understand it this gives the total voltage of five cells and the amperage of one. As the cells grow weaker the two sets are connected in parallel to the same binding post, giving the voltage of five cells and the amperage of two. After they became still weaker I thought I could make still further use of them by connecting one set in series and one set in parallel and connecting both sets to the same binding post on the coil. I then tried the ammeter on the parallel set and it ran the needle way up, so I thought I had it, but the coil failed to buzz. Can you explain my trouble? This is the way I connected the cells.—See figure 1.—GEORGE W. COOK, JR.

The trouble has been the result of a short circuit in the batteries. Referring to sketch of your writing, figure 1, 1, 2, 3, 4 and 5 are connected in parallel, while 6, 7, 8, 9 and 10 are connected in series. Connecting N 6 with N 1, would be the same as connecting 6 with 5, as the negative and positive wires are all in parallel; therefore, 1, 2, 3 and 4 would be cut out and the positive on 5 becomes negative. By using an ammeter with the positive wire on P 10 and the negative wire on N 5, it will show the maximum voltage. Connect the positive wire of an ammeter to P 10 and ammeter negative to P 5—as positive on 5 becomes negative—and the voltage of 5 and 10 will be indicated, usually about 4 volts for the two ordinary dry cells. To prove that the positive becomes negative on 5, connect the ammeter positive with P 5, and ammeter negative with P 10 and the ammeter needle will move back against the left hand stop. Immediately upon connecting P 10 with P 5 it produces a short circuit of the batteries. This reversal of negative and positive takes place at 1 and 2 by connecting 5 and 10, but this connection produces a short circuit in the batteries, the seat of trouble. Referring to figure 2—two sets of five batteries in series, connected in parallel—with positive and negative at A and positive and negative at B will produce the maximum voltage of the combined batteries. If no voltage is indicated with this it is time to recharge or get new cells.

FREEZING POINT

Linden, Ia.—Editor MOTOR AGE—Please state in MOTOR AGE how low a temperature the pure calcium chloride solution will stand in an automobile without freezing to do damage. I refer to the solution published in Motor Age some time in the early fall; 4½ pounds to the gallon of water.—E. H. MALLORY.

Watertown, S. D.—Editor MOTOR AGE—Now that cold winter weather is here, the danger of frozen radiators is with us. Can you give the formula of some composition that can be used in the radiators which will prevent water freezing and not injure the interior of the water jackets or pipings of the motor?—J. A.

A solution containing 5 pounds of calcium chloride to each gallon of water will freeze at 47 degrees below 0 Fahrenheit. Wood alcohol is being extensively used. This costs about 90 cents a gallon at wholesale drug houses. A solution consisting of ⅔ water and ⅓ wood alcohol will protect a motor to a little below 0.

FINDING SAND HOLES

Galesburg, Ill.—Editor MOTOR AGE—During the last 3 months I have had some novel experiences with my runabout. I would leave the garage early in the morning with the car running well for perhaps an hour, when suddenly it would lose power and finally stop. Then commenced a Sherlock Holmes tour of the electric system, carbureter and valves, with poor results. At night I would have it overhauled, the crankshaft removed, and the inner walls of the cylinder examined, but no cause found for the trouble. Half a dozen times the same trouble confronted me and as often the garage men overhauled the machine, as often did it start off well in the morning and suddenly lose power at inopportune times. Finally, almost distracted with the machine, I placed it in the hands of a repair man, with instructions to keep it and run it until the trouble was discovered. The discovery soon came. The first day the water jacket was tested, when it was found that a minute stream of water was issuing through the inner walls against where the piston would operate. The hole had evidently been formed by a grain of sand in the casting and had not appeared until after it had been used for some time. The cylinder being horizontal in the car, the water leaked into the bore in sufficient quantities to interfere with the workings of it. I had a new cylinder casting put in and the car has worked perfectly ever since. Can you give me the nature of the tests of water jackets before a machine is shipped from the factory?—PHYSICIAN.

The tests of water jackets vary with different manufacturers. Usually the first thing done to a cylinder casting when it comes from the foundry is to test the jacket. All holes are plugged with watertight gaskets, water is introduced into the cylinder through some convenient place, and a pressure gauge is fitted at another place. Water is forced into the cylinder by a high pressure pump up to 100 pounds or over. If there are holes in the casting they are readily discovered. This leak is sometimes caused by the slag in the moulten metal at the foundries, although the percentage of castings scrapped for this reason is very small. All concerns have their own methods of testing jackets and some builders scrape the outer water jacket walls in the hope of removing sand grains from the casting.

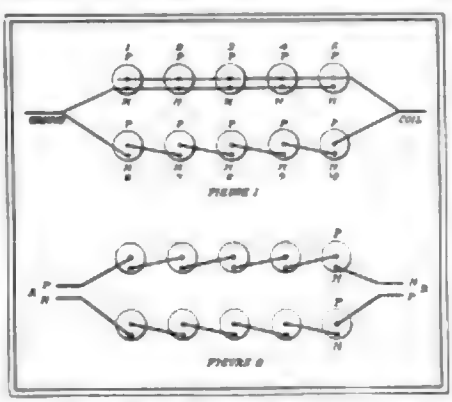

DIAGRAM FOR WIRING OLD BATTERIES

LOCATING AIR LEAKS

Albany, N. Y.—Editor MOTOR AGE—I am not going to bother you with questions this time, but write to tip off a couple of good things I have stumbled across and which I think may be of benefit to the readers of the clearing house. One of them is a sure way of locating a puncture. Of course, when you have a good-sized hole in the inner tube, it is no trick at all to find where the air escapes—it's the little pin pricks that make you scratch your head and worry. My scheme is to take aniline or other colored fine powder—a small quantity will be enough—and blow it into the inner tube. Then when you look for the pin hole puncture you simply blow up the tube, take a wet cloth and run it over the rubber. The dye is expelled through the puncture by the force of the air and the rag moistens it and causes it to leave a brilliant stain, which marks the seat of the trouble. My other tip is an easy way to test the quality of lubricating oil, which, as you undoubtedly know, should be neither acid nor tacky. Oil of the right sort is discovered by placing a drop on a polished copper plate. If it remains clear and keeps its color for several days it is O. K., but if it is acid it will turn green. If tacky it can be told by rapidly drying.—R. B. S.

Digitized by Google

TESTING A COMPOUND ON A 40 PER CENT GRADE AT THE MIDDLETOWN FACTORY

G & J Branch—The G & J Tire Co., of Indianapolis, is about to establish a branch in Philadelphia.

New Salesroom—Hatch & Co., New York agents of the E. H. V. Co., of Middletown, Conn., have established a salesroom at 1655 Broadway.

Maxwell Improving—The Maxwell people are refitting the old building in Detroit formerly occupied by the Olds company. Extensive improvements are being made in the building.

Bobs Up Again—You cannot lose E. J. Pennington. This time he hails from Grand Rapids, Mich., and he is endeavoring to interest Toledo capital for the purpose of establishing an automobile plant in that city.

Cameron Plant Moved—The Cameron car, which has been manufactured at Pawtucket, R. I., for the last 3 years, will hereafter be made in Norfolk, Va., its inventor having organized a company with $200,000 capital in the southern city.

How Compounds Are Tested—Among the many devices used by the E. H. V. Co. for testing Compound cars at its Middletown factory, is a 40 per cent grade, up which every car turned out must make its way without difficulty, before it is turned over to a customer. The grade is built of wood and is so arranged that cars cannot run off the edge of the roadway. It has been in use for a year or more.

Plug Maker—A charter has been granted to the Albright Mfg. Co., of Columbus, Ga., successor to the Camp Cycle Co., for the purpose of manufacturing the Albright spark plug, as well as numerous other accessories. The final organization of the company took place last week, L. A. Camp being elected president, E. P. Dismukes, vice-president; Paul Dismukes, secretary and treasurer and J. J. Albright, superintendent. The paid in capital stock is $14,000, with privilege of increasing to $100,000. A large brick building with over 15,000 square feet floor space has been leased. Anticipating the final organization of the Company, orders were placed some time ago for machinery, all of which is now here and is being installed.

New Carbureter—The Missnack Mfg. Co., of Detroit, is about to market a new carbureter, the invention of a local expert named Fishback.

Stoddard-Dayton Agencies—The Dayton Motor Car Co. announces the following list of its agencies for 1906: Chicago, McDuffee Automobile Co., 1449 Michigan avenue; New York, Stoddard-Dayton Agency, 1853 Broadway; Philadelphia, Hamilton Automobile Co., 206 North Broad street; Pittsburg, Central Automobile Co., 5989 Centre avenue; Buffalo, J. A. Cramer, 737 Main street; Boston, Randliff Motor Car Co., 24 Columbus avenue; St. Louis, Colonial Automobile Co., 3944 Olive street; Omaha, Deright Automobile Co., 1119 Farnam street; Cleveland, H. S. Moore, 160 Crawford road; Toronto, Automobile & Supply Co., 24 Temperance street; California, Norman W. Church, Hellman building, Los Angeles, Cal.; Minneapolis, Haynes Automobile Co., 220 South Sixth street; Denver, C. M. Wood; Indianapolis, Fisher Automobile Co., 330 North Illinois street.

LATE INCORPORATIONS

Boston, Mass.—The Penn Automobile Supply Co., of this city, has been incorporated with a capital stock of $10,000.

New York City—The Metropolitan Auto Co. has been incorporated with a capital stock of $25,000.

Newark, N. J.—The Austin Auto Co. has been incorporated with a capital stock of $25,000.

Homer, N. Y.—Among recent incorporations is that of the Baker Gear Co., with a capital stock of $70,000.

Newark, N. J.—The Calvert-Zusi Auto Co. has been incorporated with a capital stock of $20,000. Registered office, 213-215 Clinton avenue.

Atlantic City, N. J.—The New Jersey Touring Car Co. has been incorporated with a capital stock of $60,000. The object of the company is to manufacture automobiles.

Philadelphia, Pa.—Among the recent incorporations is that of the General Specialty Co., which intends to engage in the manufacture of building hardware and fittings, metal furniture, wagon and automobile fittings, etc.

Cooper to Change—Tom Cooper told a friend in New York that he was to leave the Matheson Motor Car Co. and go with Barney Oldfield in his vaudeville racing act on the stage.

Rands Moves—The Rands Mfg. Co., formerly the Wheeler Mfg. Co., maker of body tops and other automobile specialties, has just moved into its new quarters, corner of Macomb and Beaubien streets, Detroit. The building is well lighted on four sides covering an area 150 by 75 feet with two floors.

New in Detroit—A new accessory and sundry company has been organized in Detroit with W. E. Metzger president. The active management is in the hands of Messrs. McLean and Howard. The firm occupies the upper floors of the Metzger building. Besides carrying a full line of sundries the company will manufacture several specialties.

Energine Officers—The Energine Co., which was incorporated in Cleveland several weeks ago, has completed its organization by the election of William Greif as president, R. P. Beardsley vice-president, and Frank B. Many secretary and treasurer. The company has a capital stock of $500,000 and will build a plant in Cleveland for the manufacture of Energine.

To Make the Carter—Byron A. Carter, of Pontiac, Mich., has organized the Motorcar Co. of Detroit, to manufacture the Carter car embodying his friction transmission. The first model is nearly completed and a factory is being equipped. The officers of the company are: Frank T. Canghey, president; Fred Postal, first vice-president; Byron J. Carter, second vice-president; R. A. Palmer, secretary; Harry R. Radford, treasurer. The factory is at 230 Twenty-first street, Detroit.

To Interest French—E. V. Hartford, president of the Hartford Suspension Co., sailed for Europe last week. He is now going over to sell the foreign makers the license to make use of the device as it will be marketed in 1906. The new Hartford suspension is now fitted with a self-adjusting device, which requires no tightening up as in the past. There is a five-prong spring washer that takes up all of the inside wear, and the whole is held in place by a split nut of Mr. Hartford's own design. The sample has one double and one single arm, instead of two single arms. This makes it impossible for the arms to shear off.

Purdue's Testing Plant Working—Purdue university's new automobile testing plant, the latest innovation in the mechanical engineering department, has had its initial tryout, and it was found to be in perfect working order. Tests were run on Prof. Arthur Goss's Reo car, and the results obtained were according to expectations. The 16-horsepower machine, when driving at its maximum power, was always under perfect control of the testing force. The first test was a mild tryout, as the plant is capable of testing touring and racing cars of the highest power. After a few minor changes are

Digitized by Google

made in the arrangements of the plant several high-power 1906 machines are to be brought in for tests.

Franklin Man Dies—Harry Simpson, assistant treasurer of the H. H. Franklin Mfg. Co., died at his home in Auburn, N. Y., last week at the age of 27 years.

Increases Force—The Pope Motor Car Co., Toledo, O., has added about 150 men to its working force, in view of the new addition having just recently been completed.

Burning Question Solved—They have an artificial coal mine at the Packard plant in Detroit, the company having taken the precaution to lay in a stock of 3,000 tons of coal for a reserve supply.

Nearly Ready—The new factory building of the American Locomotive Automobile Co., which is to build the Berliet car in Providence, R. I., is nearly completed. The plant will be 375 by 63 feet.

Ode by Owen—Ralph R. Owen, of Cleveland, who secured the first 1906 Oldsmobile four-cylinder car delivered, has written the factory stating he has not made an adjustment since getting it and that he drove from Lansing to Detroit over the muddiest kind of roads without the engine making a skip.

Unique Party—A party of forty New York city automobilists spent Saturday in Bridgeport, Conn., as the guests of the Locomobile Co., of America. John F. Plummer, Jr., the New York manager of the Locomobile company, conducted the party to Bridgeport by private car over the N. Y., N. H. & H. R. R., and on arriving at their destination the party was taken to the Locomobile factory, where the day was spent going through the plant. All of the visitors on the trip were either purchasers of 1906 Locomobiles or prospective purchasers.

Car Wanted—The Eastern Automobile Co., of 326 North Broad street, Philadelphia, agent for the Peerless Motor Car Co. and J. Stevens Arms & Tool Co., has so outgrown its present quarters that it has given out contracts for building an addition to its garage and salesrooms. The new building is nearly three times the size of the present quarters and has more than twice the frontage of the present building on Broad street. There has been a change in the personnel of the company, A. B. Cumner resigning and L. Howard Smith, of Philadelphia, entering the firm. The company is now looking for another car to fill out its line for 1906.

Thomas In a Hurry—Without waiting for its completion, the E. R. Thomas Motor Co., of Buffalo, occupied a part of its new factory during the week. Rather than delay shipment, the expert mechanics were placed at their benches on the first floor of the new concrete building before all of the floor had been laid, and consequently visitors were given a sight of automobiles being set up within half a dozen feet of where other workmen were laying a concrete floor. While cars were being finished on the first floor, the last touches were being put on the roof. The new building is in the shape of an irregular letter L, and is 190 feet long by 195 feet, and is three stories in height.

BRIEF BUSINESS BITS

Chillicothe, O.—O. M. Houser has opened a garage on Mulberry street.

Pontiac, Mich.—The board of trade is considering the establishment here of an automobile tire factory.

Atlanta, Ga.—The Piedmont Motor Car Co. has secured the local agency for the Marmon car in that city.

York, Pa.—Theodore R. Helb is to build an automobile garage at the corner of King street and Howard avenue.

Baltimore, Md.—Jesse Lippencott Cassard, Jr., has acquired the agency for the Ford car here and will open in the Gill building as soon as it is completed.

Fostoria, O.—The Fostoria Motor Car Co., will shortly be formed for the purpose of manufacturing automobiles. The capital stock of the company is given as $300,000.

Indianapolis, Ind.—Having taken the Indiana agency for the Marmon car, the Gibson-Short Cycle & Auto Co. has greatly enlarged its establishment and expects to make still further extensions.

Rochester, N. Y.—A. L. Mora, of this city, will soon start an automobile factory in the village of Newark, if arrangements can be made with the board of trade. Alterations have already been started on a building for Mr. Mora.

Newark, N. J.—The building at 213-215 Clinton avenue is to be converted into an automobile garage. A deal has been consummated whereby the Newark Garage & Repair Co. becomes the owner of the property. George L. Paddock, of the Auto Vehicle Co., is the president; L. B. Zusi treasurer, and Andrew Schwind is the secretary and general manager. While this will be the holding company, and will occupy the major part of the building, two other automobile companies are connected with the establishment. They are the Auto Vehicle Co., which will handle the Thomas Flyer, and the Calvert & Zusi Automobile Co., which will handle the Winton in that section of the state.

Baltimore, Md.—An agency for the Pierce car has been established by the Southern Auto Co.

St. Louis, Mo.—The Van Automobile Co., 4706 Washington avenue, will handle the Marmon car in this city.

Boston, Mass.—C. H. Saunders has secured the agency for the Moline line of cars, which are well known in the west, but have as yet to be introduced here.

Tacoma, Wash.—The Reliable Automobile Co., agent for the Packard, Cadillac and Winton cars, has opened a garage and general repair shop at 111-115 South Eighth street.

Newark, N. J.—The Jackson Automobile Co. has established a branch in this city, which will act as general sales agent for the agents of New York, New Jersey and Pennsylvania. The branch is in charge of C. W. Oathout.

Boston, Mass.—Frank D. Stranahan, manager of a Tremont garage company, has decided to add an automobile supply department to his station. The Prest-o-lite tank agency, which has been in charge of P. A. Sheehan for the past year, has been turned over to Stranahan, who has also another.

Indianapolis, Ind.—The Elston Automobile Co. has closed its establishment and S. W. Elston has accepted a position as manager of the Indiana Automobile Co. This company has completed arrangements for the agency of the Oldsmobile, which was recently relinquished by the Fisher company. The Indiana company will also handle the Cadillac, Winton, Franklin and Autocar.

Worcester, Mass.—An addition 100 by 60 feet has been completed by the L. W. Pond Machine & Foundry Co. and the force at the factory has been increased. The manufacture of metal planers has been discontinued. The space which has been devoted to this industry will now be devoted to automobile work. The company is preparing for a first-class garage and repair department.

THIS LEAGUE
Is Now Collecting Route Information

covering all automobile routes in the important states and will publish road books for motor car users as fast as complete information is received. The A. M. L. is the only organization engaged in this work, and it invites the co-operation of all persons interested. For full information and membership blanks address American Motor League, Vanderbilt Building, New York City.

Reduced Railroad Rates

to all members of the AMERICAN MOTOR LEAGUE who travel

to the City of New York

to attend the meeting of the A. M. L.—to which all automobilists are invited—beginning Monday, January 15, and ending Saturday, January 20, both dates inclusive. As this is the

Week of the Automobile Shows

our members will have an opportunity of taking part in convention work and of enjoying the gala week at the same time.

Important Notice—This reduced rate benefit is for league members only. Persons wishing to join the league and to receive this benefit should immediately send names and addresses—plainly written—with 1 year's dues—$2 for each applicant. The railroad associations will not grant reduced rates in aid of an automobile show or any other purely commercial enterprise. They will recognize only those certificates which are held by league members.

Each member who comes to these meetings should bring his membership ticket. This will save the trouble and delay of searching membership records. Every expired membership should be renewed. Full printed information will be sent on request. Address

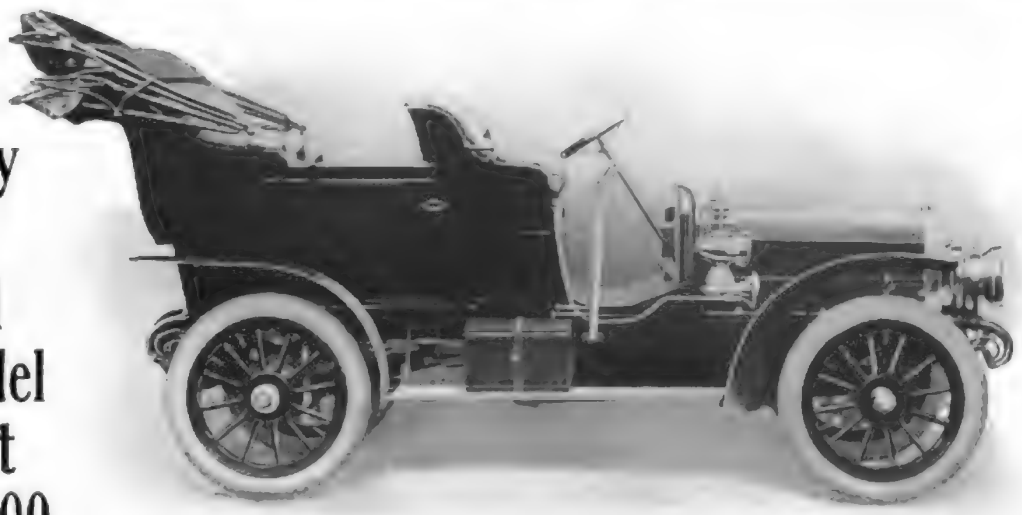
WINTON MODEL-K

Why We Sell Model K at $2500



"I don't understand why you sell Model K at $2600. No other car is in its class at less than $3500, and I wouldn't trade my K most cars that sell as high as $5000.

That is a boiled-down summary of the verdict of practically every purchaser of the new Winton Model K.

And it states the truth in a nutshell, too.

Now we'll tell you why.

1.—This company is proud of its reputation. It was the first company in America or elsewhere to market a really high-grade car at $2,500, and it thereby set the pace that has made it America's foremost producer of motor cars. And **it intends to stay ahead.**

2.—We are making **only one model.** To produce two or more models divides the possibilities of real success. No man can serve two masters, and no automobile manufacturer can make two or more models at the same time and do himself justice. **To make one model well** is a supreme achievement.

3.—Our superb facilities—the largest and best equipped touring car plant in the world, and the fact that we **make for ourselves a greater proportion of the parts** used in the complete car than does any other touring car manufacturer, mean **economy of production,** by CUTTING OUT MIDDLEMEN'S PROFITS.

4.—For 1906 we set the price of $2,500 first, and then designed and constructed absolutely the best motor car which we, with our great facilities and long experience, could produce at a profit. Model K is the result. And——

Model K is unquestionably without an equal on the market.

DON'T compare it with other $2,500 cars; you would be **wasting your time.**

Compare it with cars selling from $3,500 to $5,000.

We'll risk our chances on your verdict.

MODEL K WINTON.—Four vertical, water-cooled cylinders, 30 H. P. or more. Quiet running. Abundant reserve power. Velvety, non-jar, non-shock, non breakable transmission. Flexible speed control. Shooting rider. Exclusive Twin Springs. Easy Riding. And every other feature that a real high-grade car should have. $2500 f. o. b. Cleveland.

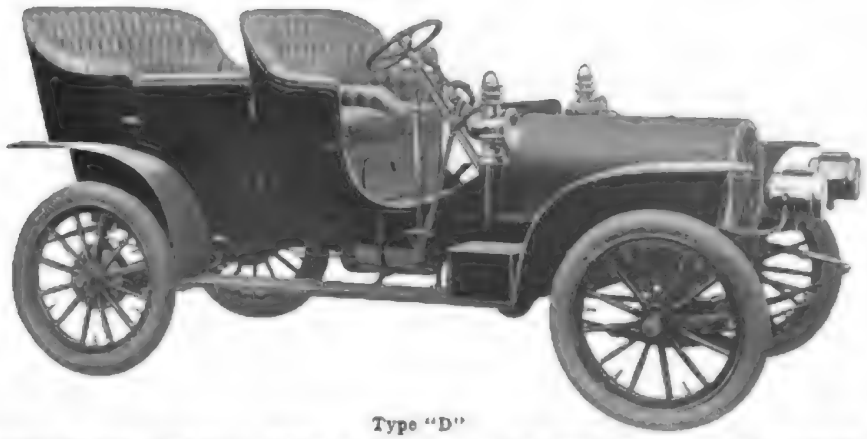
FRANKLIN



Type "D"

FOUR-CYLINDER TOURING CAR. Shaft drive. Sliding gear transmission. Three speeds and reverse. New and perfect disc clutch. Four cylinders. Air-cooled. Side doors. 5 passengers. 100 inch wheel base. 1800 pounds. 20 "Franklin horse-power." 45 miles per hour. Full head and tail-light equipment. $2800. f.o.b. Syracuse.

This car is remarkable for its great surplus power, quiet running, easy riding and wide speed range on the throttle. It holds high speed under full load for an indefinite run, and meets full touring requirements as completely as most cars of double its power rating, as far greater weight, and which are vastly more expensive to operate and maintain.

The Carbureter

An automobile's carbureter is something like the human liver.

A car may have great potential merits, but with a sluggish carbureter they cannot develop into action, and you have a mighty sick car.

The wide-awakeness, the always-on-tap energy of Franklin cars is constantly insured by the most accurate, sensitive, positive carbureter ever put into an automobile.

We manufacture it ourselves; as carbureters purchased on the market, many of which give satisfaction on ordinary motors, are not efficient enough for FRANKLIN motors.

The Franklin carbureter is an automatic float-feed type. Gasoline enters from the lower side of carbureter and is strained through wire gauze before entering the float chamber. Dirt and water are collected in a trap, which can be entirely removed or easily cleaned, without disturbing any other part of carbureter.

A by-pass operated by the throttle acts positively when that is opened, and supplies auxiliary air in proper proportions. This by-pass, being mechanically operated, does away with springs, separate air-control and a multiplicity of other parts. All connections are made with ground joint unions.

The Franklin auxiliary exhaust, improved oiler, clutch, brakes and bearings, more convenient levers and better protection of parts, are some of the other details which make 1906 Franklins not only exceptionally powerful but the readiest and liveliest of motor cars.

Type E: Gentlemen's Roadster. The best-built, ablest Runabout in the world.

Type G: The new Light Touring Car.

Type H: The new 6-cylinder top-notch flyer.

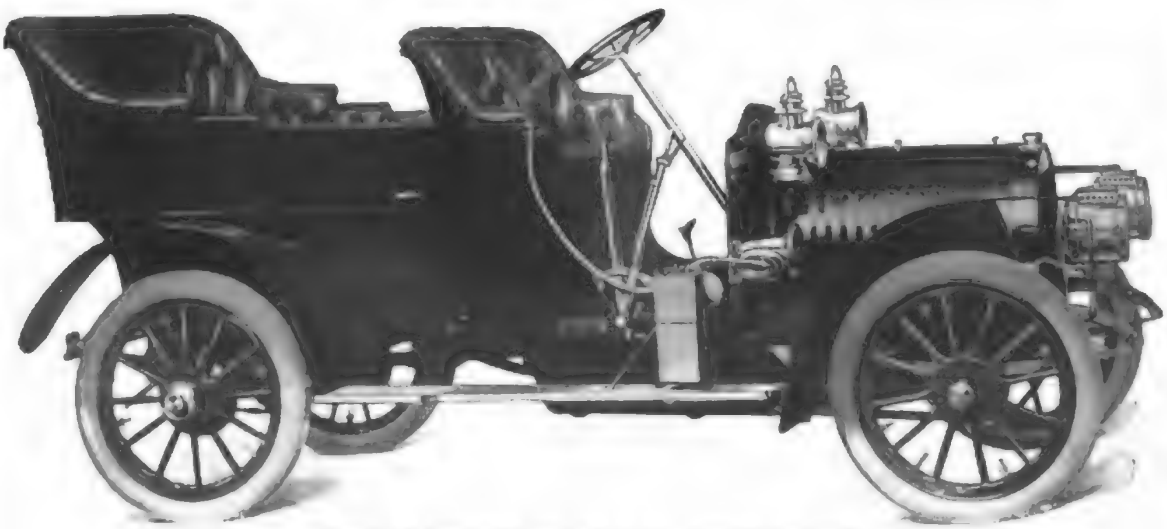
THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

Absolutely the highest grade motor car built in this country, bar none, and the only car that can consistently compete with foreign machines. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. New style make and break spark. Simms-Bosch Magneto, bevel gear drive. Very large and roomy, full aluminum bodies.



MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

Guaranteed free of repairs for one year

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order?

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.

Good Agents Wanted in Unassigned Territory

Digitized by Google

If you are looking for the "best" car you can't recognize the ear marks by size, speed, price, quietness, number of cylinders, where they are located, whether the car is gear driven or chain driven, or any such externals. As we said last week and as we want to repeat, the car that is "best" for you is that car which will return you the most fun and enjoyment per dollar expended, and which will fill your mind with the greatest number of pleasant recollections and the fewest unpleasant.

And as we said further, you can't determine which that car is by listening to what the makers and sellers of the various cars have to say in its favor at the beginning of the year, but what those who have purchased it have to say for it or against it at the end of the year.

Better read this again and then look up our last week's ad if you have forgotten what we said in it.

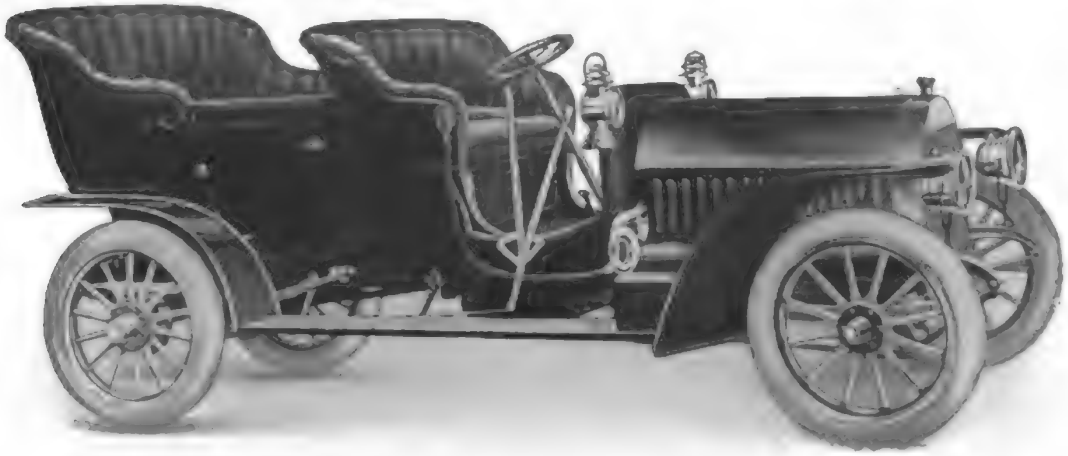
Wayne

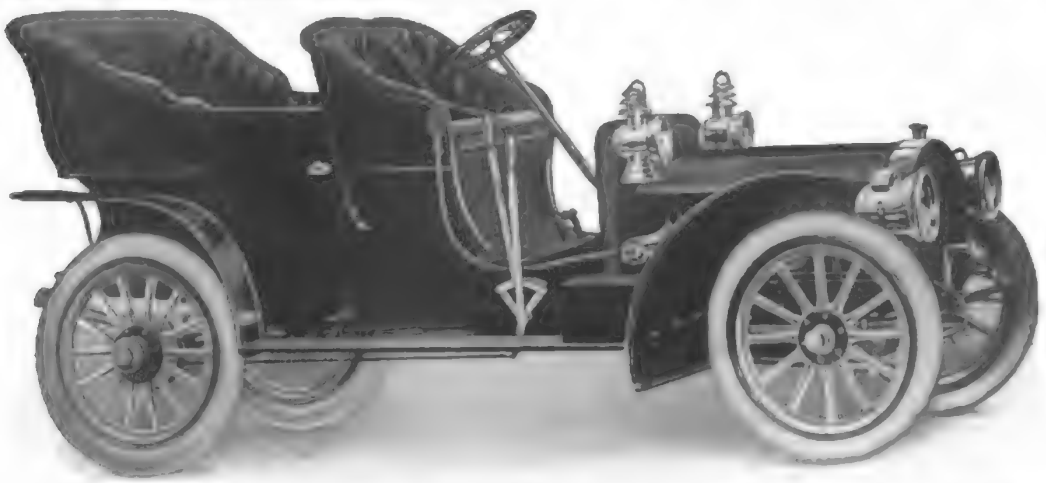
An Introduction to the Wayne Cars of 1906

The appreciation accorded our cars last year warrants us in greatly increasing our capacity and in placing before the automobile trade improved types of Wayne cars. The four models we now present are the result of mature experience. They are not new and untried experiments. Each car is a distinct type of Wayne design and construction and each model has been built with a view to supplying the varied demand for high grade machines. In the Wayne cars of 1906 the automobilist will be sure to find a car suited to his needs.



Wayne Model F $3500

MOTOR, 4 cylinder vertical, cylinders 5½ x 5 cast in pairs. Cylinders and pistons ground. Engine develops by brake test 50 H. P. Water Cooled. IGNITION, jump spark with quad coil and storage battery. TRANSMISSION, sliding gear with three speeds forward and reverse. Hess-Bright ball bearings throughout. REAR AXLE, shaft drive floating type. FRONT AXLE, I beam drop forged, one piece, nickel steel. WHEEL BASE, 114 inches. TIRES, 34 x 4½. EQUIPMENT, includes all necessary tools of the best quality, 2 side lamps, 2 acetylene head lights with generator, tail lamp and tube horn.



Wayne Model K $2500

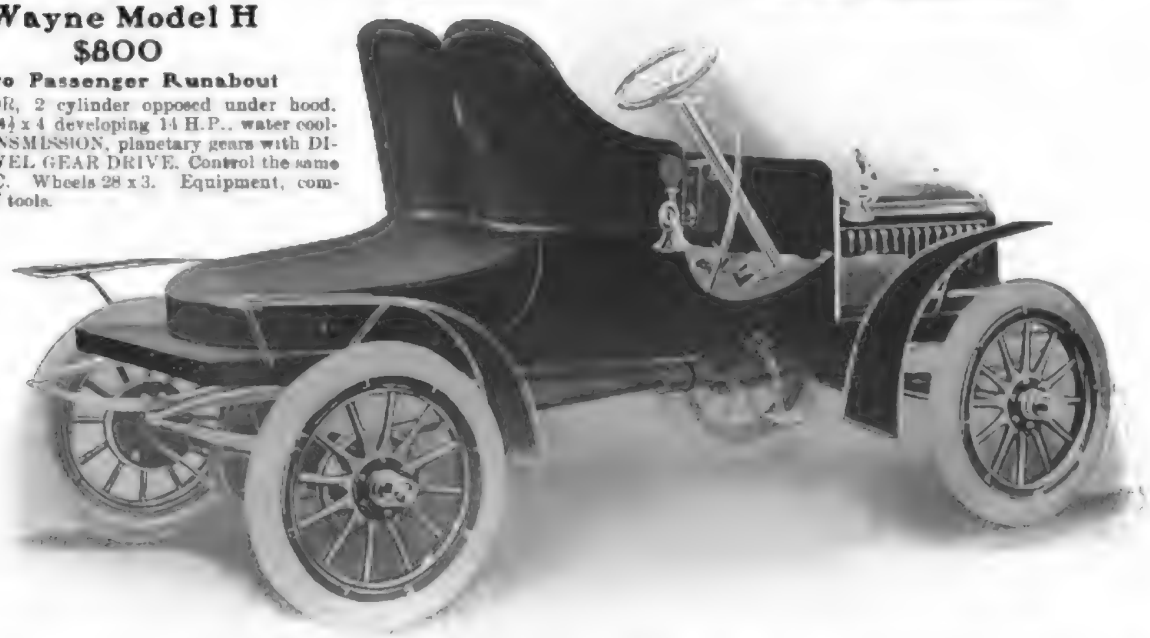
MOTOR, 4 cylinder vertical, cylinders 4¼ x 5 cast in pairs and water cooled. Engine develops by brake test 35 H.P. Cylinders and pistons ground. IGNITION, same as Model F. TRANSMISSION and axles same type as Model F. TIRES, 32 x 4. EQUIPMENT, same as Model F.

Digitized by Google

Wayne

Wayne Model H
$800
Two Passenger Runabout

MOTOR, 2 cylinder opposed under hood. Cylinders 4½ x 4 developing 14 H.P., water cooled. TRANSMISSION, planetary gears with DIRECT BEVEL GEAR DRIVE. Control the same as Model C. Wheels 28 x 3. Equipment, complete set of tools.



The strong features of this car are the extreme simplicity and accessibility of the engine and transmission. The crank case and transmission case form one casting and the entire engine can be taken apart or assembled in half an hour.

Wayne Model C
$1250

MOTOR, double opposed of the standard Wayne type, with cylinders 5¼ x 5. Engine is hung under the chassis frame and develops by brake test 20 H. P. *This is the same type of car which Proved so successful last season, brought up to date and with all new improvements.* TRANSMISSION, is of the planetary gear type with chain drive. CONTROL is by a single lever which engages the high speed clutch and reverse. The slow speed and brake are controlled by foot pedals. TIRES 30 x 3½. EQUIPMENT, complete set of tools, side oil lamps, tail lamp and horn.

We want agents to write us about the Wayne Cars for 1906. Agency arrangements can now be made for unoccupied territory. Write while you think about it for full particulars.

MITCHELL

The Ford 4-cylinder Runabout

This car—Model N — is the biggest revelation yet made in automobile construction. A car of this type for less than $500.00 seemed an impossibility, but here it is. 4 cylinders. 15 H. P. Direct drive. Speed 40 miles. 78-inch wheel base. Weight 700 pounds.

Ford Model K

6 cylinders—40 H. P., 4 to 50 miles per hour on high gear. Perfected magneto ignition, mechanical oiler, 114-inch wheel base, luxurious body for 5 passengers, weight 2000 pounds. **Price $2500.**

NO FURTHER PARTICULARS WILL BE GIVEN UNTIL THESE CARS ARE SHOWN FOR THE FIRST TIME AT THE AUTOMOBILE CLUB OF AMERICA'S SHOW AT THE 69th REGIMENT ARMORY, NEW YORK, JANUARY 13th to 20th.

Deliveries for Models N and K Will Not Be Made Before March

1906 will be a "Ford Year." Agents who have closed with us can congratulate themselves.

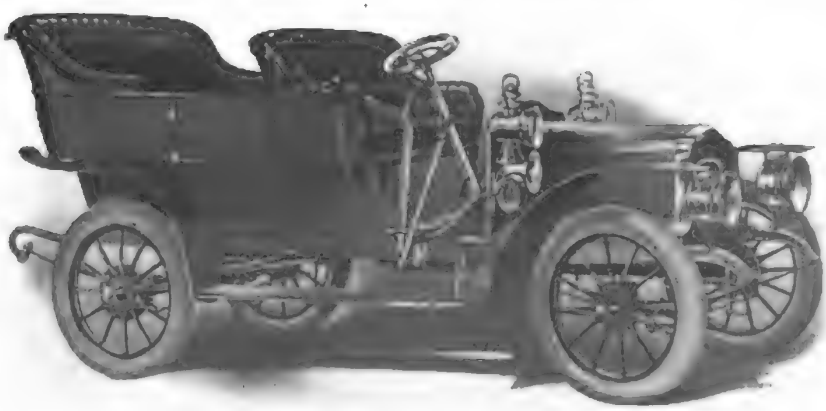
Corbin Cars for 1906



Model E. Light Touring Car, 24 h. p. $2,000.

Four cylinder vertical, air cooled engine 24 H. P. mechanically operated valves. Jump spark ignition with synchronized system of distribution of the high tension current. Positive force feed lubrication. Sliding gear transmission, selective system having three speeds forward and reverse. Pressed steel frame and steel pan construction. Bevel gear drive rear axle of the floating type. Front axle I beam section, drop forged in one piece. New type worm and sector steering gear. Internal and external brakes on rear hubs. Body of graceful design, side entrance of the latest French type, roomy in proportions and luxurious in appointment. Wheel base 100 inches. Extra long springs, of special design and great flexibility. Wheels 32x3½ inches. Weight, 1800 pounds. Speed up to 45 miles per hour. Two gas lamps, generator, three oil lamps, horn and full complement of tools, constitute the equipment.

Annular Ball Bearings Are Employed Throughout

Certain agency opportunities are still open. Representative dealers are requested to communicate with us to insure early delivery of cars.

WALTHAM-ORIENT

WALTHAM-ORIENT, MODEL R, $2250

The Car of Today Must Do More Than Look Its Price. The high-priced, high-powered motor car is all right—it has its place and its purchasers, but the **popular demand** is for a car of moderate price, reasonable speed that will be maintained uphill as well as on the level road; that will arrive on time and return when expected; that will keep on the road and out of the repair shop; that can be operated economically and safely and does not require the employment of a professional chauffeur; that will remain in service winter as well as summer.

It must look well—ride well—run well—and keep well. That's where your pleasure comes in. You pay your good money for it and you have a right to expect it.

It is because it combines all of these important and necessary features that

The Waltham-Orient is the Leading American Car of Its Price

Six Models for 1906

Model R, a Swell Special 20 h. p.	$2,250	Model M, 16 h. p. Runabout, **Detachable Tonneau,**	$1,750
Model N, 20 h. p. Tourist	2,000	Model K, 16 h. p. Two-passenger Runabout,	1,600
Model L, 16 h. p. Tourist	1,750	Model BB, 4 h. p. Friction Drive Buckboard,	400

We are alive for live agents. Write for specifications and proposition.

MODEL B B—FRICTION DRIVE BUCKBOARD
A REMARKABLE MOTOR CAR FOR $400

Digitized by Google

OLDSMOBILE

Standard Runabout Model "B." Price $650

For 1906 we have brought out, in addition to our well-known curved dash runabout (the "you see them wherever you go" kind), a straight dash or "piano box" runabout, which we sell at the same price. This style appeals strongly to a certain class of drivers. It is unique and attractive and possesses all the most desirable features essential to a satisfaction-giving runabout.

It has a simple single cylinder motor, with 7 h. p. It is lever controlled. Starts from the seat; has safety device to prevent all danger of back fire; effective and easily operated brakes, and many attractive and serviceable features, making it up-to-date and desirable in every way—a big value for the money, and essentially a car for business utility.

Use the Catalog Coupon below for further particulars regarding the Standard Runabout, Model "B," price $650; the Palace Touring Car, four-cylinder, Model "S," price $2,250; two-cycle Model "L," price $1,250, or any of our commercial vehicles.

Our New Models will be on Exhibition at Madison Square Garden Automobile Show, January 13-20, 1906

WE GATHER from the good opinions expressed by many highly pleased owners of **The Lozier Motor Car** that its "smooth running, ease of control and all-around reliability," covers about everything that is to be desired in a High-grade Motor Car. The item of low maintenance cost and all that it implies, was correctly calculated in its design, and is fully guaranteed in its perfect construction. Among the notably distinctive features that are embodied in

The Lozier Motor Car

may be mentioned—the use of Hess-Bright ball bearings in sliding gear, change speed and differential gears. Weldless nickel-steel drop-forged I-Beam axles of heavy construction—FRONT AXLE AND STEERING KNUCKLE IN ONE PIECE. Ball-bearing wheels of large diameter (36 inches). Platform spring suspension. Solid forged motor crank-shaft (arms being webbed out instead of drop-forged)—turned, hardened and ground on its own centers. Transmission and differential shafts and flexible shaft with universal joint of nickel-steel. Babbitted bronze motor bearings. Long wheel-base, 115½ inches.

1906 MODEL. TYPE C. 55 HORSEPOWER

Limousines, Landaulets and Touring Cars now delivering. Prices $4,500 to $5,500.

ELMORE
ANNOUNCEMENT

During the New York and Chicago Automobile Shows, 1905, we were approached by hundreds of automobile owners, saying, "If you people would only put out a four cylinder 2-cycle car, you would simply have the rest beat out of sight. It would be practically the same as an eight cylinder of the four cycle type with about one-fourth the complication, and as steady running as a clock." Well, we have built the four cylinder and it is all you expected, and more. You may have already heard this from persons who have seen and ridden in it, but you have never heard us say so. We, therefore, take this occasion to announce that it is our firm conviction that not only have we exceeded the most sanguine expectations of our friends, but that in all essential points we have the best four cylinder car ever built.

Our two cylinder 2-cycle car is a worthy successor to our Model 11, which, for reliability, as is well known, has never been excelled. It is in the details of construction that we have made our great advance and in changing from chain to shaft drive we accede to the popular demand for a two cylinder car of that type. Among the details we have improved is in using a new planetary gear running in oil, a popular make of circuit breaker, heads cast solid with cylinder, and on both cars we use the famous Hill Precision Oiler. But, as said above, there are so many things we want to talk to you about that we hope you will at once get into communication with us.

We have made so many improvements on our 1906 Models that we have not the space to speak of them here, but our literature will explain them all in such a manner that you will readily see we have a car with the exact features that have been talked of for years as being most desirable, but are impractical on any four cycle car on account of complication, rhythm of motion, power, etc., but which come perfectly natural to our 2-cycle. The action and power of an eight cylinder car with one-fourth the complication does it all.

Ask for literature.

NOTE—Will exhibit in New York City at Madison Square Garden ONLY, Auto Show Jan. 13 to 20

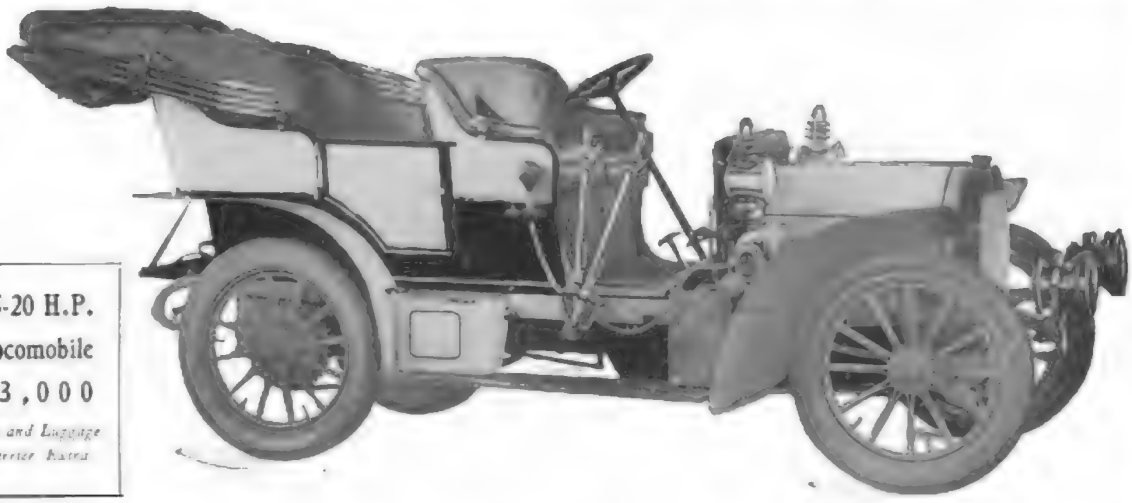
"EASILY THE BEST BUILT CAR IN AMERICA"

15-20 H. P., $3,000, 30-35 H. P., $5,000, both with complete touring equipment



15-20 H.P.
Locomobile
$3,000
Top and Luggage Carrier Extra

TYPE "E" Locomobile 15-20 H. P.

PRICE—$3,000 ready for touring.
EQUIPMENT—Five brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY—Double side entrance, seating five; extra wide doors; fitted with top irons; color and striping optional.
MOTOR—Four cylinder, 3¾ inch bore, 4½ inch stroke.
CAM SHAFTS—Hardened forgings; all cams integral.
CRANK SHAFT—Machined from one solid forging.
LUBRICATOR—Large, mechanical lubricator.
CARBURETOR—Automatic, with balanced throttle valve.
GOVERNOR—Centrifugal type, prompt and positive in action.
IGNITION—Make-and-break, with iridium contacts.
MAGNETO—Low tension, our own design and manufacture.
ALUMINUM PAN—Placed underneath the machinery.
FRONT FENDERS—Have inner wings extending to bonnet.
CLUTCH—Cone type, with ample surface.
TRANSMISSION—Three forward speeds and reverse.
DRIVE—Double side chains.
DOUBLE UNIVERSAL JOINT—Between clutch and transmission.
RUNNING BRAKE—Large and powerful, metal to metal surfaces.
EMERGENCY BRAKES—Internal expansion type, metal to metal.
BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES—"I" section hand welded axles.
RUNNING BOARDS—Rubber covered and brass bound.
TIRES—32x4 inches on all four wheels.
WHEEL BASE—93 inches.
CONTROL—Gas and spark levers on steering wheel.

TYPE "H" Locomobile 30-35 H.P.

PRICE—$5,000 ready for touring.
EQUIPMENT—Five brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY—Double side entrance, seating five to seven; extra wide doors; fitted with top irons; color and striping optional.
MOTOR—Four cylinder, 4½ inch bore, 5½ inch stroke.
CAM SHAFTS—Hardened forgings; all cams integral.
CRANK SHAFT—Machined from one solid forging.
LUBRICATOR—Large, mechanical lubricator.
CARBURETOR—Automatic, with balanced throttle valve.
GOVERNOR—Centrifugal type, prompt and positive in action.
IGNITION—Make-and-break, with iridium contacts.
MAGNETO—Low tension, our own design and manufacture.
ALUMINUM PAN—Is placed underneath the machinery.
FRONT FENDERS—Have inner wings extending to bonnet.
CLUTCH—Cone type, with ample surface.
TRANSMISSION—Three forward speeds and reverse.
DRIVE—Double side chains.

THE MARION

The New "Model Five"

This car is not an experiment. A number of them have been in commission since August last. It successfully meets the demand for a Touring Car

That is high-powered;
That is moderate in price;
That is as fast as the speediest;
That is roomy and luxurious (seats five);
That is so simple as to enable a novice to take care of it;
That is so strongly built as to cut out the repair bills;
That is so easily handled a woman can drive it at high speed;
That is so light and flexible as to make tire trouble a rare experience.

These problems have been intelligently and thoroughly worked out. Its four cylinders develop 28 horsepower and do it silently. The most efficient and noiseless chain drive yet devised delivers this power—all of it—directly to the spokes, without recourse to any roundabout transmission through rear axle or hubs. Total weight, 2,100 lbs. This combination of high power and light weight tells its story of speed and "get there" through any kind of country that has wagon tracks.

FEW AND SIMPLE PARTS

CLEAN COMPACT CHASSIS

Extreme simplicity marks every feature of the mechanism, while liberal dimensions, high-class material and accurate workmanship of every part that bears strain enable it to stand up to the roughest kind of work without damage. Multiple disc clutch and sliding gear transmission, with three speeds forward and reverse.

Two sets of powerful brakes, simple and sure steering apparatus and instantaneous responsiveness of the engines to speed regulation makes the control certain and easy.

Automatic lubricating system that is efficient, reliable and economical.

Many excellent and exclusive features. Ask to be shown and we'll send our nearest agent with a car. Seeing and riding will convince.

Haynes

Exclusive Features that Appeal to Discriminating Buyers

Model "R" Four-Cylinder Touring Car

Roller bearing vertical engines. Cylinders 5¼"x5"; 50 H. P. Cast separately. Sliding gear transmission with exclusive device which prevents possibility of burring or stripping gears and permits instant change from high to lower speeds with perfect safety and without noise. Positive cooling system operated at very low cost of power. Individual and special lubrication. Carbureter which assures perfect mixture in all temperatures and under all climatic conditions. Master clutch that has no leather surfaces to wear. Takes hold easily and gradually without jerking. Shaft drive. Exclusive universal joints that do away with wear on pins run in housing packed with grease. One piece nickel steel rear axle with beveled sprocket gear driven by roller pinion; thrust eliminated; friction reduced; noiseless; all in a bath of oil. Roller bearings throughout. 108 inch wheel base. 50 inch tonneau with ample room for two folding chairs. Six to 60 miles an hour on high gear. Weight, 2,750 pounds. Price, $3,500, f. o. b. Kokomo. Full head and tail light equipment. Horn and tools.

Every important feature of the 1906—HAYNES—roller bearing engines, master clutch, transmission, universal joints, rear axle, sprocket and roller pinion is exclusive with and found only on the HAYNES. Every detail has been developed in the HAYNES factory and with exact reference to every other part. There is perfect harmony throughout the entire mechanism. This is the reason that in the HAYNES car there is less than 10 per cent loss of power between the engine and rear tires. It is the reason that its cost of maintenance, upkeep and operation is so remarkably low, and that for 14 years it has had the acknowledged reputation of being a car of preëminently high quality.

Its cylinders are extra large. They hold compression perfectly and give high power. When changing gears the transmission device never allows the momentum of the fast moving car to be thrown against the power of the engine, with its consequent strain to the entire mechanism, frame and tires, a fault common to all other types of transmission. No danger of stripping gears or of gearing climbing out of casing, which constitutes the chief objection offered to large shaft driven cars.

Roller bearings give noiseless operation. Large flexible springs insure riding ease and long life to tires. Simplicity of control, all parts immediately accessible. Honestly built. Body of cast aluminum and wood. Gray curled hair and hand-buffed leather upholstering. All materials—metal or wood—are tested for strength and flexibility at double severest road requirements.

These are SOME reasons why the HAYNES gives such satisfactory service at a low rate of cost for upkeep. Others are given in our catalogue Number 12, sent prepaid upon request.

THE PARLOR CAR OF MOTOR CARS

Stoddard-Dayton

Talk of luxury! The roomiest of seats—splendid cushions that take you into their generous depths and make you forget there was ever an angle to ache mortal spine.

Well, that is the kind of rich comfort you find in the STODDARD-DAYTON Touring Car.

But there's more than fine upholstering to contribute to your ease.

The STODDARD-DAYTON has every **practical** modern device that takes up jar and reduces vibration. The springs are single elliptic—40-inch front, 50-inch rear, made from best crucible analysis steel. There are roller bearings throughout. Mechanical lubrication keeps all working parts swimming.

The STODDARD-DAYTON Model-D—5-passenger Touring Car has a special type of 4½x5-in. 4 cylinder motor; water-cooled; frame of hot-rolled, high carbon, pressed steel, sliding gear transmission, three speeds and reverse—selective type, speeds can be changed instantly without clashing or friction; practically noiseless; entire transmission on roller bearings; mechanical lubrication; 30 to 35 horsepower. Proportion of power to weight, one horsepower to every sixty pounds. $2250. Immediate delivery.

Write for our 1906-book. Interesting to any one who owns a car or intends to own one.

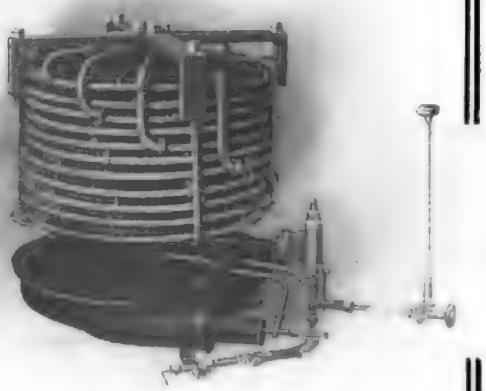
The Incomparable WHITE

The Car for Service



WHITE GENERATOR

Above is illustrated the generator of the White steam car, together with burner, vaporizer, pilot-light and gasolene connections. A glance is sufficient to show that the White generator is totally unlike any other boiler ever designed. We might point out how wide this difference is by calling attention to the fact that in the White generator the water is at the top and the steam at the bottom. In every other type of steam-making apparatus, water is at the bottom and steam at the top.

If the coils of the White generator should be unwound and straightened out the generator would be seen to consist of a single long piece of steel piping. Could anything simpler than this be conceived? The capacity of the tubes is comparatively small; i. e., the amount of water and steam contained therein at any one time is small. The tubes will safely withstand a pressure of many times that which it is possible for the steam to attain. Could any safer arrangement be imagined?

As regards the superior reliability of the White system, that is a matter which has been amply demonstrated by the continuous victories and notable achievements of six successive models of "The Car for Service."

An Investigation of Goodrich Tires

Mr. E. Shirts, cashier of the Citizens' State Bank, Noblesville, Ind., after using a set of Goodrich Tires through the year of 1904 and all of 1905 up to date, without a repair of any kind, decided to take off the tires for examination just to satisfy his curiosity. **All he found was Goodrich Rubber and Goodrich Fabric perfectly united and looking just as good as new.** His letter:

"In the spring of 1904 I purchased a Cadillac automobile, Model B, equipped with **Goodrich Tires, 3x30 inches.** I used those tires all the season of 1904 and all of this season without a repair of any kind, not a single puncture, and the tires look as good as new, with the exception that the treads are flattened down some. I have had such remarkable success with them that a few weeks ago I took the front ones off to see what they were made of, and found them in perfect condition, not even rim-rusted.

"I have driven my car every day that was fit to be out with my family and have kept them busy both seasons and my experience with them has been one round of pleasure."

THE BAILEY "WON'T SLIP" TIRE. Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, skewing or skidding. :: ::

Body Level

Rough Road Reasons

The purpose of this picture is not to show that the Marmon can be photographed on a rough road, but to show why the Marmon can be run at good speed over rough roads without incurring the ruinous strain on the mechanism and the vicious jolting to the passengers which is inevitable in **any other car.**

In all other automobiles the power plant is attached to the body frame and the body frame is suspended at four points on the axles. Except for the springs and tires, this construction would enjoy no advantage over that of a log wagon. But in an automobile, weight must be considered, and its costly mechanism must be protected. This unnatural and unyielding construction means ruinous binding and twisting strains in some part of the mechanism all the time. The rougher the road, the worse the strain.

The elasticity of the Marmon is such that no matter how rough the road, the mechanism is free from such strains and its passengers enjoy the very luxury of motion.

This elasticity is supplemented by springs, but is **primarily** due to an exclusive **patented** Marmon feature

Double Three-Point Suspension

Cast aluminum body on one frame, power plant on another frame, **each frame** suspended on three **pivotal** points. No matter how these frames are tilted, the power plant, straight and rigid driving shaft and rear axle are maintained in alignment. This means perfect power transmission, means fewer parts, simpler parts and less wear on all parts, tires included.

The Marmon oiling system gives no trouble, has no uncertainties. Starting and stopping with the engine, a constant and uniform flow of oil is forced through the hollow crank shaft directly into all the main engine bearings, crank and **piston pin** bearings. Has no adjustments. All parts oil-tight and dust-proof. One gallon of oil runs the Marmon from 600 to 1,000 miles.

These and other superior features are fully described in Booklet No. 1. Yours for the asking.

We shall demonstrate at the Armory Show, New York.

Scratch Your Head

for a moment over this:

"The total light falling on a reflector from its focus is proportional to the square of the maximum angle subtended by the rays."

Fig. 1 is a section of the Rushmore lens mirror, whose focal length AB is one-half its effective face diameter. Note the width of the angle CBD—about 120 degrees.

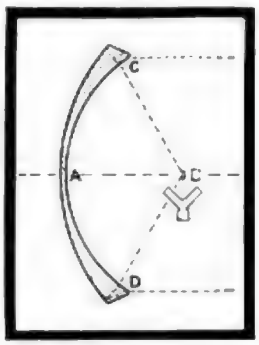

FIG. 1

Fig. 2 is a good specimen of "mirror lens" such as you will find in lamps made to imitate the Rushmore. It is flatter, because that costs less, and its focal length ab is correspondingly greater.

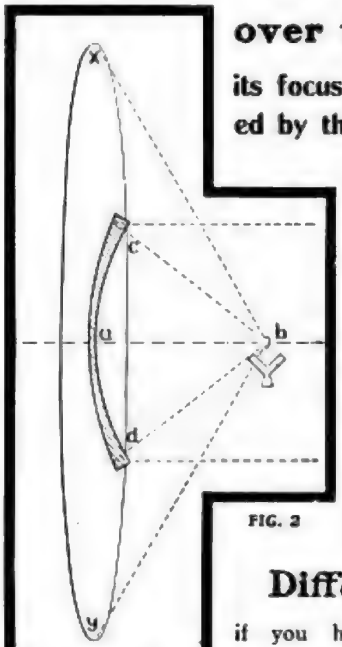

FIG. 2

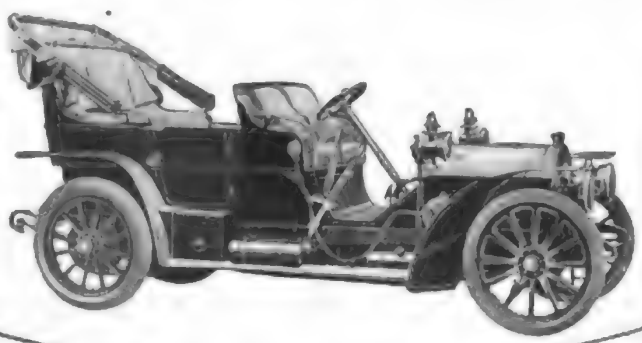
It is better than a plated reflector, certainly, because it stays bright—but compare the angle cbd with the Rushmore angle xby.

The Rushmore lens mirror gets all the light that would fall on the circle XY at the distance ab.

Whew! What a Difference!

How much more light would you be getting if you had Rushmore lamps?

RUSHMORE DYNAMO WORKS .. Plainfield, N. J.



American Mercedes

IF YOU WANT A MERCEDES

Buy it Here and Save the Duty

All the speed, all the strength, all the lightness and all the beauty of the imported 1906 Mercedes are repeated in the 1906 American Mercedes.

Every working part in the one has its counterpart in the other. No test of endurance that can be applied to these two cars will bring out a difference between them. Every patent, every device, every method of construction used by the Daimler Motoren Gesellschaft in building the Mercedes is used by us in building the American Mercedes.

We have the sole ownership for the United States and Canada of all patents, designs and shop drawings of our parent company.

Through the rights granted us by our parent Company, the Daimler Motoren Gesellschaft, we have during the past year convinced the most prejudiced and skeptical buyers of foreign automobiles that the American Mercedes is the equal in every respect of its counterpart, the imported Mercedes.

There is only one difference — you save the duty.

The 1906 American Mercedes will be exhibited at the Automobile Show.

Did You Ever

try to force your gas generator a bit, only to see the lamps grow dim and dimmer, and still more dim, till you could have run into a stone wall before you saw it? And did you find, when you got through, a savory mess of baked yellow lime in the carbide cup, that had to be dug out with a chisel and language that wouldn't look well in print? And were your burner tips clogged with tar that defied your ingenuity to get rid of it?

Not once, but dozens of times, probably!

All part of the game, you say?

Not if you had a Rushmore Generator!

It is *the one* portable generator that can be forced *ad lib.* without overheating and without making tar instead of gas.

It is *the one* portable generator whose mode of action will bear scientific discussion.

We want to tell you more about it. Write us.

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.

Sectional views of WASHSTAND-TURNTABLE. Patent applied for.

POPE AUTOMOBILES

POPE Waverley ELECTRICS

Profit to the Dealer

The sales of Pope Waverley Electrics last year increased 60 per cent. over the year before; and the past three months have increased 60 per cent. again over that. We are not the only ones who have increased sales, and we are glad, because it shows that the ELECTRIC is being appreciated by the public and by some AGENTS. Are you among those agents who sell gasoline cars only? If so, you are neglecting the most profitable part of your business. Many of our agents have told us, that, had it not been for the ELECTRIC part of their business this year, they would have lost money. The ELECTRIC is an all-the-year-round carriage. Its sales are almost as great in fall and winter as in the spring and summer. Are you neglecting a chance to make money at this season of the year? What you can make now is all velvet. We exhibit in New York at Madison Square Garden only.

Why Goodyear Detachable Auto Tires Won't Rim Cut

WHEN an Auto Tire gets rim-cut, it's time to feel for your pocket-book and ask yourself, "What tire shall I get *next* time?"

For a rim-cut tire is pretty near its finish.

And the chances are ten to one that if you are forced to ride around the block on a deflated ordinary tire with ordinary rims your tire will be rim cut before you get there. Because ordinary rims are just like a dull jack-knife. Now if you wished to cut a strap with that dull knife, and the strap was held like Fig. 1 you couldn't do it, because your strength would not be great enough. But if you take the strap like Fig. 2, with a little sawing you can cut it. That's exactly the way the ordinary rim cuts the ordinary tire. When the tire is inflated, like Fig. 3, even the tremendous weight of the car is not sufficient to cause the rim to cut the tire. But just as soon as it gets partly deflated or flat, like Fig. 4, then the rim begins to cut it, just as the knife did the strap in Fig. 2.

Fig. 1

Fig. 2

Fig. 3

Fig. 4

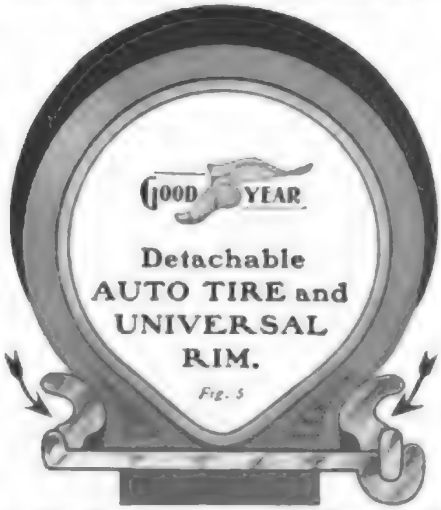

Fig. 5

Now look at the picture of the Goodyear Auto Tire on the Goodyear Universal Rim (Fig. 5.) The portion of the rim against which the tire rests forms the arc of a large circle. That rim can no more cut the tire than you could have cut the strap by using the handle of the knife instead of the blade.

Fig. 6

Notice the edge of the ordinary rim used with ordinary tires (made into a circle), in Fig. 6, and compare with the Goodyear Universal Rim, used with Goodyear Auto Tires (Fig. 7.) Then you can see more clearly what we mean.

Fig. 7

We (and others) have ridden the Goodyear Auto Tire on Universal Rims *absolutely flat* for **25 miles** on rough roads without serious injury to the tire. We have the evidence if you would like to see it.

This is only one reason why wise riders are specifying Goodyear Auto Tires on Universal Rims for their new cars. Our "Good News Book" gives ALL the reasons. It is intensely interesting to Manufacturers, Dealers and Riders seeking relief from tire troubles.

The new "STEEL-STUDDED CONTINENTAL TIRE" is a very resilient tire, especially constructed with heavy walls and tread. Over this is built an extra heavy tread with many layers of the strongest Egyptian cotton canvas, which protect the carcass of the cover and the inner tube from the steel studs, which are firmly held in place by being vulcanized into the mass of material of which this outer tread is constructed.

These tires are the safest for slippery streets, asphalt, etc., and are already in use on many of the better class automobiles.

Don't be afraid of water freezing

You can enjoy motoring in the winter time without subjecting the circulating system of your motor-car to the dangers of freezing and bursting.
All you need is one charge of

No-Mor Auto-Freeze

Put it in your circulating system and you won't have any freezing troubles even at 10 degrees below zero. Already dissolved, doesn't clog the system; contains nothing that will corrode the metal or injure the rubber.

It's a wise precaution to use No-Mor Auto-Freeze and is liable to save you many times its cost. Think of the money you would have to spend to repair the damage if the water pipes should burst. Think of the inconvenience and delays to which you would be subjected. Do you want to run these risks when they can be overcome so easily?

75 cents a gallon at dealers' or f. o. b. Cleveland, Ohio. **Sold only in 5 and 10-gallon cans.**

Chemist's Report

THE GENERAL LABORATORY CO.
Chemists
125 Quebec St. Cleveland, Ohio

"We have examined and tested No-Mor Auto-Freeze and find that it will not corrode brass, aluminum, copper, galvanized iron or solder, and that it will remain fluid at 10 degrees below zero Fahrenheit. Another good feature of the product of this formula is that it will not crystalize out, hence no danger of clogging the circulating system."

THE GENERAL LABORATORY CO.
(Signed) F. N. Sealand.

Dealers find it pays to handle **No-Mor Auto-Freeze.** There is a demand for it and selling is easy. Write for items and full particulars.

MOLINE for 190

Model "A" 30-36 H. P. $2500.00
Model "C" 18-20 H. P. $1750.00

Both the above have four cylinder vertical, water cooled motors. Cylinders cast in pairs. Valves all mechanical and interchangeable. Pressed steel frames. Three speeds forward and reverse. Sliding gear transmissions. Mechanical oilers. Storage cells for ignition.

Model "G" 16 H. P. $1000.00

Double cylinder opposed motor under body with single chain drive. Planetary transmission, no internal gears. Engine bearings of liberal dimensions and easily adjustable. Mechanical oiler. New design of water pump. Double side entrance detachable tonneau body.

All three Models have cylinders, pistons and piston rings accurately ground to size.

All three Models have double side entrance bodies with divided front seats.

All three Models have mechanical oilers that force oil direct to the bearings—not force it part way and then let it drop the rest of the way

All three Models are top notch value for the money. AND WE CAN TAKE CARE OF ONLY A FEW MORE DEALERS.

Advance circular ready for distribution.

Ask Any Owner Of A Royal Tourist.

This Letter is a Mild Sample.

Toronto, Dec. 2, '05.

THE ROYAL MOTOR CAR CO.,
Cleveland, Ohio.

Gentlemen—My family are not particularly fond of driving in the cold weather, and I have, therefore, laid up my car until Spring. As I had the honor of signing the first Canadian order for a Royal Tourist, thought you would be interested in what I thought of the machine after one season's experience, and have only to repeat what Prince Louis of Battenberg had to say when traveling in the machine, "a wonderful car, good enough for any man living." Quite a number of your cars have come to Toronto, and the above few words express the opinion, I think, of all the owners.

Wishing you the success that your machine should bring, I am, Yours truly, WM. J. SMITH.

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

THE OSCAR LEAR AUTOMOBILE CO.
Automobiles
Corner Fourth and Gay Streets

Columbus, Ohio, September 5, 1905.

The Steel Ball Co., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6-day endurance and economy run at Long Branch. In a run of 3,202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of all this we fully realize and its help in getting this record for our FRAYER-MILLER car. Yours truly,

THE OSCAR LEAR AUTOMOBILE CO.

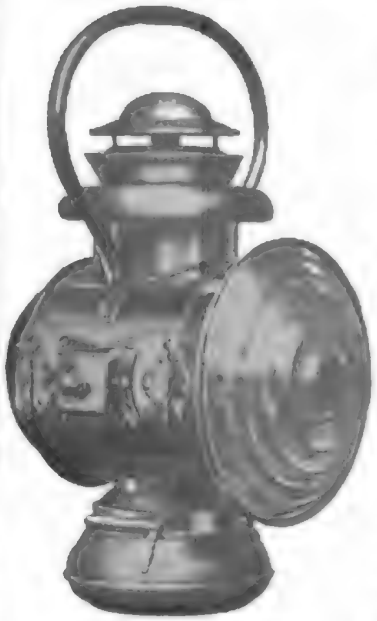
AN EPOCH IN THE HISTORY OF OIL LAMPS



THE TOURIST

Cold Blast Lamp for 1906 is a wonderful light-producer and is the most dependable pathfinder made.

See the Lens?

Burns common kerosene, will not blow out or jar out, emits no odor, and is entirely free from the usual lamp troubles.

We can't pick a car for you, but our oil lamps are so superior they are easily recognized as absolutely the best on the market. They are the result of thirty-five years' experience in making oil lamps.

Write for booklet showing complete line.

C. T. HAM MFG. CO. ROCHESTER NEW YORK

Automobile Knowledge

means

Money in Your Pocket

We are the only school that provides complete, practical, *money-earning* and *money-saving* training by mail in operating, repairing, constructing, and designing every kind of motor vehicle and motor boat.

We have special courses for *owners*, shop and factory *employees*, *chauffeurs*, *motor boat* and *motorcycle users*, and *others*.

There are only two ways of learning anything. One is slowly and tediously to gain the experience yourself; the other (and better) way is to take advantage of the experience of others.

Though we offer you the long, hard-learned, thorough experience of experts who have done prominent work in the development of the new vehicle, we offer this experience in such form that to teach it to you will take only a few minutes and cost only a few cents each day—*the few minutes and the few cents that you ordinarily waste.*

Our instruction has been prepared and is conducted by well-known men, of long experience and proved ability both in automobile engineering and correspondence instruction. It is strongly endorsed by *prominent manufacturers*, *club* and *association officials*, *racing men*, *trade-paper editors*, and others whose standing in the automobile field lends authority to what they say.

In the automobile industry, the demand for competent men is so great that ability, no matter how acquired, is considered above "pull" and length of service. This makes it easy for an ambitious man to qualify quickly for good wages and prompt advancement.

For further information, send us your name on the accompanying coupon. This will cost you only a moment of time and a postage stamp, which will be well spent for interesting and convincing literature.

THE COIL THAT DOES THE TRICK

In the Climb to the Clouds

Chas. Soules, driving a Pope-Toledo fully equipped Touring Car, made the ascent in 29:37 2-5. This is considered a most wonderful performance. Besides

SPLITDORF COILS

were winners in nearly every event. Ask the Glidden Tourists how they like the Splitdorf Coil.

Seventy-five per cent of the cars on the tour were equipped with them.

HERE IS DR. PARKER'S LETTER:

Mr. C. F. Splitdorf. June 24th, 1905.

Dear Sir: I feel that in the recent 200 mile contest my success, in a large degree, was due to your coil. It seems to me that your latest is superior to anything in use to date. I tell my automobile friends to give me a SPLITDORF for reliability every time. Very truly, C. B. Parker.

167 Remsen St., Brooklyn, N. Y.

Made in three sizes

GARFORD PARTS

Some of the best known high priced touring cars for the coming season will be composed exclusively of Garford parts. In a great many high grade vehicles they will be conspicuous features of construction. Isn't that enough to establish the character and worth of Garford products? We regret that for the present we cannot accept further orders for touring car parts without sacrificing the interests of present customers. Our productive capacity for 1907 will be so enlarged as to avoid the disappointment of fruitless inquiry.

MOTOR WAGON PARTS

We can, however, promptly execute orders for steering gears, brakes, sprockets, motor hangers and other parts for motor wagons. They are suitable for all classes of commercial power vehicles, from the lightest to the heaviest. They are not "freak" components of a wonder working vehicle. They enjoy the rare distinction of having been thoroughly tested for some years past in the most varied and severe kind of commercial service. Circulars 2, 3, 5, 10 and 11 give information concerning them.

MANGIN

Search Light Mirror Lenses

Afford the only means of utilizing ALL of the light produced by the burner of an automobile headlight. You never can have too much light if you want to ride safely at night. Be sure your lamp has a B. & L. Mangin Mirror.

¶ These mirrors are of optical glass as accurately ground and polished as the search-light mirrors used on battleships, silvered by our own process, which assures the utmost brilliancy and permanence and tempered to withstand heat and vibration.

¶ See that your lamps have these mirrors. They are used by all the best lamp makers.

¶ When used on launches and motor boats of all kinds you are insured against accidents.

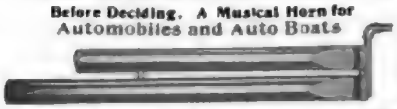
BY ALL MEANS HEAR
THE GABRIEL HORN
Before Deciding. A Musical Horn for Automobiles and Auto Boats



Blows a full, strong blast from exhaust from gasoline engine, or can be attached to steam, same as ordinary whistle; blows with less than one pound pressure.

Each horn is tuned to a musical key—no discordant screeching note—is easily blown, and is strong and durable.

Comes in three styles—two, three or four horns.

Write today for Catalogue, giving prices and full information.

WELCH

1906 LIMOUSINE CAR 1906

FOR

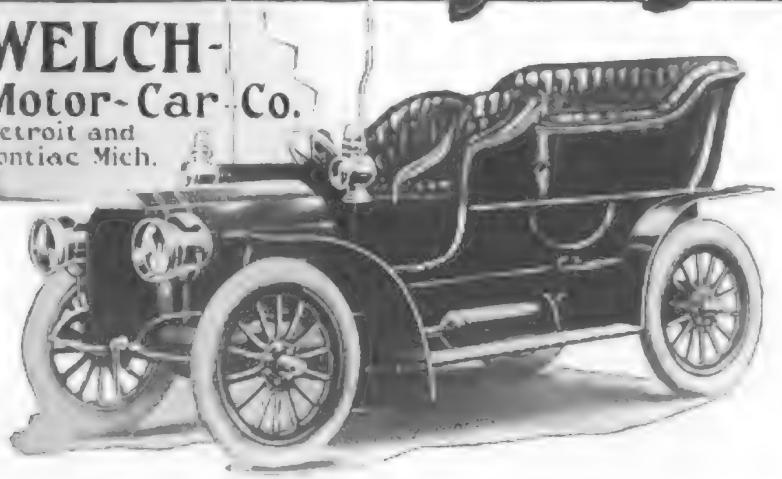
FALL AND WINTER USE

PRACTICALLY IMMEDIATE DELIVERIES

¶ Ask for 1906 Catalog just out, describing WELCH PATENT DETACHABLE PULLMAN LIMOUSINE CARS. ¶ Seven passenger car to suit all seasons; Cape Top in Summer, Half Limousine in Fall and Pullman Limousine in Winter. ¶ 4 to 50 miles on direct drive.

So simple a child can operate.

WELCH-Motor-Car Co.
Detroit and Pontiac Mich.



¶ The Automobilist who today doesn't include a Jones Speedometer in his list of accessories is eliminating two thirds of the pleasure of automobiling—and is encouraging the officer of the law to make his arrest.

¶ When the Judge says: "Did you have any *positive* means of determining the speed at which you were traveling?"—he is asking if your car was equipped with a Jones Speedometer. Don't forget that!

¶ The Mounted Officer with his primitive stop-watch method of timing the Automobilist can seldom make a case. Guess work testimony doesn't go in court. The Officer means well, but his method is wrong.

¶ Our Speedometer Bulletin contains speed information and tells of our Protection Tag. Free on application.

The "Breech-Block" Plug

The Plug With a Handle

To take out your watch or open a Breech-Block requires just the same time, same tools, same effort, and one twist cleans the entire porcelain to the whiteness of snow.

To remove the porcelain only, loosen the clamping nut and it comes out of the holder, and the gaskets of copper drop with it. No digging!

It is nickeled inside and out. Highly polished and dust-proof. Sparks between two platinum points and not between one point and the shell. Its points are protected.

Porcelains are hand turned and so perfectly glazed that soot cannot stick to them. Their threads are cut to perfection, and every particle of the idea of economy is left out of them.

Postpaid, Anywhere, $2.50. Booklet Free. Made by

EARL CANEDY, 2002 West Ave., CHICAGO HEIGHTS, ILL.

Digitized by Google

There was a time when a regular and reliable ignition was a problem. This problem is solved today by the **HERZ TIMER**. We have made and sold over 70,000 of these instruments last year, to the most prominent manufacturers in this country, as well as in Europe, and are making now four distinctly new models for four of the leading manufacturers in America. The reason for this success: It's Tool Steel vs. Tool Steel, best Sheffield grade obtainable; **Sticking Vibrators** absolutely impossible; running packed with grease; built like a watch, tool maker's work throughout. We make 18 models and fit any make of motor. State make of your motor when ordering.

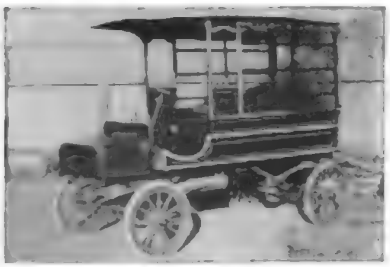
Logan

1906

That Car of Quality



2 Cylinders Opposed. Air Cooled.

Speed 15 Miles per Hour. Capacity 1500 lbs.

THE DEPOT CARRIAGE AND BAGGAGE COMPANY

Kansas City, Mo., Nov. 22, 1905.

THE LOGAN CONSTRUCTION CO., Chillicothe, Ohio.

Gentlemen:—We want to let you know how well we are pleased with your "Light Air Cooled Delivery Car" which we purchased from you some six weeks ago. It has more than fulfilled our expectations, so much so that we will place an order for several more at once.

It is about doing the work of three two-horse wagons, and is covering from seventy to ninety miles a day with less expense than the shoeing of one team would amount to, and is so simple that any one of our drivers can operate same without any trouble.

Wishing you the success that you deserve in making so good a car, we remain,

Yours very truly,

THE DEPOT CARRIAGE & BAGGAGE CO., F. W. SCHOOLEY, Sec'y.

"Logan" MODEL I, WILL DO AS WELL FOR YOU

Write for Catalogue A 122.

The Logan Construction Co., Chillicothe, Ohio

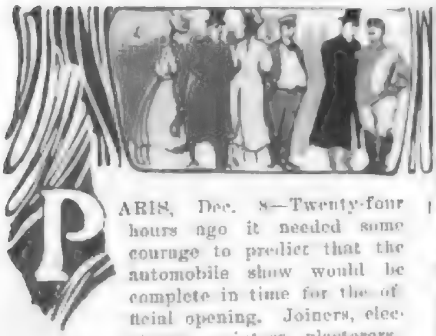
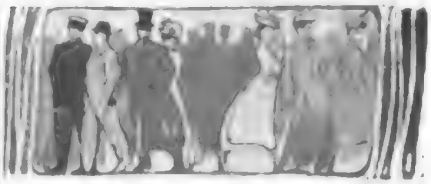
MOTOR AGE

VOL. VIII NO. 25 CHICAGO, DECEMBER 21, 1905 $2.00 Per Year

SALON THE MAGNET IN FRENCH CAPITAL





PARIS, Dec. 8—Twenty-four hours ago it needed some courage to predict that the automobile show would be complete in time for the official opening. Joiners, electricians, painters, plasterers, and laborers filled every portion of the vast building. Not a stand was finished. Some had not even got the name up, others were being painted; on one stand an army of women were busily sewing carpets, on another an indignant attendant was indignantly sweeping the mud off his red carpet, only to find that it was put on again by the constant stream of passing workmen as rapidly as he took it off. But **it is indeed one of the marvels of the Paris salon that when you leave it at night swearing that it will not be ready for the following morning, you come back to find that a sudden transformation has taken place, and instead of workmen, disorder and incompleteness, there are beautiful women, frock-coated men, stands that should be called drawing rooms, and automobiles so perfectly polished, so beautifully painted, that it appears sacrilege to think of taking them on muddy roads.**

Outside, as well as inside, there is the utmost lavishness of decoration and illumination. Externally, the whole of the outline of the building is illuminated; a searchlight flashes from the corner of the Champs Elysées, bands of fire are festooned from column to column all round the palace, while there are double bands of light across the annex by the side of the river, where, in its big glass house, the commercial section of the show is exposed. This building, too, is outlined with electric lights, and viewed from the opposite bank of the river, gives almost as brilliant an effect as the more gorgeous main building. Inside there are 200,000 electric lamps, 100,000 of which form the decorative scheme under the cupola. In the rotunda is a magnificent raised flower bed, which turns out to be composed entirely of lectric lights.

WHERE THE GLADIATOR IS SHOWN

In the whole show there are only two inartistic signs, one an impossible sort of a painting representing a bicycle hub, and another a huge negro's head; fortunately, both of these are out of the way. Today the crowds were as large as ever before.

PARIS SHOW BUILDING A DAY OR SO BEFORE THE OPENING

There are 133,333 square feet in the Grand palais; it is the utmost that can be obtained, even with the greatest economy of space, and every inch of it is occupied by the 1,000 stands. There is a bigger building in Paris, but it is a hall and not a palace, and so long as the exhibition remains a salon, and not a mere show, the Grand Palais will continue to be used. On a first day's visit it is difficult to study closely the numerous models exhibited and one has to be satisfied with generalities. There is a notable increase in the number of new firms, especially small manufacturers making small runabouts, and to judge from this year's indications this type will not continue to be neglected in France. **The big firms all continue to construct high-power cars, but there are several among even these who are now showing cheaper-priced machines. Steam is not much in evidence, Serpollet and Chaboche being about the only two representatives.**

Foreign firms are showing well, several of them having obtained large central stands. The Itala and Fiat have the biggest shows, the former having one of the most costly stands in the exhibition, where tall, imposing footmen in green and gold livery, who could not distinguish between a spark plug and a crankshaft, awe one by their presence. English firms are well represented, Wolesley, Giddeley, Argyll and Napier, as well as several minor firms, all having stands.

America is represented by the Cadillac, the Electric Vehicle Co, where Columbia gasoline and electric cars are shown; the Oldsmobile, the American Locomotive Co., and, in the industrial section, by Pratt & Whitney, and Brown & Sharpe, machine tool manufacturers. Germany has its Mercedes, and, as usual, it seems to be the parent of all the other big cars in the show, so much has it been copied from this machine.

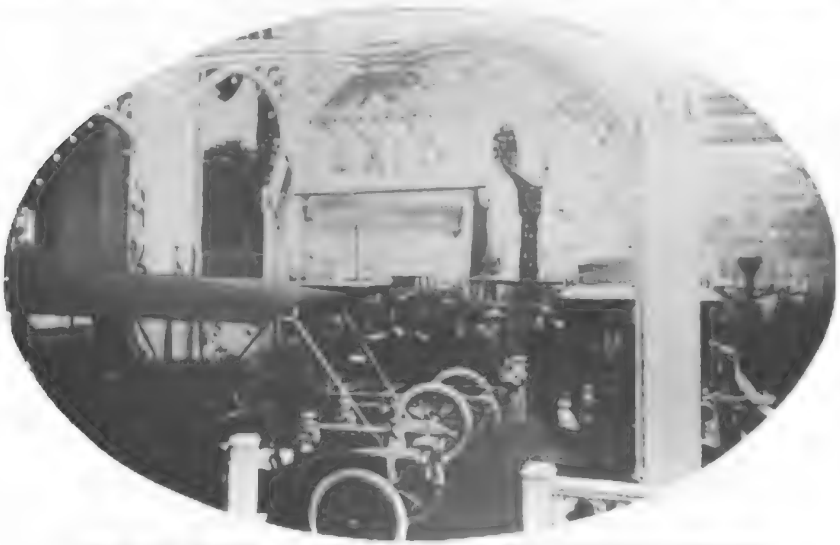
Digitized by Google

MAGNIFICENT DECORATIONS AT THE STAND OF THE FIAT, ITALY'S LEADING MAKE

The industrial section of the show, which is housed apart from the main building, consists of heavy wagons, machine tools in motion, engines in motion, automobile boats, and a very small collection of flying machines. So far as can be judged from a first day's visit this section will be one of the most interesting in the show

A great novelty outside the exhibition is a motor omnibus service which has been inaugurated especially for the salon. The buses, which include a de Dion-Bouton, Peugeot, Kriéger, Gobron-Brillié and Mors, run between the stock exchange and the show at the same fares as the horsedrawn vehicles. At the terminus as many as 400 and 500 people gather round the buses in the vain attempt to get a seat.

But what is it that most attracts one's attention at this greatest of all exhibitions of the motor car? The beautiful decorations, myriads of fashion's leaders and countless social functions that appear to fill every moment, are mere secondaries—the magnet is the car for next season, its innumerable parts, unnoticed to the casual observer, but so finely differentiated by the skilled Parisian motorist that the slightest change in vaporizer, control or adjustment does not escape his searching glance; the new methods of driving direct on top speeds, or the minutest alterations in motor displacements are all noticed, and it is not surprising the motorist lays aside his hat and gloves and cane to peer deeply into a new design of gear change box, to trace the intricacies of fresh steering wheel control or to test the workings of new brakes.



ONE OF THE EXHIBITIONS—GEORGES RICHARDS'—THAT ATTRACTED ATTENTION

It is beyond the bounds of possibility at this early stage in the progress of the grand salon to say in which part of the chassis construction the greatest progress has been made, but in not one single detail in motor car build is stagnation apparent. The inventive, experimenting, restless French designers, and those from adjacent countries, have not been content to leave one part of the car exactly as it was a year ago. In many ways the general design remains unaltered, convincing proof that present efforts are along the proper road and will, unless something untoward occurs, lead to the eventual goal. But from cooler to driving axle little alterations—those that might be expressed in the third or fourth decimal places—are found. Nevertheless these changes are interesting, for in not a single case are they foolishly made. Neither for innovation nor uniqueness have these been made, but that the completed car may be a better

Digitized by Google

proportioned whole, with all parts more properly related to one another and with the finest construction in each.

Pressed steel in frame work rules supreme, but finer workmanship appears. One-piece construction is the ambition of many makers, and whereas a few years ago the Darracq was supreme with its mysterious make, having side, cross and motor support parts all in one piece, without visible union, other firms like the Decauville and Clement-Bayard are using similar construction. In these frames, webs from the side pieces, with graceful downward curves, serve as supporting arms for the motor box and gear box. They also prevent the splashing of mud on the machinery. Other makers, while not using the one-piece design, combine single, double and in a few cases triple curves in each side piece. The connoisseur is not surprised in discovering in each side piece an offset along the motor to increase the turning angle of the front wheels; or an upward offset over the back axle to afford greater spring resiliency; or short upward curves where the jackshaft is carried.

Mercedes, Mercedes, Mercedes—it is almost nothing but Mercedes when change speed gears are examined. Of course it must not be expected that exact designs of the parent German company are duplicated, but in most of them a touch of the German lines is evident and one cannot imagine he is in proud Paris, the home of French ideas, or that the events of the war of 1871 are still a part of history. In spite of these, good features are imitated

FLORENTIA CARS SHOWN IN A LARGE AND ATTRACTIVE SPACE

and nearly all of the big houses have the selective system of changing speed in use on one model at least. Daimler machines still use the four forward speeds, with several sliding gears, all, however, operated through one lever working in a three-way sector. This year the gears are strengthened and the main shaft is furnished with a bearing in the rear of the bevel pinion that works in the differential bevel. The use of four forward speeds has not been deemed an essential by many makers, three being preferred owing to the extreme elasticity of the motor. By varying the speed quite as good running results are obtained as by using the fourth speed. The reverse idler that has for so long been a source of contention still holds on, and although many makers have it revolving only when in use a few are satisfied that the power required to drive it when idle is immaterial compared with the additional intricacies necessary in moving it in and out of engagement with the other

COMPREHENSIVE EXHIBIT OF PANHARD & LEVASSOR, WITH STANDS OF OTHERWELL-KNOWN MAKERS IN THE DISTANCE

ATTRACTIVE DISPLAY OF THE OLDS MOTOR WORKS, OF DETROIT, MICH.

gears. The carrying of the gear box by the top part has not so many disciples as was looked for. This manner of support has the advantage in assembling that all gears can be taken out by dropping the bottom part and not interfering with the alignment of the parts, but so rarely is the box dissembled that the point loses its merit. Ball bearings are universal on both shafts, rollers are seen in very few cases, plain bearings rule in heavy commercial machines and a comparatively few heavy touring machines, but 1906 is to be a season for ball bearings.

Will it be shaft or chain drive to the back wheels? The Frenchman cannot answer you this question at present, nor can the present Paris salon. Both appear and it would seem that leading makers, like the house of Panhard & Levassor, in using both drives, are experimenting and trying to settle the question to their own satisfaction. The Mercedes still retains the double chains but, like others, is carrying the gear box further to the rear, thus placing the differential jackshaft closer to the rear axle and shortening the length of the drive chains. Shaft and chain each has a good following. Richard-Brasier, Fiat, Germain, de Dietrich, Berliet, Peugeot, Brohut, Motobloc, Delahaye and a score of others remain faithful to side chains, whereas Renault, Opel-Darracq, Darracq, Decauville, de Dion-Bouton, Clement, C. G. V. and others resort to the shaft, with its universal joints. In the Hotchkiss a very long cardan shaft is used, unsupported throughout its length, and not relieved of strain by an accompanying torsion rod; in the Clement-Bayard a comparatively short shaft serves; an equally short shaft suffices in the Thornycroft, an English make exhibited, but in this car an assisting torsion rod is found.

One cannot help noticing that the floating type of drive axle is used in many machines. By this axle the outer casing enclosing the driveshaft from the differential to the road wheels carries all the weight of the back part of the car, the shafts themselves only driving the wheels. Where this is used the axle housing must be well supported, which in nearly every case is done by heavier casings rather than by truss rods, which the French enthusiast asserts injures the appearance of the car. The Aries uses a novel method of support. This car has a double axle, one an inverted arch from wheel to wheel, which has on either end a hollow sleeve on which the road wheel revolves. Resting in the arch is a horizontal driveshaft with its differential casing reposed on the center of the dropped part. The driveshafts passing through the hollow ends are connected by lock jaws with the road wheels. The axle looks heavy; the clearance in no place is greater than that beneath the differential.

Frames, shaft and chain drives, rear axles, springs and steering gears are necessaries. They must be of sufficient strength for all emergencies, but everybody is after speed and speed reposes in the motor and its accompaniments. What part of this is most instrumental in giving a 70-mile-an-hour speed remains unanswered, but if engineers and designers can do it and if refinements in finish will bring this about, perfection may be looked for in the near future. With some makers casting cylinders in pairs, or separately, or in one piece, seems the point to be attained. C. G. V. cars have a one-piece motor, the head a rectangular casting and the cylinders separated. For this the makers claim parallelism of bore in all four cylinders, equal cooling of each and perfect alignment on the crank box. Panhard-Levassor, in their leader, a six-cylinder car, have each cylinder a separate casting with wide space separating each. The Itala has its cylinders arranged in pairs. So has the Mercedes, Gobron-Brillie, Peugeot, Thornycroft, Bianchi, Gladiator, Argyll, Napier, Spyker, Chenard-Walcker, de Dietrich and Motobloc, whereas single-cylinder castings remain in such machines as the Germain, Aries, Clement-Bayard and Delahaye. It is now possible to cool cylinders whether in pairs, single or as one unit, and the points of argument reside with a question of alignment. Crankshafts are invariably turned and ground and revolve on three or five bearings in most four-cylinder machines. Plain bearings rule almost absolutely in this part of the motor, a few makers, of course, using balls in smaller-powered machines. The boring of the shaft throws in order to lubricate the lower connecting rod bearings is not widely followed, most designers holding that the splash serves for this.

Admission and exhaust valves on the right side, or inlet and exhaust valves on the left side, or both together on the right or left side, is a query that is being fairly positively answered by the show. One thing is certain—the method of placing valves direct in the cylinder heads and resorting to an overhead shaft with cross arms for opening and closing the valves has not much of a following and cannot be considered. Last, or rather this year, many makers followed the Mercedes fashion in disposing the admission valves on one side, preferably the right, and locating the exhaust valves on the left, using

UNDERBERG & CO.'S EXHIBIT

vo camshafts, one for actuating each set. his is not followed for 1906, the tendency eing unmistakably to place both sets side y side in the bottom of ports on one side f the motor and to use only one camshaft. implicity in motor build has compelled . Everybody asks for simplicity, simlicity, simplicity, and naturally the aker must give simplicity. Putting both ts on one side calls for enlarged valve oxes to insure proper diameter of valves nd prevent heating.

It must not be taken that all cars are ade on these lines—far from it. Particurly where make-and-break ignition is ed are the admission valves placed oppote to the exhaust valves. To decrease ie size of its ports the Daimler house akes them with a taper toward the base, iving a triangular effect. The Itala has iem disposed on opposite sides and makes iem as square and as angular as posble, with the make-and-break mechanism rectly on the top of the ports. In the otobloc it is difficult to distinguish valve rts, as the water jacket is almost circur around each pair of cylinders.

Aspirators, carbureters, vaporizers, mixs or by whatever name they are known, and foremost in the novelty row, many them being so unique and yet not sufciently tested that the exhibitors hesitate out stating whether or not they are regar equipment for the coming season. The aimler house shows its novel four-jet degn. The float is placed separately and nnects with four vertical aspirating tips, ch of which is in a separate compartent, with separate pipe connecting rough a throttle with the admission lves. In starting only one aspirating is used, and when it is accelerating is is cut out and, one at a time, the reaining three are brought into use. A gle throttle does this combined work cutting out and introducing and it is ticeable that this throttle is, at the int of union of the admission pipes, conecting with each pair of cylinders. In e Aries vaporizer a bypass is operated rough a piston valve in the mixing amber, so that on low speeds all the air passes the aspirating tip, but with acceleration the piston on rising opens the bypass ports, permitting air to pass direct to the cylinders without traversing the aspirating tip. The Renault uses a design of multiple type aspirator with four vertical aspirating spraying tips side by side, each taking its fuel from a common pipe. But surrounding the four is a barrel throttle with a four-step opening. It cannot be said that the auxiliary air valve is as popular as heretofore, the designers prefering other methods of regulating the mixture supply.

The common practice is to place the throttle control on the steering wheel, and to use an accelerator as a push bar in the body floor. Governors are still connected with the throttle. Water jackets remain as a year ago; in fact, it might be concluded that they are gradually disappearing, a better disposition being to carry the carbureter very close to the admission valves and use only a short piece of large piping to each set of cylinders. Carrying the carbureter in this position calls for feeding the gasoline by pressure from the exhaust or from a small pump. It must not be overlooked that a few makers have attachments on the dash by which the spraying tip can be adjusted by hand. This at first glance appears an added necessity, but experience seems to indicate that instead of leaving the carbureter to take care of its own fuel and air supply, the makers feel that by attending to it, seeing that more fuel is furnished on high speeds and less fuel when going slow, much more power is obtained from the motor.

A few years ago double sets of ignition met with laughs and sneers from many of the spectators. They have learned, however, that two sets are none too much when one gives way on a long tour. Now many machines use make-and-break mechanism supplied with current from a positively-driven magnet and have fitted regular spark plugs and carry accumulators for providing the current in case of magnet troubles. Hotchkiss machines use only a high tension current, furnished by a magneto. In the Mercedes and Fiat

[MODEST DISPLAY OF THE CLEMENT CONCERN

make-and-break remains; both high and low systems are in vogue on the Peugeot; the de Dietrich prefers the low only; in the Decauville are two sets of spark plugs, with current for one supplied from a high tension magnet and for the other from accumulators. The Renault has its low tension magnet placed crosswise, driven by helical gears; the Delahaye uses a double system, with a Simms-Bosch magneto furnishing current for the make-and-break system; in the Metalurgique a similar dual arrangement is adopted; in the Thornycroft low tension remains; Rochet-Schneider is the same, and throughout the entire salon the story continues—either high or low tension with magneto, or one or the other with accumulators for reserve. A few makers place importance on the controlling of the motor speed more from the spark than the throttle, but they are greatly in the minority. It remains common practice to interconect the throttle with the clutch.

STYLE NECESSARY FOR LIFE OF TRADE

PERIODICALLY for some time the matter of distinguishing a maker's certain model by the year of production has bobbed up, only to be forgotten in the rush of factory work and designing of a new lot of cars about to be brought out. The question has again come to the surface, evidently with a view of settling the matter one way or the other for all times.

Many who have had any views on the subject have been of the opinion that it is a mistake to produce a new car each year and to determine its model by the the year in which it sees the light of day, a majority preferring to make the improvements with each batch of cars put through the factory.

There has been argument both for and against this proposition. Some makers have adopted the plan of making improvements when they thought necessary and at no other time; when they thought it desirable the previous year's models have been retained. The majority, however, feel it is reasonable and sensible to change models each season, and it is likely this plan will continue for a number of years —until there is a settlement as to what is good construction and good style in automobiles.

It may well be pointed out that in almost all lines of trade style regulates the production. It is seldom a man wears a hat or an overcoat or a suit so long as to destroy its usefulness. Styles will not permit him to continue to wear a garment until it is useless as a means of covering nakedness; nor would a person desire to associate with such a clinging friend, no matter how good it might be.

If the Easter trade in women's headgear had to wait for hats to wear out it would be compelled to go out of business; if in the days of cycling a man bought a new wheel only when his old one had been worn into uselessness [illegible] would have been sold, and the [illegible] quite as well in the automobile [illegible] any other line.

It is true a manufacturer [illegible] to make new tools and to do [illegible] ingly unnecessary work in [illegible] der to keep to the front in [illegible] matter of fact the buying [illegible] ciates the up-to-date man, whether he is an automobile maker or a garment maker. There is always a market for something that is different in style, even if it is a rehash of some fashion that prevailed a decade or more before. The dealer who handles the out-of-style garment is not the one having the best trade and is not the one showing the most prosperity.

Ever changing styles are what keep up the great commercial system of the country and give employment to hundreds of thousands of people, who prove factors in turning over the currency of the country and keeping it in circulation. Style is absolutely necessary for the life of trade —quite as much as anything else that can be named. As a matter of fact, probably outside of foodstuffs, nothing is as important a factor in the world's trade as style.

Were automobile manufacturers to disregard the demands of fashion, except occasionally, there is every probability that the automobile owner would prove a better patron of the paint shop than of the automobile dealer. The owner would have no incentive to purchase a new machine as long as his old one could be made to look like his neighbor's car, fresh from the factory. There could be no object in the change except a desire for more power, or unless a machine had proved so worthless as to put the owner in the class of non-owners. Present day machines, even the poorest on the market, however, preclude the probability of such a condition.

To do away with seasonable models would mean the end of automobile shows; the end of cycle shows was largely responsible for the end of the popularity of cycling. It would naturally follow that there would be improvements, both in manufacture and in styles, but styles are seasonable affairs and must naturally be such in order to influence the market, as they do in all lines where they are changed once or twice a year.

The argument that there should be no season, so that manufacturers could work their factories at any and all times, can have little weight. As a matter of fact a well regulated factory works all the time now, with the experimental department a year or so ahead of the other departments. There need be no delay in producing if a factory is well operated, if the designers are up to snuff and if the management is intent upon producing not only the best and the latest, but in having the product on the market to meet the demand.

Would there be any particular saving were the season model to be abandoned and the car be known only by number? It is true an apparent saving might exist for a time, but alterations would have to be made to keep up with the times, and new jigs, templates, tools and dies would be necessary, with quite as much expense in the end. It is doubtful if there could be a material saving in the manufacture of cars from this change alone, but time will doubtless alter methods of manufacture and selling, so that there will be savings that at present seem impossible.

PUBLIC INTEREST IN AUTOMOBILE SHOWS

PARIS is wild with excitement over its salon de l'automobile—from 15,000 to 25,000 people attend the exhibition daily. It is not at all strange that Parisians should be excited—that is their usual state. But it is small wonder they should go into ecstasies not only over the splendid French, German, Italian, English and —modestly—American automobiles, but over the superb decorations in the Grand palais and in the individual booths occupied by the cream of the world's automobile constructors. The elaborateness of the 1906 salon is almost beyond description, either by printed word or illustration; in fact, the exhibitor at the salon has attempted to outdo his neighbor in [illegible] quite as much as he has in dropped part [illegible] constructing automobiles, through the [illegible] folly to suppose that all of look jaws wit[illegible] 20,000 daily visitors to the looks heavy; [illegible]e to inspect automobiles greater than [illegible] of placing orders. The Frames, sh[illegible]w is the thing now and the axles, springs [illegible] are take in whatever is on the style boards.

The thousands of people who attend automobile shows have little intention of buying immediately. They probably would like to be included in the list of the fortunate ones, however, and they are interested to the extent that at some future date they may be with the rest of the people.

This but illustrates the trend of affairs; it shows the public pulse; it gives some idea of the possibilities of the motor car trade. It also proves most decidedly that the masses are not so antagonistic toward automobiles and automobilists as the few calamity howlers would make it appear; it proves that where there is one opposed to the automobile there are a dozen to stand up for it.

What the business is coming to may be judged from the fact that the French show management, knowing the public's desire, made provision to keep the doors open for a period extending over 2 weeks, in order to give everybody an opportunity to see the show. The French management was far-seeing. New York will have two shows; they will be packed daily. Chicago will have a week and all Chicago and the west will attend if the buildings will hold the crowds. All the prominent cities in the United States will hold shows; all will be crowded to overflowing.

Yet there are a few motorphobists and their howl is long and loud.

Digitized by Google

That speedway story is getting to be almost as familiar as the sea serpent tale.

That the French automobile show opened with the usual accompaniment of French excitement.

There will be at least one consolation about the forthcoming shows—most of the surprises have been sprung already.

The French exhibitors ought to go the Englishmen a few better in the reports of big show sales, now they know the English figures.

An Indiana doctor who said automobiling is a cure for indigestion probably had the editorial writers of the Chicago Tribune in mind when the statement was made.

Now that Megargel has completed the worst part of his trip across the country and back, probably there are many willing to take the car over the last half of the journey, which is to be through decent climates for a while.

The Philadelphia automobilists seem to be up against the real thing to be compelled to take out both city and state licenses. Now that the federal government is thinking of getting in its work, what does the Philadelphian think? For once he will have to move.

As an excuse for not permitting their cars to be closely inspected at the Olympia show, the French makers will probably say there were too many good new things to be stolen to permit the public to rubber too closely. Or is it possible that one French maker was afraid of the next door French maker alone and not the English and American makers?

Nobody need worry—old Dame Fashion will have something to say about automobiles just as long as the dear members of the fair sex brigade have anything to do with automobiling.

The holding of the English and French automobile shows before the holiday season is a pretty good indication that another season the American makers will follow suit. In other words, the year 1906

Arguments heard in case of Automobile Club of Philadelphia against city in mix up over state law, decision being reversed.

Britons find fault with excessive fees demanded by the Automobile Club of Great Britain for tire test next February.

Percy Megargel and D. F. Fassett nearly perish in snow near Flagstaff, Ariz., being rescued by searching party.

Many pleasure parties planned for winter racing circuit, full attendance of world's best drivers being promised.

Belief expressed in Great Britain that not many English firms will be represented in the French tour.

Grand prix to be run over course at Aix-les-Bains, France deciding it will have road race.

French runabout test decided in favor of Vulpes car, last day of run counting.

International conference decides there shall be no Bennett race in 1906.

French show continues, record-breaking attendance being reported.

Reports show that St. Paul carnival last summer made $337.05.

Automobile Club of Pittsburg secures option on site for club house.

is apt to see four New York and two Chicago shows.

Shows appear to be alike the world over—nothing ready a few hours before the opening and completeness in the extreme at the hour set for the admission of the public.

Now the tide has turned; instead of Americans stealing ideas from the foreign makers the foreigners are picking up some helpful little bits in American automobile construction.

Chicago's license numbers now exceed 3,500 and it is predicted these figures will be doubled before the summer of 1906 has passed. All of which will prove consoling to some of the howlers, no doubt.

Webb Jay says it doesn't take skill or nerve to run an automobile on a beach; that it is on a track where these requisites come into play. It also takes some skill to keep a machine on the track, as Webb probably knows.

By the time the automobile associations and the motorists at large are well at work hammering Congressman Morrell's bill for the interstate commerce commission's control of automobiling, the congressman will begin to realize how unpopular he really has made himself.

If the forecaster keeps on dealing out snowless weather it will be pretty hard to tell when the 1905 season leaves off and the 1906 season begins. As it is the fur dealers have had no snap and the Standard Oil Co. has been doing about as much business in gasoline in December as at any time of the year.

CAUSES FOR SCORCHING AND MOTORPHOBISM

At last the great truth is out; the trouble with the motorphobists and the cause of the desire to scorch have been discovered. The scorcher is not to blame for his shortcoming any more than is the motorphobist for his. The cause in one case is diametrically opposite to that in the other. It was a doctor who discovered the ailment of the motorphobist and the cause of the itching to scorch. The doctor lives in Indiana, but that is not so much against him. This is what he says: "Mental depression can destroy entirely the effect of food and cause digestive disorders of the gravest nature," said Dr. McCaskey. "Recreation has a most beneficial effect, and the desire to go to a restaurant after witnessing a pleasing performance at some theater is due mainly to the effect of having one's mind relieved and influencing the flow of digestive fluids. For recreative effects most persons need some sort of diversion, which contains fast motion, and this explains the popularity of automobiling, the beneficial effects of which I know by experience."

All of which sounds pretty good to the automobilist even if it does not set well in the stomach of the motorphobist—nothing would rest easily there. The motorphobist newspaper man is not to be blamed for his work; he is suffering. Dr. McCaskey said so, after he had made a careful analysis of the case.

The newspaper man and the non-owner of an automobile who growls about speed and automobiles and other things, need recreation to rid themselves of that depressing spirit which is occasioned by being shut up and apart from men and the world. They need good long rides and a few draughts of pure country air to relieve their minds of the little burdens they carry.

They need recreation, and good, kind automobilists ought to waste a little time taking them out where these things may be found. Medicine is not pleasant to take, but it does one good sometimes, and automobiling is about as pleasant medicine for a good many ills as one can find.

PLANS FOR WINTER CIRCUIT

Easterners Taking as Much Interest in Racing as They Are in Shows—Pleasure Parties Going to Florida and Cuba—Americans to Fight For Beach Honors

New York, Dec. 17—The annual winter southern racing circuit shares with the coming shows the attention of both tradesmen and laymen in New York. The early bookings for places on the trains leaving this city on Saturday of show week and on the Sunday following, by their number prove that interest in the Ormond-Daytona meet is not only unabated, but that the promise of a general participation by foreign cracks and more American entries has given it a big impetus. Mr. Stratton, of the Seaboard Air Line, says that advance bookings are far ahead of last year. R. E. Olds has bespoken a special car for a party of ten, which, after Ormond, will take a boat ride down the Halifax and Indian rivers and then cross the Gulf Stream for tours in a motor car in Cuba and Jamaica. To accommodate his party Mr. Olds has conceived the idea of a high-wheeled trailer, after the fashion of an Irish jaunting car, carrying six people. There is such a demand now for the Reo buses that he fears one of them cannot be spared for Cuba, as was suggested to him. A. L. Kull has chartered two special cars for the Wayne racing campaign outfit and followers. James Couzens has booked staterooms for himself, Henry Ford and Dan Wurgis, and so have Harry B. Joy and S. D. Waldon, of the Packard company of Detroit.

Clifford Earp, who will pilot the Napier six-cylinder, is the first of the foreign contingent to reach this country. He arrived at Boston last week. Lancia is to come over with George H. Tangeman early in January. It is probable that Fletcher and Cedrino will go to Florida this week, the former with the Lancia Fiat and the latter with the other two Vanderbilt Fiats, to try out the course and learn what alterations in gearing will be needed to best fit the George W. Young and Hollander & Tangeman cars for the beach sprinting campaign. Anent the other European invaders, MOTOR AGE has been told repeatedly of the great Darracq 200-horsepower aspirant for 2-miles-a-minute speed crown honors. On his return from the Paris show Mr. McWilliams will probably be able to tell definitely whether or not Hemery will come over to be its pilot. The Darracq will also be represented by the 80-horsepower car which scored 38 seconds for the mile at Cape May, recently purchased by Charley Schroeder, of Manasquan, N. J., a chum of Arthur A. Zimmerman, of cycle racing fame. If C. A. Tiletson does not succeed in getting Sisz and a new Renault racer his firm will still have a 90-horsepower flyer, to be piloted by Maurice Bernin. Mr. Massenat has gone to Cuba to look over the course. If it satisfies him it will probably mean the appearance of George Heath with a Panhard, not only at Havana but at Ormond.

Reports have it that the Italians will also be in the hunt with an Itala car, driven by Maurice Fabry, and a Zust flyer piloted by Victor Pisani.

That Uncle Sam does not propose to let Johnny Bull, Monsieur Jacques and Signor Macaroni have it all their own way is proved by Senator Morgan's correspondence and the news the writer picked up on a recent trip through the western factories. The senator says Harry Houpt, of New York, will be there with his 60-horsepower Thomas, which finished in the leading quartet in the eliminating trials. On his recent trip to New England Morgan saw Louis S. Ross, winner of the Duer cup last year. Ross is now building touring cars, but has yielded to the importunities of the Bay State Automobile Association to defend the cup by driving the racer being built by the Stanley people with this object and the 2-miles-a-minute speed crown in special view. Henry Ford will be on hand with his six-cylinder racer. Its power, he says, has been raised to 105, which he believes will be sufficient to carry the 1,700-pound car over the 2 mile course within the minute limit.

It is believed to be the intention of the White people to have on hand not only the Vanderbilt cup flyer, but Webb Jay's track sprinter as well. So far middleweight class assurances are confined to Frank Kulick and the Reo Bird and A. L. Kull's new 40-horsepower Wayne, which Deacon Holmes will drive. It is believed the Stanley people will enter a steamer and it is possible that Sidney Burman will be able to persuade M. Clement to send over a Clement-Bayard racer for the middleweight championships. Morgan has read with pleasure the stories in two of the Chicago dailies that Dr. H. E. Thomas will enter the 90-horsepower Locomobile, which finished third in the Vanderbilt race, and will pilot it himself in the Corinthian championship race.

At the Franklin factory last week no orders had yet been given to prepare any air-cooled flyers for Florida. No word, however, had yet been received from E. H. R. Green, of Texas, as to his intentions. Mr. McCutcheon says no expert can be spared from the factory to drive the Premier Vanderbilt cup candidate, and so it will not be sent. The National will be represented in the American championship race by one of the new six-cylinder touring cars, which either Carl Fisher or Jap Clemens will drive. MOTOR AGE readers, of course, have read stories of the great 200-horsepower Yankee flyer being built to carry Alfred G. Vanderbilt's colors, with Paul Sartori as its pilot. How many speed crown candidates are being quietly built without any drumbeating, only the final closing of the entries on January 8 will tell. They are beginning to come in already. George W. Young's Lancia Fiat and the Stanley candidate are entered.

W. P. Clyde, Jr., of the Clyde line, has given a $500 trophy, which has been allotted to the 10-mile free-for-all championship. Col. C. B. Ryan, of the Seaboard Air Line, and W. P. Taylor, of the Southern Railway, have also given cups.

This time there will be a grand stand erected in front of the club house at Daytona, with twenty boxes seating six each and individual seats for 250. There is now perfect harmony between Ormond and Daytona and whichever end of the beach is the better each day will be used.

There will be automobiling at Palm Beach this season. Hitherto the only vehicles on the island have been the mule car running between the breakers and the Royal Poinciana and the tricycle chairs pushed by grafters of Afric origin. The 60-mile road to Miami will be opened on January 1. This will furnish a fine drive. Accordingly, Mr. Flagler is building a garage and has ordered six White steamers for its equipment. The railroad bridge will have a 12-foot driveway added, furnishing communication between the island and the mainland. The garage will afford storage facilities also for private cars used at the beach.

Senor Conill, president of the Cuban Railway Association, will sail for Havana, next Saturday. The latest arrangement of the carnival schedule calls for a floral parade and battle of the flowers on Sunday, February 4; tours of the island on the 6th, 7th and 8th; the big race on Sunday, the 11th; and the sprint races on Tuesday, the 13th. The start of this year's Havana cup race will be from Camp Columbia to secure better communication by railroad and trolley than Arroya Arenas provides. A new road has been built from the Camp Columbia highway connecting it with the military road at a point on the outskirts of Marianao. Camp Columbia, being 7 miles nearer to Arroya Arenas than Havana, the race will be lengthened to 228 miles, made up of four relays of 57 miles each.

Morgan now purposes to make as a feature of the meet at Atlantic Beach on April 4, 5 and 6 a straightaway counterpart of the Vanderbilt contest. There being 30 miles of beach available for racing, his idea is to run a 283-mile cup race in laps of 28.3 miles to furnish a time comparison between the Long Island circuit and the Atlantic course. Such a race would require nine rightabout turns and ten were the start and finish to be in the middle of the course.

PHILADELPHIA SEASON ENDS

Philadelphia, Dec. 18—Last Friday and Saturday's snow storm was a stiff body blow to the most successful winter season the local automobile trade has ever experienced. The beautiful seemed to drive all thoughts of motor cars from the minds of prospective buyers, and the row was as dead as the proverbial doornail, for the first time since January last. The 1906 models, which were the center of attraction at the various branches and agencies for the past fortnight or more, were overlooked. Besides, the near approach of Christmas is having its effect, although there are, of course, the few who contemplate filling some loved one's stocking with an up-to-date car. It seems to be the general opinion of the habitues of the row

Digitized by Google

that the season is practically over at last, and that the 1906 rush will not put in its appearance until just before show time, in February. But satisfaction with both the past season and the prospects for the next was the keynote all along North Broad street. Indeed, there was not a single discordant note in the harmony of the song of rejoicing over the fat figures which will make next week's balance sheet the best ever. New faces still continue to put in an appearance among the ranks of the elect. The latest is the Hamilton Automobile Co., which has secured quarters at 206 North Broad street—incidentally forcing out another horse goods store.

RECOMMENDS WIDE TIRES

Syracuse, N. Y., Dec. 18—Robert E. Bogardus, county superintendent of highways for Onondaga county, after a thorough canvass of the situation, has made a report to the board of supervisors of Onondaga county which will be of great interest to automobilists. His recommendations are attracting widespread interest in other counties and will be supported by automobilists. Mr. Bogardus advises the passage of a wide tire law which would prevent the sale after January 1, 1907, of farm and truck wagons with tires less than 3½ inches wide. Wagons designated to carry heavy loads usually have tires 2½ inches wide. To adopt regulations preventing the use of these wagons which have already been paid for would be a hardship to the farmers and the superintendent thought the result would finally be obtained by preventing the sale of narrow-tired wagons after a certain date. This would also be more fair to manufacturers of wagons. Mr. Bogardus makes other regulations which are summarized as follows:

1—That an earlier date be fixed for the filing of appointments of overseers of roads.

2—That the county assume sole control of the care of improved roads.

3—That an enlarged stone crushing plant be installed at the penitentiary quarry.

4—That a state law be passed legalizing the sale of crushed stone prepared at the penitentiary to contractors engaged in building improved roads.

Even the farmers themselves admit the fairness of the rules framed by the county superintendent of highways.

CARNIVAL SHOWS PROFIT

St. Paul, Dec. 18—All members of the St. Paul Automobile Club have just received copies of the report of Secretary B. A. Ledy upon the cost of the St. Paul carnival and race meet of last July. The statement shows that with subscriptions of $6,000 and race meet receipts of nearly $10,000, the meet produced a net profit of exactly $337.95. According to Secretary Ledy's figures, the business interests of St. Paul contributed by popular subscription exactly $6,483. The race meet cost $9,278.35, and produced $9,978.59. This saved the day, as the entertainment for the small body of visitors, together with advertising, salaries of employes, and other incidentals, cost over $350 more than the amount received by subscription.

TEST COSTS TOO MUCH

Britons Think Fees Demanded for Tire Trials Are Excessive—Blow to Makers

London, Dec. 9—The conditions of the proposed tire trials of the Automobile Club of Great Britain are now beginning to receive an attention which was denied them in the rush of the show business, and considerable objection is being taken to several points which the club makes in its conditions. The first of these is the relatively high cost. This is a matter upon which little has hitherto been publicly stated, but not a little has been privately discussed. The automobile club fees have always been stiff, but the industry was one which could stand heavy taxes of an occasional character, but the benefits were obvious and the imposts have been paid without demur. But now that matters are getting into a commercial line, the question of expenses is being looked at more closely. The fees for this tire test are so set that it must be impossible for any but the wealthier firms to face them, and as the qualities of the goods of the wealthier firms are perfectly well-known, it is difficult to see what particular end is in view in holding such tests under such conditions. To show what these imposts are like they are quoted.

A set of tires is held to consist of four tires, solid or pneumatic, or hybrid, exactly as they will stand on the vehicle ready for the road. For any firm entering for these trials not fewer than five sets nor more than ten sets the entrance fee is fixed at $500 per set; exceeding ten and not fifteen $375 per set; exceeding fifteen and not twenty $300 per set; exceeding twenty and not thirty $275 per set; exceeding thirty sets $250 per set over all. These fees include the registration fees for the competition. The character of these imposts are evident on their face, and as has been pointed out preclude any but the wealthier firms from considering them. But on the other hand, these wealthier firms do not consider that the tests are calculated to recoup them for the commercial risks they run, not to speak of the costs which they will incur, for in addition to these entrance fees the competitor is bound to provide suitable vehicles for running in the competition. He is not permitted to select his tires; the officials of the club walk into his warehouse and themselves withdraw from his ordinary stock tires to the quantity represented on his entry form.

The tests are to be over 4,000 miles with an average daily mileage of 200, but at the end of 4,000 miles, it is to be then the option of any competitor to continue indefinitely on paying a fee of $10.50 per day; this is presumably to enable the trials to be run to a finish for the benefit of any competitor who thinks that his rival's tires are not lasting as well as his own at the end of 4,000 miles. There are other conditions which, while no doubt justifiable from the club's point of view, do not seem suited to a commercial venture in which road luck will have so much to say that it is an intensely speculative test from a business point of view. Thus the competitors entering bind themselves to refrain from advertising anything during or after the trials not actually and officially sanctioned by the club and at the completion of the trials the tires and the appurtenances become the property of the club. The classification for pneumatic tires is:—

A—For cars whose total running weight, including two passengers averaging 150 pounds, shall not be less than 1,500 pounds.

B—For cars whose total running weight is 2,400 pounds, including two passengers averaging 150 pounds.

C—For cars whose total weight is 3,000 pounds, including four passengers.

D—For cars whose total running weight is 4,500 pounds, including four passengers.

None of these tires will be permitted to have any protective device. A separate class is provided for tires carrying any protection outside the ordinary rubber cover. These are to be fitted to cars with total weight of 3,000 pounds and carrying four passengers. For solid tires four classes corresponding to the pneumatic classes, are projected, the weights, however, being 1,500, 3,000, 6,000 and 14,000 pounds, and no spring device in the wheel will be permitted.

The date fixed to start the trials is February 1, and unless a minimum of five sets of tires are entered by January 3 next the trials will be declared off.

WINTER SPORT IN NORTH

Minneapolis, Dec. 16—One never can tell about this glorious northwestern country. Forty years ago this week, according to newspaper clippings dug up by a local publication, the twin cities were in the grasp of a blizzard so strong that for 3 days there was no communication whatever between Minneapolis and St. Paul. Trains which started out of St. Paul to make the 10 mile run to Minneapolis were stalled midway, and stayed in the drift for 3 days, until shoveled out. Automobiling has been simply fine this winter. The roads have packed down to a fine hard running surface, there is little snow, the cold is not severe enough to freeze 'em up, and Minnesota is as much a winter automobiling locality as the majority of the middle western towns. The automobile enthusiasts have even talked of joining the winter sports class here. It was proposed to build a cinder track down through the middle of Lake Harriet, and tear off some straightaway races. But the skaters and ice boaters won't stand for the cinder track, and the automobile drivers have about made up their minds that it would be too cold for fast driving, anyhow, so the project is not likely to hold.

PITTSBURGERS SEEK SITE

Pittsburg, Dec. 19—An option has been secured on a large site near Montrose, a few miles above Allegheny on the Freeport pike, for a country club house for the Automobile Club of Pittsburg. The site is near the Allegheny river, and if the option is taken up it is probable a motor boat club will also have quarters there. The Freeport road is easily reached.

NAMES THE SPACES AT CHICAGO

General Manager Miles of National Association of Automobile Manufacturers Gives Out Allotments for Fifth Annual Exhibition To Be Held in Coliseum and Armory.

Chicago, Dec. 18—Samuel A. Miles, general manager of the National Association of Automobile Manufacturers, has completed his list of exhibitors for the fifth annual Chicago show. A few applicants have not yet qualified, but the list given out by Manager Miles is practically complete:

MAIN FLOOR—COLISEUM

Apperson Bros. Automobile Co., 96, 97.
Autocar Co., 5, 6.
Baker Motor Vehicle Co., 85, 86.
Bartholomew Co., 91, 92.
Cadillac Automobile Co., 100, 101.
Corbin Motor Vehicle Co., 83, 84.
Duryea Power Co., 13.
Electric Vehicle Co., 14 to 19 inc.
Elmore Mfg. Co., 60, 61.
H. H. Franklin Mfg. Co., 102 to 104 inc.
Ford Motor Co., 111, 112, 113.
Haynes Automobile Co., 7, 8.
Holsman Automobile Co., 95.
T. B. Jeffery & Co., 42 to 47 inc.
Knox Automobile Co., 55 to 59 inc.
Locomobile Co. of America, 48 to 51 inc.
Mitchell Motor Car Co., 80 to 82 inc.
National Motor Vehicle Co., 76 to 79 inc.
Northern Mfg. Co., 69, 70.
Olds Motor Works, 62 to 67 inc.
Packard Motor Car Co., 34 to 37 inc.
Peerless Motor Car Co., 9 to 12 inc.
George N. Pierce Co., 105, 106, ½, 107.
Pope Mfg. Co., 20 to 26 inc.
Premier Motor Mfg. Co., 93.
Reliance Motor Car Co., 94.
Royal Motor Car Co., 98, 99.
F. B. Stearns Co., 40, 54.
J. Stevens Arms & Tool Co., 27, 28, 29, 41.
St. Louis Motor Car Co., 68.
Studebaker Automobile Co., 38, 39, 52, 53.
E. R. Thomas Motor Co., 30 to 33 inc.
Waltham Mfg. Co., 89, 90.
Wayne Automobile Co., 87, 88.
Winton Motor Carriage Co., 1 to 4 inc.
Woods Motor Vehicle Co., 71 to 75 inc.
White Sewing Machine Co., ½ of 107, 108, 109, 110.

ANNEX—FIRST FLOOR

Auburn Automobile Co., 122.
Austin Automobile Co., 119, 120.
Buick Motor Co., 114, 115.
Chicago Automobile Mfg. Co., 116.
Jackson Automobile Co., 123, 124.
Pierce Engine Co., 125.
Punge-Finch Auto & Gas Engine Co., 121.
Tinther Motor Car Co., 117.
Vehicle Equipment Co., 128 to 130 inc.
Welch Motor Vehicle Co., 126.

SECOND FLOOR ANNEX—COLISEUM

Automobile Supply Co., 264.
Aerocar Co., 247, 248.
Beckley-Ralston Co., 222 to 224 inc.
Cook Railway Track Appliance Co., 280.
Continental Caoutchouc Co., 274 to 278 inc.
Columbus Buggy Co., 241 to 243 inc.
Chicago Pneumatic Tool Co., 235 to 238 inc.
Cullman Wheel Co., 257.
Dac Automobile Supply House, 288, 289.
Dayton Folding Tonneau Co., 285.
Dorris Motor Car Co., 233, 234, 239, 240.
Joseph Dixon Crucible Co., 217.
Duff Mfg. Co., 268.
Excelsior Supply Co., 272, 273.
Gaulois Tire Co., 287.
Hendee Mfg. Co., 283.
Imperial Brass Mfg. Co., 279.
Knoblock-Heideman Mfg. Co., 221.
London Automobile Supply Co., 263.
Limousine & Carriage Mfg. Co., 219, 220.
Mahattan Storage Co., 269, 270.
Madison-Kipp Mfg. Co., 266.
Motor Car Equipment Co., 260.
Motorcar Co., 250.
North Chicago Machine Co., 281.
Nordyke & Marmon Co., 227, 228.
Railway Appliance Co., 271.
Sherwin-Williams Co., 286.
Samson Leather Tire Co., 261, 262.
Standard Carriage Lamp Co., 225.
Universal Storage Battery Co., 218.
Volta Battery Co., 282.
Vesta Accumulator Co., 259.
Windsor Automobile Co., 251, 252.
Whiteley Steel Co., 226.

GALLERY—COLISEUM

American Electric Novelty & Mfg. Co., 136.
Atwood Mfg. Co., 201.
Aurora Automatic Machinery Co., 138.
Autocoil Co., 139.
Badger Brass Mfg. Co., 162, 163.
Baldwin Chain & Mfg. Co., 187.
Belden Auto Transmission Co., 216.
Brown-Lipe Gear Co., 186.
Brennan Mfg. Co., 157.
William H. Brown, 176.
S. F. Bowser & Co., 141.
Briscoe Mfg. Co., 134.
Byrne, Kingston & Co., 198, 199.
Consolidated Mfg. Co.
Detroit Motor Car Supply Co., 211, 212.
Detroit Steel Products Co., 208.
Diamond Rubber Co., 142, 143.
Diamond Chain & Mfg. Co., 182.
R. E. Dietz Co., 154.
Dayton Electric Mfg. Co., 150.
Edmunds & Jones Mfg. Co., 193.
Firestone Tire & Rubber Co., 132.
Fisk Rubber Co., 161.
Gabriel Horn Mfg. Co., 204.
B. F. Goodrich Co., 169, 189.
Goodyear Tire & Rubber Co., ½ 166, 167.
Gray & Davis, 165, ½ 166.
G & J Tire Co., 164.
Hartford Suspension Co., 195.
A. W. Harris Oil Co., 179.
R. E. Hardy Co., 178.
Hartford Rubber Works Co., 158, 159.
Hyatt Roller Bearing Co., 151.
Hine-Watt Mfg. Co., 146.
International A. & V. Tire Co., 155.
Jones Speedometer, 152.
Long Mfg. Co., 184.
McGlehan Mfg. Co., 207.
McCord & Co., 156.
Morgan & Wright, 148, 149.
Motsinger Device Mfg. Co., 144.
N. Y. & N. J. Lubricants Co., 180.
National Carbon Co., 133.
Oliver Mfg. Co., 192.
Pennsylvania Rubber Co., 202.
Pantasote Co., 209.
Prest-O-Lite Co., 177.
Rose Mfg. Co., 168.
Republic Rubber Co., 210.
Remy Electric Co., 171.
Spicer Universal Joint Mfg. Co., 185.
Swinehart Clincher Tire & Rubber Co., 183.
Standard Oil Co., 175.
Standard Roller Bearing Co., 173.
Schwartz Wheel Co., 172.
C. F. Splitdorf, 152.
Shelby Steel Tube Co., 147.
Sprague Umbrella Co., 140.
Steel Ball Co., 135.
Timken Roller Bearing & Axle Co., 188.
Tokeim Mfg. Co., 170.
Valentine & Co., 206.
Veeder Mfg. Co., 160.
Weed Chain Tire Grip Co., 200.
Wheeler Mfg. Co., 196, 197.
Webb Co., 191.
Warner Gear Co., 181.
Warner Instrument Co., 174.
Whitney Mfg. Co., 145.
Wray Pump & Register Co., 137.

Way Muffler Co., A 54.

MORE GOOD ROADS BILLS

Washington, D. C., Dec. 18—Senator Latimer and Representative Brownlow have again introduced in congress their bills to establish in the agricultural department a bureau of public highways and to provide for national aid in the improvement of the public roads. Both bills are identical and set forth that the object and purposes of the public highways bureau shall be to cooperate with the various states and territories in the construction and improvement of permanent public roads; to make investigations and experiments in regard to the best methods of road making and the best road making materials, and to bring about as far as possible a uniform system for the repair, improvement and construction of the public roads throughout the United States. The various provisions of these bills were fully set forth last year when they were pending in the last congress and are familiar to all readers of MOTOR AGE. The Latimer-Brownlow bills carry with them an appropriation of $24,000,000 to carry out the provisions of the proposed law, said appropriation to be available at the rate of $8,000,000 a year.

HARD SLEDDING FOR MORRELL

Washington, D. C., Dec. 16—Representative Morrell's bill to place touring automobiles under the jurisdiction of the interstate commerce commission has been freely discussed in government circles and more than one high government official has stated that the bill savors too much of class legislation to be popular with the masses. The members of the interstate commerce commission are not particularly enthusiastic over the proposition of Representative Morrell to add to their already arduous duties. While the members of the commission decline to express an opinion regarding the merits or demerits of the pending bill, it is known that they are not at all in love with the measure and indirectly they may cast their influence against it. On the whole, it looks like pretty hard sledding for the Morrell measure.

DAY HAS ASSISTANCE

Marcus I. Brock To Be Associate Manager of the A. L. A. M., Beginning January 20

New York, Dec. 18—The announcement is made that the Association of Licensed Automobile Manufacturers is to have an assistant general manager. This is Marcus I. Brock, former sales manager of the Autocar Co., of Ardmore, Pa. The appointment is made necessary by the increasing work of the association. The system adopted within the last year of increasing the number of departments has resulted in a division of the work so that the association now has the board of managers, executive committee, agency department, patent and legal department, mechanical branch, technical and test committee, metallurgist, association patents committee, traffic department, show committee and hand book committee. Many of these branches have frequent meetings and the increase of detail and routine business has almost swamped General Manager George H. Day. Mr. Brock will take off of his hands the great bulk of the detail work and leave Mr. Day free to attend to the more important matters of litigation, patents and the shaping of the general policy of the association. Mr. Brock will begin work with the licensed association January 20. It was announced several days ago that he had severed his connection with the Autocar Co., but his future intentions were not given out until the announcement was made that he would be Mr. Day's assistant in the management of the license association. Association work has grown extensively during the past year and still more work is in sight, so that assistance in the executive department became necessary.

MADE LONG TRIP

Houston, Tex., Dec. 16—Intended for use on the Southern Pacific Railroad between Houston and Galveston, a motor car built in the shops of the Union Pacific at Omaha last week traveled under its own power to Houston. The test given it in this manner was perfectly satisfactory and made a great impression on railroad men who watched its performance. Frequently it maintained a speed of 30 miles an hour for 25 miles and on one or two occasions did several separate miles in 57 seconds, or at the rate of 63.2 miles an hour. The stretch between Beatrice, Neb., and Kansas City, a distance of 210 miles, was done in 9 hours. This motor can pull two trailers easily and tests have shown that it can be stopped in 112 and 115 feet while going at a speed of 20 miles an hour without inconvenience to the passengers. It seats fifty-eight.

REOITES LOST IN THE SNOW

Megargel and Fassett Nearly Perish in Storm 13 Miles Outside of Flagstaff, Ariz.—Searching Party Finds Them Without Gasoline or Food—Tourist's Last Letter

Flagstaff, Ariz., Dec. 19—Special telegram—Percy Megargel and David F. Fassett, the representatives of the American Motor League, who are working their way back to New York after a trip to the coast in their Reo Mountaineer, nearly perished in the snow 13 miles from this town. They left here yesterday but owing to the heavy storm fears for their safety were entertained, so a searching party was sent out and the missing ones found late tonight in a desperate condition, snowed in without food or gasoline, near a deep pass in the mountains. A few hours longer and they would have perished from the bitter cold. Both men had managed to save themselves from being frozen to death by use of gasoline to start a fire. Smoke from this fire led the rescuers to them. By a mere chance a squirrel had been shot during the day and cooked over their fire. It was their first food for over 36 hours. While looking for the automobilists the searching party came across the frozen body of a logger who had been lost for 2 days.

Flagstaff, Ariz., Dec. 17—After passing a cold night in the snow some 30 miles west of here, the Reo Mountaineer plowed its way into town late this afternoon and will leave on the morrow for the east. Flagstaff is the highest point on the Arizona division of the Santa Fe and it was pointed out to us at Los Angeles that we would be unable to get over this mountain at this period of the year, but beyond having to plow our way through from 12 to 18 inches of snow and sleep on the ground a couple of nights, we have not experienced the troubles pointed out to us.

While I much prefer sleeping in a bed, sleeping in the snow is not so bad as anyone would imagine. If the snow bank is high enough you can shovel a hole large enough to spread your blanket in and sleep fairly warm. Of course, toward morning when the mercury drops down toward the zero mark one does feel a little numb and sometimes it takes 15 to 20 minutes to awaken your feet and hands after the remainder of your body is wide awake, but when they tell us it is much colder in the east and as we are bound that way we have no business to complain of Arizona weather—even as experienced in the vicinity of Flagstaff.

At Williams where we stayed Friday night, the Santa Fe railroad switches tourists' cars to the Grand canyon of the Colorado, some 60 miles to the north. Despite the winter weather there are a great number of tourists taking the canyon trip. Had we a little more time I would have headed the Reo Mountaineer northward and run to the canyon, as it is considered one of the American wonders of the world. It looks to me as though there would be an excellent opportunity for someone to start an automobile stage line from either Williams to the Grand canyon or from Flagstaff to the same place, the canyon being about the same distance from either town. Numerous automobile stage lines in Nevada are paying handsomely, passengers in some cases cheerfully paying $20 for a 50-mile trip, which can be made in 2 hours by automobile, but takes 12 for stages drawn by horses.

When we rolled into Seligman last Thursday morning, we did so with the knowledge that our desert traveling was mostly over. Soon after we left that town we came into the ranch country, meeting herds of cattle every few miles and occasionally passing bands of cowboys and freighters. The roads, however, were about the worst it has ever been my lot to travel. In many places the trail along the railroad track had not been wagoned for weeks, the teamsters simply running from the nearest railroad station back into the country to their ranch or mine as the case might be.

Lava rock, the terror of automobile tires, was encountered Thursday, Friday and Saturday and we have more to follow. These sharp black stones simply cut a tire all to pieces in a short time. I would sooner wind my way through tin cans, broken bottles and nails, than to have to run continuously over lava. Nor were the tires the only part of the machine to suffer from these obstructions, for sometimes we would find huge piles of lava in the very middle of the trail and so situated that it could not be rounded. In these cases we would stop our car and getting out, pile stones and brush on either side of the obstruction until we had built a temporary bridge that would allow us to cross.

When hidden by several inches of snow these lava rocks are at their worst and broken truss rods, missing petcocks, and battered muffler show only too plainly the hard knocks the little Reo Mountaineer has been receiving since it left the sand desert along the banks of the Colorado. Occasionally we get hung up and then it is necessary to get out our wagon jack and hoist the wheels up until the obstruction is cleared. This all takes time and we are now 3 days behind our schedule with abundance of snow reported all along the line ahead.

Tomorrow we will have to undertake one of the most dangerous and correspondingly exciting adventures of the trip. This is the crossing of the Canyon Diablo on the narrow railroad trestle. The trestle is a single track affair, 250 feet from the bottom of the canyon below, without either guard rail or outer planking. Some ranchmen have told us that it made them dizzy to crawl across on their hands and knees. Just what effect it will have on my nerves as I steer the Reo across is yet to be ascertained. Fassett says he thinks he will walk across, and I don't know as I blame him much. Still, with nearly a foot to spare on one side and the other two wheels securely inside the rails, there should not be much danger for me in the car I have crossed the continent in.

There is one thing I miss very much on this trip and that is the good old-fashioned side hampers that were in vogue before the side entrance tonneau cars came out. While we have our tonneau to put things in, we manage to lose out pretty nearly everything we need. Thursday I purchased a lot of canned provisions and Thursday night when I went to cook supper a box of crackers and some black coffee was all that I could find.

While 3 days behind in our schedule we still have hopes of gaining enough time in the east to bring us into New York in time for the automobile show, although too much snow reported in Kansas, Illinois or Pennsylvania would cause us to pull for the south and end up our trip at some southern Atlantic seaport rather than in New York city.—PERCY F. MEGARGEL.

Needles, Cal., Dec. 10—With the Great American desert half crossed, and a large part of that done in the face of the worst sand storm of the season, it looked here as if the Reo Mountaineer would get through to New York in time for the automobile show unless held up by very severe weathers further east. The car left Los Angeles on December 6, and averaged 80 miles a day all the way across the desert, over a barren waste of sand that has always been considered impassible for automobiles or horses.

For the first time since leaving New York city last August the Reo Mountaineer capsized coming over the Cajon pass, tipping over and rolling down to the bottom of a steep embankment, but without serious damage to itself or to its crew. The spill was caused by taking a bad turn, concealed in the road, at too great a speed for sandy roads. With the exception of the mud guards, lamps, searchlight, front spring and steering wheel, the car was unharmed. Using the cable and windlass, the car was soon in the road and running like a thing of life toward the east. It was a narrow escape and fully illustrates the fact that it is unsafe to run at a greater speed than 15 miles an hour over unknown roads in California.

From Daggett, Cal., to Albuquerque, N. M., the trail lies for the greater part of the distance over a barren waste of white shifting sand, known as the Great American desert. We left Daggett knowing full well what was in store for us. We carried sand tires for every wheel and in addition two long strips of the heaviest canvas we could procure. A new and stronger cable has replaced the old one that we added at Omaha and a new pair of tires adorned our two rear wheels. It was difficult pulling and more than once we had to change to our low gear, sometimes using it for miles, but our water circulation was good and the engine struggled gallantly onward, each mile counting and encouraging us to proceed.

It was the first time the desert had been invaded by an automobile and every human being we met stopped and stared at us in amazement. Large crews of Mexican section hands stood with mouths and eyes open in wonderment as the Reo Mountaineer glided past, running through

Digitized by Google

sand 5 and 6 inches deep and doing it on the high speed, while the section bosses, usually Irishmen, invariably took their hats off and bowed in reverence as we sped past. At every railroad tank at which we stopped for water, the railroad hands crowded around us and plied us with questions.

To cross the desert in either America or Africa without running into a sand storm would be a tame affair and the fates well know this, so Saturday morning we awoke to find the wind blowing a gale, and the desert before us a mass of rushing, whirling sand. The storm was general and all through California, Arizona and New Mexico the wind howled and piled, shifting sand so high on some of the railroad tracks that service on that branch was delayed for hours. Trains were stalled everywhere, yet the Reo Mountaineer plugged on through the desert, making 87 miles that day, directly against the wind and facing a sand storm that obscured the sun's rays and caused a darkness at noon equal to that of night. Not only was the desert ahead hidden from view, but the sand cut like knives and our unprotected faces suffered greatly. The other occupants, Fassett, the mechanician, and W. C. Vaughan, a Los Angeles automobilist and cattleman who is acquainted with the country through California, Arizona and New Mexico, used their hands to protect their faces. I had to steer with one hand, but the other I used as best I could to keep out the sand. My eyes, however, insisted upon filling up time and time again despite my goggles.

We understood that we would find a good ferry boat at Needles that would cart our automobile across the Colorado river into Arizona territory, but found upon arriving at the river bank, that the ferry boat had been broken up months ago, and that the ferry had ceased to be used owing to no roads on the opposite bank. After considerable delay we found an Indian who owned a rowboat and after bargaining with him we secured the services of himself, boat and an assistant for the sum of $6. It was our only chance of getting across the river and, although risky business loading the automobile on a row boat, we accepted it as one of the conditions imposed upon automobile tourists and took the chance. The boat rocked and rolled when it struck the rapids in midstream and once or twice all of us thought the Reo Mountaineer would dive into the depths below, but it didn't and we eventually landed on the opposite side in a pile of as white light sand as I have ever encountered on my travels. Luckily we had a cable, for the bank was steep and it took a long pull and a hard one to get the car to the top of the bank, where we encamped for the night, in our twelfth state or territory.—PERCY F. MEGARGEL.

FOR ARMY USE

Cleveland, Dec. 17—An automobile ambulance, intended for use in the army service at Washington, started from Cleveland last week on the overland trip to the capital. The machine was constructed after the design of one of the captains in the army corps and embodies several features heretofore unknown in army ambulance construction.

BIG RACE FOR FRANCE

Pressure So Great Grand Prix Will Probably be Revived at Aix-les-Bains

Paris, Dec. 7—France will race next year. The tire contest and the little run around Europe in a touring car does not satisfy the sporting section of the Automobile Club of France, and a few hours ago that body decided to hold a long distance road race next season. Before taking a final decision the advice of the most influential French makers was asked, and they were found to be almost unanimously in favor of the old course being followed. M. Mors was opposed to racing and the Marquis de Dion, whose hobby is regularity, did not vote. The balloting was sufficiently unanimous to leave no doubt in the minds of the members of the Automobile Club of France, and immediately they charged the sporting commission to organize a road race for 1906.

Speculation as to what the event will be is not a difficult matter, inasmuch as less than 12 months ago the club brought forth a scheme known as the grand prix, and dropped it almost immediately. It is thus quite safe to say that next year will be the revival of the grand prix of January, 1905. As to the choice of a circuit the Aix-les-Bains district, proposed for the Bennett of 1905, is likely to be decided upon. There will be no controls, a few stiff grades are thought desirable, and a moderate length of circuit, giving a total distance of 300 or 400 miles at highest possible speed, will be sought. Whatever may be the decision of the international committee, the Bennett event will not be run again under existing regulations. France cannot undertake it now, and Italy which is the nation next best qualified to take it over, has really got as much as it needs in the Florio cup event over the Brescia circuit.

Runabouts are really coming to the fore in the republic, and on every hand new machines are being put on the market and new tests imposed in order to bring these smaller vehicles before the attention of the public. Lacoste & Battmann, who took part in the 7 days' touring contest around Paris, have just sent their little machine on a further trip from Paris to Bordeaux, a return journey of about 700 miles, just to prove that its automobile can still keep going although it did not win the first prize. They have also undertaken to assemble a new machine, all the assembled parts for which will be brought together at a given hour; travel to Bordeaux and back again to Paris, all in 50 hours. Two hours are calculated for stamping the part, about 6 hours for fitting and 42 hours, or as many less as possible, for the 700 miles journey. Considering this is the worst season of the year and that there are a few stiff hills to climb between Paris and the famous wine city, it is a no small task that the little 8-horsepower car has to face.

The Automobile Club of France is of opinion that there is no precedent for interference in the runabout contest which took place a week ago and the stage of the journey which was disorganized by nails being strewn over the road, must remain a part of the contest.

The first prize thus goes to the Vulpes, which had but 241 points against it for the whole 7 days, and the regularity prize is carried off by the de Dion Bouton, the only team of three cars finishing the contest. The official results are as follows:

Car and Driver	Penalties
1. Vulpes, Barriaux	241
2. De Dion Bouton, Lionel de Dion	327
3. De Dion Bouton, Cormier	439
4. Lacoste & Battmann, Gachet	502
5. De Dion Bouton, Bardin	561
6. Gregoire, Tavenaux	1,334
7. Lacoste & Battmann, Rochay	1,726
8. Gregoire, Renonce	3,437

FIGHT SHY OF FRENCH TOUR

London, Dec. 9—The European circuit organized by the Automobile Club of France is attracting some attention on this side, but only from firms who consider that they have a chance of establishing themselves on the continent. Among these must be included Napier, Wolseley, Daimler, Humber and Rolls. It is certain that all these firms will enter and take an active part in this event for various reasons. Edge declares his is merely a defensive policy. He will enter and compete in every French event merely in order to show that his cars are not afraid of continental competition. The Daimler policy is one which favors participation in reliable contests for ever and ever, and as the firm did well in the Herkomer trophy contest it proposes to pursue it further. The Wolseley policy is largely founded on the same lines. This firm has never failed to score in any reliability contest in which it has entered. The Rolls-Royce is dictated by somewhat the same ideas as actuated Edge, but beyond these firms there is no prospect of further support from the British trade. The whole thing is regarded as a huge advertisement got up by the French club for the French trade, inasmuch as the competitors to a large majority will be drawn from French manufacturers, consequently their chance of success, quite apart from the conditions which are certain to be constructed in their favor, must out-weigh those of any other country. Of course there is a risk so far as they are concerned in some particular foreign firm coming out ahead, but that risk might easily be discounted in betting parlance as a 33 to 1 shot, not because of any inherent superiority in French cars, the Englishmen think, but ply because it will be impossible to give a decisive verdict.

NO '06 BENNETT RACE

New York, Dec. 19—Special telegram—Cable advices from Paris say delegates of the International Association of Automobile Clubs met yesterday and decided there would be no race for the Bennett cup next year. It was arranged to hold another conference in June, 1906, to decide whether a race for the cup should be held in 1907 or whether it should be definitely abandoned. The consensus of opinion is that the race will be abandoned, the cup remaining in the possession of France. Some of the delegates censured the alleged bad organization of the race for the Vanderbilt cup on Long Island.

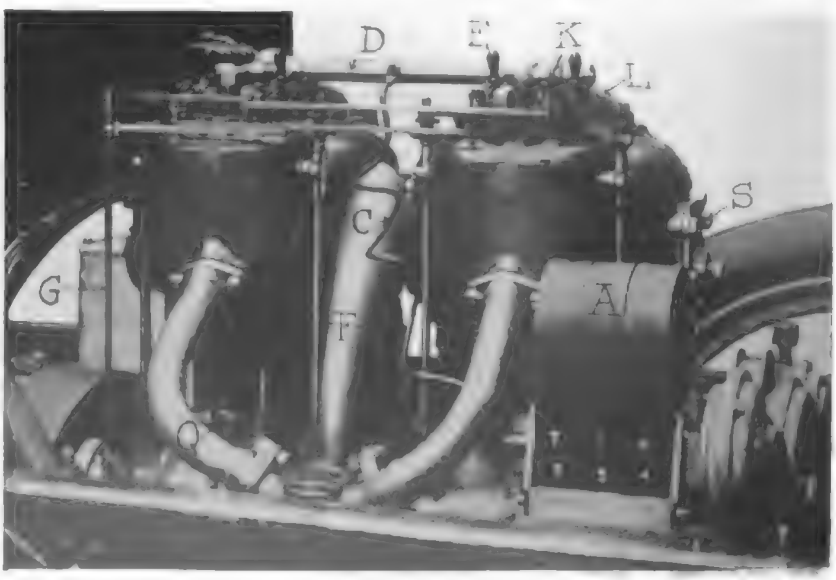
'06 Cleveland with Victoria Body

THE Cleveland Motor Car Co., of Cleveland, O., is introducing its model F 30-35-horsepower car, which will be its leading production for the coming year in place of the 20-horsepower car it brought out this season. It is practically a new model, although a great many of the features which proved successful this year have been retained, most of them with increased size and capacity. Among the most important changes is the adoption of the Simms-Bosch low-tension magneto with make-and-break spark in place of the jump spark ignition, used this year. Ball bearings are used wherever practicable and much imported steel is used. The wheelbase is 6 inches longer than before and the wheels 34 inches instead of 32 inches. The Hill precision oiling system is used and the control of spark and throttle is from the wheel entirely. But one lever is used in gear changes. The propeller shaft has two universal joints and the torsion rod has been dispensed with. The new body is of particularly attractive design, being of the Victoria type, with graceful curves.

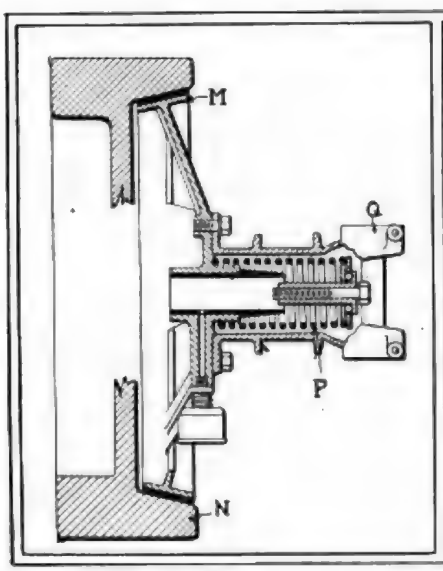
Replacing its system of jump spark ignition with a low tension scheme with mechanical make-and-break devices in the inlet valve ports heads, and having the current supplied by a gear driven Simms-Bosch magneto, is the one leading change in the motor construction. The motor, as before, is made with the four cylinders cast in pairs and with valves disposed in ports at opposite sides, the inlets in the bottom of ports P on the right side, with the ignition plates H bolted to the top part of the ports and the exhausts similarly situated in ports N on the left side. Both sets of valves are removable through openings in the port heads, caps with yokes holding them in place being used for closing these. Simplicity in the intake pipings on the right is very marked and on the left by having a separate exhaust pipe M connecting each exhaust valve with a common pipe, besides being novel makes this side of the motor much more accessible and also has the advantages of the hot pipes being well removed from the cylinders. The magneto A, carried on a separate bracket on the motor and gear driven from the camshaft, the gear being housed in the part B of the forward casing, delivers its current direct to the make-and-break igniters by a single wire C, which collects the current from the armature and delivers it to a horizontal bus bar D, carried on the top of the motor. From this bar the current passes to each cylinder igniter by way of knife switches E. By these switches any of the igniters can be tested conveniently. In operating the make-and-break devices recourse is had to a set of four vertical rods F, one for each igniter. These rods are driven by bevel gears off the camshaft. Instead of being raised and lowered by cams, as are push rods, they are revolved through the bevel gears. A long bearing X on the top of each valve port is furnished. On the top of each rod is an eccentric drive by which the make-and-break device is operated. Timing of the spark is through the vertical rod G with arm at the lower end, to which the shifting mechanisms are attached. By placing the make-and-break devices on the top of the inlet ports instead of on the sides or end of the ports they are made accessible for examination and repair.

The timing gears are enclosed in aluminum casings and are of hard bronze. The camshaft is forged of one piece, the cams being forged integral with the shaft itself. The cams are case hardened and the rollers which operate the lifting movements are also case hardened. The connecting rods are of nickel steel and are hardened at the piston end, the wrist pin also being hardened and secured in the piston by means of a spring washer fitting into a groove in the piston ring which makes it impossible to work loose. The brasses on the crank ends of the connecting rods are of special bearing metal. The circulating system consists of a honeycomb cooler and the circulation of the water is positively induced by a centrifugal pump R of large dimensions, mounted directly on the engine and driven by a gear from the exhaust camshaft. A cooling fan is mounted on the front cylinder and is driven by a leather belt from a camshaft pulley. The mounting of the fan on the front cylinder at S eliminates, to a large extent, the noise that is generated by this high speed action when mounted in a hollow standard such as the

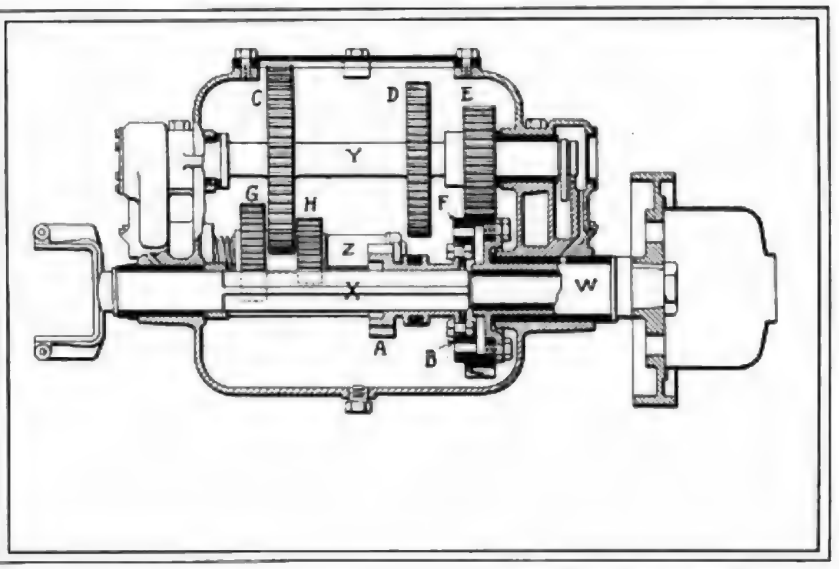


CLEVELAND MOTOR, SHOWING MAGNETO AND MAKE-AND-BREAK DEVICE

Digitized by Google



CLUTCH ON CLEVELAND CAR



SLIDING GEAR SET ON THE CLEVELAND

cooler. A Hill oiler lubricates all the bearings in the engine and transmission, besides furnishing a surplus of oil, which is used for the splash lubrication of the cylinders. The carburetor is of the float feed type, with compensating air openings. The interior of the float chamber has a hollow tube and there is a needle point valve in the center of the air opening. The needle is adjustable from below and is set to give the proper amount of air for any particular condition. The float fits around the inside wall of the float chamber. The throttle valve portion is cylindrical in shape and has gas ports in the upper portion and air ports below. The throttle is controlled by a lever on the steering wheel and is independent of the spark advance.

The clutch is an aluminum leather-faced cone M which is received into a corresponding shaped recess in the fly wheel N. The spring P, which gives the clutch its gripping action, is so arranged that no thrust is transmitted to the engine bearing. A universal joint Q connects the clutch to the transmission, preventing undue wear to the engine and the transmission, due to the two principals being out of alignment.

The transmission is of the sliding gear type, giving three speeds forward and a reverse. The intermediate pinions are on one countershaft Y, which is always running, while the reverse pinions are on a second countershaft Z. For low speed the sliding gear A passes into mesh with gear C, which drives the main driving gear F through the countershaft driving gear E. For the second speed, gear B passes into mesh with countershaft gear D which drives in the same way as before. For the third speed, sliding gear B engages with an internal gear cut in F which connects the mainshaft X and propeller shaft W as one. For the reverse, sliding gear A passes into mesh with reverse pinion G which operates on the reverse pinion countershaft, at the same time the reverse pinion H engages with the countershaft gear C, reversing the direction of C, consequently reversing the entire driving mechanism. The shafts and gears are all of high point carbon steel and are oil tempered. The bearings are also of carbon steel and are hardened, ground and equipped with oil rings. The driving gear, which is always in mesh, is pinned and keyed to its shaft. The hubs of all other gears are forged integrally with the shafts, and the gears are bolted to them.

The propeller shaft is equipped with cardan joints and is made of high carbon steel. The rear axle is bevel gear driven and is of the well known hub clutch type. The exterior casing upon which the rear wheels revolve is hardened and ground. It carries the weight of the machine, and the floating axle which this tube surrounds has but one function to perform; driving the rear wheels. The differential is mounted on ball bearings and the driving shaft is also equipped with similar bearings. The driving gears are of four pitch. All wheels are equipped with ball bearings and the races and cones are hardened and ground to size.

The brake equipment consists of a band brake on the propeller shaft, actuated by a foot pedal, and emergency brakes of the internal expanding type, enclosed in dustproof covers on the rear wheels. The brake bands are of phosphor bronze and work on steel drums. The front axle is of I-beam section and is made of a single piece of drop forged nickel steel, while the steering knuckles are of high carbon forgings, oil hardened. Oil hardened pivots are used, as well as pins in the front axle and steering connections. The steering gear is of the nut-and-screw type and is irreversible. The casing is a malleable casting in a single piece and is substantially fastened to the frame. The controlling levers for the mixture and spark are on top of the steering wheel, the quadrant for these levers being stationary. The gear change and emergency brake levers are on the side of the driver's seat. The clutch is operated by a pedal as is the brake on the rear transmission shaft.

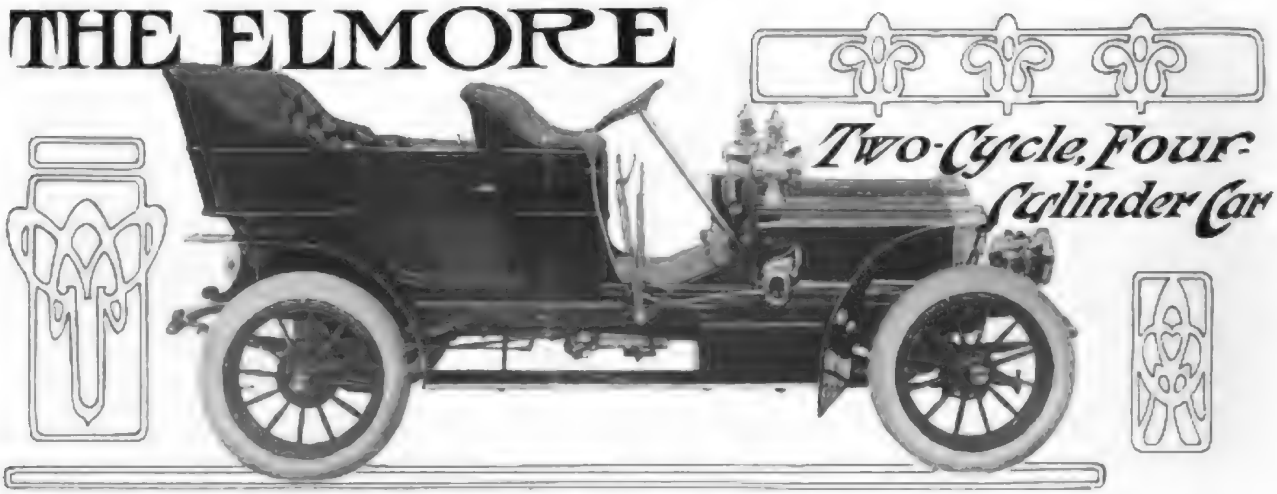
THE ELMORE

Two-Cycle, Four-Cylinder Car



DEVOTEES of two-cycle automobile motors will have many new points of interest in the 1906 machines built by the Elmore Mfg. Co., of Clyde, O., the leading and practically the only exponent of the two-cycle for motor car use up to the present season, when one or two other concerns brought out motors designed on this principle, noticeable among which must be noted the Olds Motor Works, of Lansing, Mich. The consistent performance of the present Elmore car, the Pathfinder, was followed with interest 17 months ago when it made the double journey from New York to St. Louis and return and since then the two-cycle principle has aroused much discussion as well as undergone considerable experimenting by several of the leading car builders in this country.

Elmore motors have always been constructed with horizontal cylinders placed side by side beneath the center of the chassis, each provided with a separate gas-tight crankcase, into which the mixture was supplied by a separate carbureter and the compression of the case in turn used in forcing the mixture into the explosion part of the cylinders. In two of next year's models vertical cylinders carried under a forward bonnet are used. One is a 35-horsepower five-passenger touring car with four separately-cast cylinders and driving through a Mercedes type of clutch, sliding gear set and cardan shaft to the rear axle and the other has two vertical cylinders mounted in front and power transmitted from them through a clutch the same as used in the larger model and thence through a planetary gear set and shaft drive to the live back axle. An Elmore carbureter fashioned along Krebs lines supplies mixture to the entire set of cylinders in each model.

In the larger machine, two views of the chassis of which are shown, standard frame construction is used. Side pieces made from deep channel sections are offset alongside of the motor and a sub-frame is used for carrying the motor and gear case. Both the crankcase and gearbox have integral lugs, resting direct on the sub-frame pieces. In tying the side pieces of the main frame together, channel cross parts are used. Each is cut with a gusset plate integral with it for reinforcement. Four semi-elliptic springs carry the main frame. Each has five leaves 2 inches wide, with both sides polished to reduce friction as well as to prevent water entering. The thickness of the leaves is graded from the center to the ends and clips are used to retard the recoil. Both axles are of tubular construction. The forward carries on either end the steering knuckles, brazed in position, and is slightly dropped to protect the crankcase base. The rear axle is of standard live type, with all parts revolving on Hyatt roller bearings. A Brown-Lipe spur differential gear is used and is enclosed within a large housing, the top portion of which is removable for inspection purposes.

Few changes have been made in the cylinder design other than placing them vertically. Of the changes made the casting of the head integral with the cylinder walls and waterjacket must be noted, as must the arching of the top of the combustion space instead of having it flat, as heretofore; the placing of the spark plugs vertically in the cylinder heads and those changes imperative in the crankcase because of the vertical cylinders.

As can be seen in the plan view of the chassis, each cylinder is a separate casting and has a gastight crankcase, the interior of which is made with as small a capacity as possible. In taking gas into the cylinder it is first conducted from the carbureter, which is carried low at the left side, into the crankcase, in which is sufficient pressure to force it through a channels in the sides of the cylinders to ports, where it enters the combustion chambers. On the right side of the cylinders are channels connecting the crankcase and combustion chambers and on the opposite side are the entrances to the crankcase and the exhaust ports. The reciprocation of the piston serves to open and close the inlet and exhaust ports, opening the inlet on the down stroke, so that mixture can be transferred from the crankcase to the combustion chamber by suction in the latter and pressure in the former. This construction means that there are only three moving parts in the cylinders—the revolving crankshaft, the reciprocating pistons and the connecting rods, valves being replaced by ports and camshafts, push rods and the other four-cycle accompaniments eliminated. The pistons are made with a vertical ledge across the top, which serves in directing the intake gas to the top of the cylinders when entering, their movement aiding in driving out the exhaust gas, the inlet and exhaust ports being so placed on the opposite sides that the inrushing gas aids in scavenging the cylinders. The cylinders have a bore and stroke of 4½ and 4 inches, respectively, and all internal parts are turned and ground. The crankshaft is a hammered steel forging and runs in long bearings. The pistons are made with four rings, three at the top and one at the bottom.

A Hill oiler is used in lubricating the

LEMOET TWO-CYCLE FOUR-CYLINDER TOURING CAR

Digitized by Google

SIDE VIEW OF CHASSIS OF ELMORE FOUR-CYLINDER TWO-CYCLE TOURING CAR

motor. This is carried on a separate bracket on the right side, near the dash, and is belt-driven from a horizontal shaft on right side of crankcase. Oil is supplied direct to the motor bearings and a sight indicator on the dash shows that the oil passes through each lead of the bearings. The main engine bearings are fed by one main high-pressure cup on the dash; turning the hand wheel on this oiler to the right feeds grease to these bearings. In the water circulation system a positively-driven pump is carried on the front end of the horizontal shaft. The pump takes its supply from the base of the radiator and delivers it to the left side of the waterjackets; from the top it passes to the top of the radiator. The commutator, made with regular roller contacts, is carried on the top of a short vertical shaft, driven by bevel gears off the front of the drive shaft which carries the pump and from which the oiler is driven. Both the high tension wires to the clasp and the commutator wires are supported by rods from the top of the dash to the radiator.

The clutch used is of the Mercedes bronze ring expanding variety, claimed to be smooth in action and not requiring frequent adjustment. It has the expanding ring always centered, preventing friction when not in use. A universal coupling connects with the mainshaft in the gearcase.

This gear set, working on the sliding principle, gives three forward speeds and one reverse, with direct drive on the high speed. All changes are made through one lever at the driver's right. Roller bearings are used on both shafts in the case. All gears are heavily made and run in oil. By the use of an interlocking system it is impossible to engage the clutch with the gears out of mesh. The clutch is also interconnected with both the internal expanding emergency brakes on the rear hubs and the regular band brake on the drive shaft in the rear of the gear box, application disengaging the clutch. The cardan driveshaft carries Spicer universal joints front and rear and carries a small bevel pinion for driving onto the differential bevel.

Steering is through a worm and segment gear from a hand wheel 15 inches in diameter, two and one-quarter turns of which turns the front road wheels from the right to the extreme left. Gasoline is carried in a 20-gallon steel tank under the front seat. Attractive body lines predominate in this model. They are an imitation of Napier curves, combined with Mors lines in the hood. The seats are made from bent wood, access to the rear seat being through a very wide side entrance.

A straight dash, carrying the coil, hand oiler and battery switch is used. Both of the operating levers on the right—the change speed and emergency brake levers—are nearly vertical in their normal position and, being close to the seat, do not obstruct the entire entering space at the right. The steering column is well inclined, rising from the footboard close to the dash, and is of the non-tiltable variety. On it are located the spark and throttle control levers. A neat effect is gained by using normal size fenders over the front and rear wheels. Metal running boards connect these. On the front of the right board is placed the battery box. A complete lamp and horn equipment is furnished.

In model 14 the two vertical cylinders have a 4½ and 4 inch bore and stroke, respectively, and a rating of 24 horsepower at normal crankshaft speed. The motor construction is practically the same as in model 15, but being proportionately smaller. This model has 92-inch wheel base, 32 by 3½-inch tires, and seating accommodation for five. In the planetary gear set roller bearings are used throughout. For control of the car the spark and throttle levers are on a quadrant on the steering wheel and the clutch can be thrown out by either the pedal or the change speed lever at the right of the car. Regular brakes are applied by pedal and emergencies by side lever.

In both models the water tank and radiator are combined. The radiator part is a series of flat tubes surrounded with copper fins. The combined capacity of the two is sufficient for 150 miles' travel on ordinary roads. The radiator is made with a heavy brass framework, taking the shape of the hood and having on top the usual filling cap. A simple tubing system to the pump and water jackets is used, regular cooling being followed.

Model fourteen has a body differing entirely from that of the large machine. It has the usual hood, with side inspection doors, covering the motor, and a flat tube radiator in front. The tonneau, seating five, is entered by wide side entrances, and can be detached, and a turtle deck substituted, giving a runabout effect. Bent wood is used entirely in making the seat parts; heavy upholstering is used, and green adopted as a standard color.

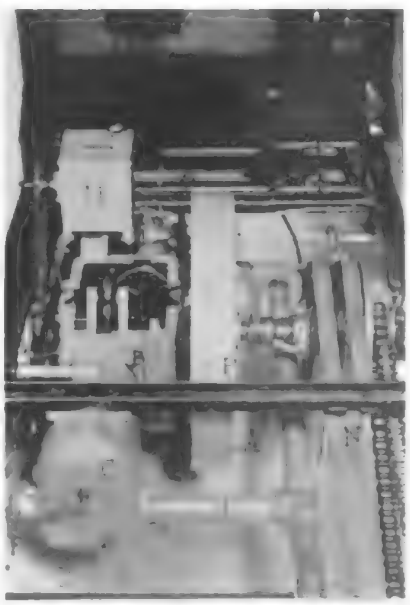
GALE TWO-CYLINDER TOURING CAR

GALE 18-HORSEPOWER, TWO-CYLINDER TOURING CAR

AN 18-horsepower touring car, with two-cylinder opposed motor carried lengthwise beneath the body, and drive through a two-speed and reverse planetary gear set and single chain, is the new machine built for the coming season by the Western Tool Works, of Galesburg, Ill. This company, after a year's experience in building its light runabout, has entered upon the construction of this larger model, with the hope of placing on the market a machine of ample power for four or five passengers and not weighing more than 1,800 pounds. Nothing radical in design or construction has been attempted, the maker preferring to include only tried features, giving practically nothing that has not been embodied in successful American machines during the present season. As in the runabout, accessibility has been sought and in doing this the body has been hinged at the rear and divided behind the footboard so it can be raised at the front to an angle of 45 degrees, thereby exposing the entire power plant of the vehicle and making it possible to effect repairs or replacements without crawling under the machine. In order that the body may be so hinged the fuel tank and battery box are carried beneath a large false hood in front, the horizontal tube radiator forming the front of the bonnet.

In building the main frame angle steel pieces have been used in the sides and ends. Two channel cross parts A midway of the ends carry the motor. In having the cylinders C take their support beneath these pieces the center of gravity of the machine is lowered and the body of the vehicle is left open for carrying baggage. The crankcase B is made box-like and has the ends bored for carrying the phosphor bronze crankshaft bearings, which have a diameter of 1¾ inches and are long. By leaving the top open, using a large readily removable inspection plate to cover it, accessibility to the inner parts is assured. Both sets of valves are mechanically operated and interchangeable, the inlets on the left being removable through inspection ports covered by the caps D and the exhausts on the right side are removable by taking out the caps E. By this disposition the float feed carburetor can be conveniently placed beneath the footboard at the left. It connects through a Y system of piping, necessitating the mixture to each pair of cylinders traveling the same distance. The exhaust piping H is carried outward direct from the motor and connects with a longitudinal pipe K to the muffler, carried crosswise at the rear, the pipes thus lying between flywheel and gearcase and supported midway of their length by a bracket from the cross piece A. In actuating the valves regular push rods lying along the under side of the cylinders are used. The valves are made with integral heads and stems, the former beveled to 45 degrees. Instead of rollers on the ends of the push rods, large curved integral feet are used, the curves on the feet being determined by testing. The use of these feet lessens the number of parts used in the valve scheme and, the maker claims, gives as easy action and long life. The pistons carry three compression rings, each with lap joints. Each ring is ⅜-inch wide and 5-32-inch thick. I-section steel connecting rods carry bronze bushings, those at the crankshaft end being split diagonally and held by screw studs and pins. The crankshaft is a drop forging.



SUSPENSION OF THE GALE MOTOR

Lubrication is by a chain-driven Hill oiler M, supported on a bracket on the forward cylinder. It delivers oil directly to the crankpins by a feed pipe at each side, the crankshaft being drilled for this purpose. The oil is fed through the cheek of the crank directly to the pin and the excess thrown off is caught by oil pockets and oils the camshaft, bearings, gears and cams. A portion of the oil through the leads passes to the end bearings in the crankcase. Another oil lead connects with the end bearing to the right of the gearcase.

Ignition is by means of a double dash-pattern coil with current supplied from two sets of dry cells. The timer and secondary wires, which are of Immunity cable, are conducted back to the motor through a conduit L, which not only supports them, taking the strain off the plugs in the cylinder heads, but further protects the wires from oil and dirt and aids in preventing short circuits. Snap connections are used on the plugs. Imported spark plugs of standard ½-inch pipe thread are used.

Both cylinders are cooled from the same system, a single pump on the end of the crankshaft at the left maintaining the water circulation. The pump takes its supply from the radiator base and delivers it to the bottom side of the jackets. It exits at the top and passes directly to the radiator, which is of regulation design and consists of successive sets of horizontal tubes combined with a water tank.

Standard construction exists in the gear set, carried on the right end of the crankshaft, which has a third bearing in the right side of the frame. Perhaps the feature of the transmitting scheme is the placing of the chain sprocket at the outside of the gearcase and consequently the placing of the differential at the right end of the divided axle, a construction that greatly increases the clearance of the machine and places the driving strain on both the crankshaft and the axle close to the end bearings instead of in the center and remote from the bearings. The maker claims to be able to deliver more power to the axle because of this arrangement. The transmission case is made oil tight and the gears are packed in grease. For high speed, which is with direct drive, the cone P is thrust to the right through a bell crank connected with the change speed lever, not shown in the chassis illustration but seen in the view of the machine. This cone separates a set of levers pivoted on the end of the case and which operates direct, locking all gears so that the case revolves as a unit with all its gears idle on their shafts. For slow speeds and reverse two fiber-lined friction bands are brought into use. These bands, as shown in the chassis illustration, take their support at N on the frame cross piece and also through the operating connections

Digitized by Google

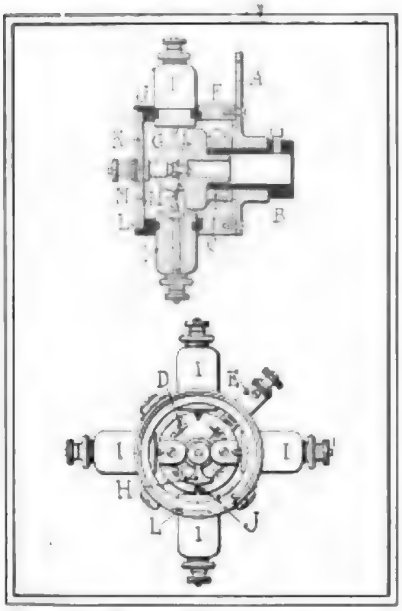
at the front. All gears within the case are made with coarse pitch and the set is designed on the three pinion principle. The operating lever for the forward speeds is so designed that the wear of the low speed band is taken up by a longer throw of the lever. By this method the driver is always sure of himself on a long hill by simply throwing the lever another notch. After excessive wear the speed band rod can be shortened and the lever brought back to its original position. The rear axle is strongly made with the drive shaft 1¾ inches in diameter and centrally bored from end to end, one oil cup thus lubricating the entire axle. Hyatt roller bearings are fitted and ½-inch ball end thrusts are used for removing any possible friction. Radius rods connect direct from the end of the crankshaft with the center of the axle and are fitted with a ball joint and turnbuckles for adjustment. The rear springs are provided with an adjustment so that when the chain is tightened the springs remain horizontal instead of having a tilt.

The body is of the side entrance type, with individual front and wide rear seats. Besides a regular vertical motor bonnet, for sheltering the ignition batteries and gasoline tank, there are such other parts as hollow metal dash and large fenders connected with metal running board. The tires are 30 by 3½ inches. The color is imperial blue, with light yellow running gear. Equipment includes 6-inch Mangin mirror reflector headlights and generator.

MOSLER'S IGNITION DEVICE

A. R. Mosler, 1679 Broadway, New York city, has as one of his specialties for the coming season a combined ignition outfit in which is carried all parts of the electric system except the batteries, spark plugs and the five wires used in the outfit. On the automobile dash is carried a glass box made with a brass frame work and hinged door, the latter secured with Yale lock. Through the door of the box the entire mechanism, consisting of the coil, a primary interrupter and secondary distributer, can be seen at all times and should adjustments be needed it is only necessary to open the door, when the entire unit can be examined. In advancing or retarding the spark the high tension wires to the plugs are not moved, the wire terminals being in sectors bearing directly against the terminal in the distributer and the sectors are of sufficient length to permit advancing or retarding without the terminals passing beyond the sector ends.

The wire from the batteries connects with a binding post B on the left end of the glass case, the wire connecting through this with the primary winding of the coil B. The other end of this winding connects through the contact D, so that the current passes to a fixed sector E on the back panel of the case and from this sector through the brush post F to the four segments of the primary interrupter. From these it goes to the grounded shaft and returns through the car frame to the battery, thus completing the primary circuit. The secondary or high tension winding of the coil has one terminal grounded through this same post and the other connects with a brass strip L which has its

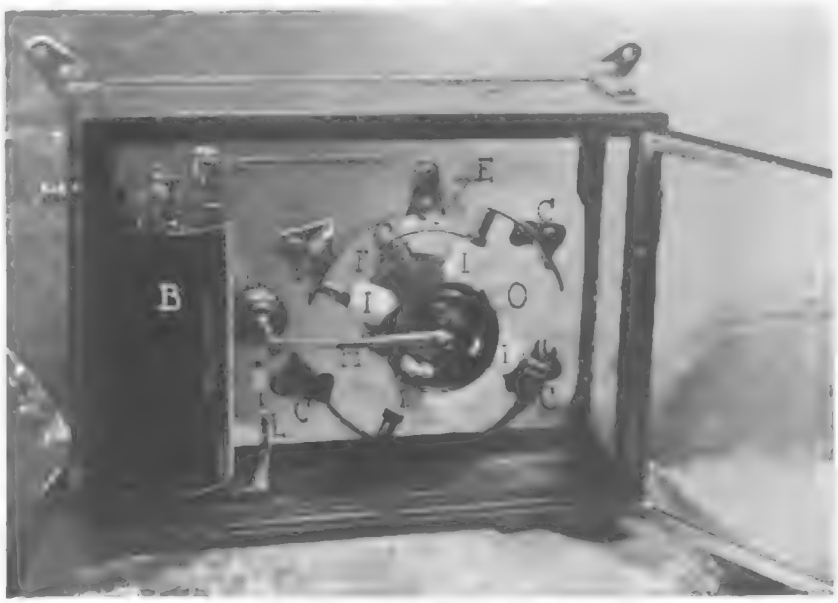


TWO VIEWS OF THE MOSLER DISTRIBUTER

upper end supported by a hard rubber bracket K on the back panel of the case. From this bracket a movable flexible arm H carries the current to the central terminal O of the high tension distributer. This arm hinged at the end connecting with the bracket K can be swung around its pivot away from the center of the distributer, so that with the case locked and the arm H away from the distributer it is impossible to start the motor. The course of the high tension circuit after reaching the distributer center O is through revolving ball contact with the rotating T-shaped brush. The four high tension terminals are within the insulations I and at their outer ends bear directly on the four segments C, which are secured to the rear of the case and to these are attached the four wires to the plugs, the high tension wires being connected in brass bending posts.

Construction of the primary interrupter and secondary distributer can be best understood from the sectional illustrations, showing the regular Mosler interrupter and distributer, identical with the one used in the glass ignition box. In the side section the hollow shaft B is intended to fasten to the end of the shaft, which is to drive the commutator, set screws being furnished to fasten it in place. To this sleeve is journaled a plate A, which aids in supporting some of the parts. To the inner end of the sleeve B is attached the hard fiber insulating collar C. In the outer surfaces of this collar is embedded the four equally separated contact pieces D, shown in dotted lines in the plan view. These blocks are grounded to the frame of the machine through the small screws which hold them in position. Upon these revolving parts bears a carbon brush E, fastened in the electrode ring F, which is in turn carried on the part A. The secondary distributer is well insulated from the primary parts through a porcelain insulating block G secured to the end of the shaft B, revolving of course when it revolves. This insulation G carries a contact piece H with a segmental end as can be seen in the plain section of the device. The high tension wires to the spark plugs connect with the terminals I and instead of the brush H contacting with these it passes very close to the small point within them and the spark bridges the gap.

The secondary distributor is easily detachable from the primary part. The electrode ring piece F is so constructed that by pins and spring catches the part or ring J carrying a separate glass front for the secondary part can be readily detached. In holding the rings parts F and J together one is made with a pin entering a hole in the other and a pair of flat springs on the ring F have openings at their outer ends so that when the parts J and F are together the springs engage pins with rounded heads in the part J and thus the two parts are linked together.



MOSLER IGNITION DEVICE AS IT APPEARS ON DASH

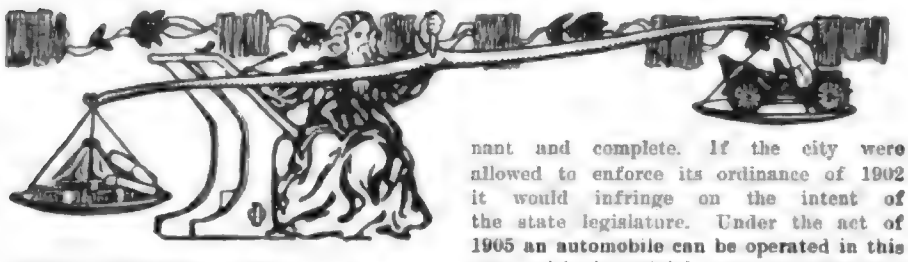
LEGAL LIGHTS AND SIDE LIGHTS



ARGUE QUAKER CASE

Every automobilist of note in Philadelphia—layman and tradesman alike—crowded into common pleas court No. 4 last Wednesday to listen to the arguments of counsel in the case of the Automobile Club of Philadelphia vs. the mayor and other officials of the city, in which the former asks for an injunction restraining the latter, on and after January 1 next, from enforcing the municipal laws governing the operation of motor-propelled vehicles in Philadelphia, the contention being that they conflict in many particulars with the new state laws and that automobilists cannot observe both. There was a learned array of counsel on both sides, with Judges Willson, Audenried and Carr on the bench. The latter, after hearing the arguments, announced that they would reserve their decision in the case until some time next week.

The ball was opened by Attorney Ira J. Williams for the automobile club, who said his clients were all tax-paying members of said club, and that the injunction was asked against the city authorities to save his clients from additional expense in purchasing tags bearing the city's license numbers for display on their cars. Mr. Williams argued that the ordinance of councils of 1902 providing for these license tags was abrogated by the later legislation contained in the act of assembly of 1905, which provided a state tax for motor cars operated within the confines of Pennsylvania.

One section of this act, Mr. Williams pointed out, sets forth "that not more than one state license number shall be carried upon the front and back of said vehicle while operated or used on any of the public streets or highways, * * * and a license number obtained in any other place or state shall be removed from said vehicle while the vehicle is being used within this commonwealth."

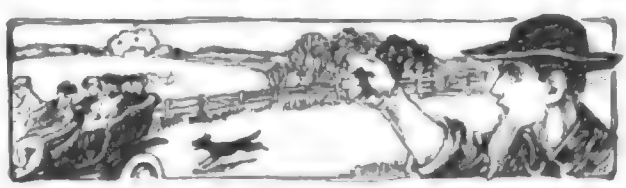
Attorney Williams contended that the purpose of the passage of this act was obviously to create a uniform method of licensing automobiles in Pennsylvania, and to dispense with the necessity of an automobile being decorated with a galaxy of numbers such as made Mark Twain exclaim, when he was struck by a motor car, "I heard it; I felt it; I smelt it—but all I saw was a mass of numbers." The municipal ordinance, said Mr. Williams, was inconsistent and repugnant to the new state law. The city, he said, is a creature of the state and its powers over the highways and the running of vehicles are limited. They must not conflict with any law of the commonwealth, which is absolute, dominant and complete. If the city were allowed to enforce its ordinance of 1902 it would infringe on the intent of the state legislature. Under the act of 1905 an automobile can be operated in this state with the official state tag displayed, and if it is stopped in any city or county for failure to display that city's or county's tag, the authorities of said city or county must show authority to compel the display of its license tag. This practice of compelling automobilists to decorate their cars with a series of tags issued by different cities and counties was a mongrel system, and if sanctioned by the honorable court would destroy the value of the license required by the state law.

Mr. Williams concluded by pointing out that the act of assembly of 1905 clearly showed the legislature's intent to regulate the licensing of automobiles with uniformity throughout the state, for the very purpose of avoiding multiplicity of licenses being required by motor vehicles driven through the various localities in the commonwealth.

On behalf of the city, Assistant City Solicitors Alcorn and Lowengrund appeared, the former doing the talking. He asked the judges to construe the act of 1905 and then say what effect it had, if any, upon the ordinance of 1902. He argued that the ordinance was not nullified by the act, and the city had a perfect right to continue with its enforcement. He further said the rights and powers of the city to regulate the running of vehicles on its highways had existed long prior to the passage of the act. The act of 1905 was not a prohibitory measure as to automobile licenses, but simply gave permission for the running of automobiles under a state license. This permission, he argued, did not deprive the city of the right to enforce its ordinance relative to the same licenses. This ordinance provided that a license was only to be issued by the bureau of boiler inspectors to a competent operator, and in this respect the ordinance differed from the act, which only requires an applicant for a license to give his name, residence and age. The city ordinance also provided for a thorough inspection of the automobile for which a license was sought. There was no doubt, said Mr. Alcorn, that the city had full power to pass the ordinance, as several acts of assembly specifically authorized councils to provide for the proper regulation of vehicles.

In concluding his argument Mr. Alcorn said: "The act of 1905 does not supersede or repeal the earlier ordinance within the limits of the city of Philadelphia. The inquiry remains whether those particular sections of the ordinance under which a license fee is required to be paid and a license tag to be shown, are in such necessary conflict with a somewhat similar provision of the new state law that they must be regarded as nullified thereby. If is reasonably clear that the terms of section 4 of the act do not of themselves apply to license tags required by the municipal regulations of cities within the state. The restrictive part of the act—'not more than one state license number shall be carried upon the front and back of the vehicle,' etc.—does not contain a word to show that license tags other than those furnished by foreign states are alluded to, unless significance can be given to the single word 'place,' but it would seem obvious from the context that the word is used in a substitutionary sense for the purpose of extending the meaning of 'state,' so as to embrace other places beyond the commonwealth which are not states, such as territories, the District of Columbia, foreign countries, and the like. The entire section is evidently intended to provide that the license number furnished by the state highway department shall be displayed upon tags at the front and rear of the vehicle, and no other state license number shall be shown; and that this requirement extends to automobiles coming from other states or other places temporarily into the state of Pennsylvania. There is thus no conflict between this section of the act and those portions of the ordinance of 1902 which make it obligatory to obtain a license within the city of Philadelphia, and to display the license number. To attach any other meaning to these provisions of section 4 of the act would be to interpret them most narrowly and in such a sense as conflicts absolutely with the context and meaning of the section as a whole. If it be said that the purpose of the act, and particularly of this section of it, is to require the displaying of only one license number, the answer is that no such purpose anywhere appears from the language used. Again, it is considered how easy it would have been for the law making power to have said in a few words that but one tag number should appear, and with the knowledge that must be imputed to the legislators of the municipal ordinances upon the subject in various portions of the commonwealth, each requiring that a license must be obtained and a license number shown, it is especially significant that no such intention existed. The purpose nowhere appears in the act of 1905 to prohibit the display of more than one number, and that purpose could not be imported into it by interpretation, it was argued.

The decision, it is expected, will be handed down before Christmas day. Meanwhile, both sides are confident, and both the city and state authorities are preparing to collect from the automobilist, despite his confidence, that one of them will be beaten. The city has ordered its tags and the state highway department has all its paraphernalia ready for the expected rush of



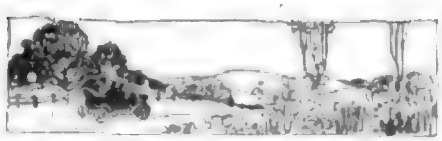
Digitized by Google

automobilists from all over the commonwealth after January 1 next. The highway department has already placed a batch of its applications in the hands of a local license broker, but pending the result of the legal battle he is not being overburdened with business.

The state highway department has solved the problem of getting the applications legally filled out by placing them in the hands of notary publics and license brokers in the various cities of the commonwealth, the latter, of course, asking an additional fee from the applicant. To save its members this added expense the Automobile Club of Philadelphia will have its secretary receive applications at the regular rate, $3.50.

MUST IDENTIFY DRIVER

One of the most important and interesting decisions affecting the rights of motorists that has ever been made by a criminal justice was handed down during the past week by Judge Gaskill, in the Middlesex superior criminal court, of Boston, on the appealed cases of Edward W. Taylor, of Concord, and Charles V. Smith, of Lincoln, charged with overspeeding automobiles in Concord. The evidence presented tended to show that at the time the machines owned by these men were caught exceeding the speed limit, neither of them was aboard and the cars were being driven by other than the owners. The decision of Judge Gaskill was to the effect that an owner of an automobile who is registered and has a license is not criminally liable



for overspeeding when he is not in the machine at the time of overspeeding and the chauffeur is controlling the car. He further ruled that in order to convict an owner of a machine for overspeeding the police officer must be able to identify him as being in the machine, and that it is not enough for the prosecution to prove that it was his machine that was overspeeding without knowing that he was controlling the same.

In the past it has been a common practice to convict the owner of a machine for overspeeding whether he was a passenger therein or not, and, what is more to the point, the great majority of convictions for overspeeding have been secured without the complaining official being forced to recognize the defendant as the man who was driving the machine at the time.

This decision of Judge Gaskill's will unquestionably form the basis of more than one appeal from the decisions of lower courts, owing to the established practice in more than one Boston court. This is considered as one step toward what has long been desired by motorists, namely, the identification by the prosecuting officer of the individual charged with overspeeding. More than one-half of the convictions have been secured without such identification, and in several instances that might be cited innocent persons have been found guilty. This was so in the case of W. C. Temple, who was convicted in Worcester for overspeeding in Leicester. As a matter of fact, the car was then operated by Mr. Temple's chauffeur, as it always is. Had he been a resident of the state he would have appealed from the fine levied upon him and fought the case to a finish, but being a resident of the west the easiest way out was the best for him and so he settled.

Judge Gaskill made another decision pending the settlement of the question, brought by Roland F. Sherman to the supreme court. The judge found Harry Fosdick guilty of overspeeding in Concord and fined him $10, but suspended the fine pending the decision. The evidence in the case which is now before the supreme court is exactly the same as in this instance, the defendant contending that although a passenger in the car he was not operating the same at the time of the arrest, and that on a point of law he cannot be convicted of a misdemeanor actually committed by another, even though he, the owner, may be a passenger in the car. For all this fight the motorists of Massachusetts are making for what they regard their rights the Bay State Automobile Association is being given the credit. Its efforts to clear the legal atmosphere and secure for its members a chance to win their cases in the courts have met with great success so far. The association will not rest content with these honors, however, but will take up other motoring cases.

THE INTERNATIONAL EXCHANGE

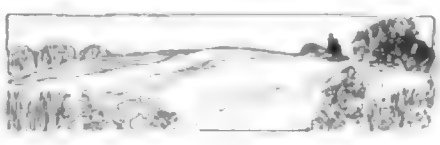
A special trade commissioner of the federal government who is now traveling in the orient has just forwarded some interesting details on the introduction and sale of automobiles in China. The trade to this time has not been very extensive, but it is likely to become so. The American cars seem to be firmly established by reason of their superiority. Some good advice is furnished manufacturers with regard to packing and shipping their machines.

China presents a steadily increasing market for automobiles, and the sale of cars of American make has kept pace with the demand. While the purchase of cars to this time has been confined almost exclusively to the foreigners of Shanghai, the wealthier Chinese now regard this mode of travel with especial favor; and as they are well able to afford the luxury it is safe to assume that the demand will soon extend to them. Chinese chauffeurs are the rule rather than the exception in Shanghai, and this familiarity of the natives with the running of the car, its speed, comfort and utility is assisting materially in influencing the Chinese in its favor. The roads in and around Shanghai are macadamized and kept in excellent condition by the municipal authorities, money is abundant, and conditions are generally favorable to the extension of the automobile business.

In 1900, six or eight steam cars were imported from the United States, but none of them was sold. In 1902 three Oldsmobile runabouts were imported and disposed of, and the next year two French gasoline cars were brought over. The cars were de Dion runabouts. A marked increase in the number of cars imported was noticeable in 1904 and 1905, while there has been a greater demand for higher-power cars. Several cars of from 10 to 20 horsepower have been sold and have given good satisfaction.

Close attention should be paid to the details of the shipment. No car should leave the United States unless its equipment is complete. This caution becomes all the more important because several instances are cited where a car has arrived in Shanghai and when unpacked discovery was made that the starting crank or some other essential part had been forgotten. This kind of carelessness occasions a long, unnecessary delay and natural irritation on the part of the purchaser.

Freight rates on automobiles are high, both by San Francisco and the Suez canal, and while it may be difficult to procure any reduction because of the comparatively limited number exported to the Orient, it is suggested that some action be taken, in the interest of the Chinese trade, looking to cheaper transportation.



The foregoing recommendations were made by men in Shanghai who have carefully studied the situation, and who believe that if they were faithfully followed a decided improvement in the business would result. The American method of packing automobiles is commended in Shanghai and is regarded as superior to that of any other country. Although the freight rates on automobiles from the United States to Shanghai are regarded as too high by the dealers there, yet they compare favorably with those from other countries. Insurance rates, however, are slightly higher. The freight and insurance charges on a car laid down in Shanghai amount approximately to $50 gold. The warehouse charges there are the same to all countries exporting automobiles to Shanghai, and are comparatively unimportant, as the cars are usually removed immediately on arrival. A customs duty of 5 per cent on the invoice valuation of the car, including freight and insurance to Shanghai, is collected.

In Shanghai there are now established two garages, and a third is soon to be erected. There is also a club known as the Automobile Club of China, which was organized in May, 1905, and already has a membership of twenty-two.

The New York Export & Import Co. and a French firm are the only business houses in Shanghai dealing in automobiles, but both regard the outlook for trade in this particular line as bright.

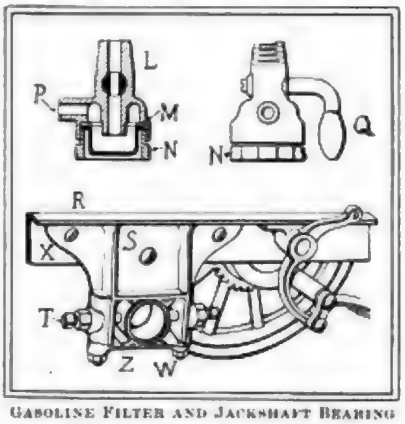
Digitized by Google

is a vulcanized fiber, which serves as an insulator for the device. The camshaft is inserted in the opening B and the connections for swinging the device in advancing and retarding is coupled at the opening F. Current enters through a wire attached to the one binding post E, and this post on the other side of the fiber part A connects with a spring C one end made fast to E and the other end resting on the pin G. The camshaft has two toes which bear upon the portion of the spring which is slightly curved and located adjacent to the camshaft opening B. The contact of the cam toes with the spring is positive as a screw D on the opposite side of the spring serves to hold the spring within touching distance of the cam toes. This screw, as shown, has the head cut away on one side, so that by giving it a quarter turn the spring C can be easily removed. As the camshaft carries two cam toes set at 180 degrees, two contacts and consequently two sparks are given for every revolution of the camshaft and each cylinder receives double the number of sparks necessary.

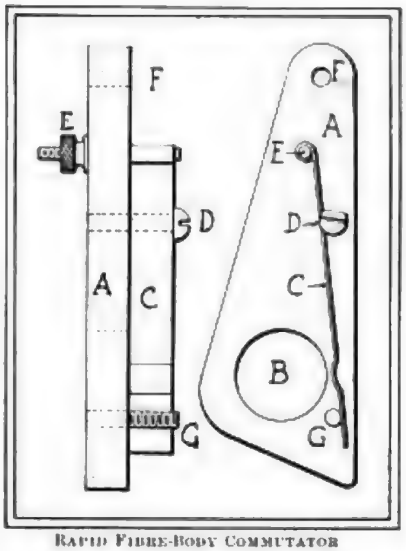
Mixture is supplied from a regulation float feed carbureter, supplied with gasoline, by gravity flow from a tank carried near the rear of the chassis. In the base of the tank is placed a special Rapid filter of which a sectional illustration is shown. Gasoline enters the top of the filter from the tank through and passing the stop cock L enters a cup-like basin N in the bottom of the strainer, supported by a screw seating holding the cup portion in position. In passing to the carbureter the liquid passes out by the passage P which is higher than the top of the cup and before reaching this passage has to pass a wire screen M.

Changes in speed are made through a two-speed and reverse planetary gear set carried on a continuation of the motor-shaft at the right, the motor fly wheel and sprocket for chain drive to the jackshaft being carried between the motor and gear set. The gear design is standard throughout, giving direct drive on the high speed and making use of two steel fiber-lined friction bands for the slow speed and reverse. These bands are so supported that when not in use they are held free of the drums by spring supports. Speed reductions are from a ten-tooth sprocket on the sleeve on the crankshaft to a thirty-tooth sprocket on the jackshaft and from sprockets with fourteen teeth on the ends of this shaft to others with thirty teeth on the rear hubs, giving one revolution of the rear wheels to every 6.42 revolutions of the sprocket on the transmission.

The jackshaft is carried close to the rear of the motor and carries the enclosed balance gear. Both bearings of the shaft are made with the object of ready adjustment of the shaft or quick removal. Manganese brackets S are riveted to the side angles of the main frame, each reinforced by vertical and horizontal webs across the bracket surface. The bottom portion of the bracket in the form of a hollow square carries a bearing cage W, which is held in place by the bottom part Z of the bracket, held in position by a pair of vertical screws. The bottom is reinforced by a central web. The bearing journals are slidable horizontally, there being set screws T at either side and locknuts for moving the cages to the front or rear for chain adjustment. Not the least important point about this method of jackshaft suspension is that the shaft can be dismounted without taking one of the drive chains apart. By removing the bracket caps Z the shaft and its parts can be lowered to the ground. Timken roller bearings are used.



GASOLINE FILTER AND JACKSHAFT BEARING



RAPID FIBRE-BODY COMMUTATOR

Steering through a 14-inch hand wheel on the top of a slightly inclined column is the same as in most commercial vehicles, but the use of a pinion and internal sector steering gear is construction not widely practised. The column A carrying the hand wheel has keyed and pinned on its lower end the twelve-tooth pinion B which meshes with the internal sector C. This sector is itself carried on a steel shaft D, to which it is keyed and taper pinned and on the lower end of this shaft is similarly secured the steering arm E, which has a 7-inch radius. A bronze housing encloses the pinion and sector, the housing being in two parts, an upper and lower one, the former F secured to the latter G through a set of screws so that the top one can be quickly removed for examining the gears.

COMMERCIAL STEPPING STONES

PARSON'S 25-HORSEPOWER FRICTION DRIVE TRUCK

Hoosier Talk—There is talk of an interurban automobile line in Carroll county, Ind. The proposed route is through Burlington, Flora, Camden, Rockfield, Yeoman and other places. The object of the route is the offering of better transportation to and from Delphi.

In Maryland—The railway between Frederick and Thurmont, Md., which the Washington, Frederick & Gettysburg Railway Co. proposes to build, was originally intended to be an electric, but it is probable it will be the first railway in Maryland on which gasoline motor cars will be used. D. Columbus Kemp is the president of the company.

Fire Engine Auxiliary—A new role for the automobile truck is the carrying of coal for fire engines. This unique work has been instituted in Hartford, Conn., by the Knox agent who has had in the service of the fire department a regular Knox machine. During the past month it has been in service it has never missed a run and the fire chief has been well pleased with it.

Even In Cuba—An order for three twenty-eight passenger buses and one six-passenger touring car has been placed with the Knox Automobile Co., of Springfield, Mass., by the West Indies Transportation Co., of Havana, Cuba. This company has at present in its service eight Knox cars which have been in constant use for the past year. The present order will make a total of twelve machines in its employ.

An Express Wagon—A Knox commercial express wagon used by the Bethlehem Silk Mills, Bethlehem, Pa., which was placed in commission in February, 1904, has for the first time since its installation been placed in the repair shop for a coating of paint and other adjustments. The machine does heavy work. Formerly two two-horse teams were employed by the mills in unloading freight and taking it to and from the depots, but the Knox supplanted both of them. Between February 1, 1904, and July 1, 1905, almost 1½ years' constant service, the actual period covered being 17 months, the mileage made was 5,122. The cost per mile of lubricants, fuel, etc., was .0029; gasoline, .0448; license, insurance, etc., .0136, a total mile cost of .0874.

In Texas—The automobile service for passengers between San Angelo and Sonora, Tex., has been installed by the Southwestern Transit Co. Endeavors will be made to secure the mail contract, and a regular passenger service will also be operated in the former city.

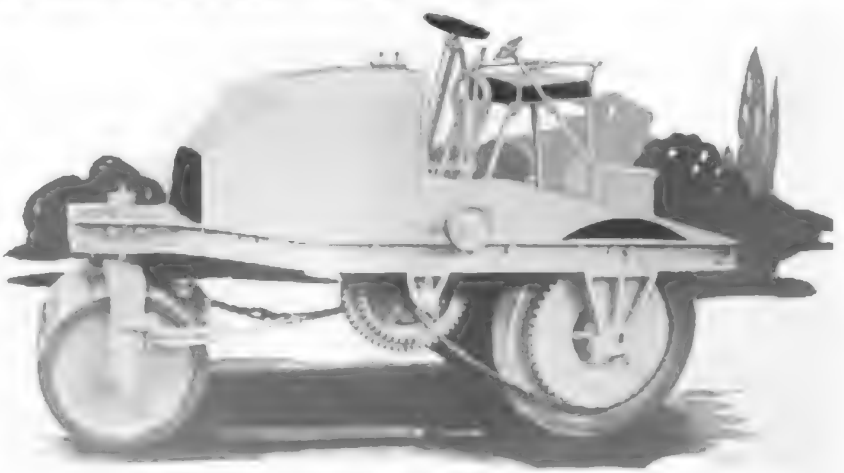
New Plant—The Torbensen Motor Car Co., of Bloomfield, N. J., announces it has purchased property in that place and is fitting it up for the manufacture of motor trucks. The property consists of a two-story brick building 50 by 60 feet and a similar building 30 by 75 feet.

Edge's Latest—The Regent is the name of a new 12-horsepower motor delivery wagon manufactured by S. F. Edge, London. This is the first commercial wagon manufactured by the company and the machine from tests already made is looked upon as a success. Power is supplied by 12-horsepower two-cylinder vertical motor, carried beneath a standard shaped bonnet in front. Front wheels have a diameter of 30 inches with 4½-inch tires, and the rear ones are 3 inches greater. The carrying platform of the car has an area of 64 square feet and the wheel base is 11 feet 6 inches in length. The gear box gives four forward speeds ranging from 3 to 8 miles per hour. Drive is by double side chain. The machine has a carrying capacity of 2½ tons.

A Kansas Product—The Parsons Auto Street Car Co., Parsons, Kan., is building a line of 25-horsepower friction drive trucks as shown in one of the illustrations. This machine is capable of making 12 miles an hour on ordinary city streets with full load. The concern is making other strides in the motor industry, having in operation in Kansas several passenger buses which run on regular schedule, taking the place of street cars. These buses carry five to twelve passengers and are fitted with lower-powered motors than the trucks. The motors are placed horizontally beneath the load platform.

Evidently Not a Jay—Elmer M. Cooper, a farmer enthusiast of the motor car living near Cadiz, Ind., uses a steam engine around his farm for grinding grain for his fellow farmers. Recently when everything was going along merrily the engine broke down and disappointment stared the visiting farmers in the face. Undismayed, the farmer motorist ran his automobile out of its shed and driving up to the barn where the corn-grinding was taking place, he jacked the rear wheels up and, coupling the motor car engine to the grinder, used it until the day's work was done. The motor of the automobile did the work well and was in continuous use until the steam engine was repaired.

Gasoline Roller—A novelty that is going the rounds in European commercial motor circles is a gasoline land roller suitable for market garden use or for regular farm purposes when built in large sizes. A vertical motor is carried on a steel frame work, to which is attached in front and rear a long roller equal in length to the width of the machine. The front roller is pivoted and connected up to a steering wheel and serves in guiding the machine. Drive is through a partly enclosed gear set and double side chains to the ends of the rear roller. All controlling means are grouped around the operator, who sits on a small seat above the rear roller.



GASOLINE LAND ROLLER FOR AGRICULTURAL USES

FROM THE FOUR WINDS

HOME-MADE 1-BOYPOWER RACING MACHINE SEEN AT ORMOND, FLA.

Farmers Interested—At the 2 days' meeting of the Lucas County Farmers' Institute, at Sylvania, O., last week, a good roads program was an entertaining feature of the event.

Judge All Right—Judge Porter, of Newcastle, Pa., has called the township road supervisors and constables before him and directed them to hold a good roads convention there this winter, when competent engineers will be secured to show them how to make good roads.

Air Ships May Race—Toledo may be the scene of a race for airships during the coming season. A. Roy Knabenshue, of Toledo, and Lincoln Beachey, of the Pacific coast, have both come under the management of Charles J. Strobel, the former baseball magnate, who is now busy arranging dates for the two aeronauts for the coming season. Beachey declares he is willing to make an aerial sprint with Knabenshue.

Many Want State Aid—It is announced from Harrisburg, Pa., no new applications for state aid in road building can be accepted for 6 months. Applications are in excess of the power of the highways department to investigate, and of the fund at its disposal. This is a marked change from the report a year ago when applications were few. There has been an awakening of interest in the meantime that augurs a transformation of Pennsylvania highways.

Chauffeurs Organize—A new organization has been formed in San Francisco, known as the Chauffeurs' Association of Northern California, and it already includes nearly all the chauffeurs in the western metropolis, besides many country drivers. The association has adopted strict rules in regard to speeding and has cautioned its members to respect all laws regarding driving so that they may not conflict with the authorities. The association proposes to act summarily with offenders against these regulations and it will go hard with a driver who is seeking employment to have his name in bad standing with the Chauffeurs' association.

Florida Boymobiles—Even the kids at Ormond, Fla., have the racing fever and home-made machines are seen in impromptu speed contests. The motive power comes from another small boy behind who pushes.

Not Raffles After All.—It has developed that the mysterious automobile, which was supposed to be the medium by which the famous York road Raffles journeyed around suburban Philadelphia, is nothing more alarming than the innocent conveyance employed by several out-of-town young men who are regularly detained in the city beyond train time—sitting up with a sick friend.

Talk Club in Toledo—Another automobile club is expected to be formed by owners at Toledo. It has been 3 years since the Toledo Automobile Club died. It's dead now. The club, if formed, will be an entirely new organization, a brand new one, with all the new owners of machines as members and as many of the old club men as desire to join. A. L. Spitzer and F. H. Dodge and other prominent enthusiasts are interested in the formation of the club.

Insists on Signboards—Judge J. D. Shafer, in the quarter sessions court of Pittsburg, has taken up the matter of placing signboards alongside highways throughout the county. When the constables were present the judge lined them up before him and instructed them in the future to report any violation of the law by the borough commissioners and township supervisors. The act of 1836 requires that supervisors shall cause signboards to be erected at the intersections of all public roads, the index hands pointing to the direction of such roads, and on which shall be inscribed in large and legible characters the name of the town or city to which such road may lead. If any supervisor shall fail to do this he shall forfeit $10. The court said that all such violations should be reported in the future. He mentioned that there are but few of these signs left in Allegheny county, which is a great hardship to travelers. The Pittsburg consulate of the American Motor League is credited with calling attention to this matter.

Will Cut Speed Limit—The commissioners of the District of Columbia are considering the advisability of amending the police regulations reducing the speed of automobiles and other vehicles from 12 miles an hour to 4 miles an hour when approaching transfer points and other places where travel is congested, particularly in front of the theaters.

Dedicates New Quarters—The Bay State Automobile Association dedicated its new quarters at the Auburndale Casino on Thursday evening of last week by holding of a gigantic smoker. The quarters are situated within 7 miles of Boston, along the beaten path of motorists, and are located on an eminence overlooking quite a territory. Here are to be found a comfortable cafe, private committee and officers' rooms, a large pool and billiard room and bowling alleys.

Accessory Show—Secretary A. M. Andrews of the proposed automobile parts, appliances and accessories exhibition, states that he proposes to hold the show in the First Regiment armory, Chicago, September 22-29 inclusive. There are 15,000 feet of available space, divided into 120 spaces of different sizes. Application has been made to Motor and Accessories Manufacturers' Association for a sanction. Secretary Andrews is located at 184 La Salle street, Chicago.

To Pick Up Glass—Acting upon a suggestion of the Automobile Club of Washington, the superintendent of the street cleaning department of the national capital has arranged to care for the removal of broken glass from the streets by sending out special messengers to collect the dangerous substances as soon as notification is received. So many automobile tires have recently been cut by broken glass in the streets that the club decided to secure the aid of the municipal authorities.

After State Dough—Samuel Huston, highway commissioner of Ohio, in his annual report to the governor, which was filed on the 14th of the month, asked the state for $150,000 as state aid in good road construction for 1906 and $200,000 for 1907. He recommends that the assistant commissioner, an office that has never been filled, be increased from $300 to $1,800, as the person filling that office must be experienced in road making and have a knowledge of geology, besides being a civil engineer.

Bay State Progress—The runs and tours committee of the Bay State Automobile Association is considering the advisability of holding a 1-day endurance or economy contest. This contest is to be held when the snow is on the ground and will be used as the means of developing the best snow-plowing machine owned by the club members. The scheme is to hold a run from Boston to Worcester or Providence and return and to award a silver trophy to the owner making the best showing for the entire distance.

AMONG MAKERS and DEALERS

NEW AND PRETENTIOUS DECAUVILLE AGENCY AND GARAGE IN NEW YORK

Is a Veteran—George Bennett, sales manager of T. B. Jeffery & Co., will complete his twentieth year of service under Mr. Jeffery on January 19.

Lands a Plant—The board of trade of Bradford, Pa., has induced the Amazon Rubber Co. to locate there. The concern manufactures automobile, bicycle and carriage tires and employs over 200 men.

Berkshire in Chicago—The Berkshire Automobile Co., of Pittsfield, Mass., will open a Chicago branch, having rented the present quarters of the Ford branch at 1413 Michigan avenue. The company will take possession of the place when the Ford people move into their new building—along the latter end of January.

Switch in Owners—Edward Inman and Joe Brown Connally have bought the interests of J. H. Nunnally, Ernest Woodruff and Will Kiser in the Atlanta Automobile Co. and have combined it with the White Motor Co. The name of the Atlanta Automobile Co. will be used and the concern will handle the White, Cadillac and Franklin.

Durphy a Systematizer—W. H. Durphy, manager of the Chicago branch of the Electric Vehicle Co., has written owners asking them to support him in his effort to clean out grafting among the chauffeurs. Durphy wants to establish a system in the Columbia garage requiring chauffeurs to register their comings and goings and to inform owners of the amounts of their supplies and repair bills.

Tire Suit—Charles Blake Cisco, assignee of the rights of the New York-Broadway Tire Co., has brought action in New York against the Goodyear Tire & Rubber Co. to recover $150,000 damages, alleging breach of contract. Judge Smith has issued a warrant of attachment against all the property of the Goodyear company in the state of New York. The New York-Broadway people claim they had a contract with the Goodyear company for tires for 2 years at a price that would allow them to undersell their competitors. Just as they were about to enter into a contract to supply a western maker with 11,000 sets of tires, they say they were notified that the contract had been abrogated.

Moline Deal—George E. Robertson has closed with the Automobile Exchange & Storage Co. for the agency for Moline cars for New Jersey, New York and Connecticut.

Cramer Leader—J. A. Cramer has been elected president of the Buffalo Automobile Trade Dealers' Association, with W. C. Jaynes vice president, Dai H. Lewis secretary, John J. Gibson treasurer and P. W. Eigner, E. C. Bull and N. P. Baker directors.

Tire Changes—The Hartford Rubber Works Co. has so changed its rims for 1906 that all standard makes of clincher tires will fit it. This is accomplished by having the rim edges or beads with a straight wall on one side and grooved on the other so that should a driver want to substitute a clincher tire for the Hartford Dunlop, it is merely necessary to reverse the beads. Both the Hartford clincher and Hartford Dunlop will be of the open-cure, wrapped-tread variety, but instead of vulcanizing the parts separately and then giving them one final cure, the whole tire will be vulcanized at one operation. In addition to this the tires are made and cured in the same shape the tire assumes when in service. This relieves the tension on the fabric and offsets any tendency it may have to split. No lugs will be employed to hold the Hartford Dunlop 1906 style of tire in place, but instead a light endless metal band or floating ring will be inserted between the tube and the edges of the tire. Should it be necessary for any cause to ride a tire flat, this band rests lightly on the inner edges of the tire and prevents creeping. This floating ring has another excellent feature in that it keeps moisture out of the tire. The special Sea Island cotton fabric incorporated in the tire will be considerably stronger than used in other years. A pure strip of Para rubber is placed next the outer layer of fabric, and before the rubber cover proper is applied a strip of fabric is incorporated which positively prevents what is known as shuffling or blistering.

Quaker Show Office.—C. I. Campbell, of Boston, who is to manage the local show in Philadelphia, will open offices in the Fidelity Trust building, on North Broad street, during the coming week.

Changes Name—The American Metal Wheel & Toy Co., of Toledo, O., has changed its name to the American Metal Wheel & Auto Co., and increased the capital stock from $100,000 to $150,000. The company manufactures a large number of toy automobiles for children.

Burke Moved to New York—W. W. Burke, who has been manager of the Boston branch of the Electric Vehicle Co., has been selected to replace Frank C. Armstrong as manager of the New York branch. Burke's successor in Boston has not yet been named.

Now Crouch & Co.—The firm of Alexander & Crouch of Chicago, manufacturers of of auto marine engines, reverse gears, propellers, etc.,. has been dissolved. Mr. Crouch, former partner and general manager of the firm, has made preparations to carry on the business on a much larger scale and in order to do so he has added a complete equipment of new machinery and tools, doubling his former capacity. The new firm will be known as Charles P. Crouch & Co., and is located at 472-484 Carroll avenue, Chicago.

Buffalo Deal—The Babcock Electric Carriage Co., just organized, has purchased the assets and good will of the Buffalo Electric Carriage Co. The capital has been increased and it is expected to turn out not less than 500 cars for 1906. Two or three new models will be added. The officers of the new company are: F. A. Babcock, president and general manager; F. L. Bapst, vice-president; E. R. Whitney, secretary and treasurer; directors, R. B. Adam, Harry Yates, Charles L. Williams, Samuel J. Dark, all of Buffalo.

No Delay—The Spicer Universal Joint Mfg. Co. states there will be no let-up in deliveries despite the fact it is moving into new quarters. Both the new and old factories will be operated until spring. With the new equipment it is expected that the capacity will be increased about 600 per cent, so that all orders can be cared for without it being necessary to work a night shift. More than half the new machines will be driven by individual electric motors and the entire factory will be driven electrically, either individual or in groups.

Eat Moose—The annual moose dinner of the Electric Vehicle Co.'s staff took place at Parsons' theater cafe in Hartford and was attended by forty of the officers, salesmen, foremen and factory managers. The dinner was declared to be of the "float feed ex-aspirating type." Drinks were labeled "76 test raw gasoline in fire balls or straight, three tremblers to man," and "Old Valvoline Brew in Kegs." The first edible was "Little Neck Cams, with Valve Push Rods on the side." Moose and venison were supposed to be "smothered in lock washers and Albany grease." There were shop hits and

Digitized by Google

the dinner was supposed to close with cigars labeled "Spitfires."

Metzger Out—W. E. Metzger, who has been one of Detroit's leading retail dealers in bicycles and automobiles for years, has given over the business to the Cadillac Automobile Co. of Detroit. Only the Cadillac and an electric vehicle will be handled. The company retains possession of the old premises on Jefferson avenue.

New Rubber Company—The Wright Rubber Co., capitalized at $1,000,000, has opened offices in the Blymer block at Mansfield, O. It proposes to erect a factory for the manufacture of artificial rubber. The inventor of the process is E. E. Wright, who claims that this artificial rubber can be vulcanized and that it will stand greater heat and cold without injury than the genuine article and that it can be produced in its crude state at one-tenth the cost of crude imported rubber. The company proposes to start with the manufacture of automobile and vehicle tires.

New Compound—The E. H. V. company will exhibit a new Compound model at the A. C. A. show, and at about the same time at the salesroom of its New York agents, Hatch & Co., 1655 Broadway. This rig will be a special combination car, with Victoria top, trimmed with leather or cloth, with front seat trimmed with leather or cloth, half Belgium pattern. This model will be known as Model K. It will be mounted on the regular 1906 Compound 12-15 horsepower chassis, and will be equipped with either double chain or shaft drive. Another new model to be known as Compound model 5, will be a light touring car, with non-detachable tonneau, seating five people, and installed upon the same chassis as the model H.

Pope Truck in Test—The Pope Mfg. Co.'s gasoline truck designed by Herbert W. Alden has been completed and the model is now on the road in a process of testing out.

Will Carry Commercial Line—The Weed Garage, of Toledo, O., has decided to handle commercial vehicles during the coming season. This is the first concern to go into the commercial line in that city.

Maxwell Limousine—The Maxwell-Briscoe Motor Co. announces it will put on the market after January 1 a new limousine body car, using the model H touring car chassis. The body will be finished in solid mahogany, with French plate glass trimmings.

Breaks into Chicago—The Hamilton Automobile Co., representing the Smith & Mabley Automobile Co., of New York, has opened in Chicago, occupying the premises at 1337 Michigan avenue, with J. W. Hayden, representing the Prest-o-Lite company, and H. F. Branstetter, Chicago agent for the Queen.

Still in Embryo—The impression has been circulated among the motorists of San Francisco that a new organization, the Northern California Automobile Dealers' Association, was formed some weeks ago. Such, however, is not the case, for at present the aforementioned organization is still only in contemplation. Some of the dealers have held a few meetings at which the restrictions against motorists using the ferry boats was earnestly discussed and the proposition of forming an association of the principal automobile dealers in the northern part of the state was broached, yet nothing further has been done in the affair.

Going in Style—R. E. Olds, president of the Reo Motor Car Co., has completed arrangements with the Seaboard Air Line for transportation to the Florida races for himself and a considerable party.

Decauville's New Home—The Decauville Automobile Co., of New York, successor to the Standard Automobile Co., took possession of its new building at Broadway and Fifty-sixth street this week. Here will be handled not only the Decauville and Franklin cars, imported accessories and supplies, and Gaulois tires but it has also taken the New York agency of the C. G. V. and the English Daimler. Other lines will be taken on later. The building is 50 by 60 feet and only three stories have been erected at the present time in order to get into the place as soon as possible. The garage is directly in the rear of the office building.

Indian Wigwam—The Hendee Mfg. Co.'s new motor cycle factory at Springfield, Mass., has been dubbed the Indian wigwam. It is of brick construction, four stories high, 150 feet long and 50 wide. On the first floor is the motor cycle and frame building and finishing department, metal department for tri-car seats and vans, tank and brazing departments, blacksmith shop, nickeling department and receiving and shipping rooms. The offices, machinery department and tool room are on the second floor. On the third floor are the carbureter, wheel-truing, assembling, testing-out and repair departments and stock room, while on the fourth are the enameling and upholstering departments.

THE READERS' CLEARING HOUSE

SYNCHRONIZED IGNITION

Chicago—Editor MOTOR AGE—What is meant by synchronized ignition? From time to time I have noticed reference to it but have never been able to have a good definition of it and its use.—R. F. C.

Synchronized ignition is made by having but one trembler coil in the electrical circuit to act upon each cylinder at the proper time, rather than the multiple coil with primary and secondary windings and the contact-maker for each cylinder. The winding is sometimes greater in one coil than another, or the contact makers are not evenly adjusted, which causes the spark to become uneven. With but one trembler coil it is necessary to have a high tension distributer for the greater voltage in this circuit, so much greater that a slight difference of resistance has no effect upon the efficiency of the spark.

REPAIRING WORN CASINGS

Park River, N. D.—Editor MOTOR AGE—Do you think I can prolong the life of tires that have some weak places, caused by the rim pinching them when bumped against stones or other hard substances, by cementing heavy canvas on the inside of the casing? I thought of putting in three strips—one on each side, and then a wider one in the center to overlap on the side strips. I think they would fit the casing better put in that way. What is your idea of what effect would it have on the tube?—SUBSCRIBER.

It is invariably poor policy to put any reinforcement in the shoe of a tire, especially by one who is inexperienced in tire making. The least particle of any hard substance will cause puncture, even a hard lump of cement. As a matter of fact, the rim should not cut or injure the shoe if the inner tube is inflated to the proper pressure. Of course, the tire is supposed to act as a cushion for all ordinary obstacles with which it may come in contact, but it should be pumped up so that the indentation will not be more than approximately a fifth the thickness of the tire.

MISSING EXPLOSIONS

Baltimore, Md.—Editor MOTOR AGE—Kindly answer the following questions through the Readers' Clearing House: Is it necessary or advisable to have a vent hole in the top of gasoline tank so that air can escape? When running at a high rate of speed my 9-horsepower motor, having suction intake valve, misses explosions. Is this due to the carbureter or the spring on the valve? What can be done to stop the intake valve from snorting?—F. L. L.

It is necessary to have an air escapement in top of the gasoline tank. There are various things that will cause the motor to miss an explosion, due both to the valve spring and carbureter. Try the carbureter by giving it a little more gasoline. Try all adjustable parts first, as the trouble may be located, thus saving considerable work. Then if the motor does not fire regularly examine the inlet valve spring. It may not be heavy enough for the action required at high speed; oftentimes the spring becomes weak through constant exposure to high temperatures.

ADJUSTING CARBURETERS

Chicago—Editor MOTOR AGE—I have a new 5 by 5-inch opposed motor which I cannot get to fire correctly. I have a 1¼-inch Kingston carbureter and the intake pipes are equal in length. When one cylinder is adjusted for slow speed the other fires alternately, and vice versa; in other words, one cylinder requires a little more gasoline than the other, but when the spark is advanced and the throttle opened, the motor fires nicely. Do you know of anything I can do to make the motor fire evenly on slow speed?—Reader.

When a motor misses explosions on low speed it is invariably due to poor mixture. If the intake pipes are of equal length, the mixture at the carbureter must be the same for both cylinders. Therefore, adjust the air or gasoline until the explosions become regular with the motor running at slow speed, and the motor will fire regularly at high speed. Both air and gasoline may have to be regulated.

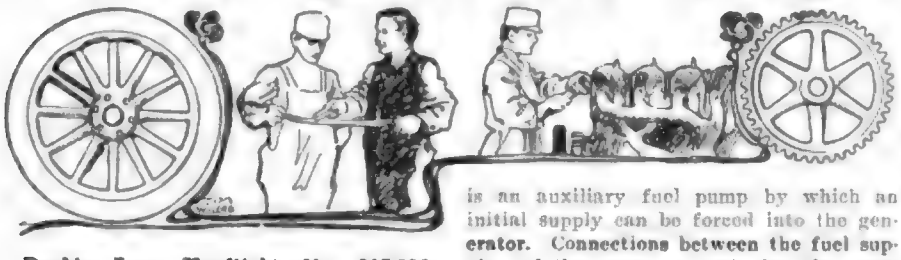
Current Automobile Patents

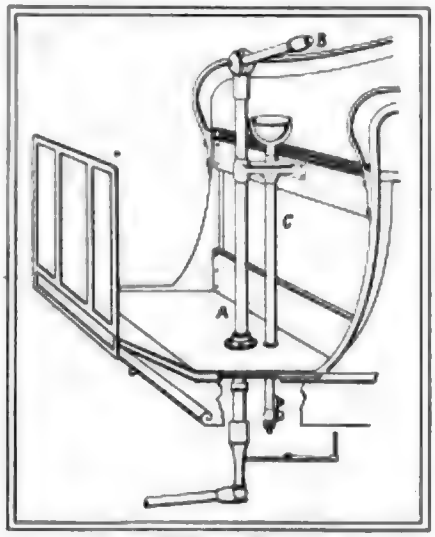


Double Lens Headlight—No. 807,296, dated December 12; to Nicholas Loewenstein, Philadelphia—The invention is a double lens automobile head or side light in which are combined two lens, the forward one A being cone-shaped and the other B, slightly to the back of it and much smaller in diameter, is in the form of a prolate spheroid. The reflecting surfaces of the two are practically continuities and in unbroken planes, the burner C of the lamp occupying the back part of the reflector and located entirely within it. In front of the reflector are several differential lens, one behind the other, the inner lens being supported by arms so that a comparatively unobstructed space exists in the casing around the periphery of the lens.

Combined Radius and Truss Rods—No. 806,798, dated December 12; to B. A. Gramm, Chillicothe, O.—In supporting the side pieces of his automobile frame the inventor makes use of an irregular block A beneath the center of each side piece of the frame and from the respective sides of this block extend a radius and a strut rod. The truss rods intended primarily for assisting the side pieces of the frame in carrying their load are connected to the bracket above the radius or strut rods, which connect the bracket with the front and rear axles. The strut rods serve only in taking axle strain off the springs, leaving the latter only to carry the weight of the machine and not to share the driving strain.

Steam Vehicle Control—No. 807,419, dated December 12; to Edward S. Clark, Boston—In controlling a steam automobile supplied with pressure from a flash boiler or generator the inventor uses a vertical steering post A with a horizontal lever B hinged to the top of it so that the lever can be swung upwards or form side to side of the post. A fuel supply controlling rod is placed parallel with the steering post and just back of the post is an auxiliary fuel pump by which an initial supply can be forced into the generator. Connections between the fuel supply and the pump are such that the pump and fuel rod are worked simultaneously by the pivotal movements of the steering lever.

Spring Throttle Valve—No. 807,144, dated December 12; to Benjamin F. Walker, Bridgeport, Conn.—The inventor's carbureter is conspicuous by having its

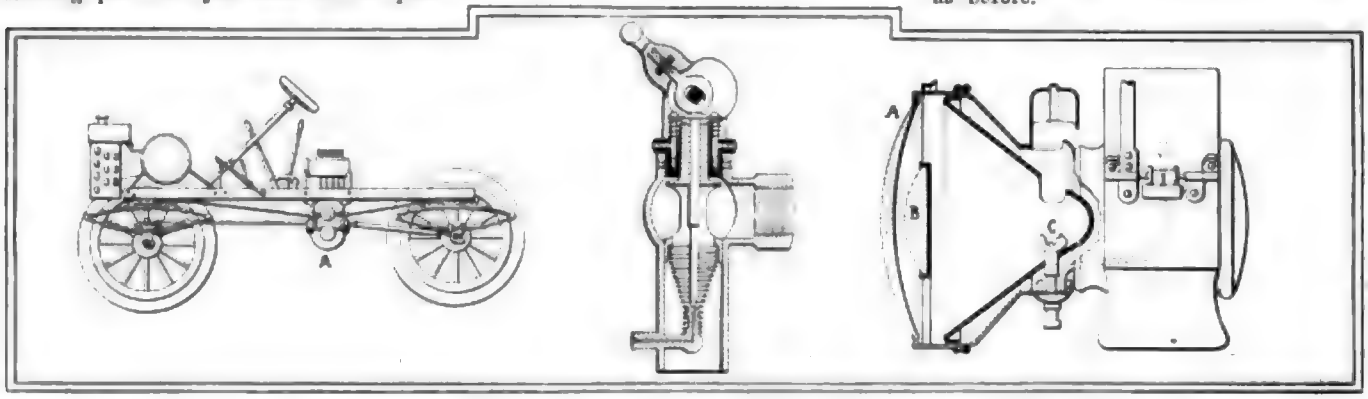


CLARK'S STEAM CONTROL

throttle in the form of a coil spring. The gasoline enters the base of the carbureter, the spraying nozzle being centrally located. Surrounding the nozzle are the smaller coils of a spring and as the air enters through the carbureter base it has to pass through the coils before it enters the mixing chamber and finally exits through a passage at the right of the motor. When the springs are depressed little air can pass through and when stretched, separating the coils, a free passage is offered. The compressing and stretching of the spring are accomplished by a cam action on the top of the device, a movement of the cam in one direction compressing the spring and in the opposite relaxing it, permitting it to come to its free and normal tension. In the top of the spraying nozzle is a depending check valve, which is also operated from the top of the carbureter. This check valve is raised and lowered by cam action and the two cam actions are so combined that a compressing of the coil spring is accompanied with a partial closing of the spraying nozzle, thereby limiting the gasoline supply and a liberating of the spring has the opposite result. In this way fuel flow is restricted on low and accelerated on high speeds.

Friction Drive—No. 804,421, dated November 14; to George W. Marble and William R. Donaldson, Chicago—This invention relates to a friction method of transmitting power from a gasoline engine to the front wheels of an automobile railroad wagon, the vehicle being specially intended for use on such roads. On the front axle near the center are opposing friction disks and between them is a friction wheel made slidable on the crankshaft from the motor, which is short and placed lengthwise on the car frame. The motor is pivoted so that the friction wheel can be moved to right or left to form a contact with one friction disk to drive the car ahead and to contact with the other for reversing. The motor pivoting is accomplished by a bracket fastened to a cross piece of the frame and at its other end forming a bearing for the entire top part of the cylinder, a similar bracket carrying the bottom part, both brackets take the form of large metal rings, with eye-holes for attaching to the motor.

Yieldable Gear—No. 804,778, dated November 14; to George W. Smith, Rockford, Ill.—In this invention two gears are shown in mesh, one of which is carried on a yieldable shaft. The hole in the gear for receiving the shaft is cone-shaped instead of having a flat surface, and the shaft is concaved, half of the concave being rigid with the shaft and the other part held to the gear by a coil spring. Should any obstacle such as a piece of iron get between the gears its pressure on the one with the yieldable bearing will cause one part to be pushed out against the action of the spring, thereby preventing gears being broken, and as soon as the obstruction passes through the gears the spring will force that part back in position, causing the gears to mesh closely as before.



GRAMM'S DOUBLE STRUT AND TRUSS ROD SCHEME — WALKER'S SPRING THROTTLE — LOEWENSTEIN'S DOUBLE LENS LAMP

BRIEF BUSINESS ANNOUNCEMENTS

Lincoln, Neb.—The Glide agency has again been taken by Shore & Beach.

Buffalo, N. Y.—J. A. Cramer, 737 Main street, will handle a line of sundries and will also do a jobbing business.

Waldwick, N. J.—M. Toole, of Undercliff, has had his garage completed at a cost of $1,200.

New York City—The American Automobile & Storage Co. has the agency for the Premier for New York and vicinity.

Chicago—C. H. Plumb, formerly of the Mead Cycle Co., has been appointed sales manager of the Holmes-Schmidt company.

Newark, N. Y.—An automobile factory is about to locate here. The industry is being undertaken by A. H. Morn, of Rochester.

Pittsburg, Pa.—The Liberty Automomobile Co. will enlarge its building as soon as it can secure the property it desires. Plans have already been made and contracts let.

Los Angeles, Cal.—The Reo branch will remove to its new building at 633 Grand avenue. The company is now located at 420-422 South Hill street, under the management of L. T. Shettler.

New York City—La Mott Hartshorn has been appointed receiver for the Interborough Vehicle Rubber Supply Co. on the application of two of its directors, who ask for a voluntary dissolution of the corporation.

Hartford, Conn.—The Remington Oil Engine Co., of Stamford, has filed a certificate of incorporation, with a capital stock of $100,000. The concern will manufacture and deal in oil and gas motors and engines and build and operate vessels, it is announced.

New York City—An automobile garage is to be opened at Broadway and Sixty-second street, which will be devoted entirely to the storing and repairing of cars. It is to be operated by the Alborak Auto Co. and will have accommodations for about 175 cars.

Boston, Mass.—Ralph F. Coburn, who has been connected with the Radcliffe Motor Co., has become identified with the Morrison-Tyler Co., and will handle the Maxwell for the latter concern. This firm is temporarily located on Scotia street, pending the completion of its building.

Indianapolis, Ind.—The Windsor Automobile Co., incorporated under the laws of South Dakota, with a capital stock of $250,000, has been given a permit to do business in Evansville. The total amount of the capital stock is held in Indiana and Willis M. Copeland is given as the Indiana agent.

Syracuse, N. Y.—Bacon, Chappel & Co., the dry goods merchants, have leased the Marshall building in North Salina street and will open a garage with H. D. Cranston, formerly with the R. M. Cornwall Co. as the manager. The company has taken the agency for the Rambler line and will have a display at the new store after December 20. Its territory includes the counties of Onondago, Madison, Oswego and Cortland.

Utica, N. Y.—The Utica Motor Co. has secured the agency for the Stevens-Duryea.

New York City—Repairs are under way at 1723 Broadway, which is to be the headquarters of the Ford company.

Los Angeles, Cal.—The Success Automobile Co. and Smith & Anthony, the Elmore agents, have been admitted to membership in the automobile association.

New York City—Hatch & Co., the New York agents for the E. H. V. Co., of Middletown, Conn., maker of Compound cars, are now established in their new headquarters at 1655 Broadway.

Philadelphia—F. W. Stockbridge, formerly manager of the Reo Motor Car Co.'s branch, has joined forces with the Foss & Hughes Co., representatives of the Pierce-Arrow.

Youngstown, O.—The Mahoney Motor Car Co., organized here about a year ago with a capital stock of $50,000, has announced that, owing to the demands of labor making it impossible for the company to manufacture automobiles, it will go out of business. The company controls a patent for an air-cooling motor.

Fargo, N. D.—Haug & Blake will continue to handle the Glide line in 1906.

Newark, N. J.—The Austin Automobile Co. has taken the local agency for the Ford car.

Boston, Mass.—C. H. Blaney is the new representative of the Corbin Company.

Middletown, Conn.—F. L. Caulkins will establish a garage here in a new building which will be put up for the purpose.

Sycamore, N. Y.—Richard E. Kolbe, of Syracuse who is fitting up a garage in East Water street has taken the agency for the Ford Line.

Boston, Mass.—The Fisk Rubber Co., maker of the Fisk automobile tire, will occupy the store on Columbus avenue recently vacated by the Oldsmobile company.

Davenport, Ia.—The Davenport Automobile Co., which will handle the Pope-Toledo and Northern cars during the coming season, has leased the building on Main street, formerly occupied by Bayliss & Eagal, and will move into the premises before the first of the year.

Los Angeles, Cal.—A new automobile distributing company, to be known as the Success Automobile Co., was recently organized by some of the leading men of the city. Mr. Sharks, general manager of the Winton branch, is one of the prime movers in the organization.

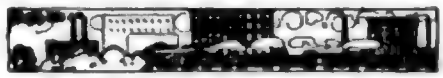
New York City—The latest in foreign cars to be brought here is the Zust, which is manufactured in Italy. The sole American agents are R. Beetelli & Co., who have temporarily located at 124 East Nineteenth street.

Bridgeport, Conn.—Arrangements have been made by the H. O. Canfield Co., manufacturer of molded rubber goods for mechanical purposes, for its removal from the present plant to the factory on Housatonic avenue, formerly occupied by the Nonpareil Cork Mfg. Co.

Milwaukee, Wis.—The Welch-Estberg Co., with a capital stock of $50,000, will open an automobile agency in the new three-story building at Grand avenue and Seventh street in the spring. It will handle commercial and pleasure automobiles and supplies of all kinds.

Springfield, O.—Clinton P. Grant has been appointed receiver of the Commercial Transit Co. on application of Joseph Lesner. This company was organized last summer to operate an automobile line between this city and Jamestown. It had a capital stock of $10,000, and the cars were furnished by a Detroit firm.

New York City—The Napier Motor Car Co. will occupy its original location at Fiftieth street and Broadway in the near future. O. B. Cole, of the Napier company, has been here for several days to make the necessary arrangements for the reopening of the branch, which was temporarily closed last year, owing to a shortage of cars.



LATE INCORPORATIONS

Augusta, Me.—The Pontiac Motor Car Co. has been incorporated with a capital stock of $25,000, to deal in automobiles.

Buffalo, N. Y.—The Motor Vehicle Garage Co. has been incorporated with a capital stock of $20,000, and will conduct an automobile garage.

Buffalo, N. Y.—The Cleveland Cycle & Auto Co. has been incorporated and will manufacture automobile motors, engines, etc. Capital stock, $2,500.

Trenton, N. J.—The New Jersey Touring Co. has been incorporated with a capital stock of $60,000. It will operate and build self-propelled vehicles and vessels for land or water.

New York City—The Franklin Automobile Agency has been incorporated with a capital stock of $500.

New York City—The Gaulois Tire Co. is a recent incorporation. Capital stock, $500.

New York City—The C. A. Mezger Co. has been incorporated to manufacture spark plugs and motors. The capital stock of the company is $5,000.

Albany, N. Y.—The Palace Motor Car Co. has been incorporated with a capital stock of $15,000.

Newark, N. J.—The Austin Auto Co. has articles of incorporation filed with the county clerk. Capital stock of the company is given at $25,000, of which $3,000 has been paid in.

Jersey City, N. J.—The Pneumatic Ball Tire Co. has been incorporated with a capital stock of $3,000,000.

New York City—The Commercial Motor Car Co. has been incorporated with a capital stock of $10,000.

Cleveland, O.—The Appel Spherical Motor Co. has been incorporated with a capital stock of $150,000.

New York City—The Zim-Rock Motor Car Co. has been incorporated with a capital stock of $15,000. The company will establish an automobile agency.

Boston, Mass.—The Harvard Automobile Co. has been incorporated to deal in automobiles, with a capital stock of $15,000.

Albany, N. Y.—The Dac Automobile Supply Co. has been incorporated to manufacture and deal in automobile parts. The capital stock of the company is $500.

WINTON MODEL-K

WHAT ABOUT DEPRECIATION?

A motor car becomes SECOND HAND, in value, when the Owner has driven it the first time

After that, whenever you sell it, you are unlikely to get as much as you paid for it.

The difference between the price you pay for a **new** car and the price you get for the **same car second-hand** represents DEPRECIATION.

Think about that when buying.

It is important to buy a car that will have a high value when second-hand.

Because you don't know how soon **you may want to sell it.**

You may want to sell upon buying a later and better car.

Or you may want to sell for any one of a dozen reasons that will come to mind when you think about it.

Good business judgment, therefore, tells you to buy a car that will Depreciate but little.

Some cars Depreciate **fast.** Notably under-powered cars, carelessly made cars, and cheaply constructed cars; cars of poor material and poor workmanship.

Some cars Depreciate **more** than others. Among these are fancy-priced machines. In buying them you pay heavy tribute for frills and an alleged "exclusiveness," which have absolutely no actual value and that bring absolutely no return in second-hand sales.

Remember this, too—other things being equal, you can always get more money—a greater percentage of purchase price—for a car of **good reputation** than for one of Unknown, Doubtful, or Poor Reputation.

Reputation is the result of **Past Performances.**

Past success in making runabouts does not mean present skill in making touring cars. And vice versa. Just remember **that.**

Note that the new WINTON MODEL K Touring Car is made by a company whose reputation is based on the long-time manufacture of **successful** Touring Cars.

Observe that the Winton Model K sells at $2,500 and is not equalled **anywhere** for $3,500.

THAT'S $1,000 SAVED ON THE PURCHASE PRICE.

AND $1,000 SAVED ON POSSIBLE DEPRECIATION.

The new Winton Model K reduces Up-Keep Expenses to the rock-bottom minimum.

Let us tell you how and why.

WINTON MODEL K—Plenty of reserve power. Easy of manipulation. Quiet running. Winton Comfort Features make riding delightful. Has every feature that a highest-grade car should have. $2,500 f. o. b. Cleveland

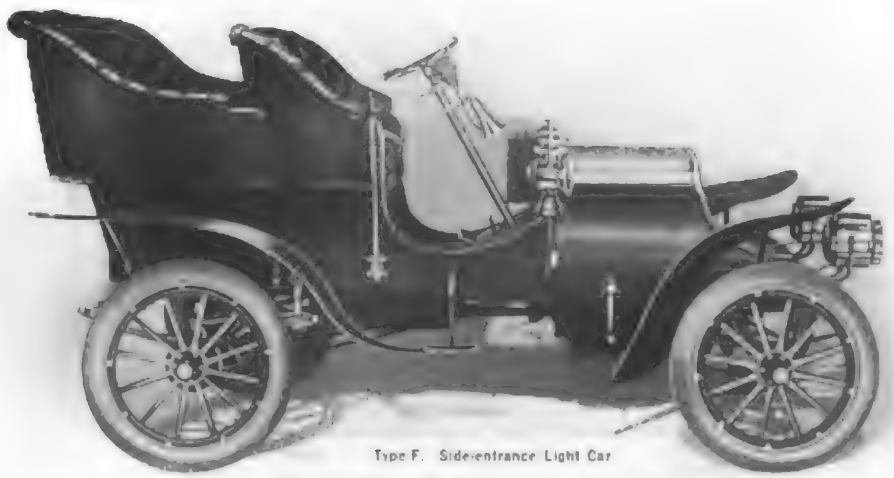
FRANKLIN



Type F. Side-entrance Light Car

Four passengers. Side entrance through tilting front seat. 14 "Franklin horse-power." 4-cylinder air-cooled engine. Wheel base, 84. Weight, 1,275 pounds. Framed for folding top. Speed on high-speed clutch, from 5 to 30 miles per hour. Price, $1,750, with either fixed or detachable tonneau. Without tonneau, $1,550. Tonneau, $150 extra.

Type F is a wonderfully strong, lively, powerful light car of a design specially preferred by many motorists.

Its comparatively short wheel-base for a side-entrance car gives unusual strength and stability; while its direct two-speed transmission exactly suits many who do not want a sliding gear.

It has all the distinctive Franklin features which produce the well-known Franklin touring ability and reliability.

Franklin air-cooling makes every Franklin an all-the-year-round car.

No weather can freeze it night or day.

Leave it standing anywhere, any time; and it is ready on the instant to make its best pace from the word "go."

"Franklin horse-power" is road-power. Not a mere figure-rating. It is real working force delivered at the rear wheels at regular average speed on all sorts of roads.

Four Models for 1906

Type H. Six-cylinder, 30 Franklin horse-power, shaft drive, 2,400 pounds, 50 miles per hour. $4,000.

Type D. Four-cylinder, 20 Franklin horse-power, shaft drive, 1,800 pounds, 45 miles per hour. $2,800.

Type G. Four-cylinder, 12 Franklin horse-power, shaft-drive, 1,400 pounds, 35 miles per hour. $1,800.

Type E. Four-cylinder, 12 Franklin horse-power, chain-drive, 1,100 pounds, 40 miles per hour. $1,400.

We exhibit in Madison Square Garden, New York, Jan. 13-20, 1906

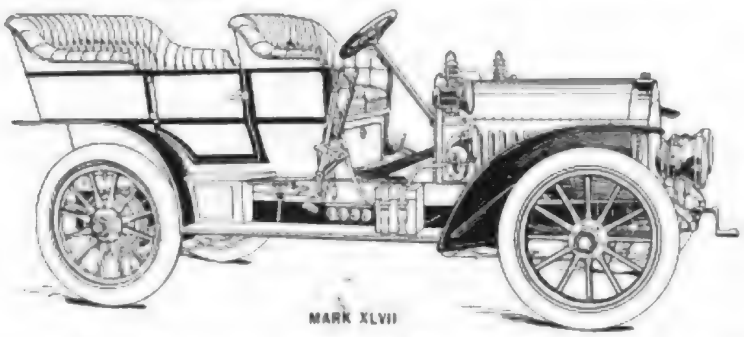
Columbia

Gasoline Cars for 1906

ARE built of the best materials in the world under methods and processes more advanced than those employed in any automobile factory other than our own. No consideration of the cost of production has been permitted to interfere with making perfect every part and piece of each model, whether pertaining to mechanism, bodywork or general equipment. The expense of making the crankshafts, for instance, is six times greater than that of any previously made in this country. We guarantee that these cars, each according to its power and place, will yield the greatest things possible in motor service.



MARK XLVII

MARK XLVII 40-45 h.p. four-cylinder motor under forward bonnet; sliding gear transmission, four speeds and one reverse; jump spark ignition from storage battery; new pattern automatic carburetor; special chrome-nickel steel gears, axles, crankshaft and jackshaft; crankshaft machined cold out of solid block; double chain drive; I-beam front axle forged in one piece; pressed steel frame; 108-inch wheel base; seat starting; new pattern brakes. Price, with standard body.....$4,000
With 112-inch wheel base, Royal Victoria, Double Victoria, Limousine or Landaulet body.....$5,000 to $5,500

MARK XLVI An entirely new model. 24-26 h.p. four-cylinder, vertical water-cooled motor; shaft drive, sliding gear transmission; three speeds and reverse; low tension make and break magneto current ignition; special chrome-nickel steel gears and shafts, crankshaft machined cold out of solid block; I beam front axle forged in one piece; rotary pump oil lubrication; pressed steel frame, 96-inch wheel base; double side entrance body seating five passengers. Price.....$3,000

MARK XLIV-2 Perpetuating Mark XLIV, one of the most successful of medium-weight 1905 cars. 18 h.p. double opposed horizontal motor under forward bonnet; frame length increased eight inches, giving ample room forward of each seat; wheel base increased to 90½ inches. Rear seat widened five inches; double side entrance body. An ideal family car, which will climb any hill and maintain a speed of 35 miles an hour on the level. Price.....$1,750

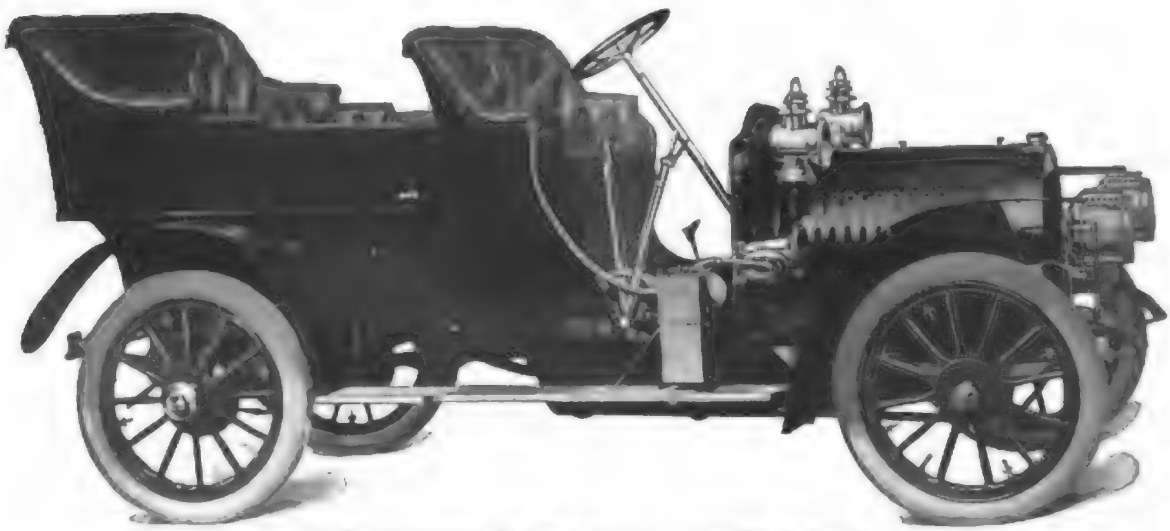
THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

Absolutely the highest grade motor car built in this country, bar none, and the only car that can consistently compete with foreign machines. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. New style make and break spark. Simms-Bosch Magneto, bevel gear drive. Very large and roomy, full aluminum bodies.



MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

Guaranteed free of repairs for one year

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order?

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase. unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.

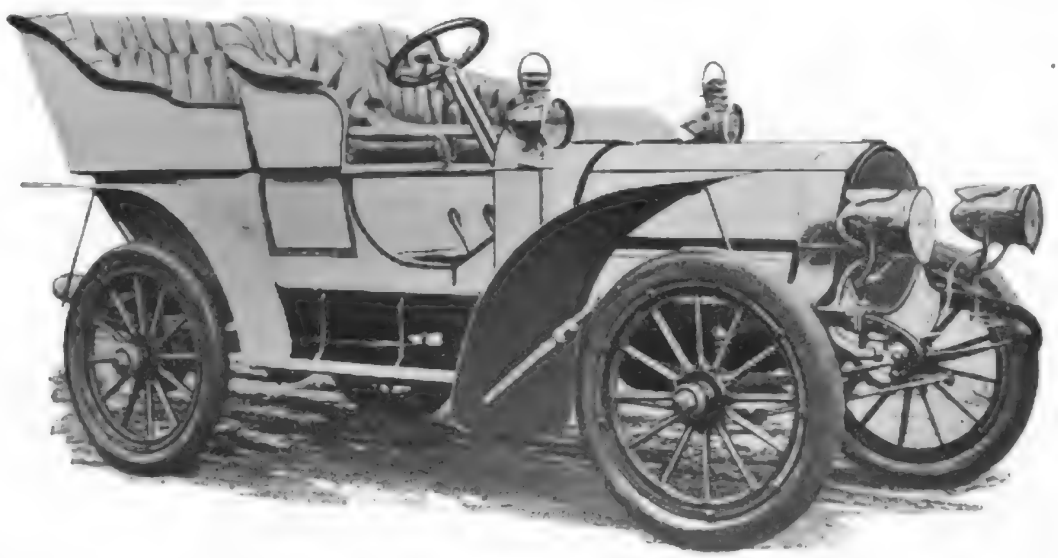
Starts from the Seat No Crank Necessary
A Foot Lever Does It



DUQUESNE

4-CYLINDER 4-CYCLE 16-21 HORSE POWER

SIMPLICITY must be the watchword of automobile builders wishing to construct a car that will stand the test.

Air-cooling is the simple way, because it does away with water tank, water pipes, radiators and pump; lightens the load on the tires and eliminates freezing in cold weather.

The DUQUESNE is not a racing car. It was designed especially to stand hard usage. Will take the ordinary country roads at from five to twenty-five miles an hour with five passengers. Will climb ordinary hills on high speed and any hill on low speed, and on paved streets and level roads will do forty miles an hour.

Direct drive with vital parts encased and running in a bath of oil is superior to the chain system with "sand shower" lubrication.

Starting the engine with a foot lever is better than the old style of "cranking.

The DUQUESNE motor is air-cooled; requires no cranking; starts from the seat by a foot lever a lady can start it.

Weight, 1,750 pounds ***Price, $2,000***

We are offering a very attractive agency proposition. Write.

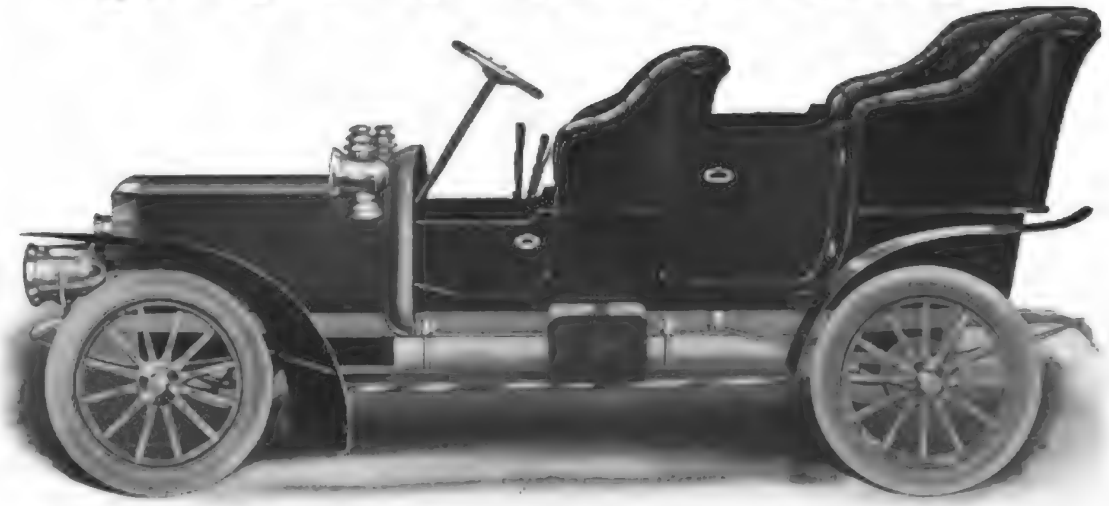
Aerocar



The Car for today—tomorrow and years to come.

Built by Practical Men

The Aerocar comes as the fulfillment of all that has been proven best in the air-cooled motor car. It represents the efforts from years of constant experimenting, testing and proving—a motor car of enduring serviceability—superior in mechanical design and construction, and carrying all the luxury and beauty in modern motor car equipment.

It is the only air-cooled motor car which overcomes all obstacles and objections in practical test.

The motor is the very soul of an automobile, and while the **Aerocar** is ideal in the graceful lines of body, in its roomy luxuriousness and elegance of equipment, it is in the air-cooled motor that its distinguishing superiority lies. Its motor is of wonderful efficiency—it is the crowning result of ten years constant effort along most practical investigation, studying and experimenting with all the adopted methods and designs of air-cooled motors, selecting the best of each, improving and adding to, until we have for the **Aerocar** an air-cooled motor which may rightly be called perfect in operation and for satisfactory results—always ready, night or day, in the hottest of mid-summer or the coldest zero of mid-winter, to meet every reasonable demand.

The Aerocar **1906.** 22-26 h. p. Four cylinders. Five passengers. 45 miles an hour. 104-inch wheel base. Shaft drive. Sliding gear transmission. Three speeds and reverse. Perfect disc clutch. Hollow steel dash. Four-sight lubricator on dash. Tool box on running board. 34x4 tires. 9-inch road clearance. Weight 2,000 pounds. Fully equipped, ready for the road, including two large gas headlights, **$2,800 f. o. b. Detroit.**

Ready and anxious to demonstrate any time or all times.

Deliveries. Ready to deliver cars February.

Will be exhibited and demonstrated at the Automobile Shows in New York and Chicago.

The dealer who has the selling agency of the **Aerocar** will have a gold mine. Territory being rapidly taken up. If interested write us promptly.

The AEROCAR COMPANY, Detroit, Mich.

About this time every year

the various manufacturers issue announcements giving the details of their "next year's" productions and these announcements give a lot of inside information to the man who takes time to dissect them and read them carefully.

The improvements mentioned in these announcements can be divided into two classes: FIRST, the correction of MISTAKES, and SECOND, the betterment of parts of the car which, while not perfect, were still giving satisfaction.

When we say MISTAKES in design, we have reference to such things as breakages of axles, crankshafts, etc., overheating, too little power and too much weight, sagging of the pressed steel frames, defective brakes, faulty weight distribution on the tires, etc. We call such things MISTAKEC because a thorough trying out of the experimental cars should have uncovered them. Now the manufacturer who stands back of his product must make good on such of these items as come under the head of Breakages, and the making good on anywhere from 300 to 1,000 cars is an expensive proposition—may be $25,000.00, may be $100,000.00. It's almost superfluous to observe that no manufacturer relishes this "making good" expense, and they are all doing all in their power to avoid it by building two or three experimental cars and running them several months in order to uncover these MISTAKES. Yet, in spite of this trying out that each gives his design, the public is sure to find blow holes that his trying out failed to indicate.

Few know that the preliminary expense of making drawings, patterns, tools, dies, jigs, a couple of experimental cars, etc., amounts to about $50,000 for each model. (If the manufacturer is making three models this preliminary cost is multiplied by three.) If the MISTAKES uncovered by the public during a year's use are not numerous nor serious, the manufacturer corrects them and retains the balance of the car for another season. If the MISTAKES are really serious, he abandons the whole model and brings out a new one.

Practically all automobile purchasers are interested less in the size, speed or first cost of a car than they are in learning whether its performance over a long term of months is going to give them pleasure or annoyance, or, in other words, they want to find out the weak points of the car; and if the manufacturer builds a couple of experimental cars and runs them several months in the hands of skilled men and yet fails to discover things that the public afterwards finds out for him (more or less at the public's expense), how much dependence can the public place upon his assertions of the good qualities of such a new model?

The point that all the foregoing leads up to is this: That the man who wants to discover the weak spots in the Stevens-Duryea is not forced to depend upon the statements of the manufacturer as based upon the performance of a couple of trial cars. No!—he can get accurate information from between 350 and 400 owners of these cars who have driven them thousands of miles over all sorts of roads. Does he want to know whether the axles are strong, whether the brakes are good, whether the car has just as much power, is just as quiet and free from rattle after a year's use; whether our claims as to freedom from tire trouble are actual fact; whether the Three Point Support of the Unit Power Plant is as good as we state; whether the bevel drive gives trouble; whether the clutch is a success; what the repair bills and tire bills are per thousand miles? We repeat, if a purchaser wants this information about the Stevens-Duryea he gets in 1906, all he need do is to look up the performance of the car during 1905, because not a single one of these mechanical features has been changed for 1906. They have not been changed because all the hammering about that the 350 owners of these 350 cars could give them did not uncover any defects. There were no defects because three years were taken to the preliminary development of this car.

Great Clearance Sale!

We are now adding a third story to our building and we need the money that is tied up in some forty machines that have accumulated in the past year. These are going to be sold at once. Please look over the prices and compare them with others.

Please note that when we say a machine is in good condition it is just as represented. When we say the tires are good, we mean GOOD, not leaky and worn out. We make it a point to trade only for machines that are in good condition, or that can be put in good condition in our repair shop before they are sold.

We have the following machines to offer at bargain prices:

Pope-Toledo, 1904, rear entrance. Model was rebuilt and repainted and made like new at factory this fall. New Continental tires, engine and entire car in A1 shape, ready for a 500-mile drive. Car has Prest-O-Lite tank, a $100 pair of front lamps, and a four chime Gabriel horn. Price $1,500.

Ford, Model F. One sample car new from factory in November. List price $1,200. Car has tonneau and Fisk tires. Our price $700.

Ford, Model C, new, came in same as car above. Our price $600. Both these cars have searchlights and Prest-O-Lite gas tanks.

Motor Boat, 25 feet. Dolphin lines in hull, 20 h. p., four cylinder Premier water-cooled engine. Boat is like new, has only been used about three months. Has double divided, automobile seats, wheel steering. Will sell on guarantee to make speed of 14 miles per hour. Boat cost $1,350. Owner now having make a 40-foot boat with same engine and design. Will sell old boat for $600.

Yale, 1904, 12 h. p. double cylinder opposed, tonneau detachable; finish, body dark blue, gears cream, paint like new, 32x4 clincher tires, A1 shape. A handsome and stylish little car that is a bargain at $500. Will guarantee in first class condition and ready for a 100-mile drive.

Winton, 1904, 24 h. p. double cylinder opposed, fine canopy top and glass front, paint like new, new tires on rear, 34x4½, front tires A1, fine reed baskets costing $100 per pair on the sides, a fine $50 searchlight and two front 8-inch lamps costing $80, a fine tail lamp, golf basket, rain apron, etc. Car used less than 800 miles, looks like a new car, will guarantee 35 miles per hour with load. Car cost complete $2,890. Our price $750.

Winton, 1903 Model C, brand new finish, special dark blue and white gears. Regular price $1,800. Our price $950.

Winton, 1905 Model A, 40 h. p., finish A1, two new rear tires fitted with Sampson covers, one searchlight, two headlights and oil lamps, electric flash lights on rear, fine cape top. Car just overhauled and in perfect condition. Will guarantee 48 miles an hour with a load of five. Car cost complete $4,100. Our price $1,500.

Pope-Toledo, 1905, a brand new sample, front entrance, fitted with searchlights, gas tank, full leather Victoria top, $50 brass bound patent leather trunk, trunk irons. This car was received October 15, on a special order for a member of our firm. On October 25 we decided to give up the Pope line. This car on hand, list price complete $3,590. Our price $2,590.

Pope Tribune, single cylinder, 5 h. p., bevel drive, three speed transmission, engine under hood and vertical. Used only about 60 days. A1 shape. Price $200.

A new 1905 Olds light touring car. Regular price $750. Our price $500.

1905 Olds tonneau, used two months. A1 shape from top to bottom, ready to deliver at any point in the state on an hour's notice. Regular price $950. Our price $500.

1903 Olds in good shape for $200.

1904 Franklin with tonneau, in perfect condition from top to bottom. In every day use. Owner wants big car. Price $850.

1905 Premier, with cape top and tonneau, 16 h. p., air-cooled, new tires all round. Run less than 1,200 miles. Car looks brand new. Price $1,000.

Olds 1904, clincher tires, $375. Machine practically new.

1903 Winton with searchlights, fine baskets, rain aprons, gas tank, new tires all around, 4½ inch Fisk on the rear wheels. Machine is a splendid bargain at $875.

1903 Winton of the same general description, has been used less than 2,000 miles. $950.

Premier, 20 h. p., two cylinder, water-cooled, bevel drive. Fast and powerful car for $300. The car is new.

National Electric, elegant condition, except the batteries, $175.

Waverly Electric, good condition except the batteries, $100.

Waverly Electric with top, wire wheels, new clincher tires all around, good batteries, will run 25 miles on one charge, $300.

Packard, single cylinder, 15 h. p., large tonneau, good 32x4 Diamond clincher tires all around, splendid finish, lamps, etc., in A1 shape. A very good cheap car for some one who does not care for speed, but wants service and reliability. $450.

Haynes-Apperson, early 1903 model, double cylinder, 12 h. p., good leather top, folding front seat, new tires, new paint. Engine and all overhauled in good shape. A splendid bargain at $400.

Haynes-Apperson, wheel steering, 3 extra tires, same model as above, $450.

Haynes-Apperson, like the above, but not as good tires. Tires are in good condition, but are second hand, good leather top, $400.

Please note that all these machines are marked from 15 per cent. to 25 per cent. less than they are worth in order to move them quick for cash.

TERMS: We will ship any of the above on receipt of enough to guarantee freight, balance collect against bill of lading.

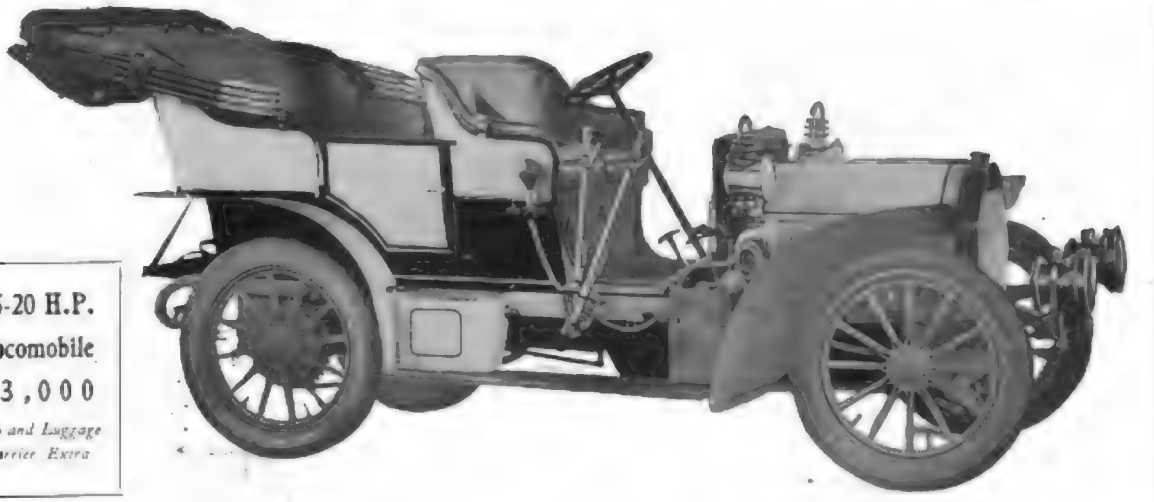
Locomobile

"EASILY THE BEST BUILT CAR IN AMERICA"

15-20 H. P., $3,000, 30-35 H. P., $5,000, both with complete touring equipment



15-20 H.P.
Locomobile
$3,000
Top and Luggage Carrier Extra

TYPE "E" Locomobile 15-20 H. P.

PRICE—$3,000 ready for touring.
EQUIPMENT—Five brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY—Double side entrance, seating five; extra wide doors; fitted with top irons; color and striping optional.
MOTOR—Four cylinder, 3¾ inch bore, 4½ inch stroke.
CAM SHAFTS—Hardened forgings; all cams integral.
CRANK SHAFT—Machined from one solid forging.
LUBRICATOR—Large, mechanical lubricator.
CARBURETOR—Automatic, with balanced throttle valve.
GOVERNOR—Centrifugal type, prompt and positive in action.
IGNITION—Make-and-break, with iridium contacts.
MAGNETO—Low tension, our own design and manufacture.
ALUMINUM PAN—Placed underneath the machinery.
FRONT FENDERS—Have inner wings extending to bonnet.
CLUTCH—Cone type, with ample surface.
TRANSMISSION—Three forward speeds and reverse.
DRIVE—Double side chains.
DOUBLE UNIVERSAL JOINT—Between clutch and transmission.
RUNNING BRAKE—Large and powerful, metal to metal surfaces.
EMERGENCY BRAKES—Internal expansion type, metal to metal.
BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES—"I" section hand welded axles.
RUNNING BOARDS—Rubber covered and brass bound.
TIRES—32x4 inches on all four wheels.
WHEEL BASE—93 inches.
CONTROL—Gas and spark levers on steering wheel.

TYPE "H" Locomobile 30-35 H.P.

PRICE—$5,000 ready for touring.
EQUIPMENT—Five brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY—Double side entrance, seating five to seven; extra wide doors; fitted with top irons; color and striping optional.
MOTOR—Four cylinder, 4½ inch bore, 5½ inch stroke.
CAM SHAFTS—Hardened forgings; all cams integral.
CRANK SHAFT—Machined from one solid forging.
LUBRICATOR—Large, mechanical lubricator.
CARBURETOR—Automatic, with balanced throttle valve.
GOVERNOR—Centrifugal type, prompt and positive in action.
IGNITION—Make-and-break, with iridium contacts.
MAGNETO—Low tension, our own design and manufacture.
ALUMINUM PAN—Is placed underneath the machinery.
FRONT FENDERS—Have inner wings extending to bonnet.
CLUTCH—Cone type, with ample surface.
TRANSMISSION—Three forward speeds and reverse.
DRIVE—Double side chains.
DOUBLE UNIVERSAL JOINT—Between clutch and transmission.
RUNNING BRAKE—Large and powerful, metal to metal surfaces.
EMERGENCY BRAKES—Internal expansion type, metal to metal.
BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES—"I" section hand welded axles.
RUNNING BOARDS—Rubber covered and brass bound.
TIRES—34x4½ inches.
WHEEL BASE—106 inches.
CONTROL—Spark and gas levers on steering wheel.

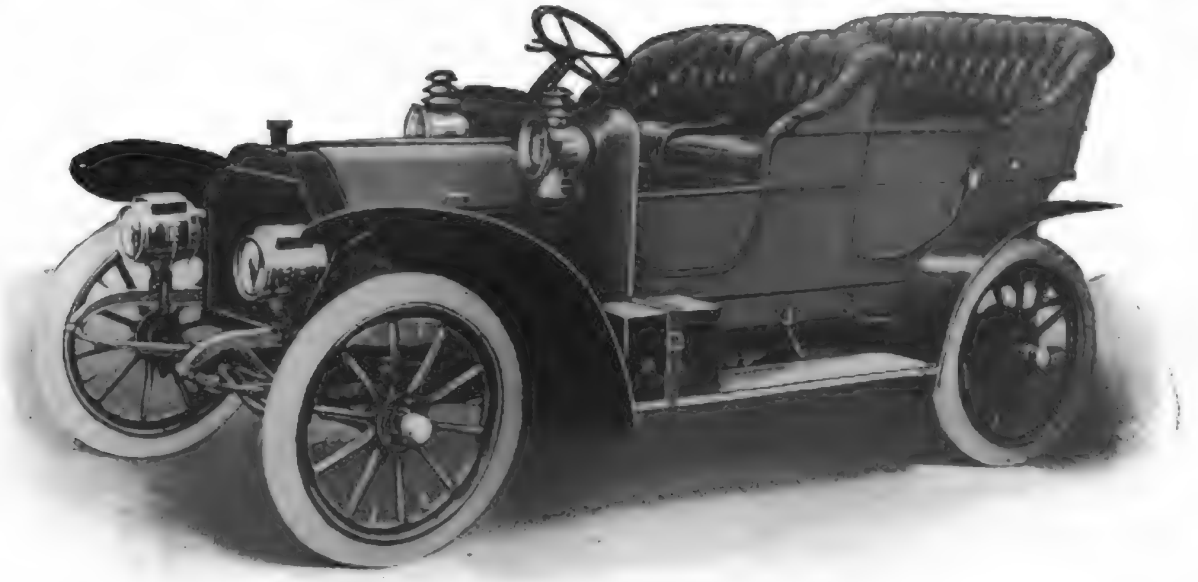
OLDSMOBILE



We certainly have no monopoly in good motor cars this year. The best American cars are all good, and we only put in a bid for our car at $2250 (Model S, 4-cylinder), because it has an individuality worth knowing before you buy anything else. Have your trial run in it and then you can purchase or not, but you will have learned something about compactness, power and style that may stand you in good stead. If you want a lower priced car, The Two Cycle (Model L) at $1250 is apt to be "it." We don't have to more than refer to The Two Cycle, because every one knows about it. If you want to read up a little, make use of the coupons below.

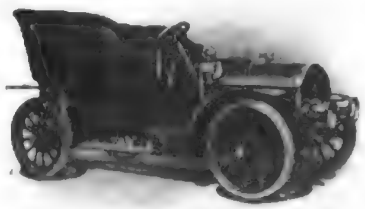
Waltham Orient



Waltham-Orient Model R, $2,250.
The Keystone of the Air-cooled Arch.

Friction-drive Buckboard Model BB, $400.
The lowest priced Motor Car made in the World.

The Car of To-day Must do More than Look its Price. The high priced, high powered motor car is all right—it has its place and its purchasers, but the **popular demand** is for a car of moderate price, reasonable speed that will be maintained up-hill as well as on the level road; that will arrive on time and return when expected; that will keep on the road and out of the repair shop; that can be operated economically and safely and does not require the employment of a professional chauffeur; that will remain in service winter as well as summer.

It must look well—ride well—run well—and keep well. That's where your pleasure comes in. You pay your good money for it and you have a right to expect it.

It is because it combines all of these important and necessary features that

The Waltham-Orient is the Leading American Car of its Price

Five Touring Models for 1906

Model R, a Swell Special 20 h. p. - - - - -	$2,250
Model N, 20 h. p. Tourist - - - - - - -	2,000
Model L, 16 h. p. Tourist - - - - - - - -	1,750
Model M, 16 h. p. Runabout, **Detachable Tonneau,**	1,750
Model K, 16 h. p. Two-passenger Runabout,	1,600

A Greyhound can run a mile as rapidly as a five thousand dollar Racehorse, and he can course through the sand and up the cliffs where the thoroughbred cannot follow; which only goes to prove that price, bulk, weight and power rating do not necessarily mean the first to finish nor the one to get nearest the top of the mountain.

The Buckboard is the Greyhound of Motor Cars. It makes no pretensions to being the thoroughbred horse. It has no five thousand dollar price tag on it, but is simply in a class of its own, equally a pleasure to its owner, for it serves its purpose and serves it well.

WHY?

BECAUSE: It creates interest quicker than any car you can represent. It conflicts with no other sales. It makes Motorists out of Horsemen and Cyclists. It sells to owners of the "thoroughbreds" for daily service to the station, the country club or the seashore. It sells for Rural Mail Routes, Telephone and Telegraph Linesmen, Parcel Delivery, etc. It requires less time and trouble for each sale, and less subsequent expense and repairs. It has an operating cost less than one-third of any other motor car in the world. It will run 35 miles to the gallon of gasoline, and 100 miles to the pint of oil. It has a maximum power ratio of 40 to 1. No other car exceeds 18 to 1. It will climb 40 per cent official grade and run 30 miles or more per hour. If you will write us we will send you forty other reasons.

We are alive for live agents. Write for specifications and agency proposition.

We will exhibit only at the New York, Chicago and Boston Shows.

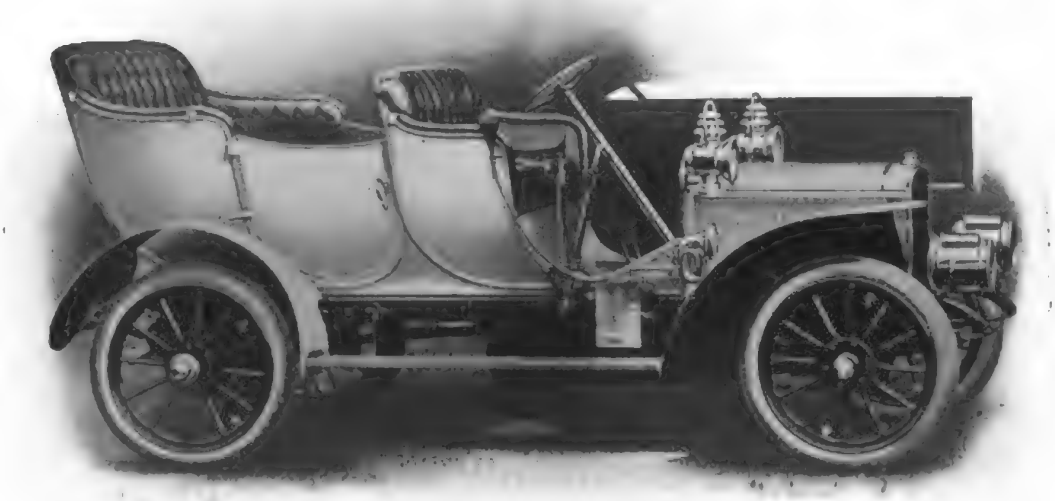
THE NEW MODEL F--30-35 H. P.

Cleveland



Is Now Ready for Immediate Delivery. Price $3,500 to $5,000, Depending Upon Body Equipment. Five to Fifty Miles an Hour on the Third Speed.

SPECIFICATIONS:

ENGINE—30-35 H.P., 4-cylinder, water cooled.
IGNITION—Simms-Bosch low tension Magneto make and break spark.
TRANSMISSION—Sliding train, 3 speeds forward and one reverse.
REAR AXLE—Shaft drive, clutch driven hub. Ball bearings.
FRONT AXLE—I-Beam Section. Ball bearings.
FRAME—Cold rolled pressed steel, aluminum under bonnet covering entire engine and transmission.
WHEEL BASE—104 inches.
WHEELS—Imperial whalebone, grade A second growth hickory.
TIRES—34 x 4.
VALVES—Mechanically operated, inlet and exhaust interchangeable.
CARBURETER—Float feed, requiring no adjustment.
BRAKES—Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
BODY—Victoria or double phaeton, tulip side entrance.
EQUIPMENT—Two head lights, 1 generator, 2 side lights, 1 rear light, 1 horn and tools.

CLEVELAND ECONOMY is the result of the perfect harmony of design, power, strength and weight with tested material and expert workmanship, which enter into *Cleveland* construction. The *Cleveland* not only does its work well, but cheaply, so cheaply that repairs are not to be figured. *It has no weak spots*—neither our exacting tests nor hard usage on the road have evidenced them—and we guarantee every car against them.

The new 30-35 *Cleveland* Chassis is made by the Garford Company, the largest manufacturers of fine Automobile parts and Chassis in America, and is in a class by itself.

The Simms-Bosch low tension magneto ignition with automatic make and break spark, with which every important Foreign Car is equipped, is a distinct feature of the 1906 *Cleveland*.

It is original and efficient and does away with every jump spark trouble, no plugs to clean, no wires to short circuit, no batteries to go wrong, no commutator to wear out or adjust, *no* expense.

The Ford 4-cylinder Runabout

This car—Model N — is the biggest revelation yet made in automobile construction. A car of this type for less than $500.00 seemed an impossibility, but here it is. 4 cylinders. 15 H. P. Direct drive. Speed 40 miles. 78-inch wheel base. Weight 700 pounds.

Ford Model K

6 cylinders—40 H. P., 4 to 50 miles per hour on high gear. Perfected magneto ignition, mechanical oiler, 114-inch wheel base, luxurious body for 5 passengers, weight 2000 pounds. Price $2500.

NO FURTHER PARTICULARS WILL BE GIVEN UNTIL THESE CARS ARE SHOWN FOR THE FIRST TIME AT THE AUTOMOBILE CLUB OF AMERICA'S SHOW AT THE 69th REGIMENT ARMORY, NEW YORK, JANUARY 13th to 20th.

Deliveries for Models N and K Will Not Be Made Before March

1906 will be a "Ford Year." Agents who have closed with us can congratulate themselves.

1906 MODELS TYPE C

117-INCH WHEEL BASE

WE GATHER from the good opinions expressed by many highly pleased owners of **The Lozier Motor Car** that its "smooth running, ease of control and all-around reliability," covers about everything that is to be desired in a High-grade Motor Car. The item of low maintenance cost and all that it implies, was correctly calculated in its design, and is fully guaranteed in its perfect construction. Among the notably distinctive features that are embodied in

The Lozier Motor Car

may be mentioned—the use of Hess-Bright ball bearings in sliding gear, change speed and differential gears. Weldless nickel-steel forged I-Beam axles of heavy construction. Drop Forged Steering Knuckle. Ball-bearing wheels of large diameter (36 inches). Platform spring suspension. Solid forged motor crank-shaft (arms being webbed out instead of drop-forged)—turned, hardened and ground on its own centers. Transmission and differential shafts and flexible shaft with universal joint of nickel-steel. Babbitted bronze motor bearings. Long wheel-base, 117 inches.

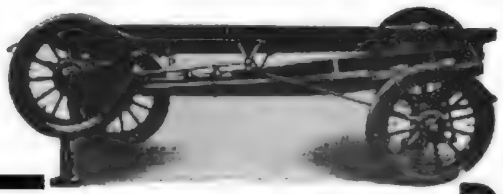
THE MARMON

"A Mechanical Masterpiece"



Front wheel and opposite rear wheel each raised over a foot.

Takes the Jolts Out of Rough Roads

Anyone who has ever made a long run in an automobile knows what it means to be shaken, jolted and vibrated almost to the point of exhaustion.

And anyone thus experienced who takes one ride in a Marmon realizes instantly that its positive luxury of motion is not only unequaled, but absolutely unknown in other cars, regardless of price or prestige. The picture shows why.

All roads present this condition in small or large degree—here a bump and there a rut, often forcing one wheel to ride through a depression while a wheel on the opposite side passes over an elevation. Unless the automobile possesses flexibility to meet these varying conditions, it means constant, ruinous strain for the mechanism and constant reaction upon the passengers, varying from vibration to jolting.

Other cars are constructed on much the same rigid principle as a farm wagon. In the farm wagon, comfort is not considered nor is there any expensive mechanism to protect. This the automobile has attempted to remedy with springs and tires of various types. But the unnatural principle is still there. Strain and discomfort are still there.

The Marmon does not depend upon its excellent springs for elasticity. It possesses an exclusive patented feature

Double Three-Point Suspension

Cast aluminum body on one frame, power plant on another frame, each frame suspended on three pivotal points. Power plant and rear axle are practically a unit, always in alignment. Rigid shaft drive without universal couplings. Wheels adjust themselves to the roughest road condition. This elimination of binding and twisting strains means perfect power transmission, greater efficiency with less wear for all parts, tires included.

The Marmon oiling system (fully patented) has no equal. Starting and stopping with the engine a constant and uniform flow of oil is forced through the hollow crank shaft directly into all the main engine bearings, crank and piston pin bearings. Simple; unfailing; very economical; has no adjustments.

The Marmon is stylish, strikingly handsome and very quiet. The tonneau is practically dustless without the aid of attachments. Constructed with minute attention to detail. Replete with excellent, instructive and distinctive features.

Write for Booklet No. 1.

Ask us to show you at the Armory Show, New York.

CRAWFORD

OUR NEW MODEL IS OUT

Here are the Specifications:

MOTOR: Four-cylinder, upright, water-cooled, 4½ by 4½ individual cylinders. 24-28 Horsepower.

CRANK SHAFT: Four throw, bearing in five bronze bushings aggregating 14½ inches.

CRANK CASE: Removable without disturbing adjustments.

WHEEL BASE: 100 inches; tread 56 inches.

WHEELS: 34-inch, wood, artillery type, on large ball bearings.

TIRES: Optional; regular clincher or mechanically attached.

DRIVE: Double chain on generous-sized sprockets.

TRANSMISSION: Selective sliding gear set, three forward speeds, one lever control, ball bearings.

BEARINGS: Ball bearings throughout.

BRAKES: Two powerful brakes on rear hub, with set lever. Two band brakes operated by foot on cross shafts.

LUBRICATION: Force feed lubricator.

FRAME: Deep section pressed steel sides, with an angle iron sub frame brazed up to carry motor and transmission, which are connected by double universal joint.

CLUTCH: Of inverted type, made dust-proof by leather diaphragm and operated by foot lever.

IGNITION: Jump spark, with four coils on dash.

CONTROL: Throttle and spark.

SPEED: 36 miles, approximate maximum.

WEIGHT: 2100 lbs.

TANK CAPACITY: 14 gallons.

STEERING GEAR: Wheel and pinion.

AXLES: Large sized tubing.

The "short" fracture shown above, while characteristic of poor oak, happens to show the fracture of poor hickory. The other fracture shows the quality of "Imperial" spoke.

Talks on Wheel Making No. 6

A burst tire is robbed of its danger if the car is equipped with "Imperial" wheels.

¶ The asset value of a car only occasionally obtrudes itself upon the attention of a buyer. And yet it is a matter which should give him deep and constant concern. "For what is worth in anything but so much money as 'twill bring."

¶ This value cannot be maintained if the components of the car are of indifferent design or material. Cheap wheels impair asset values. "Imperial" wheels help in preserving them.

The excellence of "Imperial" wheels is based upon the perfection and refinement of orthodox methods.

MODEL F

Pope-Hartford Model F

is the result of our 28 years of experience in making and marketing mechanical vehicles and is the latest product of our famous Hartford Factories. **MOTOR:** Consists of 4-cylinder, vertical, water-cooled engine with cylinders cast in pairs; all gears encased; brake test, 28-30 h. p. **TRANSMISSION:** Sliding gear, three speeds forward and reverse. **CARBURETER:** Specially designed, insuring economy in fuel consumption and maximum power. **CONTROL:** Throttle and ignition levers on single sector that does not revolve with wheel. **DRIVE:** Bevel gear through propeller shaft to the rear axle. **TONNEAU:** Non-removable, dust proof, double side entrance. **DESIGN:** Artistic in conception and execution. While great attention has been given the essentials of construction it will be found that no detail has been overlooked. Everything that will contribute to the user's comfort and convenience has been embodied in this up-to-date car. **Price, $2,500.**

Pope-Hartford Model G

is our 2-cylinder, opposed, 18 h. p. touring car. The engine is under the hood and all parts are accessible for inspection and repair. This is our dependable 2-cylinder machine of last year with such minor changes as has been suggested by a season's use. **Price, $1,600.**

Again—"As good as it looks"

THE PARLOR CAR OF MOTOR CARS

Stoddard-Dayton

Talk of luxury! The roomiest of seats—splendid cushions that take you into their generous depths and make you forget there was ever an angle to ache mortal spine.

Well, that is the kind of rich comfort you find in the STODDARD-DAYTON Touring Car.
But there's more than fine upholstering to contribute to your ease.

The STODDARD-DAYTON has every **practical** modern device that takes up jar and reduces vibration. The springs are single elliptic—40-inch front, 50-inch rear, made from best crucible analysis steel. There are roller bearings throughout. Mechanical lubrication keeps all working parts swimming.

The STODDARD-DAYTON Model-D—5-passenger Touring Car has a special type of 4½x5 in. 4 cylinder motor; water-cooled; frame of hot-rolled, high carbon, pressed steel, sliding gear transmission, three speeds and reverse—selective type, speeds can be changed instantly without clashing or friction; practically noiseless; entire transmission on roller bearings; mechanical lubrication; 30 to 35 horsepower. Proportion of power to weight, one horsepower to every sixty pounds. $2250. Immediate delivery.

Write for our 1906-book. Interesting to any one who owns a car or intends to own one.

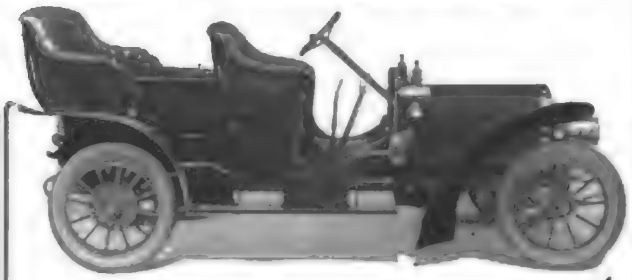
THE MARION



The New "Model Five"

This Car has been carefully and intelligently designed for the man who wants to run his own car, wants to run it fast when he feels like it, and doesn't pretend to be or want to be a mechanic or a mender of tires.

A woman can handle the Marion at high speed, steer it safely and stop it quickly—and it is as fast as the speediest. Seats five.

Has 28 actual horsepower and weighs 2,100 lbs. That tells its own story of speed when you note its sane and simple construction. (Take a glance at the chassis.)

The four cylinder motor is exceptionally silent. Air-cooled; two fans, front and rear. Multiple disc clutch and sliding gear transmission. Three speeds forward and reverse. Double Chain Drive delivers this power—all of it—not to the rear axle nor to the hubs, but direct to the spokes themselves. Chains bear no breaking strain, preventing play on the sprockets. Large sprockets. Marion chains run with such silence and precision as to win comment and praise from anyone who is familiar with chain-driven cars of any type.

Two sets of powerful brakes, each operating in the hubs, independent of other mechanism. No "forget how" for an amateur.

Automatic lubrication, efficient, reliable and economical.

Selected materials. All parts bearing strain are of liberal dimensions. Breakage is next to impossible. Few parts and simple parts.

The Marion has the low graceful build of the foreign cars, yet has full elliptic springs and 10-inch road clearance. Minimum of dead weight on rear axle. Tire trouble practically eliminated.

Ask to be shown and we'll send our nearest agent with a Car. Seeing and riding will convince.

Four Cylinders Air Cooled
- Model Five—28 H. P. Touring Car, $2,500
- Model Two—16 H. P. Touring Car, $1,500

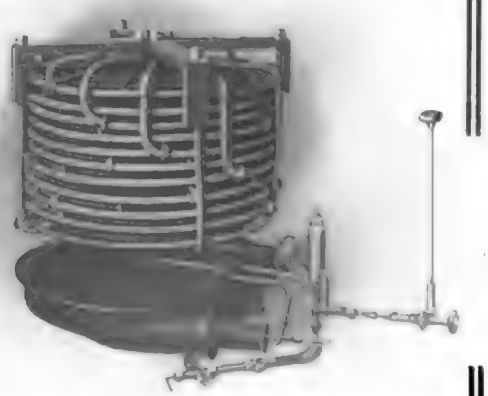
The Incomparable WHITE

The Car for Service



WHITE GENERATOR

Above is illustrated the generator of the White steam car, together with burner, vaporizer, pilot-light and gasolene connections. A glance is sufficient to show that the White generator is totally unlike any other boiler ever designed. We might point out how wide this difference is by calling attention to the fact that in the White generator the water is at the top and the steam at the bottom. In every other type of steam-making apparatus, water is at the bottom and steam at the top.

If the coils of the White generator should be unwound and straightened out the generator would be seen to consist of a single long piece of steel piping. Could anything simpler than this be conceived? The capacity of the tubes is comparatively small; i. e., the amount of water and steam contained therein at any one time is small. The tubes will safely withstand a pressure of many times that which it is possible for the steam to attain. Could any safer arrangement be imagined?

As regards the superior reliability of the White system, that is a matter which has been amply demonstrated by the continuous victories and notable achievements of six successive models of "The Car for Service."

Haynes...

Exclusive Features that Appeal to Discriminating Buyers.

Model "R." Four-Cylinder Touring Car.

Roller bearing vertical engines. Cylinders 5⅛"x6"; 50 H. P. Cast separately. Sliding gear transmission with exclusive device which prevents possibility of burring or stripping gears and permits instant change from high to lower speeds with perfect safety and without noise. Positive cooling system operated at very low cost of power. Individual and special lubrication. Carbureter, which assures perfect mixture in all temperatures and under all climatic conditions. Master Clutch that has no leather surfaces to wear. Takes hold easily and gradually without jerking. Shaft drive. Exclusive universal joints that do away with wear on pins, run in housing packed with grease. One piece nickel steel rear axle with beveled sprocket gear, driven by roller pinion; thrust eliminated, friction reduced, noiseless; all in a bath of oil. Roller bearings throughout. 108-inch wheel base. 50-inch tonneau with ample room for two folding chairs. Six to 60 miles an hour on high gear. Weight 2,750 pounds. Price $3,500, F. O. B. Kokomo. Full head and tail light equipment. Horn and tools.

Every important feature of the 1906—HAYNES—roller bearing engines, master clutch, transmission, universal joints, rear axle, sprocket and roller pinion is exclusive with and found only on the HAYNES. Every detail has been developed in the HAYNES factory and with exact reference to every other part. There is perfect harmony throughout the entire mechanism. This is the reason that in the HAYNES car there is less than 10% loss of power between the engine and rear tires. It is the reason that its cost of maintenance, upkeep and operation is so remarkably low, and that for 14 years it has had the acknowledged reputation of being a car of preëminently high quality.

Its cylinders are extra large. They hold compression perfectly and give high power. When changing gears, the transmission device never allows the momentum of the fast-moving car to be thrown against the power of the engine with its consequent strain to the entire mechanism, frame and tires, a fault common to all other types of transmission. No danger of stripping gears or of gearing climbing out of casing, which constitutes the chief objection offered to large shaft-driven cars.

Roller bearings give noiseless operation. Large flexible springs insure riding ease and long life to tires. Simplicity of control, all parts immediately accessible. Honestly built. Body of cast aluminum and wood. Grey curled hair and hand-buffed leather upholstering. All materials—metal or wood—are tested for strength and flexibility at double severest road requirements.

These are some reasons why the HAYNES gives such satisfactory service at a low rate of cost for upkeep. Others are given in our catalogue, sent prepaid upon request. For prompt attention address Desk 24.

IT'S NOT ENOUGH

TO HAVE A SHORT-FOCUS REFLECTOR

YOU MUST HAVE A REFLECTOR THAT REFLECTS

We learned that almost before automobiles were heard of. We were making parabola-lens searchlights then ourselves, and we thought they were pretty good till we compared them with a lens mirror searchlight, and found that the plated reflector was absorbing most of the rays it was supposed to project.

We "scrapped" part of our machinery, and began making the searchlights that, from that day to this, have been the world's standard for efficiency.

If you don't drive at night it matters little how you dress the front of your car. If you do drive at night **your lamps are your life insurance.** If they don't light the road, they are dear at any price.

Try the best reflector lamp you ever saw, side by side, with a Rushmore of the same price. And remember that silver tarnishes, but glass doesn't.

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

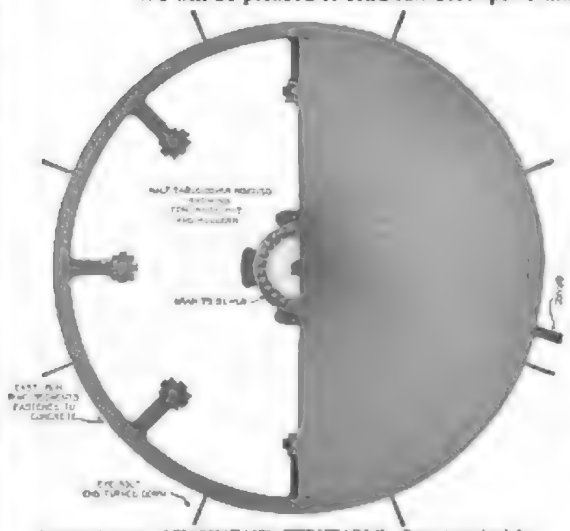
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the wash stand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.



Sectional views of WASHSTAND-TURNTABLE. Patent applied for.

How to Know When Your Tire Gets Flat

HOW much money would it save you in a season if a bell rang as soon as one of your tires began to get flat?

Supposing this were possible.

For you know the *ordinary* tire begins to rim-cut as soon as the air begins to leak out.

And generally you don't know a thing about it until you are riding on the rim. Then it's too late, for the damage is done.

Nothing remains for you to do but say things unfit for publication and make the best of it. Isn't that gospel truth?

* * * *

Now there's a sure way to know when your Tire is leaking—without watching it—without worrying about it—without getting out of the car.

If you have the Goodyear Universal Rim on your car, it will sound an alarm before the air in your tire is exhausted to a rim-cutting point. And this is the way it does it:

The flanges of the Goodyear Universal Rim (which hold the tire in place) are circles of steel which slide on and off the base of the rim, as a ring slides on and off your finger. When both flanges are in place, a "key" ring or locking ring, keeps the outer flange from being forced off by pressure of the tire. When used for Goodyear Universal (the tire that wipes out 90 per cent of all tire troubles) the Universal Rim would be assembled like Fig. 1.

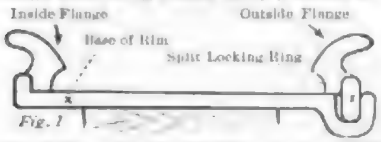

Fig. 1

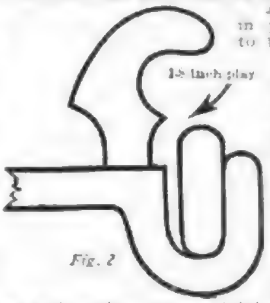

Fig. 2

As soon as the air in your tire leaks out to the danger point, it lets the outer flange slide inward slightly, except where the valve stem comes. This leaves about ⅛ inch play between the top of the locking ring and the bottom of the flange (see Fig. 2,) and just as soon as the air leaks out to the danger point, this binding ring begins to tinkle like a bell, saying to you plainly and unmistakably: "Shut Down! Stop!! Your Tire is beginning to rim-cut!!!" If you *heed* this call, you have saved the cost of a new tire.

* * * *

This is only *one* of the reasons why the Goodyear Universal Rim will preserve *any* tire to a hale old age.

There are others of even greater importance.

If you get a puncture, you can remove your tire to make the repair in 30 seconds—and it requires no tools but the hands. It's as easy to remove and put back a tire on a Goodyear Universal Rim as it is to put on and take off your cuffs, and it takes but little more time.

This is all there is to removing a tire from the Universal Rim. See how *easy* it is.

Unscrew the Thumb Nut which holds the valve stem tight against the rim. Push the valve Stem up into the Tire (this lifts the steel plate which holds the flanges in position.)

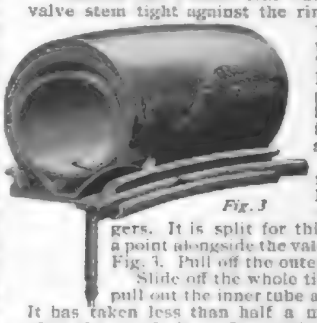

Fig. 3

Spread and remove the locking ring with your fingers. It is split for this purpose at a point alongside the valve stem. See Fig. 3. Pull off the outer flange ring.

Slide off the whole tire, or simply pull out the inner tube as you prefer. It has taken less than half a minute. And after the repair is made, another 30 seconds and you are ready to pump up.

* * * *

The Goodyear Universal Rim will take any Goodyear Tire (Detachable or Clincher, or any *standard clincher tire on the market*. If your car has Goodyear Universal Rims, you can have a tire of a different make on each wheel if you wish. And it will take less than a minute per wheel to change from one make of tire to another, *without the use of a single tool.*

* * * *

Get our "Good News Book" and see the many other convenient, money saving and time saving features of the Goodyear Universal Rim when used in connection with the Goodyear Detachable Auto Tire. This book will be found intensely interesting to the Manufacturer, Dealer or Rider, because it shows a sure way of relief from all tire troubles.

Your Tire Off and On in Less than a Minute

Tells exactly what is accomplished by means of the

Goodrich Quick Detachable Construction

And a visit to our Exhibit at the New York Automobile Show, Madison Square Garden, will afford you the opportunity to see our claims proved.

Perhaps you may wish to make dead sure and detach and attach the tire yourself. It is a pleasant little pastime with all the old time hard work features cut out. You will enjoy the experience and be impressed with the fact that the Goodrich Quick Detachable Tire and Rim is a great achievement in automobile tire building.

Space in Central Boxes directly over Madison Square entrance.

MOLINE for 1906

Model "A" 30-36 H. P. $2500.00
Model "C" 18-20 H. P. $1750.00

Both the above have four cylinder vertical, water cooled motors. Cylinders cast in pairs. Valves all mechanical and interchangeable. Pressed steel frames. Three speeds forward and reverse. Sliding gear transmissions. Mechanical oilers. Storage cells for ignition.

Model "G" 16 H. P. $1000.00

Double cylinder opposed motor under body with single chain drive. Planetary transmission, no internal gears. Engine bearings of liberal dimensions and easily adjustable. Mechanical oiler. New design of water pump. Double side entrance detachable tonneau body.

All three Models have cylinders, pistons and piston rings accurately ground to size.

All three Models have double side entrance bodies with divided front seats.

All three Models have mechanical oilers that force oil direct to the bearings—not force it part way and then let it drop the rest of the way.

All three Models are top notch value for the money. AND WE CAN TAKE CARE OF ONLY A FEW MORE DEALERS.

Advance circular ready for distribution.

THE BAKER ELECTRIC STANHOPE

is, of all motor vehicles, the one most desirable, from every standpoint, for family and professional use. For family use, it is especially adapted by its extreme simplicity and ease of operation. Any man, woman or child can drive it after a few hours' practice. There is no troublesome cranking of a heavy motor, made doubly difficult in cold weather. No loading with gasoline, oil or water, no trouble with spark plugs, and on account of their light weight, the danger of tire troubles, skidding etc., is reduced to the minimum.

THE BAKER STANHOPE is always ready for use at a moment's notice. The user merely turns on an electric switch, operates the control lever, and away he goes with as great speed as may be legally used.

BAKER STANHOPES, being noiseless, free from grease and odor, and always immaculately clean, are ideal vehicles for the use of ladies when shopping, calling, or driving for pleasure, and they are so simple to operate that a chauffeur is an incumbrance. In addition, these

ARISTOCRATS OF MOTORDOM

are so superbly finished in every minute detail as to make them eminently distinguished in appearance, their elegant refinement instantly appealing to the most casual observer. These excellent features have enabled us to sell every machine we have made, early in the season, and obliged us to refuse orders.

Our line of vehicles comprises Imperials, Stanhopes, Surreys, Depot Carriages and Broughams (interior and exterior driven), all superb vehicles, elegant and refined in every detail, and with that high degree of mechanical excellence which has placed and keeps them in the front rank of the automobile procession.

THE Maxwell

PERFECTLY SIMPLE
SIMPLY
PERFECT

16 H. P. Touring Car
$1,450

8 H. P. Tourabout
$780

THE CAR that made a perfect score in the Glidden Tour—1,004 miles without a single adjustment. No car at less than twice the price made **AS GOOD** a record. No car **AT ANY PRICE** did better.

THE CAR that won a victory over all cars costing from one to two thousand dollars in the "Climb to the Clouds" at Mt. Washington. Unlike some contestants, we did not have to send three cars to get one up, but sent the **SAME** car up **THREE TIMES.**

THE CAR whose regular stock 8 H. P. Runabout type won the race at Long Branch August 19, making four miles in 5 min. 33 sec., and defeating cars listed at several times the price.

The automobile that has done these things **MUST** be worthy of your consideration. Look at as many cars as you please, but don't buy before seeing the Maxwell.

The agency field is filling fast. If you contemplate applying for a Maxwell agency, better do it now.

Keep it new and bright with the new cleanser MOBO

Elbow grease and common soap will not preserve the polish of an automobile. It may remove the dirt—but the shine goes too. Mobo is unlike any other substance for cleaning automobiles, preserving and restoring the original lustre; removing grease and travel stains. Mobo is a preserver—it prevents blistering and cracking of the painted surface. Absolutely harmless to the hands Can be used on the leather work of the automobile (also harness) as well as the wood and metal work.

Put up in 2 lb. and 8 lb. cans; also in tubs, half barrels and barrels. If your dealer hasn't it—tell us, we will see that you do get it.

JOHN T. STANLEY
638 W. 30th St. NEW YORK

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

GARFORD PARTS

A few Garford parts in a high grade car enhance its value. Liberal use of them maintain it. Just now we have none for sale. High grade car makers snapped up all we can make this season just as soon as they were offered—a plain tribute to the excellency of their design and material. Our productive capacity for 1907 will be so enlarged as to avoid the disappointment of fruitless inquiry.

MOTOR WAGON PARTS

We can, however, promptly execute orders for steering gears, brakes, sprockets, motor hangers and other parts for motor wagons. They are suitable for all classes of commercial power vehicles, from the lightest to the heaviest. They are not "freak" components of a wonder working vehicle. They enjoy the rare distinction of having been thoroughly tested for some years past in the most varied and severe kinds of commercial service. Circulars 2, 3, 5, 10 and 11 give information concerning them.

The Lamp of 1906

The greatest light-producing oil lamp ever made, is the TOURIST Cold Blast, now ready for delivery.

SEE THE LENS?

The HAM Lamps are built on the only correct principle to obtain perfect combustion and are absolutely reliable guides to safe paths. Wind proof, will not jar out, do not smoke, emit no odor, and burn steadily without flickering.

Avoid lamp troubles by insisting that your car is equipped with HAM Lamps.

Write for booklet showing complete line.

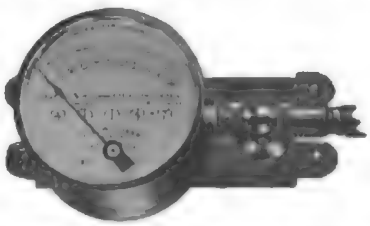
¶ The Automobilist who today doesn't include a Jones Speedometer in his list of accessories is eliminating two thirds of the pleasure of automobiling—and is encouraging the officer of the law to make his arrest.

¶ When the Judge says: "Did you have any *positive* means of determining the speed at which you were traveling?"—he is asking if your car was equipped with a Jones Speedometer. Don't forget that!

¶ The Mounted Officer with his primitive stop-watch method of timing the Automobilist can seldom make a case. Guess work testimony doesn't go in court. The Officer means well, but his method is wrong.

¶ Our Speedometer Bulletin contains speed information and tells of our Protection Tag. Free on application.

JONES SPEEDOMETER
122 West 32d Street, New York



SURETY

Messrs. Clemens & Merz were sure of the four No. 4 "Sta-Rite" Plugs which fired 850,000 charges in 24 hours—distance 1,096 miles. You can always be just as sure of any of the 47 sizes of improved "Sta-Rites" (six types). Insist upon having "Sta-Rites" in your new car and save bother.

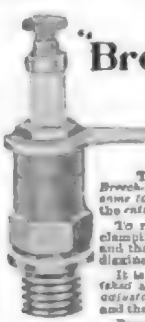
The "Breech-Block" Plug



The Plug With a Handle

To take out your watch or open a *Breech-Block* requires just the *same time, same tools, same effort,* and *one* twist cleans the *entire* porcelain to the whiteness of snow.

To remove the porcelain only, loosen the clamping nut and it drops out of its holder, and the gaskets of copper drop with it. No cleaning!

It is *nickeled* inside and out. *Highly polished* and *dust-proof.* Sparks between *two separate* points and not between *one* point and the *shell.* Its points are *protected.*

Porcelains are *hand turned* and so perfectly glazed that soot cannot *stick* to them. Their *threads* are cut to perfection, and every particle of the idea of cheapness is left out of them.

Postpaid, Anywhere, $2.50. Booklet Free. Made by

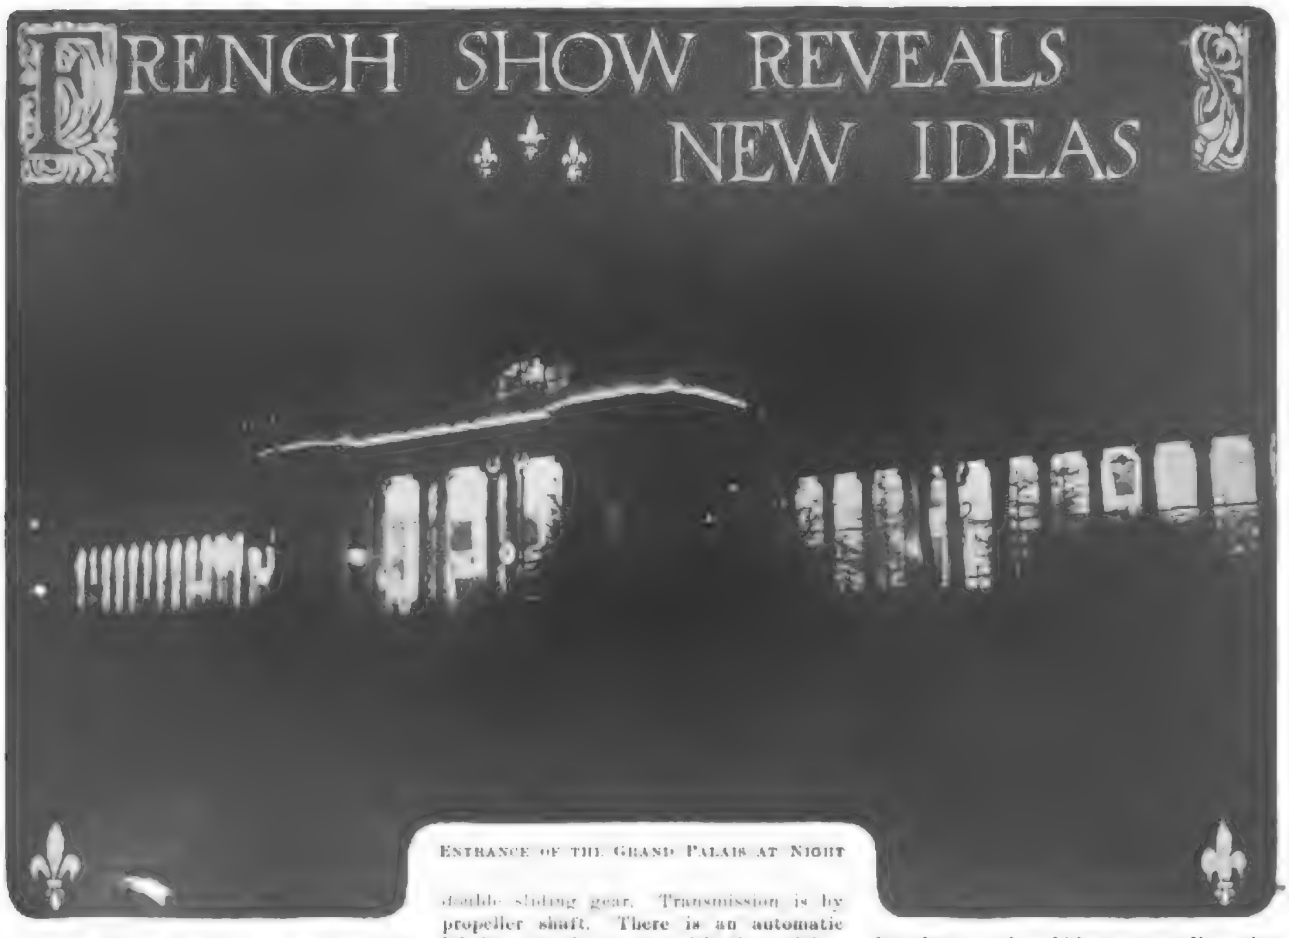
VOL. VIII NO. 26 CHICAGO, DECEMBER 28, 1905 $2.00 Per Year

FRENCH SHOW REVEALS NEW IDEAS



ENTRANCE OF THE GRAND PALAIS AT NIGHT

Paris, Dec. 13—Visits to the Paris show after the rush and crowds of the opening day reveal a great many changes in detail, but a general settling down in main lines of construction. Both users and designers now appear to know what is wanted, and there is a tendency towards uniformity of type. Small vehicles are especially numerous as compared with previous years, and French constructors after so long neglecting the runabout are now giving to it the closest attention. There are chassis sold as low as $395, and for this modest sum is furnished by the Prima company a chassis with pressed steel frame, single-cylinder vertical motor of 7-9 horsepower, running at 1,500 revolutions and having mechanically operated inlet and exhaust valves. There are three speeds and reverse by one lever, and a double sliding gear. Transmission is by propeller shaft. There is an automatic lubricator and a pump with direct drive. Dunlop or Hutchinson tires are fitted.

Sizaire & Naudin offer a runabout with single-cylinder motor, three speeds, with direct drive on the high, shaft drive, side frames all wood, and two-seated body in leather, for $590. The Elegant is sold for $385 with single-cylinder de Dion motor, three speeds and reverse, wooden wheels, big tires and a two-seated body. For $450 the same chassis with a 9-horsepower de Dion motor is supplied, and for $900 a 20-horsepower four-cylinder car can be obtained. These are but a few of the many small cars sold at similarly low prices by the French manufacturers.

The Panhard & Levassor firm exposes a 35-horsepower chassis, a 15-horsepower coupé with body by Rothschild, a 24-horsepower limousine with body work by Labourdette, and a 24-horsepower limousine by Berton Labourdette. The novelty in body work at this stand is the limousine cab, in which the driver is completely enclosed. The dash is heightened and curved inwards over the steering wheel, from which point is a glass front going up to the roof. Entrance to the fore compartment is by a door on the left hand side of the car opening from back to front, the two doors giving access to rear of car opening in the opposite direction. The 35-horsepower chassis is practically the same as the 50-horsepower shown last year. It has four separate cylinders, Eiseman magneto under the hood, gear-driven. Water circulation is by centrifugal pump, gear-driven. There is double sliding gear with direct drive on the high, without the intermediary shaft turning. The side

Digitized by Google

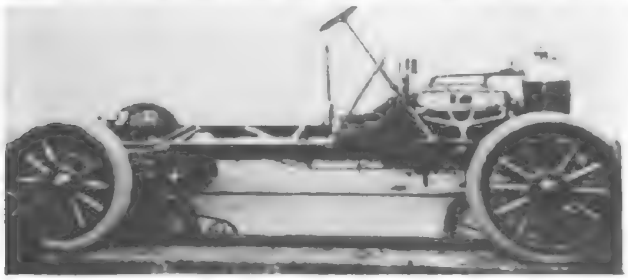
VIEW OF THE MAIN PORTION OF THE GRAND PALAIS DURING THE PARIS AUTOMOBILE SHOW

frames are in wood and steel, as on previous year's models. A new patented shock absorber is shown on the 35-horsepower Panhard. On the 15-horsepower chassis is a dynamo used for charging the accumulators employed for lighting the car. When a dynamo which has to be frequently run at a low speed, or even stopped altogether, is used for charging accumulators, it is essential to have some apparatus preventing the discharge of the accumulators as soon as the voltage of the current produced by the dynamo is insufficient. The chassis exposed is fitted with a disconnector automatically isolating the dynamo from the accumulators as soon as the state of the dynamo requires it. A patent for both home and abroad has been secured for this by the Panhard firm.

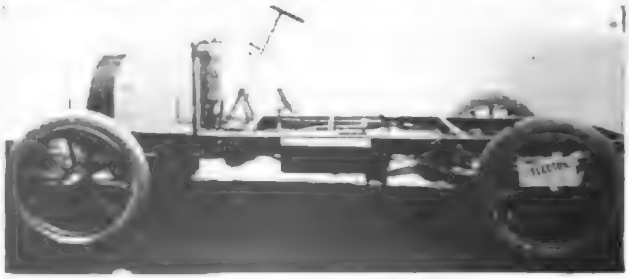
On the Charron, Girardot & Voigt stand the novelty is a chassis with steering mechanism on the left, and intended for town use. It is claimed that with the driver on the left hand side instead of on the right there is greater ease in negotiating town traffic than when he sits to the right. The suspension has been most carefully thought out, for in addition to the transverse rear spring there are longitudinal springs and C springs. The side frames are raised considerably at the rear, this chasis being intended to take a coupé or landaulet body. A 14-horsepower four-cylinder motor is carried under the usual form of C. G. V. bonnet, with radiator below the front of the chassis. Transmission is by cardan shaft; there are four speeds and reverse, with the high speed driving direct. Sparking is by Simms-Bosch magneto with small accumulator to facilitate the starting of the motor without leaving the seat. The other models for 1906 are 20, 30, 50 and 75 horsepower. Among the novelties in body work is a landaulet in which an extra seat has been gained by enclosing the front seat to the left of the driver in the rear of the car. Thus there are two rear seats and one corner seat inside and one corner seat outside for the driver. The circular seat inside has glass sides and front.

An American firm, the Dolores Co., operating in Paris, has also a town vehicle with driver's seat on the left, controlling levers in the center and steering wheel near the left-hand side. It is a 10-horsepower four-cylinder chassis, one of the lowest power four-cylinder automobiles in the show. The only other exhibit on this stand is a 40-horsepower chassis, the largest size made by this firm.

Renault has also brought out a 10-horsepower four-cylinder automobile for town use, the chief novelty the firm has produced this year. The old 10-horsepower two-cylinder model is replaced by an 8-horsepower two-cylinder car. The entire output for some time to come has already been bought up, and Renault is building few cars for the general public.

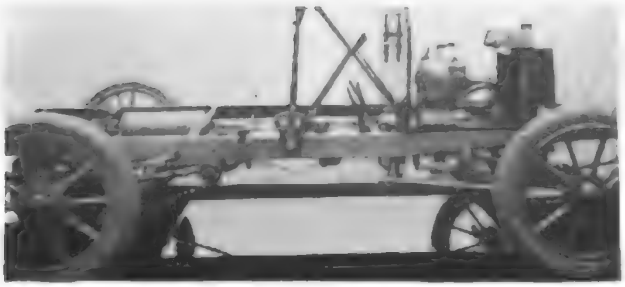


RICHARD-BRASIER 25-35 HORSEPOWER CHASSIS



BERTOLLET 20-25 HORSEPOWER CHASSIS

Digitized by Google



CHASSIS OF THE 1905 PEUGEOT

BERLIET 16-22 HORSEPOWER CHASSIS

At the Darracq stand, one of the most elegant in the show, Hémery's Vanderbilt cup racer is exposed and always has around it a big crowd of people. There is a 10-horsepower two-cylinder light car, sliding change speed gear giving three speeds ahead and reverse, with direct drive on the high, and internal expanding brakes on the differential and the rear wheels. Body work on the 10-horsepower car is a double phaeton with side entrance. The 8-horsepower model has a single cylinder and tonneau body with pivoting front seat. Changes have been made in the clutch, a number of spring studs piercing the outer face of the male cone and raising the leather slightly. By this means a progressive drive is obtained. Push forward pedals with a longer leverage have been adopted in place of the old push down pedals. There is a new system of automatic lubrication and there are now no joints in the water circulating system. Other models shown are 12, 15, 20 and 40 horsepower which excite great admiration.

De Dion & Bouton are showing 8, 15 and 24-horsepower models. Tube side frames are abolished in the 8-horsepower model in favor of pressed steel; there is a single-cylinder motor, three speeds and reverse and metal clutch. Tube side frames are only used on the 8-horsepower model. Greater changes are made on the 15-horsepower car, for the well-known type of de Dion bonnet has been replaced by a square hood permitting the use of a honeycomb radiator. The motor has four cylinders, pressed steel frame, sliding gear giving three speeds and reverse, and patent metallic clutch. The 24-horsepower car, shown with a limousine body, differs from the 15-horsepower car in having four forward speeds.

Mors models are 17, 28 and 45-horsepower. A new metallic clutch has been designed for the 17 and 28-horsepower models and flat push pedals, the same as those on the larger car, have been adopted on these two models. An exceedingly powerful compound brake is fitted to the 45-horsepower model. The most interesting feature of the stand is a self-starting apparatus. It consists of an air pump, a patent mixing chamber called a dynamogene, a decompression tap and another for the gas to each cylinder. In addition, the apparatus includes a small lever connected with the taps, and necessary piping uniting the pump, the dynamogene and the cylinders. To start the motor the small lever is drawn over to open the taps, and the pump is worked two or three times. Air is driven by the pump into the dynamogene, where the necessary mixture is obtained. The small lever is pushed back, and on sparking the motor starts instantaneously.

Léon Bollée shows 20 and 40-horsepower models in which minor changes have been made in brakes, oiling arrangements and the enclosure of working parts. A tire pump is shown on a 40-horsepower chassis, attached to the main shaft between the clutch and the gear box, and connected up or disconnected by sliding a sleeve

ONE OF THE MOTOR BUSES USED TO CARRY PEOPLE TO AND FROM THE PARIS AUTOMOBILE SHOW

Digitized by Google

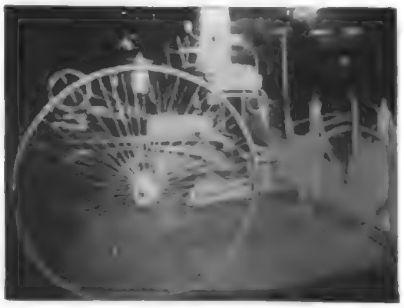
MAGNIFICENT BODY DESIGN ON THE 30-40 HORSEPOWER ARIES CAR

along the shaft. Some splendid body work by Kellner is also shown on the Léon Bollée stand, the finest specimen being an elegant limousine of an entirely new design, which will be shown at the New York exhibition.

The car which won the Bennett cup excites everybody's interest at the Richard-Brasier stand, as well as the trophy which was held for 2 years by the same firm. In the 1906 model the pistons are increased in length, giving a larger wearing surface, diminishing wear and reducing considerably the entrance of oil into the interior of the combustion chamber, and removing the wrist pins from its upper face where it is exposed to high temperatures. The inlet and exhaust valves are interchangeable and are placed on the same side of the cylinder. The leads from the exhaust are all united and are surrounded with water cooling in order to prevent deterioration of the valve. The camshafts are strengthened and are in one piece with the cams, thus preventing all differences arising from keying on and giving a more regular distribution. A special form has been given to the crankcase in order to diminish the splashing of oil on the cylinder sides. A self-starting apparatus is fixed on the 15 and 25-horsepower models by which the motor can be started from the driver's seat by the use of a lever on the side of the car.

Some changes have been made in the lubricator, and it is now possible to stop the flow of oil to the cylinders while passing through a town, and thus reduce or abolish entirely smoke from the exhaust. The clutch of the 40-horsepower model allows a greater amount of slipping when starting, but being rigid when running at high speed. This clutch was used on the 1904 and 1905 Bennett racers. The change speed gears are similar to those of 1905, with four speeds and reverse on the same lever and ball bearings throughout. In the 15-horsepower the transmission is by shaft but for the 25 and 40-horsepower models there is chain drive. There is an increased water circulation for all models, the 15 and 25-horsepower cars being by thermo-siphon, and the 40-horsepower cars by centrifugal pump. The radiator is of the Bennett type and there is a ventilator driven by a belt for the 15 and 25-horsepower models. All brakes have been made larger and more powerful.

Mercedes models are to be made in three sizes—35, 45 and 70 horsepower. The valve camshaft gearing is now of steel running in an oil bath and completely closed in an aluminum crank case. Lubrication is by merchanical pump with positive gear drive. Springs are longer and softer and both foot brakes are fitted with large butterfly adjustment screws. The coiled spring all-metal clutch is entirely enclosed and runs in an oil bath. The most important change is in the gear box and now there is direct drive on the high, while the three lower speeds are operated through but a single set of gear wheels, as on previous models. Features of the body work and fittings on a double phaeton touring car shown at the Mercedes stand are false floor boards folding over to make a sloping floor, side doors opening from back to front, side doors for the two front seats, a new trunk bracket in rear enclosed by a metal sheath following the form of the rear of car, and a swing lantern on the left side of front seats of the car.



A BENZ CAR OF 1889

DISPLAY OF THE BEESTON-HUMBER COMPANY

Hotchkiss cars are not changed much this year. Ball bearings, first introduced by this firm, are fitted throughout, even on the crankshaft. The 35-horsepower model has had its side-frames lowered 4 inches, weight has been saved on the live axle, at the same time increasing its strength. In the model shown there is a speed box with three sliding sleeves and a change speed lever without springs or ratchet, of such construction that the reverse motion cannot be put in accidentally. A heel pedal has to be depressed before the lever can be put into reverse position. It opens automatically to let the lever out, and then closes again.

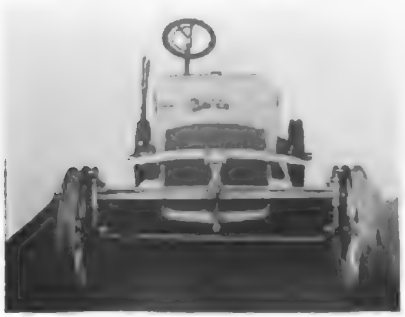
Neither Fiat nor Itala has made many changes on last year's models. The former firm shows a 12-16-horsepower chassis intended for a four-seated body for light use. This model, however, does not replace the existing 16-horsepower chassis. The two Italian firms have two of the finest stands in the whole show, both in a cen-

Digitized by Google

tral position and both gorgeously decorated. The Itala is now represented in Paris by Henri Fournier, formerly sole agent for the Oldsmobile.

In addition to the four American firms —Columbia, Cadillac, Oldsmobile and American Locomotive Co.—exposing automobiles at the Paris show, Rushmore lamps are exhibited by the newly appointed Paris representative, and in the industrial section there is a good show of machine tools by such well known American firms as Brown & Sharp Mfg. Co., Pratt & Whitney, Yale & Towne Mfg. Co., Cleveland Twist Drill Co., and American Emery Wheel Works.

In the Serpollet stand the 1906 models are absolutely new and differ much from preceding types brought out by this exponent of steam vehicles. The generator is in front, the motor in the center and the water reservoir in the rear, making the Serpollet design a perfect imitation of the gasoline machine as far as general disposition of the power plants is concerned. In next year's machines the generators used are very small and the motor a double type, with a pair of horizontal cylinders lying side by side in the center of the chassis frame. Many changes are made in detail around the generator, one



Sizaire & Naudin's Voiturette

of which is the introduction of a recuperator, by means of which the feed water to the generator is reheated by the escaping steam from the motor.

Two chassis and one complete machine are exhibited by the Ader company. One of them is a four-cylinder 16-20 horsepower, and the other, with the same style of motor, is rated at 20-24 horsepower. They both are noticeable by the strength shown in the frame work, and also in the interior mechanisms of the motor and also in the shafts and gears of the transmission set. The 16-20 horsepower chassis is intended only for city use, the concern having catered exclusively to this line for the past 18 months. Another portion of the exhibit is a limousine-bodied car mounted on the higher powered chassis. This body is commodious in the extreme, having accommodation for six in the rear and for one or two beside the driver on the exposed front seat.

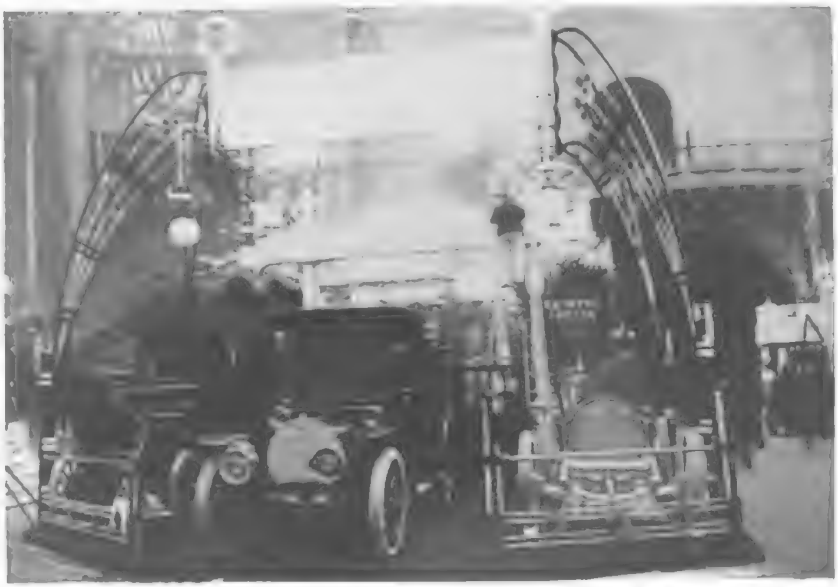
Pilain cars in three different chassis lines are shown—16-22, 20-30 and 24-35 horsepower—and a special model 40-60 horsepower. All of these models are similar in that they have four vertical cylinders. As for the 20-30 horsepower machine its construction is very strong and it is furnished with a special carbureter,

Big Exhibit of the Delahaye Cars

in which the air-controlled valve can be manipulated from the steering wheel when desired. Other points deserving of attention in this machine are the strength of the rear wheels, brakes, the use of an adjustable positive oiler and the adoption of transmissions giving either three or four forward speeds as desired by the buyer. In the 40-60 horsepower machine, the motor is unique and the gear set differs from others on exhibition in that it has three direct speeds ahead.

Four new Florentia models are exhibited on the concern's stand in the center of the hall. One is an 18-horsepower four-cylinder machine with magneto ignition, metal-to-metal clutch and final drive from the gear set to the back axle by cardan shaft. The gear set gives four speeds ahead, the top one being direct drive. Gasoline is fed to the carbureter by air compression, three brakes are used and the tires are large. A chassis similar to this uses final chain drive. The 24-horsepower chassis is of the four-cylinder type and has ignition by a low-tension magneto, with make-and-break devices within each cylinder. The clutch in this model is of the metal-face variety. It has four speeds ahead and all minor points about it are similar to those in the 18-horsepower machine. In the 50-horsepower machine low-tension magneto ignition is fitted. It has four forward speeds, metal clutch and chain drive.

Two chassis are exhibited by the house of Bruhot, one a 12-horsepower machine with a three-forward speed transmission, another a 15-horsepower chassis and the third of 60 horsepower has a gear set with four forward speeds. All models are of the vertical four-cylinder variety. Cooling is by a positively-driven water pump. Magneto ignition is fitted, and the lubrication of the motor and motor bearings is by a mechanical oiler.



Hotchkiss & Co.'s Small But Impressive Display

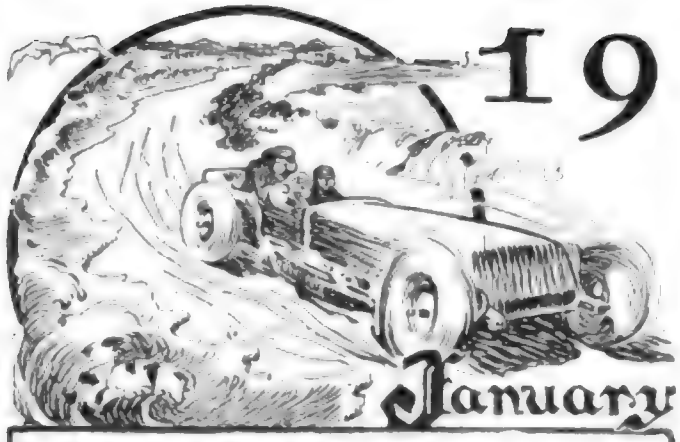
1905



January

Automobile Club of France chooses Auvergne course for 1905 Bennett cup race.

A. A. A. racing board refuses to recognize Kiser's Cleveland mile of 52 4/5 seconds and Oldfield's Denver mile of 51 1/5 seconds.

New York show is held in Madison Square garden.

Association of Licensed Automobile Manufacturers secures Madison Square garden for show purposes.

Annual meet, held at Ormond, Fla., results in mile in 32 4/5 seconds by Bowden, kilometer in 20 3/5 seconds by Bowden, 50 miles in 38 minutes 51 seconds by Fletcher and 100 miles in 1 hour 18 minutes 24 seconds by Fletcher.

February

Automobile Club of France declines to separate Bennett and grand prix events.

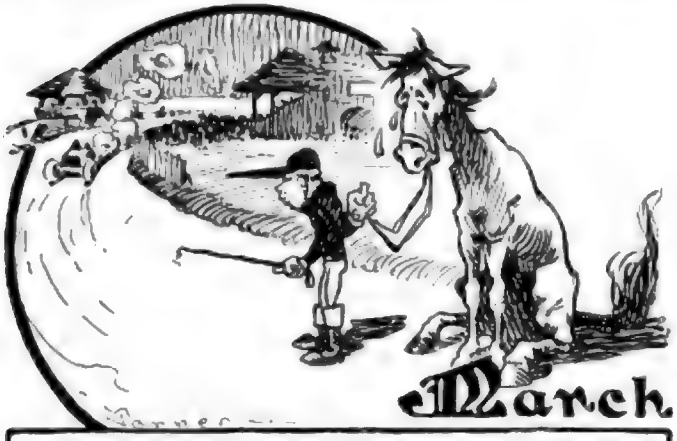
Chicago automobile show held in Coliseum, 100,000 people attending during week and $7,000,000 worth of goods sold.

Kaiser Wilhelm assists in opening of Germany's annual show in Berlin.

First road race run in Cuba won by E. Carricaburo, driving for E. J Comill.

World's standing start mile record cut to 45 seconds by H. W. Fletcher in 80-horsepower de Dietrich, at Havana, Cuba.

France decides to run Bennett and grand prix events separately.



March

American Motor Car Manufacturers' Association formed by makers not in A. L. A. M.

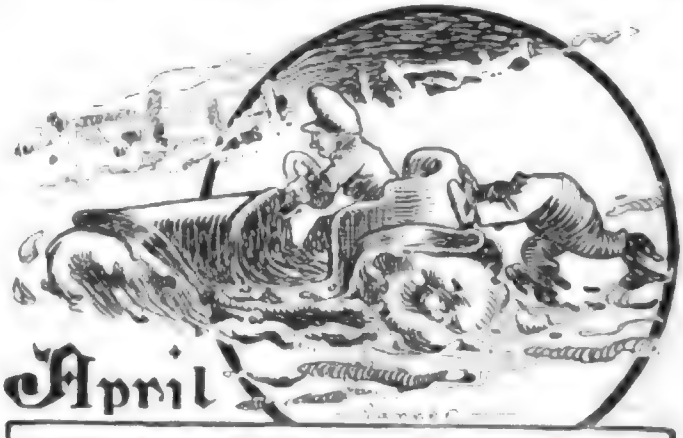
Independent makers decide to hold show next year and not leave field exclusively to A. L. A. M.

E. H. Cutler elected president of National Association of Automobile Manufacturers.

R. L. Morrell selected as chairman of A. A. A. racing board and A. G. Batchelder as secretary.

Morris Park, historic horse racecourse, given exclusively to motor car racing.

Automobile Club of America cuts into show game.



April

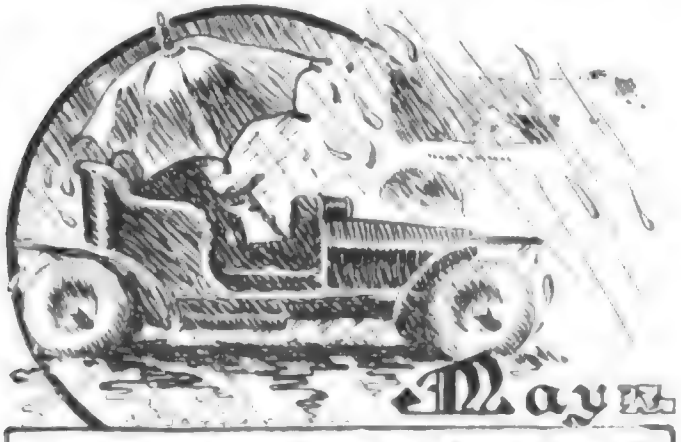
Labor system of road building condemned by Buffalo's good road convention, which favors $50,000,000 bonds for road building.

Date for Bennett cup race set for July 5, and French eliminating trial for June 16.

Racing board of American Automobile Association defines amateur and professional racing, and passes important racing regulations.

Australia's first endurance contest won by a 16-horsepower Argyll car.

Plattier, driving a 22 horsepower Berliet, wins French reliability test of Automobile Club of France, Marseilles capturing team race run in connection with it.



May

Grout steamer makes fastest time of day in Springfield, Mass., hill climb.

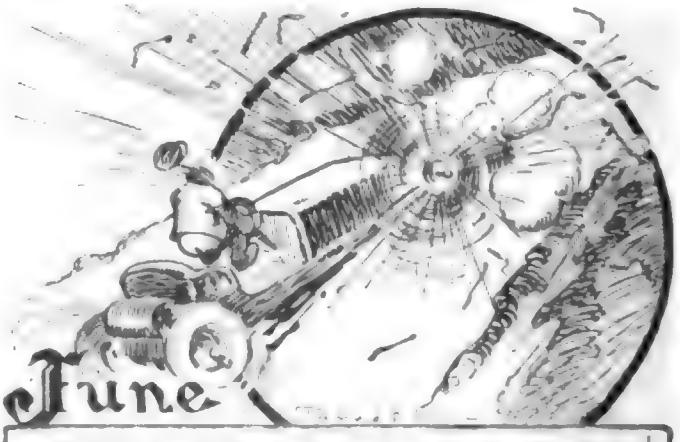
Second annual parade of Automobile Club of America in New York run over muddy streets, 130 cars taking part.

Wridgway, in a 24-h.p. Peerless, lowers 1,000 mile non-stop record to 25 hours 50 minutes 1 second.

Dwight Huss and Percy Megargel start on Oldsmobile transcontinental trip.

Thirteen nominations made by America for Vanderbilt cup race.

Louis Chevrolet cuts mile track record to 52 4/5 seconds at Morris Park.



June

Webb Jay's defeat of Barney Oldfield and Louis Chevrolet a feature of Chicago's 3-day meet.

Guy Vaughn, in Decatville, breaks Wridgway's non-stop and 24-hour records at Empire City track.

Mercedes car makes best time climbing Dead Horse hill, Worcester, Mass., and Grout steamer beats all other American cars.

Earp, Napier, and Bianchi and Rolls, Wolseley, selected as British representatives in Bennett cup race, with Hargreaves and Cecil Edge, Napiers, as alternates.

Thery, Richard-Brazier, Caillois, Richard-Brasier and Duray, de Dietrich, make French team for Bennett cup race.

Digitized by Google

July

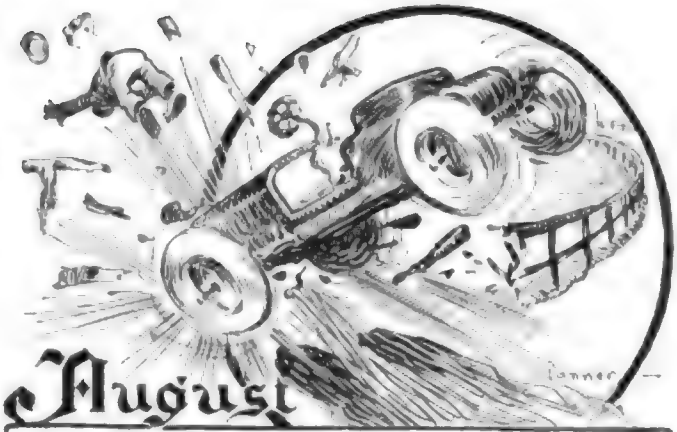
Leon Thery, France, wins Bennett cup for second time, covering 340¾ miles in 7 hours 2 minutes 25 seconds. Nazzaro, Italy, second; Cagno, Italy, third; Caillois, France, fourth. Lytle only American to finish.

Tour from Chicago to St. Paul comes off, roads being muddy and weather rainy.

Webb Jay, in White steamer, does flying mile at Morris Park in 48 4/5 seconds.

W. H. Hilliard, in a Napier, is hero of Mount Washington hill climb, reducing record to 20 minutes 58 2/5 seconds.

Glidden tour trophy is won by Percy P. Pierce, in Pierce Great Arrow.



August

Barney Oldfield injured in accident at Detroit, caused by smashing into fence during 5-mile race; injuries not serious.

Hemery, in a Darracq, wins 696-kilometer race over Ardennes circuit, in 5 hours 58 minutes 32 1-5 seconds.

Earl Kiser meets with serious accident at Cleveland, injuring left leg so amputation is necessary.

Webb Jay receives almost fatal injuries in race at Buffalo.

Official awards in Herkomer tour in Germany give trophy to E. Ladenburg, of Munich, in a Mercedes, fitted with Continental tires.

Track racing practically abandoned because of accidents to Jay, Kiser and Oldfield.

September

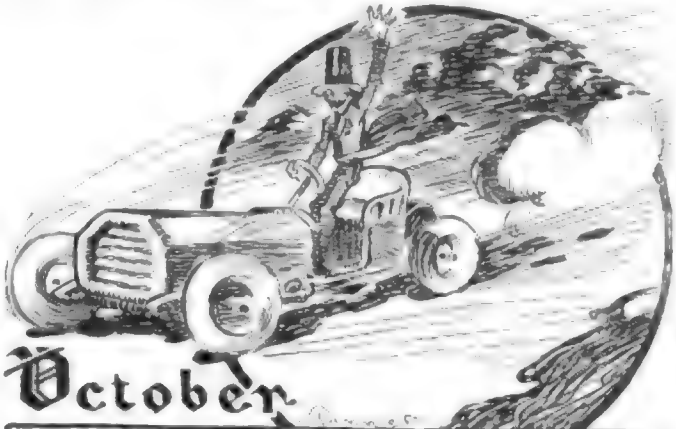
Pope-Toledo, Locomobile, Tourist, Haynes and Thomas cars finish in order named in American eliminating Vanderbilt cup trial, but commission rejects third, fourth and fifth cars, substituting White, Christie and 1.5 tie Pope-Toledo; Dingley drives winning machine, averaging 56.2 miles per hour.

Tourists' trophy race, England's big automobile contest, is won by Arrol-Johnston car, fitted with Continental tires.

Sorel, in a De Dietrich car, winner of Pyrenees cup tour in France.

Raggio, driving an Itala, captures race for Florio trophy in Italy; twenty-one cars start.

Burrelle tire trophy commission awards cup to the Continental tire.



October

France lifts Vanderbilt cup, with America second, Italy third and Germany nowhere; Hemery is winning driver, Heath being runner up; accident robs Lancia of almost certain victory. Hemery's time, 4 hours 30 minutes 8 seconds.

Clifford-Earp, in English Napier, wins Chateau Thierry hill climb in France, average speed being 38 miles an hour; he also captures honors at Dourdan meeting.

James Gordon Bennett denies story he has given his cup to Italy for touring competition.

Braun scores his third consecutive victory in Semmering hill climb in Austria.

November

English shows are held, Olympia at Olympia hall and Stanley at Agricultural hall; French makers well represented.

Reo omnibus wins economy test of New York Motor Club, with Reo runabout second.

Glidden tour committee decides to start next year's run from Buffalo, route going through Canada and White mountains and ending in New York city.

Coliseum show in Chicago so big Manager Miles is forced to secure First Regiment armory as annex.

Records broken by National car, Clemens and Merz smashing Vaughn's marks from 650 to 1,000 miles as well as 24-hour record.

December

Largest automobile show on record held in Paris.

Vandals strew nails on course on last day of French runabout test, making it impossible to immediately pick winner.

Pyrenees cup is stolen from de Dietrich exhibit on last day of Olympia show; no trace of it to be had.

Congressman Morrell, of Pennsylvania, introduces bill into house of representatives which seeks to compel tourists to take out federal licenses.

Independents' tire company, the Ajax Standard Rubber Co., organized, the plant to be at foot of East One Hundred and Sixth street, New York; Horace de Lisser, organizer.

THE HORSE AND THE AUTOMOBILE

THIS is a story about the most dangerous animal in the world—a creature which annually kills and maims more human beings than are slain or injured by any other beast. * * *

Yet, of all accidents to human beings, fatal or disabling, including mischances of every kind and description, not less than twelve per cent are caused, directly or indirectly, by this fear-inspiring creature. Just think of it—twelve out of every hundred mishaps involving physical injury more or less serious! These are official accident-insurance figures. * * *

Assuming that horses cause twelve per cent of them, it appears that these animals are accountable, directly or indirectly, for about 780,000, or say three-quarters of a million, more or less serious mishaps in the United States every year. If these mischances result fatally in only 1 per cent of all cases, the number of deaths annually in this country, attributable to horses, cannot be far from 8,000.

The chief cause of horse accidents, however, lies in the fact that this noble animal—beautiful, docile, affectionate; man's faithful friend and patient servant—is born a fool, and never gets over it. Its intelligence is overestimated. * * *

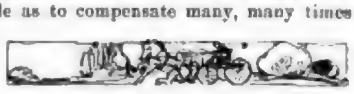
One of the accident-insurance companies recently published a statement, based upon its own returns, which showed that out of a hundred average accidents caused by the horse, the railroad, the automobile and the bicycle, eighty-two are attributable to the equine brute, nine to the railroad, five to the motor car, and four to the silent wheel. One reason why physicians are rated as bad risks is that they use horses so much for driving about—an idea the justice of which is indicated by the fact that, out of 972 accidents to doctors recorded by another concern, 267, or considerably more than one-fourth, were due to horses. * * *

Next in the scale of hazard after the ice wagon comes the express wagon. * * *

The only vehicle rated as more dangerous than the ice wagon is the newspaper delivery wagon, which is considered such a hazardous risk that most of the companies regard it as practically non-insurable. * * * Fast horses are used, and the driving is utterly regardless of the lives and limbs of pedestrians. * * *

A discussion of dangers attributable to horses would be incomplete without some reference to the fact that they are responsible for the existence of the multitudes of house-flies which, apart from the discomfort they cause in summer, are known to be carriers of disease germs. Every stable in warm weather is a fly factory, in active operation night and day. * * *

Meanwhile let us acknowledge that the horse, after all, is the most useful of all animals to man, bar none, and that if, owing to its timidity and lack of cleverness, it is a cause of many serious and not a few fatal accidents, the services it renders to the human race are so extremely valuable as to compensate many, many times over for all the mischief it commits.—René Bache in Saturday Evening Post.



THIS is a story about a machine that is not gifted with brains, but which is accused of more deviltry than any known animate or inanimate thing—chiefly because it is something comparatively new.

The automobile has been responsible for some deaths—but the majority of its victims have been the drivers of the automobile itself. And even admitting all this, it is shown elsewhere that the percentage of accidents caused by the automobile is less than half the percentage of deaths caused by the horse.

While the horse is held responsible for 8,000 deaths each year, it would be a difficult task for the most clever statistician to compile a table showing that automobiles have been responsible for more than a hundred deaths in a year—and this in every country on the entire globe.

The automobile is not born a fool, but it is sometimes placed in the hands of a fool. But horses are also placed in the hands of fools, and the fool driving and the fool being driven make a dangerous combination.

Eighty-two per cent of accidents attributable to the horse! Five per cent of the accidents attributable to the automobile!! Here the estimates of the motorphobists are sadly shattered, and the need of legislation to govern the users of horse-drawn vehicles becomes apparent. On this basis what chance in a lifetime has a man to be injured by a motor car? The motor car will not run away if left alone; it is the most harmless thing on earth then. And even when it is being operated it is usually in the hands of more competent people than are horses, which are frequently driven by small boys and girls.

René Bache has forgotten the deadly trolley car—everybody knows its record for death and destruction.

The paragraph opposite is a deathblow to the motorphobist press. While the enterprising press is making every endeavor to rush its papers through a city's streets, mindful of the life of no person, it is at the same time doing stunts in journalism to show how dangerous to life and limb is the motor car.

Automobiles are not responsible for flies; they do not make barnyards of the streets; they do not breed disease, and they are not taken to rendering establishments to be ground into something for man to use. But the day has come when a city's streets are no place for the poor horse, where it may tear itself to pieces stumbling over slippery and stone-faced pavements. The horse is too nice a brute to be subjected to such abuse. It ought not to be a part of a city's life.

The horse IS useful and it has its place. Furthermore, the horse has been done an injustice to some extent in that it has been classed as brainless. As a matter of fact, but for the horse sense that exists in the horse and the brains that do not exist in many drivers—and drivers as a rule are not over intelligent—there would be more accidents caused by the horses than there are at the present time.

Digitized by Google

The good roads fever is again epidemic, and in some places even the rural districts have been attacked.

While some automobile makers will proudly turn over new leaves, others may feel justified in turning back a few leaves.

Fitzsimmons might break into the automobile game and procure a job as chauffeur—he's still good enough to wallop road hogs once in a while.

It doesn't take a wooden Indian to discover that four-cylinder automobiles are becoming quite the thing in this country, and that other types are gradually becoming extinct.

The purchaser of a French automobile probably wonders how much of his good coin went to fitting up the Paris salon and the magnificent decorations around the stands of most of the manufacturers. No wonder foreign automobiles come high.

About the time France heard of the evident success of the 1906 Florida beach tournament—with the possibility of a few records being broken—it reconsidered its determination not to hold a big race, and is now after all the advertising it can give its makers.

Now the American Automobile Association is stirred up because its own representatives at the Paris conference did not know under whose auspices the Vanderbilt cup race was run. It might be suggested that this is the penalty for naming dummies to serve as representatives.

Getting lost in a snow storm, having one's car frozen to the ground, staying out on a prairie all night and going without food for 36 hours is a part of motoring experience which few desire, but which transcontinental tourists seem compelled to take. While not at all pleasant at the time, it makes good story-telling material, if that is any consolation.

One Frank Mudd, of Chicago, has taken pains to orate and to glory in paying a fine for exceeding the speed limits, because he has at other times received the full value of the money paid out in doing a little scorching when the police were not in sight. It is bad enough to break laws without boasting of it, but to say a judge is misguided and narrow minded is, at least, discourteous. There is some consolation in the fact that Mudd represents no automobilists other than himself and that few automobilists in any manner coincide with him in his rantings or intend following his lead.

The fantastic headgears seen at the Paris automobile salon suggests that even the French women have automobiles on the brain. Let it be hoped no such affliction shall befall this country.

Congratulations are extended to the two Chicago automobile dealers who have waxed hot for a week or so over the proposition of the speed of the car handled by one of the dealers. It requires some fine scheming to work a metropolitan daily paper for priceless reading matter.

The Week

Charges of mismanagement of Vanderbilt race, made at international conference in Paris, stir up Americans.

Prospective entry list for Ormond-Daytona meet shows most of the stars of the world in the competition.

At least ten entries expected for the Cuban road race; Americans in Havana subscribe to fund to run race.

Court of common pleas refuses request of Automobile Club of Philadelphia to enjoin city from enforcing tag law after first of year.

Unconstitutional action of Minnesota legislature may knock out the new highway commission in gopher state.

Philadelphia dealers decide to get together and fight the grafting chauffeurs.

Rules of Tourist trophy race altered so steamers get in on special fuel allowance, equivalent to about 16 miles per gallon.

In big French road race next year drivers will have to repair own tires and mend breaks in machine, no outside help being allowed; tire race sidetracked by grand prix, which will probably be held over Fontainebleau course.

Observations from Paris automobile show.

The English makers didn't seem to think much of the Paris show—which probably is a little in the line of retaliation.

English motorists have an opportunity to demonstrate to the politicians of their country that in union there's strength.

All this hub-bub about Florida and all the silence on Senator Morgan's part would indicate that the meet and not the senator is being advertised.

Although he doesn't know it, the automobile is the horse's best friend; it is the automobile that is to take the noble brute out of bondage and do away with humane societies.

What's the matter with the A. L. A. M., the N. A. A. M., and all the other alphabetical associations getting together and erecting a building on a 40-acre tract to be used for the annual automobile show?

With due consideration and respect for our own greatness and our own ability to hustle, we'll have to go some to even approach Paris in the matter of grandeur as far as automobile shows are concerned.

The American automobile community is pouring out its thanks to the good, kind weather man for the quality of winter he has been dealing out; but the probabilities are he will receive his full share of cussing before another month shall have passed.

As usual, a few slow ones have just heard that automobile shows are to be held in New York and Chicago in January and February, and are clamoring for space. What would these particular makers do if the shows were to be held in November or December?

As if automobilists didn't have enough in the trouble line, they have the grafting chauffeur with which to contend. He has been making his presence felt in every city in the union, and the fact that he is to have his fingers burned by the Philadelphia Automobile Trade Association will be welcome news to the automobile fraternity.

It's nice of Chicago's exponent of motorphobia, the Tribune, to devote a fifth of a column of space to half a dozen accidents—three of which were caused by railroad trains or trolley cars and were fatal—and cover the same with a flare head telling of an automobile accident whereby the automobile merely knocked a man down, and the victim admitted the automobile was in no manner to blame. This is enterprise

BIG TEMPEST IN RACING TEAPOT

Criticisms of Foreigners Over Conduct of Last Vanderbilt Event Stirs Up Storm in New York—American Officials Reply to Assertions, Showing Germans Were Not Posted

New York, Dec. 23—Mingled indignation at the charges and amusement at the utter ignorance of the true conditions not only by the foreigners, but by the delegates representing the Automobile Club of America have followed a cabled story of a discussion that occurred during the progress of the recent conference of clubs belonging to the international union. The story of the discussion alleged to have taken place at the meeting is quoted as follows:

"Count Sierstorpff, representing the German Automobile Club, said he wished to draw the attention of the meeting to some irregularities in connection with the Vanderbilt cup race. Germany had entered five machines for the contest and the German club was anxious to have a representative on the Vanderbilt cup commission to look after the German interests. He wrote to the American club on the matter, but the only reply he received was a list of members and the intimation 'this is the committee.' He wrote again, giving his reasons for desiring German representation, but he received no answer. He also wished to remark that the committee refused two of the machines entered by Germany and nominated two other German machines without consulting the German club in the matter.

"In reply Howard Johnstone and W. S. Hogan, as representing the American club, said they had heard nothing about the matter up to then, but promised to bring the matter before the governors of the American club at once.

"Baron de Zuylen then set the whole committee laughing by remarking that though France had won the Vanderbilt cup twice, the French club never had been able to get hold of the trophy, though repeated demands had been made. He thought this rather hard on the French automobile club.

"De Knyff caused some sensation by saying he had reason to believe some very irregular proceedings had taken place in connection with the Vanderbilt cup race itself. He had heard the weighing-in went on until midnight when all the officials had gone away, and that the third machine to be placed in the race was using a Krebs carbureter, which, of course, was of French construction. Messrs. Johnstone and Hogan simply replied that they were unaware of the facts and that they would at once report the matter to the American club."

The real incidents and circumstances are familiar to all followers of racing, and, very largely, to the general public in this country, every detail of the conditions, preliminaries and conduct of the race having been repeatedly printed in the stories previous to, and following the race. They are comprehensively covered by the replies of Chairman Morrell, of the racing board; Secretary Butler, of the A. C. A., and E. T. Birdsall, of the American Automobile Association technical committee.

"In the first place," said Mr. Morrell, "the deed of gift prevented the adding of a German representative to the commission. In the second place, no entries of German cars were declined. The entries of the machines of Baron de Caters and the late Mr. Dinsmore were withdrawn.

"A date had been set for the designation of drivers and particulars of machines and up to that time it was possible to make changes in entries. The de Caters nomination was withdrawn before that time and the Mercedes car of S. B. Stevens, of Rome, N. Y., was substituted by the commission in the belief that the entry would be acceptable to the German club. As a matter of fact a cablegram confirming the entry was received by the secretary of the Automobile Club of America on the day following.

"Upon the withdrawal of Mr. Dinsmore's car H. L. Bowden, of Boston, offered to substitute his Mercedes racer, but as that was subsequent to the date set for the designations of drivers the offer was declined. As to the whereabouts of the cup, I was under the impression that it was in the possession of the French club.

"The charge that weighing-in was done without the presence of officials is untrue. Because of the delay incurred in the substitution of new cylinders the Locomobile racer was taken to the scales at half-past 10 o'clock on the night before the race. E. T. Birdsall, technical member of the commission, in charge of the weighing, was present at the time. I would have held the scales open for any of the cup cars, foreign or American, all night if it had been necessary.

"The charge that a French carbureter was used on the Locomobile is equally groundless. I examined the Locomobile racer thoroughly and its carbureter was a duplicate of the one used on my own Locomobile touring car, and which I know to have been made in Bridgeport, Conn.

"It is regrettable that these charges have been made without a knowledge of the facts. It is the first unpleasant incident in connection with the most successful automobile race ever held in this country."

"Concerning the correspondence with the German club," said Secretary Butler, "our club simply acted as an intermediary for the American Automobile Association. We sent a list of the Vanderbilt cup commission to the German club, and apparently that was what Count Sierstorpff had reference to when he said he received a club membership list by way of answer to his demand for German representation on the committee.

"It is unjust to hold the automobile club accountable for something over which it has no control. The deed of gift from W. K. Vanderbilt, Jr., places the cup in the custody of the American Automobile Association, and designates a commission to take over active control of the race. This commission consists of the racing board of the American Automobile Association, the chairman of the sports committee of the Automobile Club of France and the donor of the trophy, Mr. Vanderbilt. Under such deed it would be impossible to place a representative of the German club or of any other foreign club on the committee.

"With the answer of our club to the German club's inquiry was mailed a copy of the deed of gift. The correspondence was then turned over to the Vanderbilt cup commission. As to the Vanderbilt cup, I believe it was placed in a vault at Tiffany's to await orders from the French club. If that organization has not possession, it probably is due to another misunderstanding. As a member of the commission I know that no German entry was declined, nor was any entry filled in the German team without the consent of the Automobile Club of Germany."

E. T. Birdsall, technical member of the commission in charge of the weighing-in of the cup cars, emphatically denied that any of the machines had been weighed without the presence of the officials as had been intimated by Rene de Knyff, of the French club. He also denied that the American Locomobile racer was equipped with a French carbureter.

"I was present at the weighing of every cup car," said Mr. Birdsall, "and I personally made a minute inspection of every machine that competed in the race. The Locomobile, owing to the delay in substituting new cylinders, was not weighed until 1:30 o'clock on the morning of the race.

"There were present at the time A. L. Riker, of the cup commission; S. A. Miles, representing the manufacturers' association, and several other race officials. We had gone on the scales at 10:30 o'clock at night expecting the car to be ready then, but we waited until it was actually in readiness to compete before we placed it on the scales.

"The statement that a Krebs carbureter was used on the Locomobile is not borne out by the facts. The carbureter used was of the regular stock type used on all Locomobile machines, and manufactured at Bridgeport, Conn. There is actually no doubt of this, as I personally examined the carbureter, as I did all other parts of the machine."

The evident ignorance of the foreigners participating in the discussion of racing conditions here is evidenced by their confusion of the Automobile Club of America and the American Automobile Association. That Howard Johnstone and W. H. Hogan confessing to practically no knowledge whatever of the circumstances connected with the winning of the Vanderbilt cup, should have been named by the A. C. A. as quasi representatives of the United States in an international conference having to do with racing is, to say the least, amazing. Mr. Johnstone, the club's foreign representative, has been fully informed of the correct facts of the case by mail and has been requested to present them to the German and French clubs.

"If any of the foreign clubs which competed in the Vanderbilt race," said President Morris of the A. C. A., "had

Digitized by Google

any complaint to make as to its conduct by the American Automobile Association such complaint should naturally have been made at the time of the race and in accordance with the rules. It hardly seems fair or sportsmanlike to make such complaints at this late date, more than 2 months after the race has been run."

For awhile the New York motoring world was agog with excitement, but when it was discovered the criticisms were made through ignorance of the situation everyone calmed down.

ABOUT NEW YORK ARMORY

New York, Dec. 25—The new armory of the Sixty-ninth Regiment, where the A. C. A. show will be held, is an immense assembly hall, altogether without an architectural parallel, its design and construction being marked throughout by departures from established practice, departures necessitated chiefly by the several requirements of large and unobstructed floor space, ample light, and complete fireproofness. To these ends the main portion o. the edifice consists of an enormous drill hall with floor space 189 by 202 feet, housed under a gigantic curbed covering, which is sustained by six semi-circular steel arches. The height from the floor measures under the arches 100 feet. An ample basement extends under the entire building, except under the unexcavated middle portion of the floor of the main hall, under which there is no basement, except around the edges. Around the edges of the main floor, at a sufficient height above it, and with no supporting pillars to obstruct the floor, there is an ample gallery for the accommodation of visitors. For the purposes of the automobile show, this gallery, which nominally is only 16 feet wide and is terraced by rows of seats, is being widened to 18 feet and floored over with level planking. The main floor likewise is being planked over with hardwood. The total floor space available for the automobile show is 152,500 square feet, an amount exceeded by but a few buildings in the world. The outside dimensions of the building are 197 feet wide on Lexington avenue, 305 feet deep on Twenty-sixth street, and 335 feet deep on Twenty-fifth street, running back to within 100 feet of Fourth avenue. The height is 116 feet. Construction was commenced on December 21, 1903.

HEMERY'S RACING CAR

New York, Dec. 25—"I heard not overmuch racing talk and no discussion whatever of the future of the Vanderbilt cup," said a tradesman just back from Paris. "Over there makers seem to think they have learned all that is possible from racing, and believe that if it be continued it will be merely as a sport. I saw Joe Tracy. He was making notes of all the cars, but said nothing to em about being commissioned to buy a racer. The only racer I heard spoken of as a candidate for Ormond honors was the Darracq. I was told that two engines of the type and power used in Hemery's car, which, I am sure, are over 80 horsepower, were to be coupled. I was also informed that the rules as to brakes, reverse and differential were to be complied with in building it."

MANY ON ORMOND LIST

Probabilities Show Morgan Will Have Cream of Racing Talent at His Meet in Florida

New York, Dec. 25—With all this talk of the Ormond-Daytona meet Senator Morgan says intending nominators do not want to forget that the entries will close positively on January 8, with him at his office, 116 Nassau street, in this city.

"I do not propose," says he, "to give out the entries piecemeal, as they come in, but will reserve the announcement of the nominations until after the final closing of the entries."

At the present writing it would seem that the entry of the following were assured: Alfred G. Vanderbilt, 200-horsepower Special, Sartori driver; G. W. Young, 110-horsepower Fiat, H. W. Fletcher driver; Hol-Tan Co., 110-horsepower Fiat, Lancia driver, and 90-horsepower Fiat, Cedrino driver; F. A. LaRoche Co., 180-horsepower Darracq, probably Hemery driver; Charles Schroeder, 80-horsepower Darracq, driver not named; Foxhall P. Keene, 120-horsepower Mercedes, Keene driver; American Napier Co., 120-horsepower Napier, Clifford Earp driver; Dr. H. E. Thomas, 90-horsepower Locomobile, owner driver; Walter Christie, 100-horsepower Christie, owner driver; Renault Brothers Agency, 90-horsepower Renault, Bernin driver; Ford Motor Co., 105-horsepower Ford, Henry Ford and Frank Kulick drivers; C. A. Coey, 90-horsepower Thomas, Coey driver; R. M. Palmer, 50-horsepower Matheson, Palmer and W. H. Owen drivers; Oscar Lear Automobile Co., 50-horsepower Frayer-Miller, Lee Frayer driver; Wayne Automobile Co., 50-horsepower heavyweight and 40-horsepower middleweight Wayne, Holmes driver; White Sewing Machine Co., White steamer, Walter White driver; Louis Ross, Stanley steamer, Ross driver; R. E. Olds, 30-horsepower Reo middleweight, Dan Wurgis driver, and National Motor Car Co., 60-horsepower National, Carl Fisher and Jap Clemons drivers.

Andre Massenot, of the Panhard & Levassor American branch, is expected back tomorrow from an inspection of the Florida and Cuban courses. That they will pass muster goes without saying. The outcome, it is believed, will be the entry of George Heath and a Panhard at both Ormond and Havana.

E. J. Conell, president of the Cuban Racing Association, who sailed for Havana on Saturday, stated he had assurances which led him to believe there would be at least ten crack cars and drivers to enter for the cup contest. As was told in MOTOR AGE last week, the start in the big race on February 11 will be from Camp Columbia, the headquarters of the American army during the occupation. It is proposed to convert the buildings into a training camp with garage, repair and sleeping accommodations. The American Club of Havana is taking great interest in the coming carnival, and subscriptions to its fund have reached $3,000. The Westrumite Co., of Chicago, has made a bid to oil the 57 miles of course for the $5,000 appropriated by the municipal council for the purpose. W. J. Morgan, manager of the carnival, was to have sent out the entry blanks on Saturday, together with those for the Palm Beach motor boat regatta, for which he says he has already received assurances of the participation of five fast boats.

The Fiat team will be the first on the Ormond-Daytona beach. Tomorrow Harry W. Fletcher, with George W. Young's 110-horsepower Fiat, which Lancia drove in the Vanderbilt race, and Emanuel Cedrino, with its mate, which was piloted by Nazaro, start for Florida. Their idea is to experiment with various sprockets and study atmospheric conditions.

RIKER ON FRENCH SHOW

Bridgeport, Conn., Dec. 20—A peripatetic MOTOR AGE man had the good luck to be at the Locomobile factory to-day on the arrival home from the Paris show of A. L. Riker, a pioneer American designer, whose recent triumph in the Vanderbilt race is still fresh in the minds of motorists. That the golden opportunity for an interview on the European 1906 output was seized goes without saying.

"The 1906 models," said Mr. Riker, "show practically no changes. The European makers seem at last to have arrived at a final type. The changes are merely in refinements and details. While propeller shaft drive is employed on the small cars, not one in forty of the big cars has other than double chain drive. Make-and-break spark and magneto ignition are now universal in the big cars. The popular powers are 24 for the low-powered and 40 for the high-powered cars. You must remember, however, that, owing to the tax per horsepower no higher powers are being brought out there. A 24 means 30-35 and a 40 will reach 50-55. The Mercedes is 45-horsepower. No higher powers are being built except for racing purposes. All cars above this are reckoned as mere freaks.

"I was disappointed in seeing so few radical changes. The bodies are smaller than last year and have fairly low backs. The king of the Belgians type has been utterly abandoned. Perhaps because of its being winter, the show cars were mainly of the limousine type, though closed cars with adjustable windows are the prevailing touring type in Europe. We have the European makers skinned to death in body building, both as to finish and workmanship.

"The makers with whom I talked confessed that the days of the European car as a big factor in American trade and sport were numbered."

OF COMMERCIAL INTEREST

London, Dec. 15—A point of considerable interest to British motorists, especially to the trade, has arisen out Bristol way, where a road carrying company, employing steam motor tractor, has been asked to pay more taxes by the Local Road Authority for "extraordinary traffic damage" alleged to have been caused by the company's motor tractors. As this case, if decided against the motor carrying company, would constitute a precedent for a number of similar claims all over the country, the Society of Motor Manufacturers and Motor Union have decided to stand behind the concern.

AGAIN ON THE TRAIL

Megargel Makes Light of His Experience at Flagstaff and Tells of the Adventure

Flagstaff, Ariz., Dec. 19—When we pulled out of Williams in the Reo Mountaineer we fully expected to make Flagstaff by midnight of the same day, having purposely delayed the start until the ground froze, as the mud made going almost impossible. After 4 miles on the low speed we decided to camp out for a few hours and wait for the ground to freeze. This we did, building a bonfire and lying wrapped in our blankets until midnight. Then the car was frozen fast to the ground, and we had to use an axe to chop it loose. Everything went well until we came to the big swamp, and here we became confused in the darkness and ran into a bog, miring the car to the body. We planted post after post to which to attach our cable, but each one pulled out, and it was daylight before we were free and ready to go.

After partaking of a cup of coffee and baked beans, we proceeded eastward, making the best of the hard running through the woods and snow. Soon it became necessary to shovel a road, as the snow was over 2 feet deep and held us fast. I think we did not make 4 miles all day Sunday, and we were traveling a road that had not been broken since the big snow storm of several weeks ago. We hadn't seen a human being since leaving Williams, and our provisions gave out. We had not considered it necessary to lay in much of a stock for the 34-mile run, which we expected to make in a couple of hours. We had gone hungry before, but the cold was intense, and all day Monday it snowed and blew until we couldn't see a half dozen yards before us. Then our gasoline gave out and we were right in the midst of the biggest drift yet found on the trip.

After a consultation we decided to make for the railroad track by compass and follow that to the nearest telegraph station. This we did, reaching Bellemont, 14 miles below Flagstaff, just as a relief party, coming to our assistance, came in sight. We wired Williams for gasoline, accepted the food brought us and, refusing to be towed into town, followed the tracks of the big wagon. The relief party, as much in search of a young ranchman named Smith as us, found his frozen body lying against a log near where we were discovered. He had been dead for several days.

Although our supply of food was insufficient for wintering in the mountain, we killed some small game, which we cooked and ate. Our blankets are too thin for this country, but with the aid of a good camp fire each night we managed to keep fairly warm, although our hands and feet nearly froze. We walked into Flagstaff tonight, leaving our car 4 miles out, in the midst of a drift that almost conceals it. We expect to go after it in the morning and run it into Flagstaff.—PERCY F. MEGARGEL.

Winslow, Ariz., Dec. 27—Reo Mountaineer reached here today. Christmas was spent in the snow crossing Canyon Diablo. The nights are below zero. The last three caught us outdoors.—PERCY F. MEGARGEL.

INCIDENTS OF MEGARGEL'S FLAGSTAFF ADVENTURE

GERMANY'S SHOW

Berlin, Dec. 17—An outline of the plans of the show to be held here from February 3 to 18, under the auspices and joint control of the Automobile Club of Germany, and the Association of German Motor Vehicle Manufacturers, is out. It will be held in Landes Austellungs park, near the Lehrte railway station, within easy access to all parts of Berlin. The exhibition will be divided into five sections, as follows: Motor cars, for the transportation of persons, also for sanitary, fire department and military service; motor cars for industrial purposes; motor cycles; motor boats in so far as the size and conditions of the exhibition space may be adequate and adaptable to such exhibits; parts and accessories of motor cars, including wheels, tires, together with automobile clothing, literature pertaining to the use of automobiles for sport, travel and transportation, and drawings and touring maps. Rent for floor space will be at the rate of $7.14 and wall space $5.95 per square meter. For outdoor exhibits space will be charged for at the rate of $2.38 per square meter.

CITY PAYS DAMAGES

Milwaukee, Dec. 24—The city of Milwaukee will be forced to pay for the automobile of Dr. A. C. Sidler, which was torn to pieces in a collision with a manhole on Trowbridge avenue, between Delaware and Kinnickinnic avenue, Friday night. The manhole stood 16 inches above the pavement and was unmarked by a light. The city will pay without a fight the price of the automobile.

REO MAKES A RECORD

Touring Car Completes 1,000-Mile Non-Stop Run Under Difficulties at Capital

Washington, D. C., Dec. 22—L. S. Jullien, the Reo agent here, C. C. Singer and R. S. Lockwood, of the New York branch of the Reo Motor Car Co., had a taste of the strenuous life this week when they succeeded in making a 1,000-mile nonstop run on the streets of Washington in a 16-horsepower Reo touring car. No such a run had ever before been attempted here and its progress was watched with more than ordinary interest by automobilists. The weather conditions were all against the run, for the night before the start there was a heavy snow storm which left the streets in terrible condition. Added to these unfavorable conditions was the undue interference of the police, who attempted in every way possible to circumvent the drivers in their efforts to run a thousand miles over the streets of the capital city without stopping the engine. These were handicaps hard to overcome, but Jullien, Lockwood and Singer were determined to achieve their object, and they came out of the contest with flying colors, although Singer was mulcted out of $30 by a police court judge on two charges of violating the speed law in different places.

Jullien had been planning for this run for several weeks. He thought he had it all worked out to his satisfaction, but after the run was well under way all the plans had to be changed because of the activity of the police. The original plan called for the run to be made on Pennsylvania avenue, the principal street, starting from Washington circle and running to the Peace monument, a distance of about a mile in each direction. This route was taken for several hours, when the car was ordered off the avenue on the ground that it was a nuisance. After that the drivers did not follow any regular route, but drove where the conditions were most favorable. Several trips were made into the country during the day time, but at night the car was kept running over the city streets.

The car used was one of this year's models. It was equipped with Goodrich tires, while a Jones speedometer-odometer was used for checking purposes. Aside from the loss of a staybolt there were no mechanical or tire troubles and the entire distance was covered in 70½ hours. A record was not the object of the run, the sole purpose being to demonstrate that the car could cover 1,000 miles without stopping the engine.

Promptly at 11 o'clock on the morning of December 18 the car was sent away on its long journey with Jullien at the wheel.

Digitized by Google

The car plowed its way through the snow and slush and the engine was working in great shape when Lockwood took his turn 2 hours later. Each driver handled the car 2 hours and then laid off 4 hours for sleep. Aside from the disagreeable weather conditions nothing transpired to mar the run until 4 o'clock Tuesday morning, when Singer was arrested while on Pennsylvania avenue. After arguing the question for some time the policeman finally agreed to let Singer go if Jullien would give his personal bond for Singer's appearance in court. This was arranged and the run was again resumed after its narrow escape from being stopped by Singer's arrest. The next day during his period off Singer appeared in court and was fined $30, which he cheerfully paid to the clerk.

Tuesday afternoon the drivers were thunderstruck to learn that the major of police had issued a general order commanding the police throughout the city to make as many charges against the drivers that the car would have to keep off Pennsylvania avenue during the busy hours, so frequent trips into the country were made, while at night unfrequented streets were used. The police were unable to make a single charge against the drivers and they were enabled to finish their great run without further molestation. The run was finished at 9:23 Thursday morning, December 21.

Despite all these drawbacks the public took intense interest in the trial. Doubtless the police cannot be blamed much for their vigilance, for if they had not been strict in the matter the traffic on the principal thoroughfares would have been effectually sewed up just at the busiest time. Still, the motorists following the test felt aggrieved and there was considerable grumbling over the high-handed methods taken by the powers that be to shunt the Reo into the background. The performance was highly commendable and Jullien and his mate deserve credit for their plucky fight against adverse weather, not to mention the obnoxious cops. It would not have been so bad if the city streets could have been used altogether, but those excursions out into the country where the snow and slush made the going hard told on the total time.

MERCEDES RUMOR

London, Dec. 16—It is rumored arrangements are now in progress for a flotation of the Mercedes company, but it has not been confirmed from official sources. It is, however, worth noting that the concession for the remainder of Europe, outside Germany, which a certain Parisian concern has held for some years, is stated to have just expired, and it is suggested—perhaps it has inspired the rumor—that the German concern is now at liberty to make other arrangements and to float for a considerable sum, without any necessity to consider interests other than its own.

MUST FIX OWN BREAKS

Rules for French Race Bar Outside Aid—May Use Fontainbleu Circuit

Paris, Dec. 14—The French club's tire race is an ill-starred event. When first proposed few people took it seriously and now, after struggling to the rules and regulations stage, it is in grave danger of being allowed to lie dusty and forgotten in the pigeon holes of the clubrooms. The sudden decision of the club to hold a road race next year is the cause of the fall in the fortunes of the tire race. No second bidding was needed by the sporting commission to prepare for the 1906 grand prize, and, although it only received its order a few days ago, arrangements are in an advanced stage. Radical changes have been made and next year there will be no work for specially trained tire experts, for all changes or repairs of pneumatics, fitting of gasoline or other tanks, must be done by the driver and his mechanic. There will be repair stations as heretofore, but everything required to be done on the car must be done by the two men in charge of the machine. Heath is not enchanted with the new arrangement; Albert Clement thinks it will be fine exercise; Hémery and Caillos like it, whilst Thery and his mechanic, Muller, having both retired from the business, do not care a rap.

Not more than four cars can be entered by one factory. Firms constructing under a license will be considered as part of the original firm and will not be allowed to enter more than four cars in all. Should entries be very numerous the number will be reduced to three each.

Fontainebleau is the most popular circuit at the present moment, and the odds are great that it will carry it over the Ardennes and the mountainous track known as Auvergne. The center of the proposed circuit is not more than 30 miles from Paris, the roads are perfect, having long, straight stretches, a few hills, no dangerous turns, and no grade crossings. They all run through splendid forest land, and owing to the shortness of the circuit—about 53 miles—and the fact that some of the roads in the center will have to be passed by each competitor three or four times to accomplish one round, the race could be followed much more interestingly than on some of the long circuits through isolated country, devoid of telephonic or telegraphic communication. The points where cars would have to cross the original track are at big clearings in the forest, meeting places of the hounds in ancient days, where there is sufficient room to construct separate tracks for cars going in different directions.

Propositions will still be considered by the club, but if nothing better than the Fontainebleau circuit is discovered within the next few days, it is certain that next year's race will be run at the gates of Paris. Long Island record crowds will appear as nothing, compared with the masses which will be at Fontainebleau for the race.

REO CAR WHICH MADE A 1000-MILE NON-STOP RUN

Much interest is centered in the Peugeot motor cycle exposed at the show, on which Giuppone lowered the world's motor cycle track record for 1 hour. On this specially constructed machine, which carries a 12-horsepower two-cylinder motor, and weighs, altogether, but 114 pounds, Giuppone was given a standing start on the Pare de Princes track the day after the opening of the salon. In 3 minutes 34⅘ seconds he had got over the first 10 kilometers, in half an hour he had covered 32.024 miles, and when the 60 minutes were called off he had traveled exactly 63.6 miles. The fastest round of the track was accomplished at an average speed of 70 miles an hour. Maurice Fournier's world's record for the 10 kilometers, established in 1903, was reduced by 17 seconds. Giuppone's time was taken every 10 kilometers and compares with Anzanisi's 1-hour track record as follows:

Miles	Guippone	Anzanisi
6.2	05:34 4-5	06:29 4-5
12.4	11:21 3-5	13:01 4-5
18.6	17:14	19:37 3-5
24.8	23:08 2-5	26:00 1-5
31.0	29:01 3-5	32:28 1-5
37.2	34:52 4-5	38:56 3-5
43.4	40:54 1-5	44:49 1-5
49.7	46:51 2-5	51:10 4-5
55.9	52:55 3-5	57:31 2-5
62.1	58:38 1-5	1:04:14 2-5
Hour	63.6 miles	58.2 miles

FOR THE ENGLISH KIDS

London, Dec. 16—For the Christmas trade in toys for the children, English novelty manufacturers have turned out some little motor cars, from 11 to 15 inches long, finished with pneumatic ruber tires and able to run straight or in a circle. One is a racer, and another, with lamps and brake, has a nickeled headlight that can be lit. Among the latest novelties is a motor omnibus driven by clockwork, beautifully modeled and japanned and running on rubber-tired wheels. Another source of joy to a boy is a motor outfit.

MAY UPSET ROAD WORK

Action of the Minnesota Legislature Likely to Knock Out Highway Commission

St. Paul, Dec. 22—The Minnesota Good Roads Association held its state meeting in the capitol building in this city yesterday, and beyond a rather interesting display of fireworks, little actual work was done. The meeting served to bring out the fact, however, that Minnesota's new highway commission law may after all be knocked out before it is well started. According to statements made by Minneapolis delegates to the good roads meeting, the legislature first passed a highway commission law and then turned around and recommended a constitutional amendment which legislates the highway commission out of business. The constitutional amendment was ostensibly to increase the amount of the state tax for roads and bridges, but in re-enacting the section of the constitution, the legislators entirely left out the authority for a highway commission.

Governor Johnson will go ahead and appoint his highway commissioners next week, however, and it will start work January 1. The state legal department will be asked to pass upon the new amendment, and if it actually does revoke all authority, express or implied, for a highway commission, the good roads association will begin an immediate campaign throughout the state, to defeat the amendment when it comes before the voters.

The country and city districts mixed at the meeting yesterday in some interesting debates. Representatives from the newer sections of central and northern Minnesota objected strongly to the statements of city delegates that the farmers knew nothing about road making. "The farmers made the roads that have built up Minnesota," declared one member, "and they know the principles of practical road building. Up in our country we don't want automobile roads at $3,000 a mile, but we want more good hard country roads and more state aid to build them."

It is generally agreed that the new state highway commission, if invested with full power, as the law intends, will start Minnesota upon a new era of road building. It is hoped that implied authority will be found in the constitution for the creation of the commission, so that the constitutional amendment approved by the legislature may be accepted by the people, even though it leaves out the provision authorizing a commission. This amendment increases the road tax from 1-20 to ¼ of 1 mill on the property of the state. It will mean a fund of nearly $250,000, instead of the present income of $60,000. With this amount the commission can do a great deal of work within the next few years.

Jackson, Mich., Dec. 23—The rousing good roads meeting which Mayor Tood has planned to hold in this city will probably come off January 4. It is expected that a large number of persons from all over the state will be present, and, as about 400 are expected from Jackson county alone, the number will swell to probably double that number. Some excellent speakers have been secured, among them being State Highway Commissioner Horatio S. Earle of Lansing and J. D. Dort of Flint. Among the prominent men of this county who are interested in the success of the meeting, and who have promised to take an active part in the sessions, are Arthur L. Landon of Springport, James A. Dean of Parma, J. D. Ballard of Leoni, Edward Ambler of Brooklyn, J. Russell Fisk of Tompkins, W. B. White of Summit and David Croman of Munith.

Since the initiative step was taken by Mayor Todd the township of Henrietta in this county has started along the road that leads to good roads. At a meeting of voters it was decided to build at least 1 mile of good road every year. This will be started in the spring.

TO FIGHT THE GRAFTERS

Philadelphia, Dec. 23—The Philadelphia Automobile Trade Association is about to take up the subject of chauffeur graft. Many members of the association have recently been solicited by chauffeurs of private owners for a rake-off on the sale of a car on the ground that without their O. K. the sale would have gone elsewhere. In at least two cases the hold-up was attempted even before the purchase, the chauffeur going from agency to agency, getting the highest figures, boldly announcing his intention of recommending the car which brought him the largest commission. The matter was quietly brought to the attention of the officers of the association, and an inquiry along the row soon brought to light the fact that few of the prominent branch managers and agents had not been so approached, many of them half a dozen times. It also developed that in a few instances some of the tradesmen, particularly anxious to effect a sale, had allowed themselves to be muleted of a portion of their profits. One case was brought to light where a chauffeur, after the sale of a car and the refusal of the agent to cough up, had actually threatened to give the car a black eye—this despite the fact that his employer had not even consulted him as to what machine to purchase. This grafting operation, it appears, has not been confined to the cars themselves, but to everything in the nature of supplies as well—tires, oils, repairs, etc.—and has been quietly assuming such proportions that the association is determined to put a stop to it before it becomes universal.

MATINEE BEACH MEETS

Philadelphia, Dec. 26—A. H. Chadbourne, manager of the Cape May Automobile Club, has in mind the promotion on that beach next season a series of matinee races on the lines of similar trotting contests, which were successful at the Empire City track, under the administration of Alfred Reeves. The plan is to divide the cars into various speed classes and as they win in their own class to move them up to the class above. Prizes of nominal value are given for each race and trophies at the end of the season go to those cars which have progressed most successfully from one class to another. Club races might be run the same way.

LIFT BAN ON STEAMER

Britons Propose Special Fuel Allowance or Cars Like the White in Trophy Race

London, Dec. 15—The regulations for the British Tourist trophy race of 1906 has just been issued by the automobile club and it is evident therefrom that pressure brought to bear by the Society of Motor Manufacturers and Traders has resulted in the abandonment of the preferential treatment which was proposed in favor of steam cars. Owing in a great degree to the sportsmanlike attitude of Frederick Coleman, of the White Steam Car Co., who, with a full knowledge of the disadvantages under which his car would labor in a fuel competition as against internal explosion engines, entered two cars and did remarkably well in the race, which was held in the Isle of Man last September, the officials were induced to propose a special fuel allowance for steam cars for 1906, equivalent to about 16 miles per gallon. But as there are practically only three steam cars selling in this country, and all the development appears to be in the direction of the internal combustion engine, the proposal was received with much dissent, which culminated in the remonstrance of the Society of Motor Manufacturers to the automobile club. As a remonstrance of that kind is, in itself, a veiled threat, the club had no alternative than to treat the test as being a purely consumption trial.

The more reasonable motorists, however, while not agreeing with the proposal of the club to permit an arbitrary allowance of fuel to particular types of cars in competition with others less favored, think that, as steam cars use lower grade fuel, the cost rather than the quantity should have been the basis from which the question could have been fairly decided, more particularly as such a basis would have induced a tendency towards using low grade spirit. As the rules stand, every car must use spirit of a specific gravity between 0.695 and 0.705 at 60 degrees Fahrenheit. The other conditions which are new are, that the minimum weight of chassis shall not be less than 1,275 pounds, while the load to be carried, exclusive of fuel, water, oil and replacements, shall not be less than 1,125 pounds. This is to include weight of driver and one passenger. The principal alteration here is that the maximum weight of chassis, insisted upon last year, is now removed, consequently the manufacturer can make his car any weight he chooses so long as it is not less than the minimum. Other fresh conditions are that every car before competing must demonstrate it can be driven for half a mile on a level road on the top gear at a speed of 12 miles an hour without any manipulation of the clutch, and it must also be capable of starting on and ascending an incline of 1 in 6. This is, of course, done in order to prevent abnormally high gears being used in assisting the car on down hill stretches only, and also to insure that the car has a starting speed gear sufficiently low to make it a practical road vehicle.

Digitized by Google

The projected tire trials of the Automobile Club of Great Britain and Ireland have been postponed for a fortnight, and the date for receiving entries extended to the end of January. This result has no doubt been arrived at by the disinclination of the leading manufacturers to give it their support, and the disadvantage to the less important firms of having to push through arrangements for, to them, a very important event, inside practically a month. All the large firms possess sufficient cars to enable them to know how many sets of tires they wished to enter, if they so desire, but with the small firms the matter is different, and as the success of the event appears to now hinge on the support of this latter class, the date had to be extended to give them time to make the necessary arrangements, not for tires, but for cars. It is stated the Dunlop, Palmer, Michelin and Continental tire companies will not take part in the contest, and as nine-tenths of the motor tire trade of the country is done by these four firms, the trading interest in the event will probably be little.

AS ENGLISH FOUND PARIS

London, Dec. 16—From all accounts the actual commercial results obtained by placing the Olympia show date in front of Paris has resulted pretty much as the British trade anticipated. At least that is the opinion of those members of the British trade who have been on duty as English representatives on the stands in the Grand Palais. Although the press correspondents who were across have asserted that the stream of English and American visitors has been even more pronounced than at any previous Paris show, the experience of the English representatives has been that little of British business was there to be gathered in, and that, in any case, little of such business was obtained by them. How this condition of affairs will be dealt with by the French trade and the French automobile club, is not known, but it is just possible that the Paris date may be changed. So far as the business obtained for British shown goods, such as the Napier, Humber, Wolseley and Star, there is no brag, if there are no details worth publishing, so that one may take it that business for these, too, was quiet and had all been secured at Olympia.

HAD HARD TRIP

Alpena, Mich., Dec. 23—One of the most interesting automobile trips ever taken was participated in by C. F. Steele and Joseph Germain, of this city, who have just returned from Onaway. At Onaway they delivered an automobile to C. H. Freeman, an insurance agent and owner of the Onaway opera house. It was the first one ever seen in that section of Michigan. It took a little more than 7 hours to make the trip, a distance of 70 miles, and a great many stops had to be made along the way to explain to farmers just what it was in which they were riding. Travel was also impeded by 5 inches of snow. During the whole distance the roads were exceedingly bad. The trip over the jack pine plains to Valentine lake was a lonely one, and from Valentine to Onaway, a distance of 24 miles, the journey was still more dreary. Only one person was seen in 36 miles of travel.

CAR FACTOR AT POLLS

British Motorists, Fighting for Repeal of Speed Limit, Think They Hold Whip Hand

London, Dec. 16—It is generally considered that England is now on the threshold of a general election of members to parliament, and in consequence motorists are bestirring themselves to see in what manner the event can be turned to their advantage. Sir Alfred Harmsworth, who, by the way, has been created a baronet by the out-going conservative ministry, has issued a formal letter, in which he proposes that every motorist should aid the candidate who appealed to him for his suffrage and the assistance of his motor car. It is generally considered that the motor car will play an important part in the impending election.

It is a remarkable fact, but nevertheless one which has always been accepted, that people who spend the most of their time in discussing politics with more or less ardor, should on the one day of days, upon which they can put their ideas and opinions into concrete form, be swayed or intimidated or prevented from registering their votes by the mere matter of personal convenience in getting to and from the polls. But the paradox is there and in that knowledge lies the motorists' strength.

Sir Alfred Harmsworth suggests no motor car should be lent to any candidate to carry voters to the poll unless he pledged himself to assist in the new parliament towards ameliorating the motorists' position by altering the new motor car act so as to eliminate the speed limit. It is, perhaps, as well to explain here that parliamentary candidates are not permitted to hire vehicles to convey voters to the poll. In legal phraseology this is classed as intimidation and corruption, but as there are many other ways of choking the dog, the restriction simply plays into the hand of the candidate with the greater following among those who possess vehicles which can be loaned. It is also open to political associations to arrange for the assistance of vehicles on behalf of the candidates of their particular choice, so that in the long run the matter comes to practically the same thing. But, particularly in country constituencies where voters are inconveniently situated to get to the polling booths, the motor car is certain to be of great assistance, inasmuch as it will cover 20 miles to a booth in less time than an ordinary horse vehicle will cover half the distance, besides which the capacity of the automobile is one of time, not mere physical energy, so that the side which can command the greatest number of motor cars can be expected to poll the greater number of its political strength.

It is not difficult to see that at the present time this preponderance will fall to the conservative party; the agents of that party have been organizing their motor car resources so they can be concentrated and flung, like a military division in war, on the points at which it will be most effective, however widely separated. Motorists in general realize that here is their opportunity to demonstrate their strength and gain the legislation they have been demanding. With such valuable ammunition at hand in the way of quick transportation facilities for the voters, what politician will have the temerity to stand out against them, and if he does, what show will he have to be elected if he depends upon the horse-drawn vehicle to bring his voting strength to market? The motorists, if they only realize it and stick together in this fight, can win.

WANT NEW LAW PASSED

Syracuse, N. Y., Dec. 26—Syracuse automobilists are uniformly in favor of a law creating a New York state automobile commission, which shall take care of the interests of the automobilists. Whether this should take the form of a state highway commission with a bureau devoted to automobiling has not been decided. In case a bill is passed by the legislature creating such a commission Frederick H. Elliott, of this city, secretary of the New York State Automobile Association, will be a candidate for one of the places on the commission and will have the support of a large number of automobilists throughout this section.

The matter will be threshed out at a meeting of the directors of the association during the New York show, and whatever is decided upon will be embodied in the form of a bill to be introduced into the legislature.

The automobilists are dissatisfied with the manner in which they have been treated at Albany. They are in favor of a graduated tax upon all motor vehicles, the money to go into the good roads maintenance fund. Secretary Elliott has letters from Winthrop B. Scarritt, former president of the A. A. A., and from William H. Hotchkiss, of Buffalo, president of the state association. Judge Hotchkiss favors a state highway commission to include a bureau in charge of vehicles using the highways. This he believes necessary on account of the good roads amendment to the constitution recently passed, providing for the expenditure of $50,000,000 for good roads throughout the state. It is thought that since such a large sum is to be expended, the roads should be looked after by a commission. Mr. Elliott agrees with whichever plan it is decided would be for the best interests of the state. President L. G. DeCamp, of the Watertown Automobile Club, recently held a conference here with Mr. Elliott, H. H. Franklin and other prominent automobilists who were agreed that some sort of a commission should be appointed.

BUCKEYE ENTERPRISE

Toledo, O., Dec. 26—John Jenkins, recently of pugilistic fame, has moved to Urbana, O., where it is rumored he is contemplating starting a motor bus line between Urbana and Mechanicsburg. The proposition at present is to use only one car over the route until the line has been popularized a little, when a second car will be added and the trips doubled. Urbana and Mechanicsburg have no direct railroad connections, a fact which makes the starting of a motor bus line a particularly favorable enterprise.

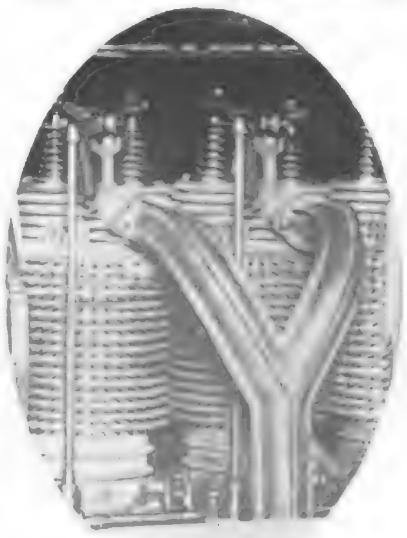
KNOX INTRODUCES FOUR CYLINDER CARS

NO TENDENCY in air-cooled machines for the approaching season is more conspicuous than the use of four vertical cylinders and the transmission of power through some form of clutch and sliding gear set. In previous issues Motor Age has described and illustrated the majority of the large air-cooled cars, many of which are built on similar lines. This week the Knox, built by the Knox Automobile Co., Springfield, Mass., the pioneer of air-cooled motors, is presented. This, too, has four cylinders placed vertically in front and has the power transmitted through a metal-to-metal cone clutch, running in oil, a Mercedes type of sliding gear and double chains. In addition to three models of this type the company is retaining its line of two-cylinder opposed air-cooled motors, all of which show many 1906 improvements, among which, most prominent, is a decided lessening of noise.

In the four-cylinder car, model G, the trade name of the new machine, as in all air-coolers, each cylinder is a separate casting, with the head integral and valve ports not required, because of placing the mechanical admission and exhaust valves side by side in cages, which reside in separate openings in the cylinder head, being secured therein by a single screw, with the consequent result that not a minute is needed to remove one. A two-part aluminum crankcase carries the four cylinders, each secured by vertical bolts passing through a bottom flange on the cylinders.

The Knox company, in all its horizontal motors of the present and past seasons has cooled by the pin, commonly known as the porcupine scheme, and which has worked without change for six seasons. It has been used in both pleasure and commercial machines, many of the latter working 12 months in the year in tropical countries like Cuba and other parts of the West Indies. Each cylinder is covered with corrugated pins—the corrugations spiral-like—screwed into the walls. These pins in model G are arranged in thirty-two rows encircling each cylinder, with some fifty pins to each row. The sharp edges of the corrugations on the pins make good radiating surfaces and the pins, entering the cylinder walls ⅛ inch, draw the heat from the inter portion of the wall as well as from the outside surface. Each pin is 1 3-16 inch long and ¼ inch in diameter. Much experimenting has been done by the company in determining the exact proportion of radiating surface and air blast and in properly locating the pins. Other experimenting was made in fan construction, with the result that the fan is of large diameter and is carried on a separate bracket on the front of the crankcase. The fan blades are made like those of a propeller and are integral with the hub and periphery band. On the cylinder walls below the pin portion are two circular radiating flanges, and on the head of each are five other flanges, made extra deep. Both of the Y-shaped exhaust pipings from the cylinders are made with four radiating ribs, which should be included in the general cooling scheme. This model has been tested under all the varying circumstances common to motoring and have the cooling features worked successfully. Cylinder bore and stroke are 4¾ and 5½ inches.

Apart from the cooling arrangements the



EXHAUST SIDE OF TWO KNOX CYLINDERS

valve actuation is deserving of special notice, inasmuch as it is by a separate overhead rocker arm for each valve, and that any valve can be removed or replaced in a few seconds. The inlets and exhausts are made interchangeable. They have a diameter of 2 inches, the inlets with a lift of ¼ inch and the exhaust ⅜ inch. Steel and nickel alloy serve in their composition. In actuation two camshafts are required, one at the right for the intakes and one on the left for the exhausts. Each camshaft runs in three bronze bearings and is driven through steel and bronze gears, enclosed in aluminum cases, on the front of the motor. Push rods with the usual rollers for bearing upon the cams work in long vertical sleeve guides on the crankshaft, their only support, and at their tops, rounded for the occasion, rest in cup-shaped receptacles in the ends of the rocker arms. A short coil spring, with one end secured to the cylinder head and the other to the rocker arm, keeps the arm resting at all times on the rod, and prevents striking noises that would result if they were not held together. One end of the spring hooks to the cylinder head and can be quickly removed. All rocker arms are angularly placed on the heads and supported by yoked standards screwed into the cylinder heads, within the yokes of which the rocker arms are pivoted on bolts pinned in position. The end of the rocker arm resting on the top of the valve stem is yoked, and carries between the yoke arms a screw stud, which can be adjusted to vary the valve lift. Another screw in the yoke arms acts as a locknut for this one. By not having the rocker arms pivoted to either the valve stems or the push rods it does not interfere much in valve removal.

The crankcase, a split aluminum chamber, carries the five crankshaft bearings in its upper half, the lower portion serving for carrying oil. The crankshaft is made from nickel steel, cut from the solid slab and turned and ground to a balanced finish. Each of the five bearings are 1⅝ inches in diameter and the four forward ones are 2⅞ inches long, the one at the flywheel end having a length of 4 inches. Bronze bearings are used throughout. The pistons.

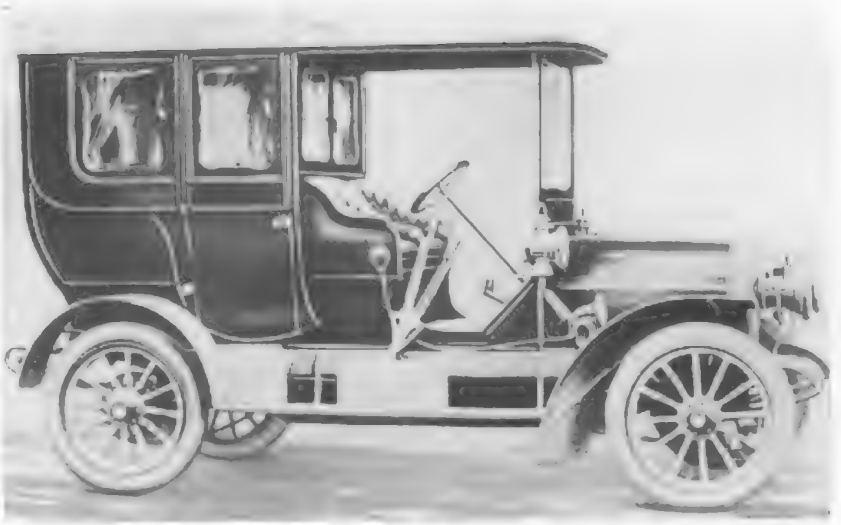
Digitized by Google

follow typical lines in every detail and are carried on the connecting rods by hardened steel pins 1 inch in diameter and affording a bearing in the connecting rods 2¼ inches in length. The crankpin bearings are 2½ inches long and have a 1¾-inch diameter. Each piston carries three compression rings.

Attention has been given the lubrication of all engine parts. In the bottom of the crankcase, which is considerably dropped for the purpose, is a rotary oil pump, working in an oil well, the pump being driven from the exhaust camshaft by spiral gears and a vertical shaft. From this pump oil ways lead to all bearings of the crankshaft, and by means of hollow connecting rods the crank pins are lubricated. The pump is of sufficient capacity and power to force a large oil surplus, the bearings being designed so this excess drains off and falls into the crankcase, being strained and used again. A pressure regulating valve is placed in the system, and on the dash is placed a regulator. By a nut and screw adjustment on the regulating valve any desired oil pressure may be obtained. This pressure is shown by the indicator. By this system oil is furnished in direct proportions to the motor speed. The disposition of the pump, its drive and the oil leads are shown in the side elevation view of the chassis.

A touch of foreign construction is seen in the ignition, in which ordinary spark plugs carried horizontally in the right side of the cylinders below the inlet valves are supplied with current from a high tension magneto carried on the right side of the crankcase. The magneto is gear driven. The current in the magneto is low tension, but is transformed to high tension in a single coil within the magneto and is distributed to the plugs by a secondary distributer, which forms a part of the magneto. A dry battery is carried for emergency uses. One wire connects from the magneto to each plug and a fifth connects with the dash, where a switch serves to connect the dry cells.

A Holley carbureter furnishes mixture, which passes by way of a three-Y piping to the inlet valves. Both governor and hand control are used on the throttle. The throttle arm, which can be seen hanging almost



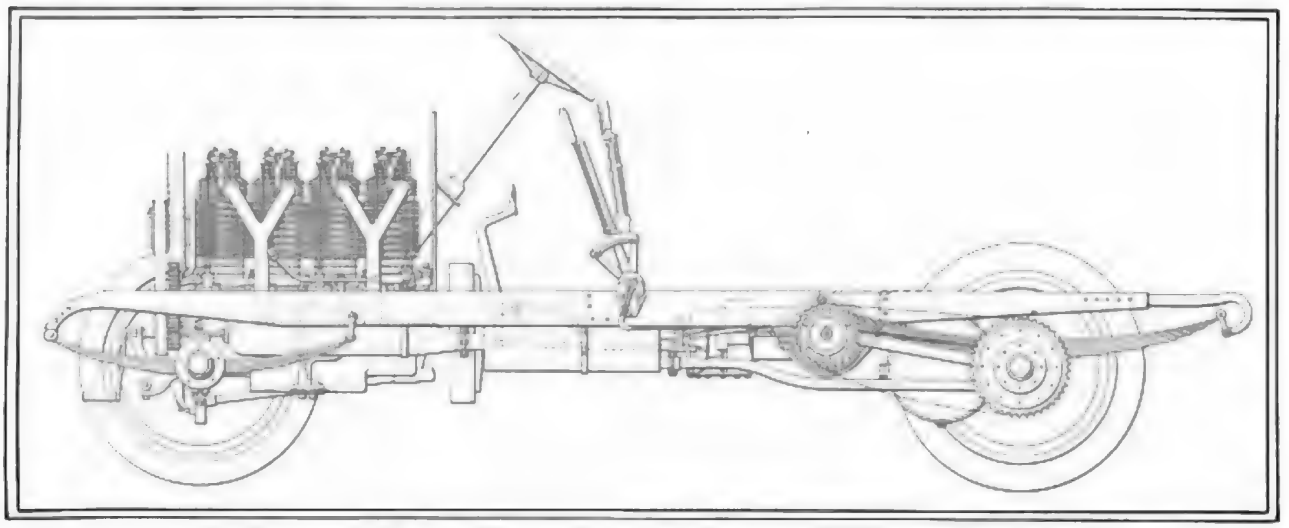
KNOX 35-40 HORSEPOWER LIMOUSINE CAR

vertically at the side of the mixing chamber, connects by a rod with the steering column control and beneath the connection with this rod it connects with a shorter one to the clutch. A spring surrounds the clutch rod, one end resting against a washer on the rod and the other against a ring on a horizontal arm connected with the clutch. The spring permits the throttle being controlled irrespective of the clutch. With this connection the motor speed falls when the clutch is withdrawn, but immediately resumes the original speed on engagement.

An innovation in American practice is shown in the metal-to-metal cone clutch. An oil-tight chamber encloses the cone surfaces and a few spoonfuls of oil is sufficient to lubricate them for a week's service. When the clutch is not engaged the surfaces of both the male and female parts are covered with an oil film, which must be expelled before both parts are positively connected. Time is required in this expulsion, which is sufficient to prevent the car starting with a jump when the clutch is thrown in.

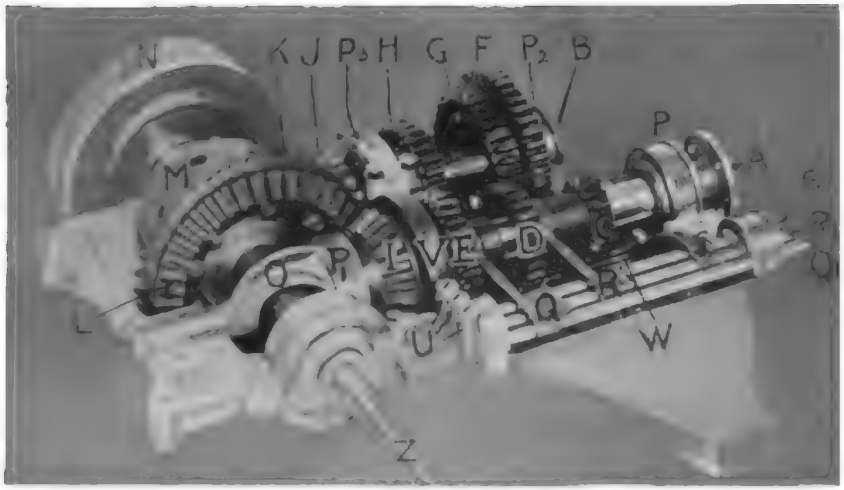
A universal joint is not used between the clutch and gearbox. The latter is patterned along Mercedes lines and gives four forward speeds and one reverse, all obtained on the selective system through three sliding units within the case and through a single lever working in a gate quadrant. Throughout the gear set only materials with high tensile strength have been used, the shafts being made of nickel steel showing tests above 120,000 pounds to the square inch. The gears are made of chrome nickel steel capable of withstanding a strain of 175,000 pounds to the square inch. Non-adjustable Hess-Bright ball bearings are used on all shafts. The case, of cast aluminum and divided horizontally in line with the main shaft bearings, takes its support through four integral arms; the forward pair being very wide and the rear pair only the width of the differential housing part. In the top portion are easily-removable inspection covers.

The main shaft A is of large diameter and has four fluted keys to drive the two sliding members, gears E and D-C. It is coupled direct to the clutch shaft and revolves in a long bearing P at the front and another P1 at the rear. The latter bearing is carried from the floor of the case and



SIDE ELEVATION OF CHASSIS OF KNOX 35-40 HORSEPOWER AIR-COOLED FOUR-CYLINDER TOURING CAR

Digitized by Google



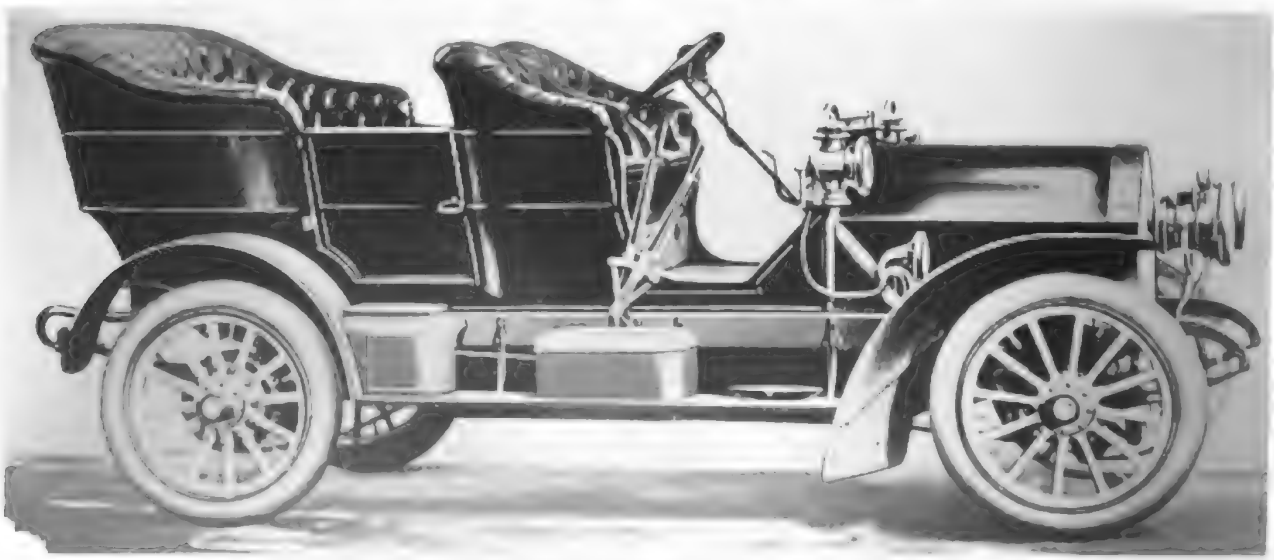
KNOX SELECTIVE SLIDING GEAR SET

is braced by an arched arm O spanning the jackshaft and resting against the rear end of the case. The counter shaft B runs in a pair of bearings P2 and P3 and has the three spur gears F, G and H rigidly secured to it and also the bevel gear J, which meshes with one of the bevels K on the differential. The gears of the differential are of the bevel variety and are enclosed in the perforated case M. Another differential bevel L, is in constant mesh with the bevel I which, by the way, is integral with an internal gear V, both being on a short hollow shaft within which is the rear end of the shaft A, having its rear Hess-Bright bearings within these gears. It is thus apparent that the shaft A can be revolved while the gears I and V are idle. For direct drive or fourth speed the gear E is moved into the internal gear V, thus locking the shaft A with the bevel I and driving through this bevel and bevel L on the differential. On this speed the countershaft with its gears is revolving but none of the gears are in mesh. For the other three forward speeds and the reverse the drive to the differential is through the bevel J on the countershaft and K on the differential. Third speed is obtained by meshing sliding gear E with H on the countershaft, the former being moved through the shifting rod yoke Q and the rod Q1, for second speed gears D and G and meshed through the shifting yoke R and its rod R1 and on slow speed gears C and F are meshed through the same shifting mechanisms. In reversing an idler W on a separate shaft in the bottom of the case is jointly meshed with gears C and F by shifting yoke S and rod S1. The three shifting rods are operated from a single lever working on the ordinary selective principle. Three plunger balls are contained within the casings U. Each is held down by a spiral spring and enters in a cavity in the top side of its respective shifting rod when the gears moved by the rod are in perfect mesh.

In connection with the speed changing arrangements can be noted the regular brake, which is of the metal-to-metal variety and in the form of a band operating on the drum N on the jackshaft. Emergency brakes are of the internal expanding type, located within dustproof drums on the back wheels. They are applied by the side lever and are connected with the clutch so that their engagement disengages the latter, whereas the pedal brake is furnished either connected with or not.

As in all previous Knox chassis strength has been an object. Both axles are of I-beam section, forged from a special grade of nickel steel made with a tensile strength of 120,000 pounds. Each is made in a single piece and is oil-tempered and annealed. The steering pivots and levers are single forgings made from the same material. Axle dimensions are 2 by 1½ inches, the rear axle is stationary and straight throughout and the forward one stepped 4¾ inches inside of the front spring seating so as to afford protection for the bottom of the engine case. All road wheels are 34 inches in diameter, the forward tires are 4 inches and those on the rear 4½ inches in diameter. Imported Hess-Bright ball bearings are used in all of them. Pressed steel constitutes the frame pieces, the side members of which are straight throughout and made in channel sections with a 5-inch depth at the center and 1½-inch channel webs and a uniform wall thickness of 5-32 inch. Short spring hangers serve in front but in rear are the long curved familiar Daimler type. Four semi-elliptic springs connect the frame and axles—the forward 42 inches in length and 2 inches wide and the rear pair 54 inches long and of the same width. The wheel base approximates 112 in both the touring car and limousine and the tread is standard.

As in the power and transmission plants, innovation in the body lines is met, in fact, in the new body types, two of which are illustrated, not a point of resemblance can be found with present models. In the touring car room for five passengers is provided in the tonneau, the rear seat accommodating three, and two jump seats serving for the others. Wide side entrances are used, the front seats are divided, and running board and large fenders are conventional throughout. A honeycomb type wire screen forms the front of the hood and by surrounding it with a heavy brass framework, a radiator effect is produced.



KNOX MODEL G, 1907 FOUR-CYLINDER AIR-COOLED 35-40 HORSEPOWER TOURING CAR

Digitized by Google

FROM *the* FOUR WINDS

EX-BENNETT CUP CANDIDATE CONVERTED INTO TOURING CAR

Next English Show—Crystal Palace is next on the English show circuit, the dates being January 26 to February 3.

Converted Racer—John Hargreaves, whose 80-horsepower Napier took part in the English eliminating trial to pick a team for the Bennett race, has converted the racer into a touring car.

Invites Everyone—The American Motor League invites all automobilists who go to the shows at New York to attend the league convention, which takes place during the same week. Reduced rates of fare have been secured from all railroad lines, covering the entire week.

Woman Passes—The first woman to pass the rigid test of the Automobile Club of Great Britain and Ireland for a driver's license is Miss Mee, a daughter of a West Sussex clergyman. Miss Mee has also demonstrated her motoring cleverness by turning in a paper on the motor car act that is declared to be the best submitted so far.

Ross Passes Up Ormond—Owing to a difference of opinion as regards the disposition of prizes that he may possibly win, Louis S. Ross, holder of the Sir Thomas Dewar trophy, will not go to Ormond this season. The Stanleys built a steam racer according to his plans and specifications and Ross was to drive it. Both are reported to desire the prizes that may be won, and neither will give way to the other, so Ross, who desires to retain his amateur standing and reputation, will be at the meet as a spectator and not as a participant.

Motorphobia Abroad—English motorists are exulting over a victory they recently gained in the courts. One of their cycling scouts who had given testimony in a case against a driver arrested for scorching was prosecuted by the police for perjury. The case came up before a motorphobist judge, who not only justified the police for setting traps, but also declared the evidence astonishing. The jury took a contrary view and discharged the scout. The defense introduced photographs to prove their case. Another case was against a man charged with driving to the common danger, the evidence consisting of the fact that 5 minutes after the car had passed the children from a neighboring school came on the road.

Clubs May Merge—The Austin Automobile Club is making overtures to the Oak Park Automobile Club looking to a merger of these two Chicago organizations.

Kiser Back—Earl Kiser, now in rugged health, although a cripple, has returned to Dayton, O., where he will start the Earl Kiser Auto Co., handling the Winton and Autocar, as soon as he can find a location.

Good Excuse—One of the causes for the bankruptcy of Ralph Dickerson, an English publisher, was given as "fined for furious driving on ten or twelve occasions, costing in all about $1,250 in penalties and costs."

Motor Skate—One of the novelties shown at the French show was a motor road skate. On a miniature four-wheeled chassis is attached a small gasoline motor. The device is fastened to the feet and for it is claimed 25 miles an hour on smooth roads. The motor is coupled direct to the back axle, which carries the driving wheels. The wearer of the skates directs his course by means of a small bogey on the front wheels and the gasoline tank is carried strapped around the waist of the operator. No way of stopping the motor, though, is given.

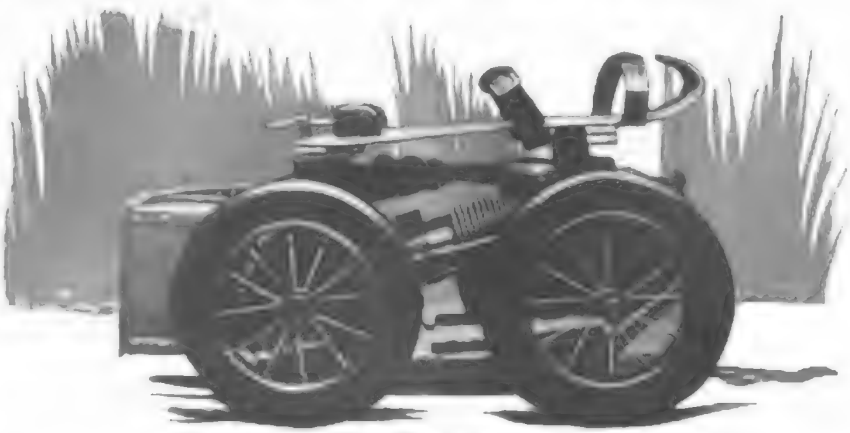
Real Actors—Barney Oldfield and Tom Cooper have temporarily abandoned their intention of entering vaudeville to become an important part of the Liebler production, "The Vanderbilt Cup," which is to be put on at the Broadway theater, New York City, beginning January 8, with Elsie James as the real star.

Dinsmore Car to Kaiser—Clarence Gray Dinsmore's big Mercedes racer is now the property of Emperor William of Germany, according to advices from Europe, which state the late patron of road racing left the machine to his friend, the kaiser, in his will, besides bequeathing $2,000 to the Herkomer tour.

Florida Parties—The Chicago Automobile Club is arranging a party to go to Florida for the Ormond meet, working in conjunction with the Minneapolis Automobile Club. The train will leave January 20. Detroit motorists will also have a special car which will leave New York over the Seaboard Air Line January 21.

Loaded With Coin—The National Cash Register Co., of Dayton, O., since it changed its system of paying its employes, dealing out the coin instead of checks, is using an automobile to transport the money from the bank to the office. On this weekly trip $55,000 is carried, two armed guards accompanying the messenger in the car from the bank.

Aid to Santa Claus—In Philadelphia there is a Santa Claus Association, an organization of women who annually, about Christmas time, make it their business to gather food, clothing and money from those more fortunately situated and distribute them among the deserving poor. This year the quantity of such supplies gathered was so great that its distribution during the week preceding Christmas day became a matter of much doubt. The difficulty was solved, however, by Managers A. E. Multby, of the local branch of the Winton Motor Carriage Co., and Percy Neel, of the Quaker City Automobile Co., each of whom placed several automobiles, with their operators, at the service of the charitable women with the result that by Sunday night every package of the veritable mountain of presents had been safely bestowed upon the numerous beneficiaries of the society by the women.



MOTOR SKATE FOR ROAD USE, INVENTED BY FRENCHMAN

WELCH TOURING CAR

40-45 HORSEPOWER

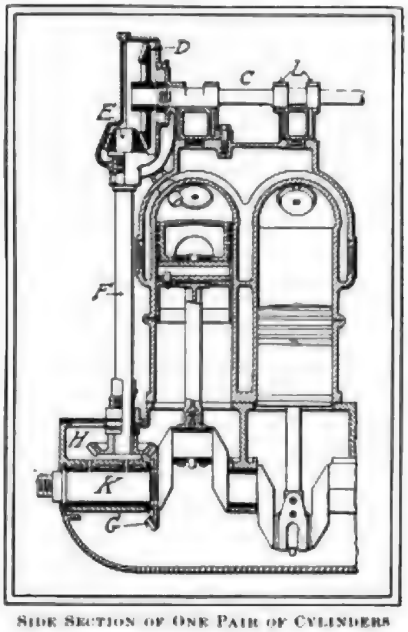
WELCH TOURING CAR, 40-45 HORSEPOWER
FOUR-CYLINDER MOTOR AND CLUTCH GEAR

MODEL D, the 40-45 horsepower four-cylinder 1906 car of the Welch Motor Car Co., Pontiac, Mich., caries most of the marks of distinction of the present machines, to which are added, however, a few of the recognized next year's designs, as well as other decided novelties. Notable among them is the placing of the water pump in the center of the radiator and having it take its supply from the top half of the radiator and deliver it to the bottom portion, from which it passes by individual pipes to each pair of cylinders. Later it passes through a similar pair of pipes from the cylinder pairs to the top portion of the radiator.

Nothing out of the ordinary exists in the running gear, but solid construction is used in every part of it. The pressed steel channel side sections are narrowed at the forward end alongside of the motor, the maximum depth of the channels in the middle of the side pieces is 4½ inches; frame cross pieces are riveted in place and reinforced by gusset plates. A set of semi-elliptic springs 40 inches long and 2¼ inches wide support the frame pieces in front and a pair of full elliptics of the same measurements carry the rear of the frame. The front axle is an I-section drop forging carrying the Elliott type of steering knuckles and the back axle is of typical live construction. The wheel base is 114 inches.

Novelty in the motor is found first in placing the valves in removable cages in the opposite sides of the cylinders, mounting them at 45 degrees to the vertical and operating them through an overhead camshaft and rocker arms. The rating of 40-45 horsepower is estimated on normal crankshaft speed. Conventional lines rule in the cylinders, which are cast in pairs with all parts, such as the heads and water jackets, made integral. Valve ports are not required. A little out of the ordinary, but not new with the Welch concern, is the arching inside of the tops of the cylinders, giving the combustion chambers a hemispherical shape. The crankcase is a two-part casting, the lower portion assisting only in carrying the oil bath. The duties of the top portion are to carry all of the five crankshaft bearings, as well as having four integral lugs through which the motor takes its support on the main frame pieces.

All the three moving portions within the cylinder, the crankshaft, connecting rods and pistons are carefully made. The crankshaft is machined down from a stamped blank of chrome nickel steel and to remove friction the bearings are ground to size. These, by the way, are of different lengths, the three intermediate ones being 1¾ inches in length, whereas the forward end one is 5¼ inches and the rear one 5 29-32 inches long. On the rear end of the shaft is a large flange to which the flywheel is bolted.



SIDE SECTION OF ONE PAIR OF CYLINDERS

Each connecting rod is an I-section drop forging fitted with bronze bushings to receive the hardened ground steel wrist pin which is pinned to the piston journal, but at its lower end exhibits construction not widely followed in motor cars. Instead of the usual connecting rod cap bolted and cotterpinned in position, the lower end of the connecting rod is arched out to receive the upper half of the bushing. The lower part of the bushing rests in a U-shaped metal stirrup, the ends of which span the lower part of the connecting rod and are attached thereto by a pair of bolts, in which provision for adjustment is included. This adjustment is made by having one bolt formed with a taper section near its ends where it passes through the stirrup arms. By tightening this bolt the halves of the bushing are brought closer together.

A slight cone effect is noticeable in the piston heads, the center of the head being the highest with a gentle slope to the sides. This shape, combined with the arched top of the cylinders, gives a peculiar-shaped combustion space. Four compression rings, all located above the wrist pin attachment, are used. They are pinned against rotation.

Valve disposition as well as movement can be studied from the sectional illustration of the motor, one of which shows an end section and the other a side section of one pair of cylinders. Both admission and exhaust valves have a diameter of 1¾ inches and are interchangeable and are retained in cages B that screw into the cylinder heads, the seats of the cages having a ground fit with the cylinder heads. Each valve A has its head and stem made integral, the former, as usual, beveled to 45 degrees and the latter working in a long removable guide within the cage. A heavy spiral valve spring surrounds the stem, the inner end resting on the cage proper and the outer end retained in a cup-shaped washer surrounding the stem and which is backed by a washer support and split washer

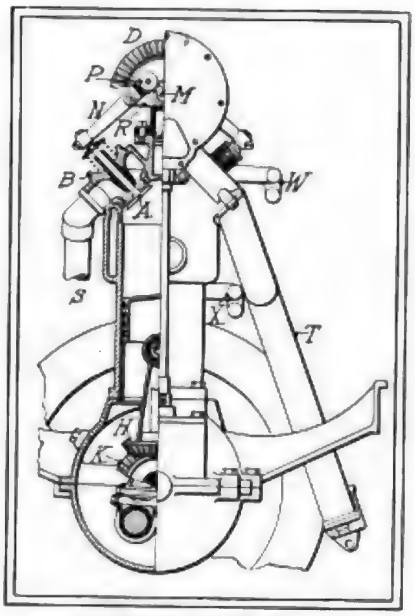
Digitized by Google

which fits in a groove cut in the end of the stem. The spring is of special wire.

Along the top of the motor is the horizontal cam rod C resting in a pair of supports L in each cylinder head and carrying between these supports cams M for operating the rocker arms N which are carried on short horizontal arms R in the cylinder heads. The ends of the rocker arms resting on the valve stems are suitably cup-shaped to receive the rounded ends of the stems. On the other ends are rollersP which bear upon the cams M. By pivoting the rocker arms close to the ends carrying the cam rollers, a good valve lift can be had without using too large cams on the overhead camshaft C. On the rear end of the camshaft is the large bevel D which meshes with a smaller bevel E on the top of the vertical shaft F. This shaft, in turn, takes its power from the crankshaft through the pair of bevels H and G. The lower bevels are entirely enclosed within the crankcase and as a consequence are lubricated from the splash, but the upper pair is enclosed within a housing supported by brackets to the end cylinder casting and is lubricated by an oil level. The inlet piping S is longer than usual, the carbureter being carried as low as the crank case. The exhaust pipes T form a series of easy steps from the front to the rear cylinder, the pipes being of large diameter and well removed from the cylinder walls.

Novelty is shown in the cooling scheme. The waterjackets enclose the cylinder heads and project down one-third of the piston stroke. The water pump is carried in a chamber in the center of the radiator and driven from the rear of the radiator by a broad belt Z the fan Y being on the same axis and driven by the same belt. The pump chamber is cylindrical, with an end plate at the back and a front cap through which it may be removed or repaired. The rotary part of the water pump is located between the removable cap and an internal flange around the circumference of the chamber. In the rear of the pump chamber is a large opening connecting with the top half of the radiator and through which the pump draws its supply. In the forward part of the pump chamber is a similar opening connecting with the lower half of the radiator. Water enters the rear compartment of the pump casing, and passes into the forward one where it receives its impetus from the propeller-bladed pump. Should the pump fail to work, the design is such that the water will circulate by thermo-syphon action. Should it be necessary to take the pump out it can be removed through the front opening and with the cap of the opening replaced the cooling system is as complete a circulating system as before. Behind the radiator is a propeller fan of standard lines.

In lubrication recourse is had to splash within the crankcase for supplying practically all of the motor-moving members with their share of lubricant. A central partition divides it into two compartments and through this compartment is an equalizer pipe placed about 2½ inches above the bottom of the case. When the car is running on level surfaces the oil will stand the same height in each half of the crankcase, but on ascending a grade part of the lubricant will flow through the pipe so as to



End Section Welch Motor

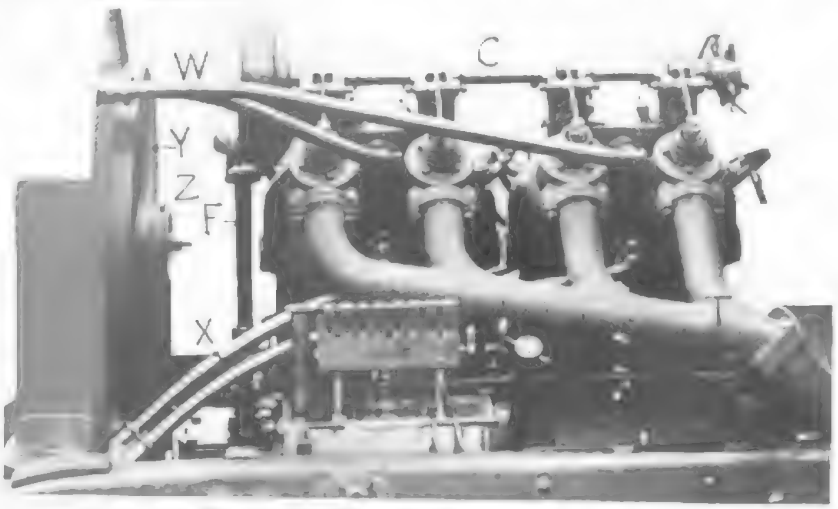
maintain a level in each compartment. In order to properly collect the splash each connecting rod at its lower end has its bearings fitted with little oil scoops which serve as collectors of the splash and from which the oil flows to the bearings. In the top of each crankpin bearings are other little troughs for collecting the oil from which oilways are drilled into the bearing. The lubricant, after passing through these bearings, flows into the crankcase, where it is used again. Provision is made for preventing the oil in the end bearings of the crankshaft working out through the bearings ends. To prevent this little oil stops are inserted. Each is a ring located in a groove cut in the motor bearings and from the bottom of the groove is a duct which conducts the oil to the crank chamber. The camshaft bearings on the top of the motor are cared for by wick oilers. Other bearings such as in the gear set have an oil bath.

Mixture is supplied from a Holley carbureter of 1906 design. Jump spark ignition is used. The spark plugs are placed angularly in the side of the arched cylinder heads and receive current from two sets of storage batteries, the current being commutated through a Leavit ball timer, located on the rear end of the camshaft. A four-vibrator coil is carried on the dash. Control of the spark and throttle is from the steering wheel.

Two forward speeds and one reverse are given by the gear set which is novel in many details. It is based on the individual clutch principle and gives direct drive on the high speed without a single gear revolving. The countershaft remains stationary. One of the novelties is that two types of clutches are used—two of the multiple disk type and one, a double clutch, of the positive jaw type. All gears used are of six pitch and made from drop forged blanks, which are cut to form and case hardened. Both shafts are nickel steel and run in bronze bearings, the pair of which on the countershaft have end caps which prevent lubricant working out of the case ends.

A shaft O connects by a Hockham joint with the crankshaft of the motor and another shaft A axially in line with it to the rear couples, through a cardan shaft and bevel gears, with the differential on the center of the rear axle. The forward end of the shaft A is hollowed from the rear end of the case to where it ends at the multiple disk clutch G. Within it is a bronze bushing which forms the rear end bearing of the shaft O. One half of the disks in the clutch G are fitted to a hexagional section of the shaft O and the other half are fitted to the shaft A so that pressing the two sets together will serve to lock the shafts O and A as one, which is done on direct drive. The method of pressing the disks is through a sliding collar K and a ring H screwed to the shaft and carrying cam levers H1. By sliding the collar K to the left the cam levers are separated, causing the cams to bear on the clutch disks, forcing them together and so locking shafts O and A as one.

To understand the other features of the gear set and how the other speed ahead and reverse speed are gained, it must be remembered that gears P, Q and S on the countershaft R are rigid with the shaft, revolving



Exhaust Side Welch 40-45 Horsepower Motor

GEAR SHIFTING DEVICES FOR DOUBLE CLUTCHES IN WELCH GEAR SET

always when it does and vice versa. The three gears B, F and N are loose on the combined main shafts O and A so that as shown on direct drive the shafts can revolve and the gears remain stationary. Two clutches are made use of, M, a multiple disk one for locking the gear N to the shaft O, and another positive double-jaw one D, which is rigid with the shaft A and through which both gears B and F can be locked to the shaft A. In the clutch M one set of disks is fitted rigidly to the shaft O, being fitted to a hexagonal section of the shaft. The other set is fastened to a drum that also carries the gear N so that when the two sets of disks are pressed together through the sliding collar K being moved to the right and separating the levers L1 on the rings L which is screwed to the shaft A the gear N is locked to the shaft. For the second speed ahead two clutches are used, both operated through the same mechanisms. First the positive clutch D, rigid with the shaft A, is moved to the right and locked with the clutch teeth E on the rear side of the spur gear F. This locks this gear with the shaft A. After this is done the shifting mechanisms locks the gear N to the shaft O in the method before explained. Then the drive is from the shaft O through gears N and S to the countershaft R and from this shaft through the gears Q and E to the shaft A and to the rear axle by the shaft and bevels. It must be understood that the positive clutch D engages perfectly before the multiple disk clutch M locks the gear N to the shaft O. For reversing, an intermediate idler, not shown in the illustration, lies between the gears P and B and is constantly in mesh with both. In obtaining this speed the clutch D is moved to the rear, locking with the clutch teeth C on the forward side of the gear B and thereby locking this gear to the shaft A. After this is done the clutch M is used to lock gear N to the shaft O, when the drive is from shaft O through gears N and S to the countershaft, and from this shaft to shaft A through the gears P, the idler not shown and gear B. It will thus be noted that the clutch G is only used on direct drive, that on the other forward speed ahead and the reverse two clutches D and M are used in each.

The method of changing speeds is worthy of attention in that on all speeds, except the direct drive, two separate clutches have to be engaged, one a friction clutch making the gear N rigid with the shaft O from the engine, and the other the positive jaw clutch coupling either the gears B or F to the shaft A connecting with the rear axle. In all cases the positive clutch has to be

THE WELCH CAR

engaged first; in fact, it must be in perfect engagement before the friction clutch begins to operate. In accomplishing this an intricate shifting mechanism is resorted to. In the sectional view of it the gear-shifting lever at the driver's right is keyed to the end of the shaft A. To this shaft is also keyed the double arm lever H. The two shafts B and C enter the side of the gear case and on their inner ends carry yokes, the first one having a yoke fitting over the clutch D and the other one connecting with the sliding ring K, by which the two friction clutches are operated. It can be noted that the upper end of the lever H connects by rod G with a lug S on the camplate H and that the lower arm of the lever connects through the rod E with a short arm F that is keyed to the shaft C. The connection of the rod G and the lug S is not positive, but through the medium of the coiled spring Z which is held in tension by a nut at the other end of it. A horizontal lever arm N is secured at one end of the shaft B and the other end is furnished with a pin M which passes through an opening or slot in the camplate H. Within the slot is a block Y connecting through a link and lever with a shaft R so that by moving the block Y into its several different positions in the slot the form of cam slots which guides the pin M is naturally changed. The illustration shows it in the neutral position. Supposing the driver uses his change speed lever, taking the arm H to the left at the top and to the right at the bottom, or counter clockwise, the shaft C is partly rotated in the same direction. This shaft being above the gear shafts within the gear box, the forward friction clutch M is engaged. A similar movement of the shaft A through the arm G results in the shifting to the rear of the camplate H and with the block Y in the position shown a clocklike movement would be given to the pin M, with the result that the jaw clutch D would be shifted to the front and the gear F locked with the shaft A. With the gear N fast upon the shaft O and gear F fast to shaft A slow speed ahead is obtained. Should the block Y first have been put in its low position and the shaft A rotated to the rear, the pin M would have taken a different course and moved upward, the jaw clutch thereby locking the gear to the shaft, giving reverse speed. For direct drive the shaft A is rotated in the direction of the hands of a clock, the camplate H is moved to the right and arm N brought to a central position.

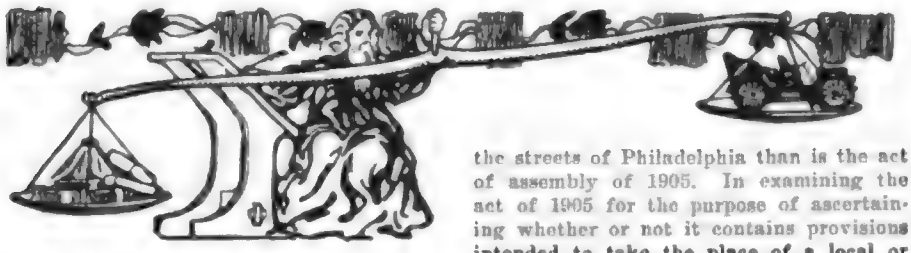
LEGAL LIGHTS AND SIDE LIGHTS



RULES AGAINST QUAKERS

To the surprise of Philadelphia automobilists, the injunction asked for by the Automobile Club of Philadelphia restraining the local authorities from enforcing the municipal ordinance providing for the purchase and display of license tags on motor cars, was refused by common pleas court No. 4, Judges Willson, Audenried and Carr on the bench. The automobilists' main point was that the local law on the subject will, on and after January 1, 1906, be abrogated by the act of assembly of April 19, 1905. The court, however, was of a different opinion.

The decision partook of the nature of a right hook to the solar plexus, but it did not result in a knock-out. The club's attorneys are preparing to carry the case to a higher court. In any event, they will put one of the members in the way of being pulled in on New Year's day for failing to observe the local ordinance, and will fight to the last ditch. It is also proposed to have a man arrested for refusing to comply with the provisions of the new state law.

As the law stands now any picayune community in the state may frame a more or less radical set of automobile regulations of its own—always with a liberal license fee and a heavy fine for non-observance—and compel a continuous performance in the tag-changing line as a touring party crosses the state. The possibilities which last Wednesday's decision open up are, indeed, too numerous to mention in detail; and the majority of local automobilists, especially those who dabble in the law, are wondering at what they consider the short-sightedness of the learned judges.

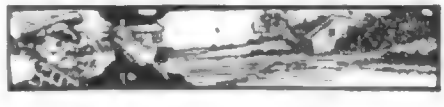
Many of the conclusions of the court appear to be too intricate for the lay mind to grasp. For instance, the opinion says: "It is, of course, beyond all question that, if the statute and the ordinance are inconsistent, or, if the statute can fairly be regarded as intended to supplant the ordinance, the latter must give way and the statute only have effect given to it. Paramount authority of the lawmaking power of the state over the lawmaking power of the city must be conceded. The question therefore comes down to this: Is there any necessary incompatibility between the statute and the ordinance, or does it sufficiently appear that the statute was intended to furnish the sole rule of conduct and regulation for the use of automobiles and similar vehicles?"

The court answers this question by saying the city had full power to pass the ordinance of 1902, and that that measure was better adapted to protect people using the streets of Philadelphia than is the act of assembly of 1905. In examining the act of 1905 for the purpose of ascertaining whether or not it contains provisions intended to take the place of a local or municipal regulation upon the same subject, the court says it may be noted in the first place that it contains no expression of an intention to that effect. The court was not impressed that, simply because the state had undertaken to impose certain regulations for automobiles operated in the commonwealth, such action excluded the right of a city to formulate and impose its own regulations. Reference is made to the fact that under the terms of the ordinance, the license to be obtained from the city is one which is based on certain examinations which the court does not regard as inconsistent with anything in the act. No satisfactory argument was presented against the right of the city to require guarantees from operators of automobiles additional to those required by the state.

The opinion then goes on to say that: "It has been argued that the act of 1905 was intended to provide that only one license number or tag shall appear upon the front and back of the vehicle when operated on the highways, but we do not regard this to be the proper construction of the act. It is provided that only one 'state license' number shall be carried upon the vehicle. There is no prohibition against the carrying of a license which was not a state license, and the limitation of the prohibition to a single class of licenses implies that it was not intended to exclude a local municipal license from being carried upon the vehicle. As to the word 'place' used in the act, the court does not regard the term as applying to a city or municipality within the commonwealth."

Laymen automobilists, when they heard this paragraph of the opinion read, looked at one another and seemed to say: "Now, wouldn't that jar you?" It was a little too finely drawn for them. As one of them said: "It sounds as if the court were hunting for pretexts for refusing the injunction. It seems to me that a contrary opinion could have been delivered without a resort to such intricate interpretations of the law."

Continuing, the opinion says: "It seems very plain that what was intended to be enacted by the clause just cited was that a foreign license number should be removed from any vehicle which comes from another territorial division outside of the state into the limits of the state. The language of the act—'while the vehicle is being used within this commonwealth'—the court construes as meaning that the vehicle in the mind of the legislature was one which came from outside of the limits of the state of Pennsylvania."



One legal motorist points out that the court seems to have lost sight of the fact that the act of 1905 was particularly designed to do away with the conflicting regulations of towns and cities by establishing a uniform law for the entire state. It is also claimed there is a straining after a possible interpretation of the reading of that act which may be construed as favoring a city's or a town's right to enforce automobile provisions of its own that is especially apparent in the closing paragraphs of the opinion, which read as follows:

"It may be argued that there is an incompatibility between the statute and the ordinance in the different provisions which are contained in the two with reference to the rates of speed at which an automobile may be driven. The statute provides that no person shall be allowed to operate such a vehicle above a certain maximum speed under certain conditions. The question might arise as to what is meant by the term 'allowed,' and as to who or what authority might allow the use or operation thereof. Perhaps it would not be straining the force of language to construe this provision as referring to the constituted authority having jurisdiction over highways in any particular district. Aside from this point, however, it must be noted that the legislature only prohibited the driving of automobiles or similar vehicles at a higher rate than the fixed maximum speed. It did not state that they might be driven at that rate, except by implication, and that implication may be regarded as having been overcome by the further provision that the prohibition against exceeding a certain maximum rate should not be construed as permitting any person to drive an automobile at a greater speed than is reasonable.

"It does not seem to us that this restriction of the force of the provision regulating the rate of speed should be regarded as applicable only to a particular case, where the question of the reasonableness of the speed might come before a jury, say, in an action for negligence. In the absence of any prohibition against local legislation it would rather seem that the legislature intended that the local authorities having jurisdiction over such a class of subjects, and having special knowledge of the conditions of their own localities, might by ordinance determine what should be a reasonable rate of speed.

"This we believe to be a permissible construction of the statute before us, and we believe that such a construction will best promote the interests of the various communities of the commonwealth composed of people living in closely-built towns and cities, and that no unreasonable restrictions are thereby placed upon people who desire to make use of the modern horseless vehicles, with due regard to the rights of others.

"We are unable to find in other portions of the act of 1905 anything which conflicts with the ordinance of 1902, and in view of what we have already stated we have reached the conclusion that the injunction prayed for by the Automobile Club of Philadelphia must be refused."

IN THE COMMERCIAL CAR FIELD

IROQUOIS GASOLINE STAGE COACH

BUILDING to the order of the promoters of a stage route in the state of Utah to connect a railroad terminus with settlements in the Uintah Indian reservation, the Iroquois Iron Works, of Buffalo, has turned out a machine which it thinks hits the nail on the head. It aimed to bring out a car that has power and durability to carry a sufficient load at a speed to mechanically meet transportation requirements and at the same time operate with a minimum amount of maintenance expense to insure its mechanical success. One of these models has been running on a government mail route in Utah and has apparently filled the bill. The chassis is so constructed that it will take any one of four bodies—stage, omnibus, van or platform truck. It is of heavy construction, this chassis, the main frame being of continuous 5-inch channel steel, with all the curves forged, and mounted on extra-long elliptic springs 3 inches wide. To the chassis are attached 36-inch wheels, fitted with 5-inch solid tires on the rear and 4½-inch on the front. There is a four-cylinder motor made of individual castings, with a 6-inch bore and a 6-inch stroke, developing 55-horsepower at 800 revolutions per minute, crank speed. There is sliding gear transmission, with three speeds forward and a reverse, the rear gears being cut from chrome nickel steel, 1¾-inch face and No. 5 pitch, stub length. There is a differential on the jackshaft, while the solid rear axle is fitted with 2-inch Timken roller bearings. The new model of the Whitney chain, with 1½-inch pitch, is used. The Remy type H high-tension magneto furnishes the ignition. The car weighs 7,500 pounds.

In the speed line the car is designed to go at an average pace of 15 miles an hour, but it can be sent along at 22 miles. The maker, however, believes when it is being used commercially that it should not be operated above 18 miles an hour. The seats on the stage are wide and built to accommodate four passengers on the three rear ones, although five can travel there without any more crowding than is customary on a horse-driven stage. Two can ride in the front seat. With the full load on the weight is 11,000 pounds.

The machine is well designed for the use intended. The seats in addition to having good width so as not to crowd the passengers are made with ample foot room—a prime essential in stage traveling. Heavy upholstering is used in the seats and backs making traveling as comfortable as in a railroad coach and the canopy top provided is not only a protection against the scorching rays of Sol in the summer months but is a good preventive in autumn and winter days repelling with similar success the driving rains and winter winds.

PLAN TRACKLESS TROLLEY

Detailed plans of the cost and construction of a trackless trolley line across the bridge from Detroit, Mich., to Belle Isle have been taken up by the Detroit council committee on parks and boulevards. According to the estimates submitted the system would cost somewhere in the neighborhood of $51,925. It is figured that at a fare of 2 cents for delivering passengers either at the casino or aquarium the system would pay for itself within a few years. The American Electromobile Co. has submitted details of trackless trolley cars which are capable of seating forty persons each, and which it could supply under the proposed system. A proposition for a regular trolley line has also been submitted, but the aldermen oppose the laying of tracks and this will do away with any consideration for such a plan. Three other companies, including two in New York, are waiting to bid on the contract. The other waiting bidder is the Commercial Motor Vehicle Co., of Detroit. A full meeting of the council will undoubtedly be called to consult on the proposition and it is more than likely that Detroit will have a first class trackless trolley system in operation in 1906.

AGRICULTURAL MOTORS

The secretary of agriculture is manifesting considerable interest in a report recently to hand from Hull, England, regarding an experiment in applying motor power to farm work, as he believes the plan would be a good one for small farmers who cannot use agricultural machinery and motive power on a large scale profitably. From the account that has been received it seems that a party near Hull has been conducting some experiments in regard to the use of alcohol on the Ivel agricultural motor. Some months ago this party was able to arrange a simple attachment whereby paraffin could be utilized for the running of the motor, which was originally designed for gasoline, and was able to secure satisfactory results—that is to say, it was found possible either to start up on gasoline and after 5 minutes' running to turn on kerosene and run on the same for the rest of the day, or in case it is impossible to obtain gasoline it is possible to start up in paraffin and run on continuously. This is accomplished without the slightest trouble in regard to sticking of the valves or fouling of the engine, so it is said.

One of the most important points in connection with motors for agricultural purposes is the fact that they should run cheaply, that the upkeep should be small, and the running expense light. Therefore the question of fuel consumption and the cost of same is very important. Gasoline at the present time is somewhat expensive. It is easy for a wealthy owner of a car used for pleasure purposes to buy gaso-

THE IVEL AGRICULTURAL MOTOR DOING NIGHT WORK IN ENGLAND

Digitized by Google

line without feeling in any way that it is a burden to his pocket. At the same time, to the agriculturist using his machine only to help him with his work, the expenditure is an important one. Therefore the first step taken in the experiment under consideration was the utilization of kerosene, which can be obtained at half the price of gasoline. This shows a decrease in the running expenditure of half for fuel, and at the same time does not carry with it the many risks which are bound to occur through the storing and handling of gasoline.

Kerosene is a clean spirit to handle, and has many other advantages. Therefore, following up the experiments, alcohol was used for the third fuel test, and it may be said the same was attended with most successful results; the same machine with the same carbureter, with a very small attachment, and with no alteration to it making it different from what it was when running in gasoline, gave nearly the power and the same pulling results. The consumption was practically the same, and the party making the experiments felt elated over having carried out experiments so successfully on a fuel which has up to the present time baffled many motor engineers in so far as its successful use is concerned. The following results have been achieved with the three fuels, running the same machine on the same oil, and, in fact, the experiments were carried out on the same day: With 2 gallons of gasoline, 3 roods of land were plowed; with 2 gallons of kerosene 2 roods 35 poles were plowed; with 2 gallons of alcohol 2 roods 25 poles were plowed.

NEW OHIO CONCERN

The Commercial Motor Truck Co., of Toledo, O., has purchased a site at Plymouth, O., and has started the erection of a new plant, which will be built on the unit system. The first building to be erected will be of brick construction two stories high, 100 feet long and 64 feet wide. The company was incorporated October 17 under the provisions of the laws of Ohio, the capital stock being $40,000. The new concern has been fully financed. A temporary plant will be maintained at Toledo until the new plant at Plymouth is completed. This will enable the concern to meet the demand for the new truck, a number of orders having already been secured. The model of the truck to be manufactured by the company was completed about 7 months ago. Since then it has been in constant use, being subjected to numerous tests. The accompanying illustration shows the truck climbing a 10 per cent grade with a load of 10,050 pounds of sugar. The design of the new model is the work of Fred C. Avery, formerly superintendent for the Chicago Motor Vehicle Co. Mr. Avery will be superintendent of the new plant at Plymouth. The office of the company for the present is at 805 Spitzer building, Toledo. Charles A. Keller is president of the concern. The first annual meeting of the company will be held on Tuesday, January 9, at which time the annual election of officers will be held. The company will employ about fifty men to start, but anticipates soon increasing this force, as well as adding to the buildings which are used for the factory.

ONCE AN ENEMY—NOW A FRIEND

During the past week Major Higginson, president of the Safe Roads Association of Massachusetts, who heretofore has been one of the strongest opponents of motorists, has come out in a new garb. In his annual report to his association he makes the flat-footed statement that the laws now on the books of the commonwealth which govern the use of motor vehicles are all wrong; that they produce a condition of affairs which prevents their being recognized by even the best disposed motorists, and that they should be revamped so that motorists will have a fair opportunity under the same. He believes it is not possible for a motorist to drive without breaking the law under the existing conditions, and virtually recommends the laws governing the use of motor vehicles be given over to the Massachusetts highway commissioners. The latter, however, do not desire to assume any such responsibility. Nevertheless that is the main idea of the Higginson report, which further advances the idea that the commission should establish a rate of speeds in different locations according to the road conditions thereabouts. He believes in the erection of sign boards announcing the speed limit in every section, and it is safe to say that in the future he will be a strong friend rather than an enemy to the motorists. The association of which he is president is the one which established the traps at Manchester during the past 2 years, the association which produced the famous Peabody, the man who went to New York to demonstrate to the officials there what was the best and most effective manner of disposing of the speed merchants. While his course thus far has been decidedly against the motor car, the fact that he denounces the state laws and other acts is all the more forcible, as he has had an opportunity to study the evil tendencies of present conditions and foresees others that are good and which should be adopted.

During 2½ months more than 10,000 automobiles were timed on 62 days, as follows:

	Miles an hour				
	15 or less	15-20	20-25	Over 25	T'tal
July, 18 days..	885	882	86	3	1856
Aug., 22 days..	2022	3028	204	11	5265
Sept., 22 days..	1234	1660	170	1	3065
Total's	4141	5570	460	15	10,186

Stated in percentage the result is as follows:

	Miles an hour			
	15 or less	15-20	20-25	Over 25
July	27 3/5%	47½%	4¾%	1-6%
August	38½	57½	3 2-5	1-5
September	40¼	54 1-6	5½	3-100
Whole 62 days	40⅖	54⅗	4½	1-6

The foregoing figures are taken from the timers' note books. The number of automobiles going faster than 20 miles an hour include several which the timers did not notify the police officers to stop, because the time was nearer 20 miles an hour than it was to the second or half-second next below the point of time at which 20 miles an hour was indicated. In other words, the speed was so little in excess of 20 miles an hour that it was disregarded.

There were also several that the police officers failed to stop, either because there were too many at once and he could not stop them all, or because they turned off the highway before they had reached him, or because they refused to stop. Sometimes, too, the wires were out of order, and it was impossible to communicate with the police officer.

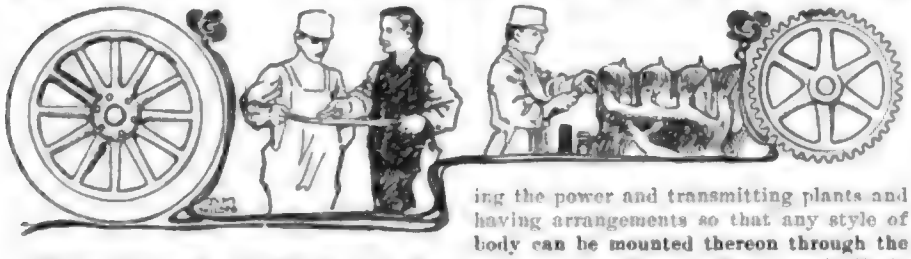
The notebooks of the police show the following:

	Stopped	Refused to Stop
July	78	0
August	170	3
September	159	4
Total	407	7

After discussing the problems of unlicensed drivers and of machines registered in other states, the report outlines the method of bringing cases before the highway commission and its action thereon in general and specific cases.

COMMERCIAL MOTOR TRUCK CO.'S WAGON

Current Automobile Patents



Friction Drive—No. 807,623, dated December 19; to John W. Lambert, of Anderson, Ind.—In his friction drive automobile the inventor has a friction disk A on the rear end of the crankshaft and against the face of this disk is brought to bear the periphery of a friction wheel B, carried on a crossshaft on the frame. The wheel B is slidable on its shaft and on the ends of the shaft are sprockets for double chain drive. The feature of the invention is in the pivoting of the bearings C on the crossshaft so that when desired the driver can force the friction wheel B against the disk A with such force as to make positive contact for driving either ahead or reversing. The bearings are carried from the side pieces of the main frame by a pair of depending arms, one at the front and the other at the rear of the bearings. The bottom of the front bracket connects through the rod D with a pedal F in the car floor and the bottom of the rear bracket connects through the radius rod H with the rear axle. By pivoting both rear springs at their tops on a stub axle G the rear axle is carried bodily forward whenever the shaft C and its friction wheel B is carried forward to give positive drive. When in its forward position the rear springs are slightly tilted, but the main frame side pieces remain horizontal throughout.

Novel Frame Design—807,958, dated December 19; to Ransom E. Olds, of Lansing, Mich.—The frame design illustrated is suitable for single-cylinder runabouts or small cars in which a one or two single vertical motor is carried in front. In the frame work the forward axle A is of conventional lines with typical steering knuckles, and mounted on the center of it is the forward portion of a tubular framework for supporting the motor and transmitting parts of the machine and connecting the axles. This frame consists of three portions. One a quadrilateral near the front axle with the front cross piece D connected with the axle, its two side tubular parts C made parallel and the rear member E connected by unions at the corners with the side pieces. From this rectangular part, in the center of which is the motor and gear case carried thereon by lugs, two diverging side pieces P extend rearwardly to the ends of the back axle, where they are united by a tubular cross piece B, which forms the axle casing and encloses within it the drive shafts to the rear wheels. Drive from the motor is by shaft, which is enclosed in the housing F, this housing being positively connected with the cross piece E as well as the axle housing B, so that the entire frame work and the front and rear axle is a compact support carrying the power and transmitting plants and having arrangements so that any style of body can be mounted thereon through the medium of either full or semi-elliptic springs. The rear spring supports are shown in dotted lines inside of the rear springs.

Friction Drive Railroad Car—No. 807,627, dated December 19; to George W. Marble, of Chicago.—This inventor comes forward with a method of friction drive suitable for use on light railroad cars, such as used by section repair gangs, section inspectors, or special road men. A two-cylinder opposed air-cooled motor is carried crosswise in the center of the car, and connected through a friction wheel on a continuation of its shaft with a pair of large friction disks, placed on opposite sides of the friction wheel and one of which is adapted for driving the machine ahead and the other for reversing at the same speed. The merit of the invention consists in this last feature, that of reversing at the same speed as when traveling ahead, a feature particularly important in railroad work. Through a pair of levers the two friction disks are moved simultaneously, one towards the friction wheel and the other from it, for going ahead and in the opposite directions when reversing.

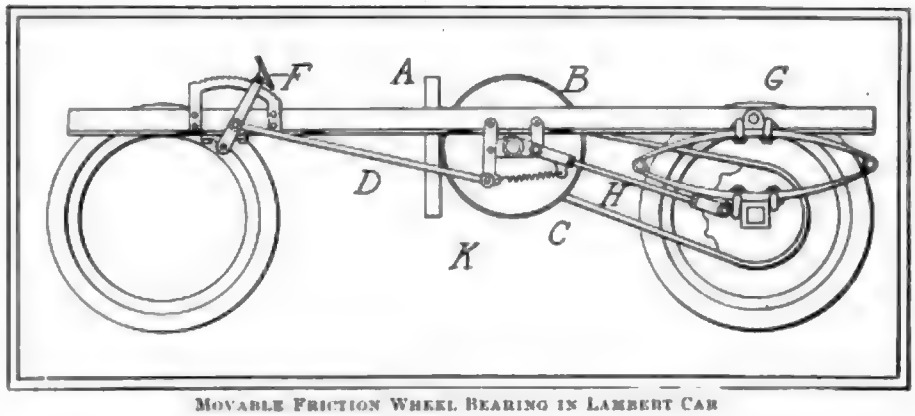
Triangular Drive—No. 807,457, dated December 19; to Benjamin A. Gramm, of Chillicothe, O.—This drive is for automobiles designed for connection between the gear box and the rear axle through a cardan shaft. The forward end of the shaft takes its bearing in the front of a triangle, the sides of which are a pair of diverging support arms running from a cross piece of the frame to the side pieces. The forward ends of these arms are held together by a bracket through which passes the front end of the cardan shaft. The rear end of the shaft has its bearing box supported beneath a cross piece of the frame. The inventor hopes by his design to get a shaft drive in which the shaft is quickly put in place and just as quickly removable.

Combined Differential and Gear Case Set—No. 807,771, dated December 19; to I. H. Pleuharp, Columbus, O.—In the invention, the differential enclosed within the rear axle has a pair of bevels, one with a single gear face and the other with two bevel faces, one of large diameter and the other considerably smaller. Between these bevels are two bevel pinions on the end of the cardan shaft. One of the cardan shaft bevels is made to mesh with the large bevel set on one of the differential bevels and also with the bevel on the other differential gear and another pinion on this cardan shaft is made to mesh only with the smaller gear face on the double differential bevel. All of these bevels both on the cardan shaft and the differential are secured to their respective shafts through the use of friction clutches operated through a lever close to the driver. When traveling on either of the two speeds ahead the bevels on the double differential are in use and in reversing the opposite single face differential gear is brought into use. The gear set gives only two speeds ahead and one reverse.

Semi-Pneumatic Tire—No. 807,748, dated December 19; to G. Knadler, Akron, O.—The tire described is to all appearances a solid one, held to the wheel by side flanges on the rim and cross bolts passing through the flanges and piercing the bottom part of the tire. The tire, however, is not solid, but carries a small circular air chamber in the center, the diameter of the chamber not being more than one-third of the diameter of the tire. A valve is not used for inflating this air chamber but the base of the tire is split and the air within it held only at atmospheric pressure when the tire is cold, but which of course increases with constant running. When the temperature increases the air within the chamber cannot escape because of the flanges and cross bolts holding the edges of the slit firmly together and forming, in short, an air-tight union.

Speed Controller—No. 802,540, dated October 24; to George A. West, of West Buffalo, N. Y. The device is for controlling the speed of gasoline engines. A governor is on the camshaft and to the governor weight is attached the outer end of a coil spring, the inner end being connected with a cam working on the valve stem, so that with high speeds the cam position is altered.

Protected Steering Wheels—No. 807,689, dated December 19; to Z. T. Sweeney, Columbus, Ind.—Over each front wheel the



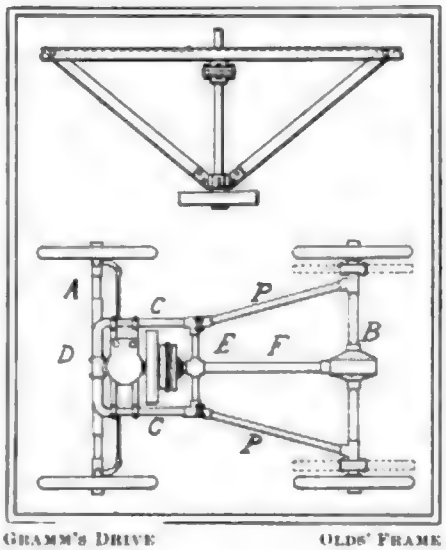
MOVABLE FRICTION WHEEL BEARING IN LAMBERT CAR

Digitized by Google

inventor places a hood device not unlike a wheel fender with the sides enclosed and covering the upper front half instead of the upper rear half of the wheel. In the forward part of this hood is mounted a wheel on a vertical axis. The wheel's diameter is perhaps 10 inches, not much greater than the width of the hood. The use of it consists in that should the road wheel approach an obstruction the hood and wheel will serve to either push the obstruction aside out of the reach of the tire or else the car will be thrust aside and perhaps saved the damage that might otherwise be encountered.

Tonneau Foot Rests—No. 807,831, dated December 19; to R. A. Leslie, of Cleveland, O.—The invention is a folding foot rest for use in the tonneau of large touring cars, in which the base of the front seats are too far removed from the front of the rear seat to serve for such. The foot rest is an inclined board extending across the tonneau floor at convenient distance from the rear seat and at such an angle as to afford a comfortable rest. This rest when not in use folds up in rear of the front seats, where it is entirely obscured and not in the least in the way. This swinging is accomplished by hinging to the rear base of the front seat a pair of brackets and connecting the other ends of the brackets with the ends of the rest so that the folding movement is complete.

Compound Pneumatic Tire—No. 807,537, dated December 19; to E. M. Birdsall, Buffalo.—In his pneumatic tire the inventor instead of using a common air chamber uses one which is divided into a number of sections, each with a diameter equal to that of the common air



GRAMM'S DRIVE OLDS' FRAME

chamber but in length not more than one-eighth of the wheel's circumference. Between the adjacent air chamber is a connecting passage partly filled with an expansible material so that in case one section of the tire becomes punctured the air would be prevented flowing from other sections into it and so deflating the entire tire. In inflating each part is inflated from a common valve, sufficient pressure being used to overcome the expansible connection between the different chambers.

Friction Sliding Gear—No. 805,978, dated November 28; to Albert C. Menges, Grand Rapids, Mich.—The inventor's transmission is of the sliding gear type, with a sliding unit consisting of three gears on the main shaft and corresponding gears keyed to the countershaft. Instead of driving them from the main to the countershaft through spur gears, friction wheels with beveled faces are used. These friction wheels are brought together for driving on low speeds and separated on direct drive so that on the latter only the main shaft is revolving.

Sand Device for Automobiles—No. 807,186, dated December 12; to A. L. Moss, Sandusky, O.—The invention is a device for laying sand on a road in front of the driving wheels of an automobile so that the wheels may secure sufficient friction to propel the machine. Five parts enter into the construction of the sand device: A sand reservoir with separate pipes, each with a spraying end leading to in front of the driving wheels, an air pump for furnishing air pressure for carrying the sand from the reservoir to the road, an air reservoir filled from the pump and a pair of working valves, one for controlling the sand outlet and another for the air outlet from the reservoir. The air pump is driven from the motor of the machine and can be thrown into gear at any time.

Spring Tire Lugs—No. 807,351, dated December 12; to J. H. Bleoo, New York city—Instead of having the casing of his tire composed exclusively of fiber and rubber the inventor places series of springs in the fabric, one series overlapping the other. The outer ends of the springs are bent and extend into the tire lugs, thereby holding the lugs in place without having a portion of the air chamber between them in order to retain them in position.

THE READERS' CLEARING HOUSE

SHOWS UP EVANSTON

Oconomowoc, Wis.—Editor MOTOR AGE—There is more intolerance and hypocrisy in the city of Evanston than there is tyranny in St. Petersburg. If the ways of courts and police in Evanston were universal in our country the liberty of law-abiding citizens would be less than that which is begrudgingly given to the serfs of Russia. Automobilists are arrested in Evanston for daring to be seen driving their machines within the limits of the city. A short time ago I drove an automobile from Oconomowoc to Chicago. Returning through Evanston alone I took great pains to drive carefully and slowly, for I had heard about the way the police arrested automobilists who were driving their cars with due caution and care. I was on a street called Ridge avenue. The roadbed is smooth, the street is straight and wide, is not in the business part of the city, and, when I was driving along over its smooth bed, not a team or a human being was anywhere within sight on the street. Suddenly a policeman stood in front of me and raised his hand. He was very near me, not more than 20 feet distant, but so slowly was my car going the policeman was in no danger. I stopped in 10 feet. I had no thought that I was to be charged with fast driving or that I was arrested. I asked the policeman what he wanted. He said nothing, but looked behind me. Just then came from behind a boy riding a bicycle. He spoke some words in a low tone to the policeman, who then began to apologize for his request that I "go to see the judge." The policeman well knew that I had not been driving recklessly or fast, and he showed so much regret that he must take me to the judge that I concluded he well understood I would be convicted, regardless of the real circumstances. The boy bicyclist swore that he, upon his wheel, followed me as I drove my machine; that he had an instrument called a speed-indicator upon his bicycle, and that the instrument indicated that his bicycle was going at the rate of 18 miles an hour. The boy did not swear that *he* knew I was driving fast, but that the little machine, which was not in court, not examined or cross-examined, or tested, as he read it, and as he told it, showed his wheel was traveling at that rate. The policeman refused to testify that I was driving fast, but in answer to my request that he state whether my car was going at a high speed, he said: "I had no means to judge. I cannot say." I had left the Palmer house in Chicago in my machine and had driven at an even speed all the way, passing many policemen and was just 1 hour and 15 minutes reaching the spot on that deserted street where I was held up by order of that boy who had a speed-indicator to play with. With true Dogberian wisdom the justice, who acted as judge and prosecuting attorney, held me guilty and fined me $15 and costs. I was not permitted to have an officer go with me to the residence of a friend in Evanston, was not permitted to leave the station, but was held there a prisoner, like a common thief, until by telephone I succeeded in getting word to the wife of an Evanston friend, and she came and signed an appeal bond with me. No automobilist being arrested in Evanston should pay a fine. Let every one appeal. Fining automobilists is a rich business if they all pay. We are strong enough now to fight. Why should we pay fines unjustly levied against us? The newspapers are more to blame than all other causes for the vindictive arrests of automobilists. Witness that motorphobist, the Chicago Tribune. It denounces the whole class for the sins of a very few, but it never has been known to condemn the outrages perpetrated by police and constables and justice courts against law-abiding citizens who happen to ride in automobiles.—GEORGE F. WESTOVER.

CYLINDER WALL THICKNESS

Vandergrift, Pa.—Editor MOTOR AGE—Will you kindly advise me through the Readers' Clearing House how thick the walls of a cylinder of 4½-inch bore and 6-inch stroke should be on a gas engine to be run at 900 revolutions per minute?—J. M. W.

If the grade of iron is good the cylinder walls should be about 7/32-inch thick.

Digitized by Google

Among Makers and Dealers

FACTORY OF THE REO MOTOR CAR CO. AT LANSING, MICH.

Glide Branch in Des Moines—The Bartholomew Co. has decided to open a Glide branch in Des Moines and will place S. W. Leonard in charge.

Reo Plant—Despite the fact that it has been in its new factory for a season the Reo Motor Car Co., of Lansing, Mich., is already finding itself crowded. The plant is an extensive one and convenient to the railroad.

Bigger Factory—The Standard Roller Bearing Co. has just started the erection of a brass and iron foundry, 60 by 125 feet, two stories in height. Its crucible steel casting plant started in operation last week, the size of this building being 60 by 95 feet.

To Help Kirkham—At a meeting of the stockholders of the Kirkham Motor Co., of Bath, N. Y., held recently, M. E. Shannon and Talcott W. Gould were selected from the stockholders to share the management of the company for the next 6 months with Charles Kirkham, the inventor of the motor.

May Patch Up Breach—A new application to have the Simplicities Auto Co., of Boston, thrown into the hands of a receiver has been filed with the supreme court. The company is not insolvent, but there is reported to be a serious disagreement among the partners and the stockholders. It is probable, though, that an agreement will be reached and a receivership avoided.

Columbia's Testing Crew—The testing crew of the Electric Vehicle Co. at the Hartford factory numbers a large crowd in the busy season. With the work of assembly just starting in on big lines the testing force is being enlarged from time to time, but the men pictured above number what is known as the old guard. Bert Holcomb, the long-distance road driver, is behind the wheel and at his side sits Pop Lull, one of the first men to drive a car professionally. Larry Duffie, who is boss of all Columbia testers, is the undersized man who sits on the battery box on the running board. With him are Fred Wright and Cap Townsend. Gene Mertens stands at the right, while the left position is held up by Pete Ballou, who has driven cars in all parts of America. Every car made in the Columbia factory is tested from 200 to 1,000 miles by these men.

Goes to Sharon—The American Tri-Motor Co. will erect a plant at Sharon, Pa., for the manufacture of automobiles, and will be capitalized at $500,000, it is reported.

Still Growing—For the third time this year the Du Brie Motor Co., of Detroit, has been forced to increase its capacity. The installation of more machinery will enable the company to turn out ten engines per day.

French Hustle—Lacoste & Battman, makers of the French runabout of that name, accomplished a novel feat recently. They took the parts of an 8-horsepower single-cylinder car and at a signal started workmen assembling the car. In exactly 3 hours 48 minutes later the machine was ready for service. Twelve minutes later M. Lacoste hopped in the car and drove from Paris to Bordeaux and back, covering the 750 miles in 61 hours 29 minutes, despite heavy roads.

In New Quarters—The Continental Caoutchouc Co. is now located in its new quarters at 43 Warren street, New York. The place consists of a double store front extending back 75 feet. The ground floor is used for offices and the first and second basements for stock and repair departments. The company has also opened branches in Boston, Buffalo and Cleveland.

In Trouble—Otto M. Knoblock and Frank Hoffman have been appointed joint receivers of the Charles A. Kaestner Mfg. Co., of South Bend, Ind., by the circuit court. They are to take care of all the property, machinery and equipment of the company. According to the complaint, which was filed by the St. Joseph Loan & Trust Co., of South Bend, the institution is in a bad way financially. The complaint recites that the Kaestner company is indebted to the trust company in the sum of $13,000. The plaintiff says the defendant company has machinery and equipment of considerable value, which should be taken care of, as the company ceased doing business last Friday. The machinery is estimated to be worth about $15,000. The company made automobile engines and automobiles and automobile parts in the plant of the Miller-Knoblock Electric Co.

Jay Locates—After a long search Webb Jay, Chicago manager for the White branch, has found a location and after the first of the year will be at 240 Michigan avenue.

Receiver Named—Justice Amend, of the supreme court, has appointed Rudolph A. Seligman receiver for the Pioneer Automobile Campus Motor Co. of New York. Suit was brought by the National Battery Co., a judgment creditor for $366.

Takes on Foreign Tire—The Harbourg Tire Co., of New York, has been organized to import and sell the Harbourg-Vien tire, made in Austria. It is announced that the New York Motor Co. was to have the selling agency, but this was denied by the latter concern.

Decauville Auxiliaries—Among the recent incorporations are several subsidiary companies to the Decauville Automobile Co. These are the Gaulois Tire Co., the Dac Supply Co., the Franklin Agency Co. and the Birdsall Mfg. Co., all of which are capitalized at $500.

New Idea—The Mechanical Advisory Board has been incorporated at Chillicothe, O., with a capital stock of $25,000, with the idea of giving expert opinion to inventors before they apply for patents, whether it can be manufactured at a profit and whether when manufactured it will be of use. The officers are: B. A. Gramm, president; B. W. Twyman, vice-president; Fred Biszantz, secretary and treasurer; Charles Elliott, chief engineer, and C. K. Probst, chief draughtsman. Mr. Gramm is manager of the Logan Construction Co.

Stanley Racer—The Stanley steam racer built for Ross for use at Ormond has a low-hung, beetle-shaped body, the frame only clearing the ground by 10½ inches. The body is made of whitewood and ash glued together and the turtle-back is a wooden framework covered with canvas. Only one engine is used, the burner being 30 inches and the boiler 10 inches more in diameter than the one on the large touring cars. The engine is set away aft and just ahead of it is the boiler. The driver sits directly ahead of this. A Stanley runabout and a touring car will also be sent south.

Tire Competition—The Pennsylvania Rubber Co. announces a tire economy test for $1,000 in cash to the owners and chauffeurs who go through the year on Pennsylvania clincher tires with the least tire expense per running mile. The first prize is $500. The conditions state that competitors may enter cars at any time during the year, but cannot hand in their records before the end of December. The car must have traveled not less than 2,500 miles during the year. The distance traveled must be measured by an accurate odometer. No bands or protective devices of any kind may be used on the tires, except that one band, covering not more than 12 inches of the tread, may be used temporarily if necessary on account of any injury to the tire. Repairs must be charged at the rates charged by the company, and all repairs must be reported in detail at the close of the year. Each competitor must notify the company of

Digitized by Google

his intention of entering the competition and must give the number of miles registered by his odometer at the time of entering.

Bailey Connects—Fred T. Bailey, an associate of Oldfield on the grand circuit, has been made sales manager of the automobile department of the Harris Oil Co., of Providence.

New Western Factory—The Hornecker Motor Mfg. Co. is building a plant at Whiting, Ind., to manufacture motor cycles with side attachments for carrying passengers. Prominent Whiting and Chicago men are interested in the enterprise.

Miller's Branches—Charles E. Miller, of New York, manufacturer and jobber of sundries, has arranged for the establishment of branch houses at Detroit and Buffalo, in addition to those already running at Philadelphia, Cleveland and Boston.

Factory in Evansville—The Windsor Automobile Co., recently incorporated under the laws of South Dakota and licensed to operate in Indiana, has located its factory at Evansville, Ind., W. M. Copeland being treasurer of the concern instead of Indiana agent as reported.

Chicago Movements—R. P. Rice, formerly of the Holmes-Schmidt company, has been made assistant manager of the Chicago Ford branch. A. J. Nicolet has been placed in charge of the stockyards branch of Ralph Temple, and F. L. Kimball has gone with the McDuffee Automobile Co.

Badgers Busy—The Auto Rapid Transit Co. has been organized at La Crosse, Wis., with a capital stock of $25,000. The company will start a rapid delivery system in the city, a passenger service between the south and north sides, and will also conduct a renting and livery business. Plans are being drawn for the erection of a fireproof garage. The officers and directors are A. J. Stephenson, president; W. J. Brayton, secretary, and Phillip McMahan, treasurer.

Adland Garage in Chicago—The Adland Motor Co., Chicago agent for the Lambert friction drive car, is building a garage at 900-902 West Madison street. This location is a convenient one for west side motorists, being but a few steps removed from Oakley, Washington and Jackson boulevards. On the ground floor the garage proper occupies a floor space of 50 by 195 feet, with capacity for handling sixty cars. A repair shop will be operated in connection with the garage, which will be completed within 60 days.

Save on Gasoline—New York garage keepers are planning to combine in the purchase of gasoline by the carload. Under present conditions buying gasoline in barrel lots costs 13 cents a gallon, delivered to the garage. Five big garage owners, who use an average of 1,000 gallons a day during the busy season, which would cost about $650, have combined forces and will buy the gasoline in carload lots at the market price of 5½ cents a gallon, which will make a saving of $275 a day, less the cost of carting, which, it is figured, will average about $50 a day. With five garages using 5,000 gallons of gasoline per day, which would mean only an average of 5 gallons per car for each of the 200 cars that might be stored with them, it gives a general idea of the great quantity of gasoline being used in New York in motor cars.

In Other Lands—The Franklin people have recently arranged for representation in the City of Mexico, Yucatan, Porto Rico and Canada.

Name Changed—The Toledo Storage Battery Co., of Toledo, O., has changed the name of the Ex-Cello battery to the Miller. The concern contemplates adding new machinery and more force after the first of the year.

Helps Importers—President Mabley, of the importers' salon, has concluded an arrangement with Collector Stranahan and Appraiser Whitehead, of the port of New York, by which their foreign cars arriving a few days before the show will be brought direct to the garden before being subjected to the inspection of the customs officials. It will save much valuable time, especially on those cars arriving on steamers getting here at the eleventh hour.

Berliet Outlook—Two hundred four-cylinder Berliet cars of 24-30 horsepower and 40-50 horsepower, is the 1906 output announced by the American Locomotive Co., of Providence, R. I., which will turn over these cars simultaneously with the Berliet factory in France. Albert Otto is manager of the new department of the company, which has built thousands of locomotives, and with him is associated James Joyce, a veteran bicycle tradesman, recently with the Electric Vehicle Co.

Smooth Trick—W. H. Durphy, manager of the Chicago branch of the Electric Vehicle Co., is looking for a youth calling himself Sid Kahn who flim-flammed the branch for a $63 tire. Just before Christmas someone called up the store, stating he was the private secretary of John J. Mitchell, the banker, who owns a Columbia, that Mr. Mitchell wanted a new tire and that his chauffeur would call for it. Sure enough, a youngster clad in the conventional chauffeur togs came and got the tire, signed his name to a receipt book and walked out. Later Manager Durphy found out he had been worked and that Mr. Mitchell had not ordered any tire. Warrants are now out for the con man. It's a game that would catch almost any dealer, and the wonder is that more have not been worked in this manner.

For Demonstration—The Packard and Buick cars have been selected for demonstration at the Long Island Automobile Club next Friday.

Now Mrs. T. B. Van Alstyn—T. Butler Van Alstyn, general sales manager of the St. Louis Motor Car Co., is now on his honeymoon, the wedding taking place at Binghamton, N. Y., and the bride formerly Miss Tina M. Porter, of St. Louis.

Co-Operative Garage—The Atwood Automobile Co., of Toledo, O., was born last week, having been incorporated under the provisions of the Ohio laws with an authorized capital stock of $40,000. The garage will be conducted on the coöperative plan, and will be located in the residence section of the city. A. A. Atwood is at the head of the new concern. The Pope-Waverly, Franklin and Packard will be handled.

Wayne's New Factory—The new factory building of the Wayne Automobile Co. is to be located at the northwest corner of Piquette avenue and Brush street, Detroit. The main building will be 400 feet on Brush street and 300 feet on Piquette avenue and will be three stories high. The testing building will be back of the main building and will be 36 by 100 feet, and the boiler and engine room will be 30 by 45 feet, with a covered loading platform 150 by 16 feet. There will also be an inclosed track for testing purposes. Part of the plant will be ready for occupancy by the middle of next month.

Wilkie at Wilkesbarre—Eddie Wilkie, of the Pennsylvania Electric Vehicle Co., of Philadelphia, opened the eyes of the Wilkesbarreites last week by breaking the record up Wilkesbarre mountain in a 22-horsepower Buick. He reduced the figures to 8 minutes flat, the best previous, 8 minutes 4 seconds, having been held by a 50-horsepower car. Wilkie also performed stunts on all the other stiff climbs about the town, and wound up by carrying a millionaire coal operator, and two other passengers a.. the way to Hazleton, over two mountains, on the high gear—over 30 miles—in a trifle under 2 hours. The return trip to Philadelphia was made in 7 hours 50 minutes.

TESTING CREW OF ELECTRIC VEHICLE CO. AT HARTFORD

Digitized by Google

BRIEF BUSINESS ANNOUNCEMENTS

Chicago—The Branstetter Auto Co., has changed its name to the Mitchell Co.

Cleveland, O.—The Baker Electric Co. is to have a new factory near Edgewater Park.

Racine, Wis.—The Mitchell Motor Car Co. has put up a 205 by 80 feet addition to its machine shop.

Morristown, N. J.—The W. H. Dutton Co. will soon take possesison of its new garage on Washington street.

Elkhart, Ind.—Plans are being drawn for a new garage to be built at Main and Jefferson streets for M. Landon.

Bay Shore, L. I.—Howard P. Foster has secured the exclusive right for the Wayne car in Brooklyn and Long Island.

Kansas City, Mo.—The Glide will be sold in Kansas City and vicinity next year by the Ferguson Implement Co.

New York—A. R. Welch, of the Welch Motor Co., will soon announce the location of a new branch to be managed by G. L. Lighthall.

San Francisco, Cal.—The Martland Automobile Co., of Los Angeles, and the Gump Automobile Co., of Los Angeles, will handle the Glide on the Pacific coast.

Springfield, Mass.—The automobile department of the Stevens Arms & Tool Co. is now located in the former factory of A. G. Spalding & Brothers, at Chicopee Falls.

New York—Rudolph A. Seligman has been appointed receiver for the Pioneer Automobile Co., formerly of 54 West Forty-third street, which recently went out of business.

New York—Another foreign car which will soon be placed on the market is the Roselle, which is named after the inventor, M. Roselle, who was formerly connected with the Peugeot company.

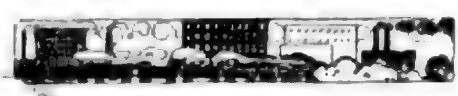
Philadelphia, Pa.—Frank P. Walton, formerly of the Kelsey Motor Car Co., has assumed the management of the Hamilton Auto Co. at 206 North Broad street. This company will handle the Stoddard-Dayton line in this city.

Detroit, Mich.—The City Machine & Mfg. Co. is a new firm, located at 9-13 Orchard street. It will manufacture automobile wheels. In addition it will make a specialty of general repairing and automobile work.

Buffalo, N. Y.—A new idea for the problem of bringing buyers and sellers of second-hand cars has been worked out by a new concern known as the Automobile Clearing Co. Those having second-hand cars for sale will be charged a small fee for registration.

Marysville, O.—The Marysville Motor Co. has been organized to manufacture automobiles. Officers of the company are as follows: President, H. A. Stevenson; vice-president and secretary, George Rausch; treasurer; L. T. Henderson. Harry Tarkington, who was superintendent of the Sommer company's factory in Detroit, will be general manager.

Bloomfield, N. J.—The Torbenson Motor Car Co. has purchased the property at 610 Bloomfield avenue, and after alterations are completed will occupy the building for the manufacture of motors and gears for touring automobiles and trucks.



Brooklyn—The Macbeth Bros. Co. has been incorporated with a capital stock of $10,000, and will engage in the manufacture of wagons, automobiles, etc.

Chicago—The Northern Motor Car Co. has been incorporated with a capital stock of $15,000, and will engage in the manufacture of automobiles.

New York—The Twombly Motor Car Co. has filed articles of incorporation, with a capital stock of $1,000,000.

Hartford, Conn.—Among the new incorporations is that of the Middletown Automobile Body Co., which has a capital stock of about $50,000, and will engage in the manufacture of parts of motor vehicles.

Orange, N. J.—The Automotor Transfer & Storage Co., has been incorporated with a capital stock of $45,000, to engage in the business of storage of carriages and motor vehicles.

Lansing, Mich.—Articles of association have been filed by the Motor Car Co., capitalized at $15,000.

New Haven, Conn.—With a capital stock of $20,000, a company has been incorporated to manufacture and deal in automobiles. It will be known as the Central Automobile Co.

Dayton, O.—The Bordersesch & Glancy Automobile Co. has been incorporated with a capital stock of $25,000.

New York—The Lock-Switch Mfg. Co. has been incorporated with a capital stock of $25,000 and will manufacture and deal in automobiles.

New Orleans—The Tracy Automobilium, Limited, has been incorporated with a capital stock of $50,000, and will engage in the manufacture, buying, selling, repairing, renting and storing of automobiles, and all kinds of vehicles and vessels propelled by power, more specially by steam, gas, gasoline, etc.

New York—The Perfection Reversing Gear & Supply Co. has been incorporated with a capital stock of $50,000, and will manufacture gears, machinery, motors, etc.

Augusta, Me.—The Pontiac Motor Car Co. has been incorporated with a capital stock of $25,000, and will deal in automobiles.

Indianapolis—The American Motor Car Co. has been incorporated with a capital stock of $25,000, and will make, buy and repair automobiles, motor cars, etc.

New York—The E. T. Kimball Co. has been incorporated to manufacture motors, engines, etc. Capital stock, $10,000.

Milwaukee—The Welch-Estberg Co. has been incorporated with a capital stock of $50,000, and will engage in the manufacture of automobiles and motor cars.

Buffalo—The Motor Vehicle Garage Co., of Buffalo, has been incorporated to maintain a garage. Capital stock is $20,000.

Detroit, Mich.—The Motorcar Co. has filed articles of incorporation, the capital stock being $100,000. The stockholders are Frank C. Caughey, Fred Postal, Randall A. Palmer, George A. Young and Harry C. Radford.

Evansville, Ind.—The Windsor Automobile Co., of South Dakota, has been incorporated to manufacture automobiles. Capital stock, $250,000, all held in Indiana, by Albert F. Kargen, John C. Zutt and W. M. Copeland.

Waukesha, Wis.—The Welsh-Estberg Co. has been incorporated for $50,000 by Harrison S. Green, Milwaukee, and William O. and Charles C. Welch of Waukesha. It will manufacture automobiles in Milwaukee.

DeKalb, Ill.—Sheets & Knodle have taken up the agency for the Mitchell car for 1906 exclusively.

New Orleans, La.—The Medina Stamping & Machine Co. has taken the Ford agency for Orleans county.

Passaic, N. J.—L. P. Lonone has made arrangements to handle the Rainier in Passaic and Bergen counties.

New York—A contract has been signed with Charles L. Seeger, giving him the agency for the Panhard in Mexico.

New York—Archer & Co. have secured the agency for the Hotchkiss cars and will shortly open a salesroom on Broadway near Fiftieth street.

Madison, Wis.—Daniel H. Scanlon, of Chicago, has taken the agency for the White steamer for this city and Janesville and will establish headquarters here.

Utica, N. Y.—C. H. Childs & Co. are about to open a new garage at the corner of Cornelia and Cooper streets, their old establishment at 126 Lafayette street being too small.

Detroit, Mich.—The Wayne will be represented in Germany by Leopold, Robert & Co., Nidderstrasse, Frankfurt, A. M. Orlando Baker will handle the Wayne in West Alexandria, O.

Milwaukee—A. D. Meiselbach, formerly a large manufacturer of bicycles, has perfected an automobile delivery wagon. A factory will be built in North Milwaukee, where this machine will be manufactured.

Newark, N. J.—Alexander Ostler, formerly with the Motor Car Co. of New Jersey, and Delancy Zane, formerly with George W. Condon, have opened a repair shop and garage on Crawford street near Halsey.

Newark, N. J.—Herbert Austin, a bicycle dealer, has decided to enter the automobile business, having secured the agency for the Ford. His territory includes Essex, Morris, Somerset and Union counties, and may be extended to the whole state.

Pittsburg, Pa.—B. L. Brown, the manager of the electrical department of the Standard Automobile Co., has organized a new company to be known as the B. L. Brown Co. It will occupy the old establishment of the Hiland Automobile Co. and will take possession February 1.

Newark, N. J.—J. B. Ryalls, manager of the Pope Mfg. Co. for northern New Jersey, has made arrangements to become agent for a French car called the Mierseet, in addition to handling the Pope line. His territory with the new car includes Canada and South America, as well as the United States. He expects to have his samples in his garage in a short time.

American Motor League

OFFICERS

ISAAC B. POTTER, President, Potter Building, New York.
CHARLES E. DURYEA, First Vice-Pres., Reading, Pa.
JOHN A. HAWKINS, Second Vice-President, Pittsburg, Pa.
FRANK A. EGAN, Secretary, 152 Nassau St., New York.
FREDERICK B. HILL, Treasurer, 33 Binford St., Boston.

National Headquarters
Vanderbilt Building, New York

THIS LEAGUE
Is Now Collecting Route Information

covering all automobile routes in the important states and will publish road books for motor car users as fast as complete information is received. The A. M. L. is the only organization engaged in this work, and it invites the co-operation of all persons interested. For full information and membership blanks address American Motor League, Vanderbilt Building, New York City.

Of course, every reader of MOTOR AGE has read Mr. Duryea's serial articles on "Roadside Troubles." They were written especially for the members of the A. M. L., and the subject has been handled in a masterly way by an author whose long experience and fine technical knowledge have enabled him to write from the standpoint of authority. It was announced that when these articles were published they would be reproduced in book form and a copy given free to each member of the league.

"Roadside Troubles" is now in press. Next week the sheets will be in the hands of the binder, and every effort will be made to distribute copies at the time of the coming automobile shows. That league members may be informed of the scope and character of the subjects treated we print here the chapter headings of the twenty separate chapters.

Chapter I—Selecting a machine—Points to be considered—Electric, steam and gasoline vehicles—Advantages of the gasoline system—Power and strength for rough and hilly roads—Ample clearance—Large wheels.

Chapter II—How weight and strength should be distributed—Importance of careful design—Select a powerful motor—All parts of car and motor should be accessible—Durability—Wearing surfaces must be ample—Avoid "new models"—Flexibility, how to test—Flexible car is the most durable.

Chapter III—The capable machine—Power and strength must combine—Importance of simplicity—The foolish demonstrator—Safety; how it can be secured—Low center of gravity—Parts that give trouble—Protecting the mechanism—Large wheels, large tires, flexible springs and long base for bad roads.

Chapter IV—Cleaning the vehicle—When and how to wash—Keep machine in a light, dry, well ventilated place—Hints to the operator—Have patience; know your vehicle—Examine all parts—Study cause and effect—The pleasure of knowing.

Chapter V—Importance of daily inspection—Knowledge is power—All may and should learn to know the motor car—The steamer; steam vehicle must be understood; features needing most attention—Practical hints and directions.

Chapter VI—The electric car—Its main defect—Care of the electric vehicle—All parts should be understood—Keeping clean—The meters—The batteries—The electrolyte—Practical hints and suggestions—Testing and charging.

Chapter VII—Gasoline; its qualities and uses—Various grades—The proper mixture—The hydrometer—Kerosene may be used—Gasoline not explosive—Possible danger—Gasoline vapor—How to secure safety—Avoid spilling—What to do in case of fire.

Chapter VIII—Storing gasoline—How to prevent waste—Water in gasoline—Keep out impurities—Protecting the carbureter—Combustion troubles—Failure to ignite—Advancing the spark—Three essentials—Testing compression—Where to look for leaks—Valve action.

Chapter IX—Ignition; rapid improvements—Two systems in common use—The primary system—The jump spark—Plugs; their defects; practical hints for care and cleaning—Spacing the points—Testing the plug—Testing the cells—The voltmeter and the ammeter—The vibrator—Importance of proper adjustment—Vibrator points should be large.

Chapter X—Ignition continued—The make-and-break spark; its advantages—Magnetos; their value and reliability—Generators—Most common in jump spark work—Primary and secondary methods compared—Batteries; number of cells—Economy in the use and arrangement of cells—Study of electricity recommended.

Chapter XI—The mixture—Carbureters—Valve movement; exhaust valves and inlet valves—Advantages of multiple cylinders—Lubrication; its high importance—Good oil always cheapest—Comparison of oils—How to lubricate—Oiling devices—Weather effects—Graphite as a lubricant—Lost power—Seized bearing—Inspection.

Chapter XII—Tires—Watch them—Danger of driving on a flat tire—Testing for leaks—Timely hints—Rubber solution; how to use it—Patching the tire—Oil on rubber—Jacks—Cleaning the hands—Large tires recommended; reasons—Avoid mud—The use of tires in winter—Cold season less trying than summer—Cars not in use should be lifted on jacks.

Chapter XIII—General hints—Dry axle; curing its troubles—Back firing; how corrected—Buzzing of the coil—Bad battery—Brake troubles; how to overcome them—Bumping; generaly caused by deflated tire—Various noises and their sources—Broken chain; what to do—Broken springs.

Chapter XIV—Tire failures—What to do when the tire bursts—Carbureter and vaporizer troubles; clogging; freezing—Rich and poor mixtures—How to correct them—Leaky floats; testing and repairing—The coil—Water-soaked coils—Causes and cures—Boiling the coil in paraffine—High tension coils must be kept dry—Clatter in the vehicle—Strange noises must be investigated.

Chapter XV—Engine troubles—Frozen water jacket—Faulty lubrication—Repairing cracked jacket—Circulation obstructed pipes—Harmful results—Gaskets should be thin—How applied—Woven wire and asbestos gaskets—Lead and copper gaskets—The governor—Thawing frozen pipes—Ice in the gasoline—Ice in the feed pipe—Lubrication; constant vigilance required.

Chapter XVI—Engine troubles continued—Unpleasant odors; what they indicate—Leaks must be repaired at once—Overheating; how caused—Remedies—Starting troubles—Advantages of multiple cylinders—Various causes for non-starting—Inspection necessary—Cold weather troubles—Warming the gasoline and thawing ice in pipes—How to proceed—Formula for starting.

Chapter XVII—When the engine stops—The warning—What to do—Testing for trouble—Directions in detail—Vehicle should be fixed before starting out—Battery defects—How batteries run down—Tool kits; a friend in need—What tools are required—The tire repair outfit; its importance—Should always be carried—Extra parts; suggestions—Manufacturers will always advise.

Chapter XVIII—Towing the vehicle; sometimes necessary—How it should be done—Freezing the axle—Pushing the vehicle—Towing by use of rope—The wrong and the right way—How to proceed under different conditions—Knots; the fundamental object in knot tying—How to tie useful knots in the most simple and effective way—Useful knots shown by illustration.

Chapter XIX—More about knots and tying—The slip knot—Sailor's knot—Square knot—Weaver's knot—A convenient knot described—Hitches—Splices—The splicing of wires—The lineman's splice—Flexible wires and stiff wires—Wire-cutting pliers should be used—Breaking wires—Hints in brief.

Chapter XX—Filling tanks and oil cups without a funnel—How to pour oil—The paper funnel for emergency use—Care of the hands—Keep the hands smooth—Glycerine and water recommended—Soaping the hands before work—Strong soaps roughen the skin—Abrasive soaps often preferred—Sawdust and turpentine—Ammonia—Cuffs; hints for keeping clean—Emergency jacks.

FREE COPY TO EACH MEMBER

Each member of the A. M. L. will receive by mail a free copy of "Roadside Troubles." This applies to all members in good standing at the time of publication. The list is now being made up and wrappers addressed. No initiation fee. Dues, $2 a year.

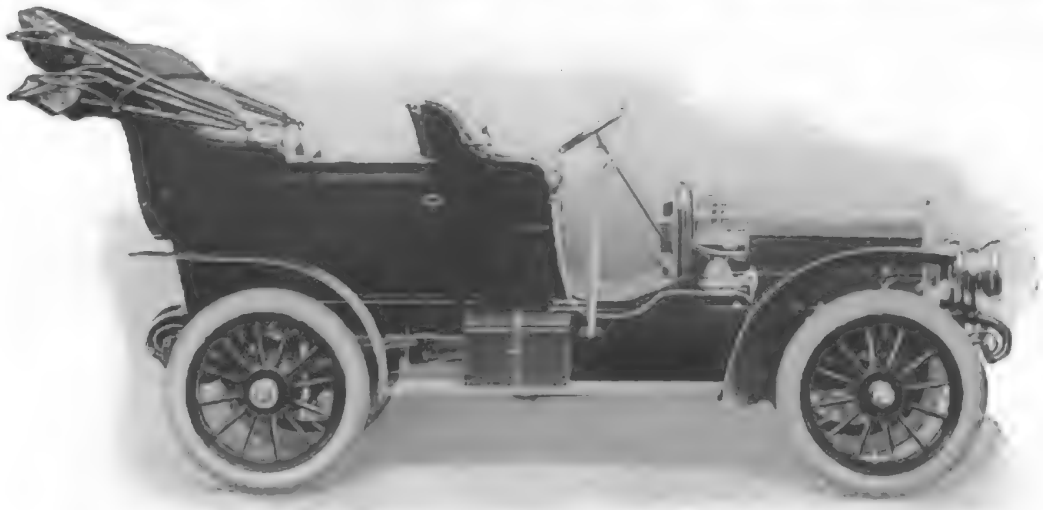
WINTON MODEL-K



WHAT DOES IT WEIGH?

That's a question often asked by prospective buyers of automobiles.

And it's a proper question, too.

Because, if the weight is not properly proportioned to the car's size and carrying capacity, the buyer gets into trouble.

So you **must** consider WEIGHT.

Some automobile builders **take chances** on light weights, making the buyer **run the risk** of breakdowns and perhaps serious accidents.

That's bad business, but it's true.

Keep that in mind when buying and **don't be misled** by any siren song of how much power you save in running a skeleton-weight motor car.

Gasoline and horse-power are cheap compared with HUMAN LIFE.

You can richly afford to waste power, if your car is so substantially built that, no matter how rough, or rocky or hilly the road, your life and limb are **never in danger.**

But you are **not compelled to waste power** to secure absolute safety in motoring.

Get a **Winton Model K.**

Every kind of metal used in the Winton Model K is **tested** in our own plant, on our giant Riehle Testing Machine, before we put a pound of it into use.

These tests show how many pounds pressure or pull to the square inch Winton Model K metals withstand before cracking or breaking.

This testing machine exerts a strain up to 200,000 pounds (100 tons) to the square inch. Think of it!

We don't gamble on weights. **We insure your safety** by using material that will live through any strain.

We cut out every possible waste of power by **grinding** all bearings to the smoothness of plate glass.

And we put into the car an engine **big enough and powerful enough** to drive the car and carry its full load of passengers at full speed, without damage to engine or danger to passengers.

If we wanted to take chances—at your risk—and save money in manufacture, we could reduce the weight of Model K at least 350 pounds.

But, every pound of weight in the Winton Model K is there because it represents honest construction, stability and utter **absence of danger** to you when you ride in it.

Look at our massive Manganese Bronze Front Axle. That's a fair specimen of Winton construction. That axle weighs something. And it's an axle that **won't let down under you,** no matter how fast you go or how many passengers you carry.

MODEL K WINTON.—Four vertical, water-cooled cylinders, 30 H. P. or more. Quiet running. Abundant reserve power. Velvety, non-jar, non-shock, non-breakable transmission. Flexible speed control. Shooting oiler. Exclusive Twin Springs. Easy Riding. And every other feature that a real high-grade car should have. $2500 f. o. b. Cleveland. Compare it with cars selling at $1500 and more.

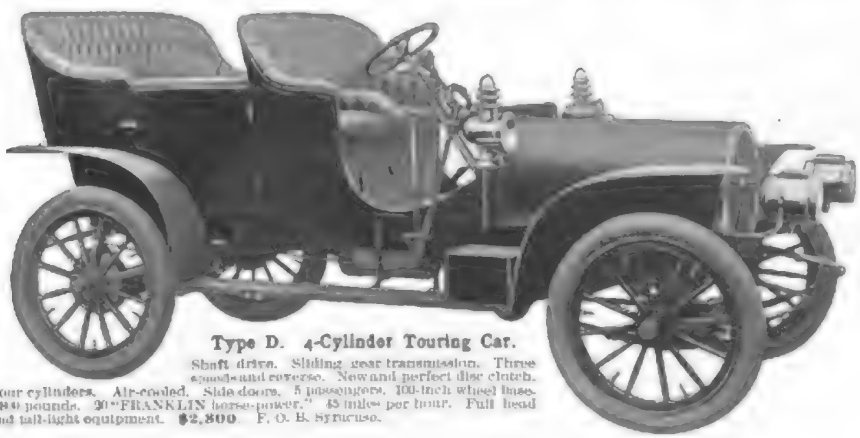
THE WINTON MOTOR CARRIAGE CO.

CLEVELAND, O. Member A.L.A.M. **U. S. A.**

CATALOG NO. 2 IS READY

We will exhibit in New York at the Madison Square Garden Show ONLY, January 13-20, 1906

FRANKLIN



Type D. 4-Cylinder Touring Car.

Shaft drive. Sliding gear transmission. Three speeds and reverse. New and perfect disc clutch. Four cylinders. Air-cooled. Side doors. 5 passengers. 100-inch wheel base. 1,840 pounds. 30 "FRANKLIN horse-power." 45 miles per hour. Full head and tail-light equipment. $2,800. F. O. B. Syracuse.

This is the most surprising car on the market. Nobody can believe what it will do until he tries it. No "30-horse" can do more under any conditions; and no car of any power or price—built anywhere, can do more with five people on American country roads.

Its perfect cooling light-weight and non-jarring qualities enable it to maintain speed indefinitely, and over poor and hilly roads; and make it an extraordinary climber.

It belongs in the "big-car" class; has all the comfort, roominess and style; without the weight, danger and excessive useless cost.

Franklin cars are built on principles that are like diamonds—they can never become old-fashioned. They are becoming more widely recognized and accepted. They are growing more and more into vogue every day.

Last year's Franklins have proven so successful that imitations of them will appear next year and for many years in many other cars. Even a second-hand Franklin is a year or two ahead of the times.

Another point—a most important one: Franklins are made—in every part, of the most suitable and durable materials; and are put together in the most substantial and effective manner that money can pay for. They will not only remain in style but they will continue to do the work.

The first Franklin ever put on the market in 1902 is running today—and running satisfactorily. A Franklin's years of active usefulness have never been measured.

That is why a second-hand Franklin is a first-rate property, commands more money than many first-hand cars of equal pretensions. The value is there; and it is known.

Four Models for 1906

4-Cylinder Runabout 4-Cylinder Light Touring Car 4-Cylinder Touring Car 6-Cylinder Touring Car

The Six-Cylinder Ford

"Always a year or two ahead." When the single-cylinder car was "it," Henry Ford produced a double-cylinder opposed motor, more powerful and at a lower price.

When the automobile trade finally awakened to the possibilities of the two-cylinder opposed motor, Mr. Ford produced a four-cylinder car at $2,000 that was in a class by itself, the public having been taught to believe that such a car could only be produced at a fabulous price.

And now, having exhausted the possibilities of the four-cylinder car in a touring car class, he has introduced it into the Runabout class, and in addition offers a six-cylinder car that is proportionately as far in advance of all competition as his first double opposed motor.

This is a wonderful car.

First, its six cylinders, with 40 horsepower, give a latitude of speed never before accomplished in a car of its class and weight, 2,000 pounds. From four miles per hour on a high-gear up to 50 miles.

While one cylinder of this car will develop sufficient power to drive it along an ordinary asphalt pavement, the whole six cylinders inspire the driver with the confidence that there is an enormous latent energy in his motor, ready for any new demand without overloading the motor, making it the easiest controlled and most flexible automobile motor ever built.

When you have seen this motor in operation you will fully appreciate that we have the smoothest running automobile motor in the world.

Price, $2500.00

The Ford Four-Cylinder Runabout

It is a fact that thousands of these cars are in course of construction.

Like all Ford cars, this one is a radical departure from previous and popularly-accepted designs, and there is a reason behind every radical idea.

Henry Ford built a four-cylinder engine for his Runabout with fewer parts than the old-fashioned single-cylinder engine had, and the Ford Motor Co. have an enormous factory that does nothing but build motors for this Runabout, with a capacity of 100 complete engines every day.

The whole thing is very simple when you go about it right.

This is why we can build the Ford four-cylinder Runabout for less than $500.00.

We are making 40,000 cylinders,
10,000 engines,
40,000 wheels,
20,000 axles,
10,000 bodies,
10,000 of every part that goes into the car.

Think of it! Such quantities were never heard of before. We buy 40,000 spark plugs—10,000 spark coils—40,000 tires—*all exactly alike.*

The first Runabout (Model A) we built cost $30,000—yet we sold duplicates of that model for $750.00.

It is the quantity that counts.

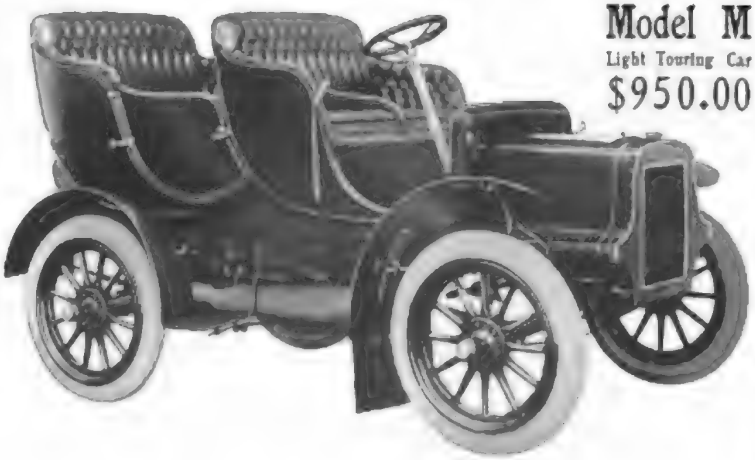
1906 Single Cylinder Cadillacs

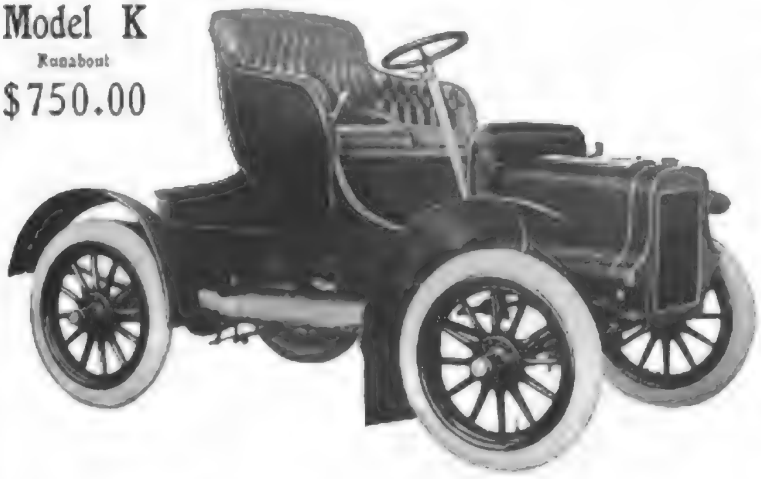
Motor, single cylinder, four cycle 5 in. x 5 in. Ten H. P. water cooled. Copper water jacket. Mechanical pump feed lubricator. Jump spark ignition, Planetary transmission, two speeds forward and reverse.



Model M
Light Touring Car
$950.00

Pressed steel frame, channel pattern. Brake on extra large differential drums. Chain drive. Three spring suspension, rocker joint on front spring, more than doubling spring efficiency. Wheel base 76 inches. Tires, 30x3 1-2 on Model M, 28x3 on Model K. Bodies, Victoria pattern, strikingly beautiful. Pressed steel hollow dash. Finish, purple lake (a deep, rich wine color) on body panels and doors with light carmine striping. Dark carmine running gear. All parts thoroughly interchangeable. Cadillac quality throughout offering values never before equaled.

Model K
Runabout
$750.00



Our four cylinder line consists of Model H. 30 H. P. Touring Car at $2500. Runabout at $2400 and Coupe at $3000. Also Model L. 40 H. P. Touring Car at $3750 and Limousine at $5000. These will be announced in detail later and exhibited at New York at Madison Square only, also at the Chicago Show.

A GOOD FRONT

We believe in putting up a good front, and our cars show it—as it will also be shown in our New Building at Fifty-fifth St. and Broadway, which we hope will be ready for occupancy in a few days, and where we will have a continuous plate glass corner front, permitting LOZIER MOTOR CARS to be shown to the best possible advantage. And they will stand all the light that can be thrown upon them, for their fine construction, finish and equipment is such as invites the very closest inspection. The Lozier Car is the very largest American Car, and in price it is deservedly the highest. We are now delivering Limousines, Landaulets, and Touring Cars, 35 Horse-power, Type C, 1906 Model, and every owner of a LOZIER MOTOR CAR is one of experience who has at last found the ideal in our product.

LOZIER

THE LOZIER MOTOR COMPANY

Temporary Quarters at R. M. Stiver's Carriage Room, 19 W. 62nd St., New York City

¶ The working out of a new principle of design as has been done in the Stevens-Duryea was a big achievement, so big that the public would have been tolerant with us if we had made a few errors in the application. In fact, most of those who have been watching the Stevens-Duryea during the year of 1905 were quite confident that such errors would show up before the season was half over. However, the makers of the Stevens-Duryea deserve unusual credit, for they not only perfected a new principle, but they got the ***application*** right in every detail the ***first time they tried.*** As a result we come before the public for 1906 with not a single excuse to offer for our 1905 product; and furthermore, we wish to direct attention to the fact that not a single one of our claims about its good features as expressed in our advertising or descriptive matter during 1905 was, after a season's use, proven inaccurate or overdrawn in the slightest degree. And, considering the many unequivocal statements we have made during the past year, the above record is without a parallel.

OLDSMOBILE

Standard Runabout Model "B" Price $650

For 1906 we have brought out, in addition to our well-known curved dash runabout (the "you see them wherever you go" kind), a straight dash or "piano box" runabout, which we sell at the same price. This style appeals strongly to a certain class of drivers. It is unique and attractive and possesses all the most desirable features essential to a satisfaction-giving runabout.

It has a simple single cylinder motor, with 7 h. p. It is lever controlled. Starts from the seat; has safety device to prevent all danger of back fire; effective and easily operated brakes, and many attractive and serviceable features, making it up-to-date and desirable in every way—a big value for the money, and essentially a car for business utility.

Use the Catalog Coupon below for further particulars regarding the Standard Runabout, Model "B," price $650; the Palace Touring Car, four-cylinder, Model "S," price $2,250; two-cycle Model "L," price $1,250, or any of our commercial vehicles.

Our New Models will be on Exhibition at Madison Square Garden Automobile Show, January 13-20, 1906

A fulfillment of Prophecy

One Model 45 Horse Power

Produced by a determination to fulfill now the prophecy of ultimate supremacy for American Automobiles—the result of devoting one factory for ten years to perfecting one model.

We buy material in any country that produces the best for the purpose; but American machinists finish it all—they spend over two thousand hours on each car finishing parts otherwise complete. More time and care than any other touring car receives. Fitted parts are required when picked up at random to snap together like your watch lid, hang tight, yet part in the hands.

By what process could any maker, anywhere, produce a better car? Where is another so made?

After producing this car we figured the cost and selling price. We were pleased to find that the duties and excessive commissions on our only competitors, make our charge—$4,250—barely half the cost of any foreign car that makes a comparison possible.

We seek communication with those who will appreciate this car. For such it will give a service greater than any other mechanism the world has produced. Shall we send our book of details?

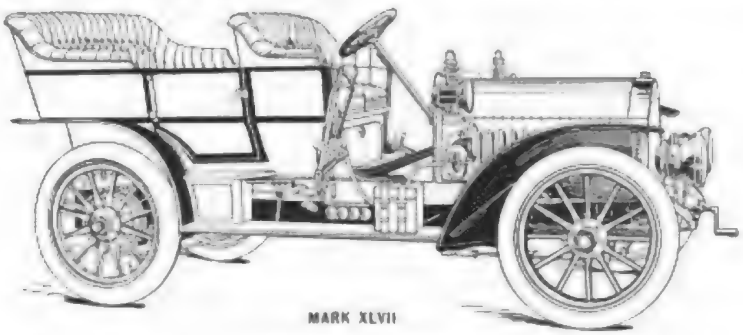
Gasoline Cars for 1906

ARE built of the best materials in the world under methods and processes more advanced than those employed in any automobile factory other than our own. No consideration of the cost of production has been permitted to interfere with making perfect every part and piece of each model, whether pertaining to mechanism, bodywork or general equipment. The expense of making the crankshafts, for instance, is six times greater than that of any previously made in this country. We guarantee that these cars, each according to its power and place, will yield the greatest things possible in motor service.



MARK XLVII

MARK XLVII 40-45 h.p. four-cylinder motor under forward bonnet; sliding gear transmission, four speeds and one reverse; jump-spark ignition from storage battery; new pattern automatic carbureter; special chrome-nickel steel gears, axles, crankshaft and jackshaft; crankshaft machined cold out of solid block; double chain drive; I-beam front axle forged in one piece; pressed steel frame; 108-inch wheel base; seat starting; new pattern brakes. Price, with standard body.....$4,500
With 112-inch wheel base, Royal Victoria, Double Victoria, Limousine or Landaulet body.....$5,000 to $5,500

MARK XLVI An entirely new model. 24-28 h.p. four-cylinder, vertical water-cooled motor; shaft drive, sliding gear transmission; three speeds and reverse; low tension make and break magneto current ignition; special chrome-nickel steel gears and shafts, crankshaft machined cold out of solid block; I-beam front axle forged in one piece; rotary pump oil lubrication; pressed steel frame, 96-inch wheel base; double side entrance body seating five passengers. Price.....$3,000

MARK XLIV-2 Perpetuating Mark XLIV, one of the most successful of medium-weight 1905 cars. 18 h.p. double opposed horizontal motor under forward bonnet; frame length increased eight inches, giving ample room forward of each seat; wheel base increased to 90½ inches. Rear seat widened five inches; double side entrance body. An ideal family car, which will climb any hill and maintain a speed of 35 miles an hour on the level. Price.....$1,750

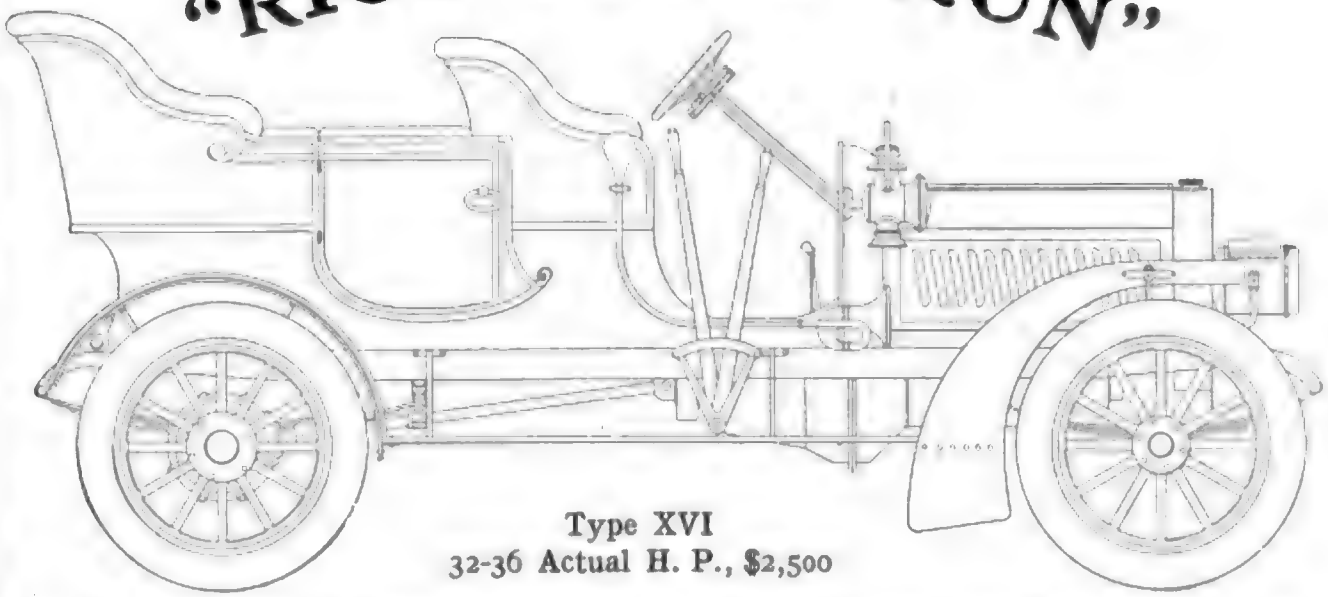
1906 ST. LOUIS 1906

"RIGS THAT RUN"



Type XVI
32-36 Actual H. P., $2,500

Our 1906 Type XVI is the crowning triumph of fifteen years' experience in building gasoline automobiles. This model represents EVERYTHING GOOD in modern automobile construction. You cannot afford to pay more, and you couldn't expect to pay less. Compare Type XVI with any other car listing from $3,000 to $5,000, and we doubt if you will find any vast difference in other than the price. An agent should sell a car that will instantly appeal to all classes. Thousands of prospective purchasers are in the market—a few of them will insist on paying $5,000 and over—a few more will insist on $2,000 and under, but eight out of every ten will be the BETWEEN class, if they can get the satisfaction at a reasonable price. Type XVI is between the two extremes (in price), but from closest observation we fail to see where it will not compare inch for inch with any car built in AMERICA. A FAIR, UNPREJUDICED COMPARISON IS ALL WE ASK. It will carry five people comfortably at any speed from four to fifty miles an hour, absolutely noiseless, no vibration, will negotiate 22 per cent grade on high speed. General finish, upholstering and trimmings cannot be surpassed—no matter what the price.

MOTOR—Four-cylinder vertical, under hood, water-cooled, developing 32-36 actual H. P. Entire construction highest grade. Muffler reduces noise to nothing. (Quietest car in existence).

VALVES—All are mechanically operated, generous bearings (Cramp's special bronze) throughout. Large fan behind radiator.

CRANK CASE—Made of special metal. Instantly accessible aluminum side plates allow instant inspection of connecting rod, crank shaft, etc. Full metal pan under engine.

FRAME—Specially prepared pressed steel, channel section; 4¾ inch tapered and reinforced. Motor and transmission integral assuring perfect alignment under all conditions.

TRANSMISSION—Sliding type, three speeds and reverse, all gears made of special high carbon steel. All shifts made with one lever. Clutch metal to metal, multiple disc, load is taken up gradually. No matter how sudden the shift is made the jerk is ABSENT.

CONTROL—New style rack and pinion with ball and socket joints to take up all wear. Spark and throttle control placed conveniently under steering wheel, also accelerator foot pedal to use if desired for QUICK SPEED CHANGES.

BRAKE—Three in number—any one of which will hold car on any grade. Same are controlled by both foot and lever at side of car. Application of foot brake throws out clutch, disconnecting transmission from motor.

AXLES—Front extra heavy dropped forged I beam, guaranteed not to spring. Rear axle of the floating type all equipped with Timken roller bearings throughout.

DRIVE—Bevel gear regular ratio three to one. We will furnish lower gearing upon request.

SPRINGS—Large half elliptic of the best quality obtainable. Front 38 inch, rear 48 inch. Three-point suspension throughout, allowing perfect riding over the worst road conditions.

Our cars contain many individual features of merit, which we have omitted to mention. Our new elaborate catalogue explains every detail and will be mailed upon request. Fifteen years' building experience has taught us the proper kind of material to use and how to use them correctly. We have simply covered the broad points of general construction, that you may compare Type XVI with other makes costing nearly twice as much. Some cars may COST MORE—but none are better. We have not sacrificed one iota to cheapen our product. The material throughout is GOOD OLD ST. LOUIS quality from the ground up. Our name is on it and our guarantee back of it.

LASTLY—We are fast closing all available territory and our agency list will be filled before the New York show. If we are not already represented in your immediate vicinity, you had better write for printed matter AT ONCE. Don't wait until show time and be among the "ALSO RANS." Our agency proposition is most entertaining—it MIGHT pay you to investigate.

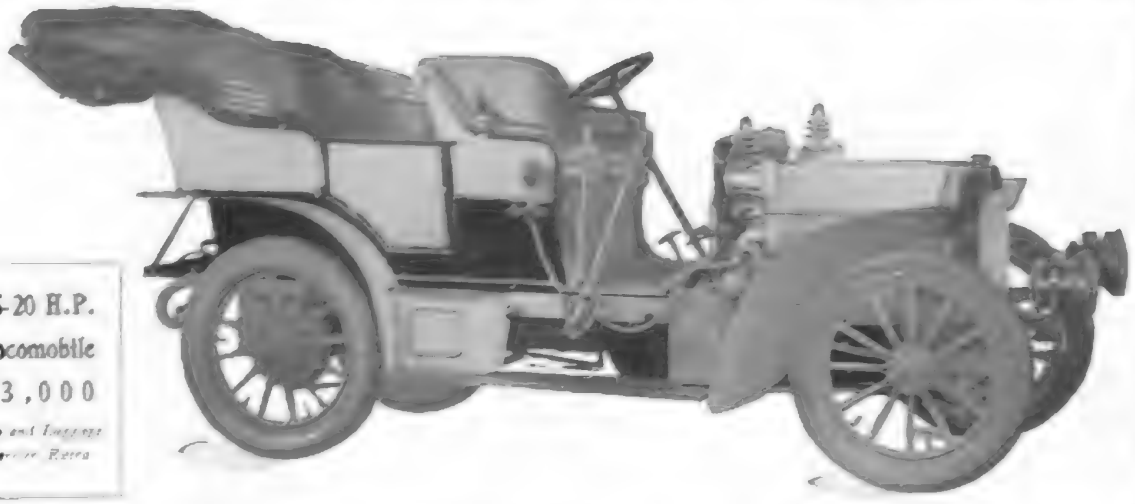
Locomobile

"EASILY THE BEST BUILT CAR IN AMERICA"

15-20 H. P., $3,000, 30-35 H. P., $5,000, both with complete touring equipment



15-20 H.P.
Locomobile
$3,000
Top and Luggage Carrier Extra

TYPE "E" Locomobile 15-20 H. P.

PRICE—$3,000 ready for touring.
EQUIPMENT—Five brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY—Double side entrance, seating five; extra wide doors; fitted with top irons; color and striping optional.
MOTOR—Four cylinder, 3⅝ inch bore, 4½ inch stroke.
CAM SHAFTS—Hardened forgings; all cams integral.
CRANK SHAFT—Machined from one solid forging.
LUBRICATOR—Large, mechanical lubricator.
CARBURETOR—Automatic, with balanced throttle valve.
GOVERNOR—Centrifugal type, prompt and positive in action.
IGNITION—Make-and-break.
MAGNETO—Low tension, our own design and manufacture.
ALUMINUM PAN—Placed underneath the machinery.
FRONT FENDERS—Have inner wings extending to bonnet.
CLUTCH—Cone type, with ample surface.
TRANSMISSION—Three forward speeds and reverse.
DRIVE—Double side chains.
DOUBLE UNIVERSAL JOINT—Between clutch and transmission.
RUNNING BRAKE—Large and powerful, metal to metal surfaces.
EMERGENCY BRAKES—Internal expansion type, metal to metal.
BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES—"I" section hand welded axles.
RUNNING BOARDS—Rubber covered and brass bound.
TIRES—32x4 inches on all four wheels.
WHEEL BASE—93 inches.
CONTROL—Gas and spark levers on steering wheel.

TYPE "H" Locomobile 30-35 H.P.

PRICE—$5,000 ready for touring.
EQUIPMENT—Five brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY—Double side entrance, seating five to seven; extra wide doors; fitted with top irons; color and striping optional.
MOTOR—Four cylinder, 4½ inch bore, 5½ inch stroke.
CAM SHAFTS—Hardened forgings; all cams integral.
CRANK SHAFT—Machined from one solid forging.
LUBRICATOR—Large, mechanical lubricator.
CARBURETOR—Automatic, with balanced throttle valve.
GOVERNOR—Centrifugal type, prompt and positive in action.
IGNITION—Make-and-break.
MAGNETO—Low tension, our own design and manufacture.
ALUMINUM PAN—Is placed underneath the machinery.
FRONT FENDERS—Have inner wings extending to bonnet.
CLUTCH—Cone type, with ample surface.
TRANSMISSION—Three forward speeds and reverse.
DRIVE—Double side chains.
DOUBLE UNIVERSAL JOINT—Between clutch and transmission.
RUNNING BRAKE—Large and powerful, metal to metal surfaces.
EMERGENCY BRAKES—Internal expansion type, metal to metal.
BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES—"I" section hand welded axles.
RUNNING BOARDS—Rubber covered and brass bound.
TIRES—34x4½ inches.
WHEEL BASE—106 inches.
CONTROL—Spark and gas levers on steering wheel.

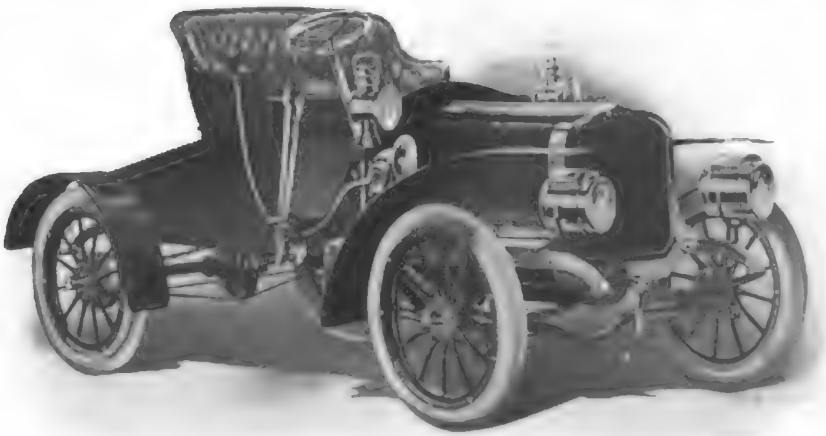
Corbin Cars for 1906



Model G. High Powered Runabout, 24 h. p. $1,800.

Four cylinder vertical, air cooled engine 24 H. P. mechanically operated valves. Jump spark ignition with synchronized system of distribution of the high tension current. Positive force feed lubrication. Sliding gear transmission, selective system having three speeds forward and reverse. Pressed steel frame and steel pan construction. Bevel gear drive rear axle of the floating type. Front axle I beam section, drop forged in one piece. New type worm and sector steering gear. Internal and external brakes on rear hubs. Body latest French type for two passengers, divided front seats. Long, graceful tail box. Wheel base 93 inches. Weight 1,650 pounds. Speed 50 miles per hour. Three oil lamps, horn and full complement of tools, constitute the equipment.

Annular Ball Bearings Are Employed Throughout

Certain agency opportunities are still open. Representative dealers are requested to communicate with us to insure early delivery of cars.

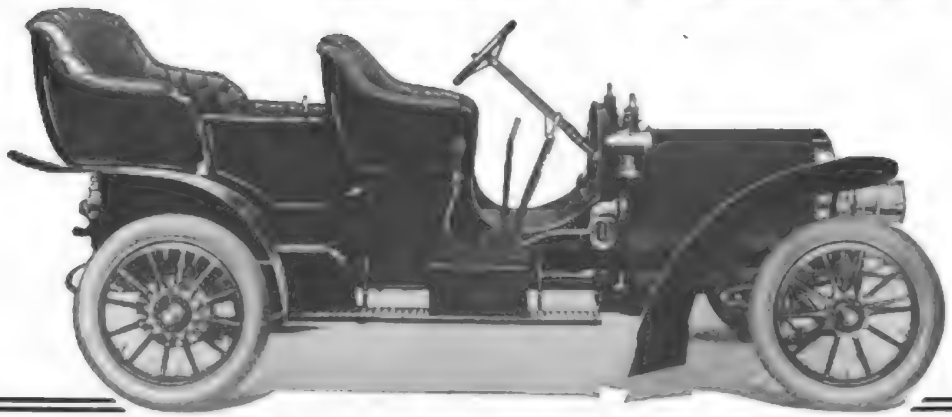
THE MARION



In designing the perfect car progress is towards the complex, but improvements are from the complex to the simple. The two questions before us are, first, what is best; and, second, what is simplest. If both can be found in one form that form is certain to be the ultimate. The MARION contains both.

Detailed Specifications of "Model Five"

Body: Beautiful design; wood, selected and thoroughly seasoned; double side entrance, detachable tonneau, door width 21 in.; seating capacity five persons. Semi-divided front seat.

Upholstering: Finest quality French finished hand buffed leather, curled hair, and oil tempered steel springs in seats and backs. Deep full cushions, luxurious and very comfortable.

Springs: Full elliptic, oil tempered; 36 in. front; 38 in. scroll rear; 1¾ in. wide. Auxiliary leaves take severe blows.

Finish: The highest obtainable skill in using paints and varnishes of the finest quality produces a superb finish. Standard color, body light Brewster green, trimmed with black. Running gear light Brewster green. Both having an appropriate fine carmine striping, giving a refined and handsome appearance.

Frame: Pressed cold rolled steel, consisting of two straight side members and three cross members only. Gusset plates at every joint. Hot riveted.

Hood: Plain, triple hinged, lifting from either side and removable, brass front grill, stationary.

Weight: Fully equipped and ready for road 2,100 pounds.

Wheels: Artillery, Schwartz patent, second growth hickory; 10 spoked front, 12 rear; diameter 32 in. Large ball bearings.

Wheel Base: 108 inches.

Wheel Gauge: 56½ in. from center to center of tread.

Tires: 4 in. Clincher type, of any standard American make. Optional 3½ in. Fisk heavy car type.

Control: Right hand side. Steering wheel 16 in., gear irreversible. Spark and throttle levers in wheel. Clutch and running brake operated by "push" pedals. Gear shifting and emergency brake levers at side.

Brakes: Hand and foot, very powerful, in the form of bronze expanding shoes applying within drums fastened to spokes of wheels.

Motor: 4-cylinder vertical, placed lengthwise. "Marion" system of air-cooling. Mechanically operated valves; cam shaft and gear inclosed within crank case, of aluminum. All working parts carried by upper half of case; lower half removable without interfering with bearings. Starting crank fastened to frame and held in vertical position when not in use.

Horse-power: 24-28. Range of speed 150 to 1,500 revolutions per minute.

Cylinders: Special quality cast iron, machined all over, giving absolute uniform distribution of metal. An important air-cooled feature. 4½ in. bore; 4½ in. stroke.

Crank Shaft: 4 throw; 1¾ in. diameter; machined from hand forged billets of 25 point carbon steel. Five extra long bearings, the rear being 4¼ in.

Fly Wheel: Accurately turned, balanced, and finished, 19 in. in diameter; weight 105 pounds. 6 fan blade spokes.

Fan: Aluminum, 16 in. in diameter. Hess-Bright bearings. Driven by 1¾ in. flat belt.

Lubrication: Splash, 4 compartments in bottom half crank case, holding approximately one gallon of oil, sufficient for 200 miles. Supply readily replenished by tank supported from crank case. Inspection glasses to ascertain height of oil.

Muffler: Exceptionally large, noiseless, and without back pressure. Exhaust pipe 2½ in. in diameter. Cutout operated by heel.

Ignition: Jump spark, 4 unit coil, 3 cell 6 volt storage battery, good for 1,000 miles, carried in box in running board. Plugs located in intake chamber; fouling impossible.

Gasoline Capacity: 17 gallons. Copper tank under front seat.

Clutch: In transmission case; multiple disc; non-adjustable and running in oil. Gradual but positive engagement.

Transmission: Sliding gear, 6 pitch, giving 3 forward speeds and reverse. Secondary shaft does not revolve when driving on top gear.

Drive: Double side chain; large sprockets; 25 and 40 teeth.

Road Clearance: 10 in. This extreme is only possible by the divided chain drive.

Dash: Cast aluminum, oval.

Equipment: 2 acetylene head lights, 1 acetylene gas generator, 2 oil side lamps, 1 oil tail lamp, 1 French horn, reflexible tube; a complete set of tools and parts carried in accessible tool box under rear of frame.

Accessibility; Simplicity: THROUGHOUT.

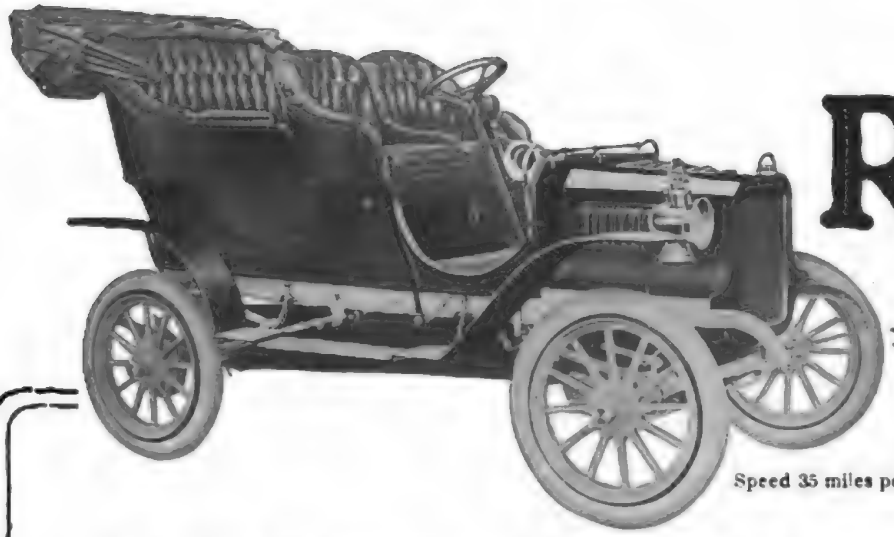
MARION MOTOR CAR COMPANY INDIANAPOLIS INDIANA

We have a few attractive agency propositions still open.



REO

REO 1906 TOURING CAR —16 h. p., 1600 pounds, 90-inch wheel base, 5 passengers, side door detachable tonneau. Speed 35 miles per hour, $1,250.

The REO Bus with exactly the same motor won the National Trophy in the great 6-day Economy Test by carrying its load 682 miles at a total cost of one cent per mile per passenger.

The REO Face

No worry; no mind-strain; no anxiety goes with a REO car.

The few simple operating devices are placed exactly ready to the hands and feet. Every movement is as natural as walking.

The feeling of surplus power under absolute command; the sense of strength, certainty and comfort; the assurance of getting there and back—these make the satisfied expression of the REO face.

Better get it

REO 1906 RUNABOUT—8 h. p., 900 pounds, 2 passengers, 25 miles per hour, $650. With folding seat to carry two extra passengers facing forward, $675.

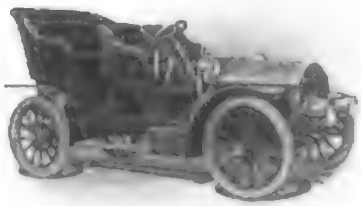
Waltham Orient



Waltham-Orient Model R, $2,250.
The Keystone of the Air-cooled Arch.

Friction-drive Buckboard Model BB, $400.
The lowest priced Motor Car made in the World.

The Car of To-day Must do More than Look its Price. The high priced, high powered motor car is all right—it has its place and its purchasers, but the **popular demand** is for a car of moderate price, reasonable speed that will be maintained up-hill as well as on the level road; that will arrive on time and return when expected; that will keep on the road and out of the repair shop; that can be operated economically and safely and does not require the employment of a professional chauffeur; that will remain in service winter as well as summer.

It must look well—ride well—run well—and keep well. That's where your pleasure comes in. You pay your good money for it and you have a right to expect it.

It is because it combines all of these important and necessary features that

The Waltham-Orient is the Leading American Car of its Price

Five Touring Models for 1906

Model R, a Swell Special 20 h. p. - - - - -	$2,250
Model N, 20 h. p. Tourist - - - - - - -	2,000
Model L, 16 h. p. Tourist - - - - - - -	1,750
Model M, 16 h. p. Runabout, Detachable Tonneau,	1,750
Model K, 16 h. p. Two-passenger Runabout,	1,600

A Greyhound can run a mile as rapidly as a five thousand dollar Racehorse, and he can course through the sand and up the cliffs where the thoroughbred cannot follow; which only goes to prove that price, bulk, weight and power rating do not necessarily mean the first to finish nor the one to get nearest the top of the mountain.

The Buckboard is the Greyhound of Motor Cars. It makes no pretensions to being the thoroughbred horse. It has no five thousand dollar price tag on it, but is simply in a class of its own, equally a pleasure to its owner, for it serves its purpose and serves it well.

WHY?

BECAUSE: It creates interest quicker than any car you can represent. It conflicts with no other sales. It makes Motorists out of Horsemen and Cyclists. It sells to owners of the "thoroughbreds" for daily service to the station, the country club or the seashore. It sells for Rural Mail Routes, Telephone and Telegraph Linesmen, Parcel Delivery, etc. It requires less time and trouble for each sale, and less subsequent expense and repairs. It has an operating cost less than one-third of any other motor car in the world. It will run 35 miles to the gallon of gasoline, and 100 miles to the pint of oil. It has a maximum power ratio of 40 to 1. No other car exceeds 18 to 1. It will climb 40 per cent official grade and run 30 miles or more per hour. If you will write us we will send you forty other reasons.

We are alive for live agents. Write for specifications and agency proposition.

We will exhibit only at the New York, Chicago and Boston Shows.

ANNOUNCEMENT

The 1906 Model F **Cleveland** 30-35 H. P.

Is now ready for immediate delivery. A demonstrating car is in commission at the salesroom of our General Eastern Distributing Agent, E. B. Gallaher, 228-230 W. 58th St., New York, also at our Cleveland salesroom.

BRING AN EXPERT WITH YOU

NO other American car is made of such uniformly perfect and high-grade material adapted to the purpose, or so thoroughly and intelligently assembled. There is no car on the American market that will stand up to its work so well or so long. Infinite care is exercised in every detail of construction and the **Cleveland** car represents the highest and most advanced ideas in automobile building. It is in a class by itself. The complete chassis of the **Cleveland** car is manufactured by the Garford Company, whose experts have designed and built more high-grade automobile parts and complete chassis than any other concern in America, and the **Cleveland** is, therefore, the product of years of practical experience.

SPECIFICATIONS

ENGINE—30-35 H. P., 4-cylinder, water-cooled.
IGNITION—Simms-Bosch low tension Magneto—make and break ignition.
TRANSMISSION—Sliding train, 3 speeds forward and one reverse.
REAR AXLE—Shaft drive, clutch driven hub. Ball bearings.
FRONT AXLE—I-Beam section. Ball bearings.
FRAME—Cold rolled pressed steel, aluminum under bonnet covering entire engine and transmission.
WHEEL BASE—104 inches.
WHEELS—Imperial whalebone, grade A, second growth hickory.
TIRES—34x4.
VALVES—Mechanically operated, inlet and exhaust interchangeable.
CARBURETOR—Float feed, requiring no adjustment.
BRAKES—Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
BODY—Victoria or double phaeton, tulip side entrance.
EQUIPMENT—Two head lights, 1 generator, 2 side lights, 1 rear light, 1 horn, and tools.

Price $3,500 to $5,000, Depending Upon Body Equipment. The 20 H. P. Model D will be continued without change. Price $2,800. Both models guaranteed for one year.

CATALOGUE AND FULL INFORMATION UPON REQUEST.

Wayne

One of Our 1906 Models

Wayne Model H—$800—Two Passenger Runabout

Motor, 2-cylinder opposed under hood. Cylinders, 4¼x4 developing 14 H. P., water-cooled. Transmission, planetary gears with DIRECT BEVEL GEAR DRIVE. Control is by a single lever which engages the high speed clutch and reverse. The break and slow speed are controlled by foot pedals. Wheels, 28x3. Equipment, complete set of tools.

The strong features of this car are the extreme simplicity of the engine and transmission. The crank case and transmission case form one casting and the entire engine can be taken apart or assembled in half an hour.

Model F 4-cylinder car, cylinder 5¼x5. 50 H. P. Seating 7 people. Price, $3500.

Model K 4-cylinder, five-passenger touring car. 35 H. P. Sliding gear transmission. Price, $2500.

Model B 4-cylinder, five-passenger car. 24-28 H. P. Sliding gear transmission. Price, $2000.

Model C Five-passenger car. Double opposed motor. 20 H. P. Planetary transmission. Price, $1250.

The Wayne Agent can supply a high-grade car at any price his customer may demand.

We have the BEST—Car for the Customer —Proposition for the Agent

WAYNE AUTOMOBILE COMPANY

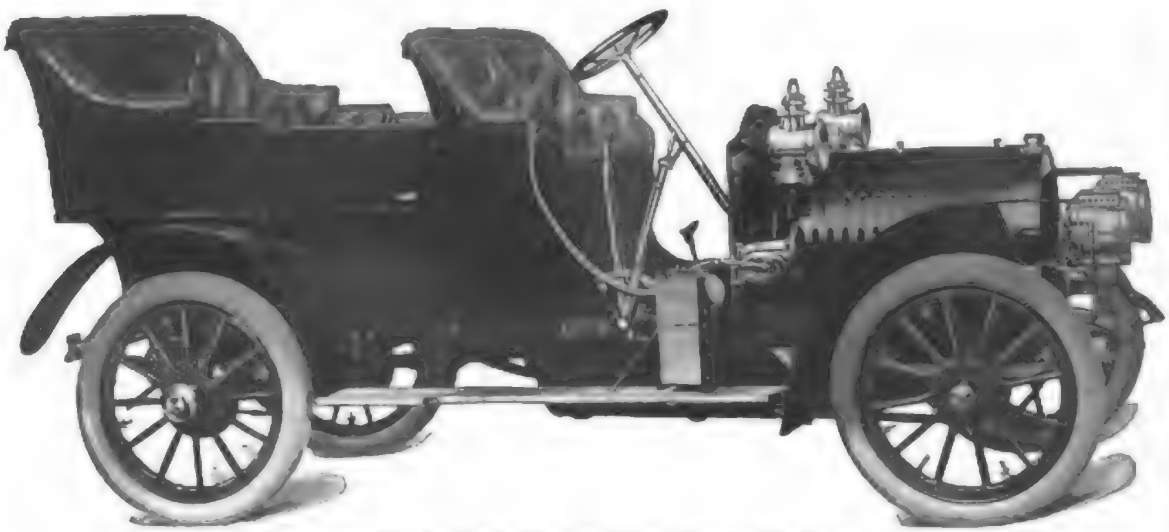
DETROIT, MICHIGAN

THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

Absolutely the highest grade motor car built in this country, bar none, and the only car that can consistently compete with foreign machines. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. New style make and break spark. Simms-Bosch Magneto, bevel gear drive. Very large and roomy, full aluminum bodies.



MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

Guaranteed free of repairs for one year

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order?

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.

THE RAINIER COMPANY, Broadway, Cor. 50th Street, New York

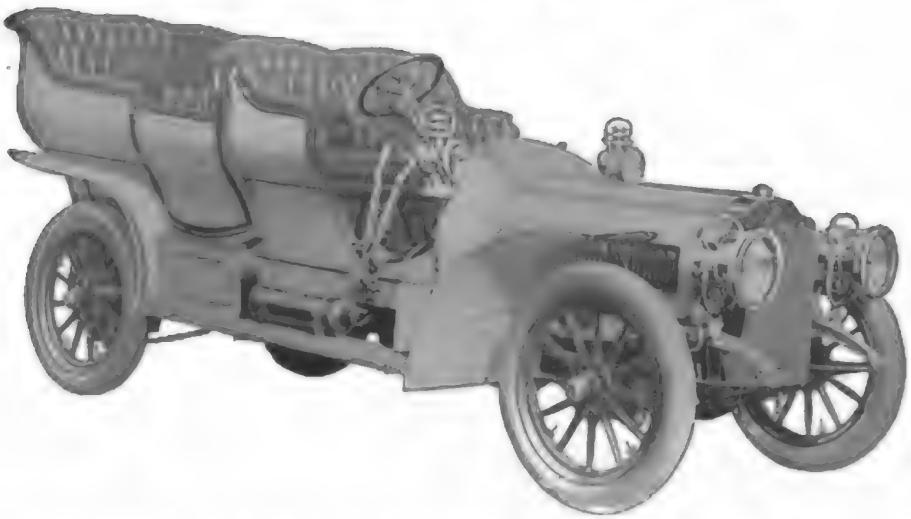
NO—Sixty Miles an Hour is Not Necessary

BUT IT'S SATISFACTION TO KNOW THAT YOU CAN ATTAIN THAT SPEED IF YOU WISH IN THE 50 H. P.

THOMAS



Why do we emphasize the fact that every stock Thomas is guaranteed to show sixty miles an hour before leaving the factory? Not because that is its chief claim upon your consideration. Not because the average owner cares to travel at any such speed. But because the extraordinary efficiency of the Thomas in that respect is merely an indication of its absolute perfection in every other respect.

We believe 50 h. p. to be necessary to the highest degree of smoothness, easy riding and comfort in taking steep grades or rough roads, and picking up speed quickly without changing gear on crowded streets. That's what the Thomas furnishes—full 50 horsepower.

The Thomas does not merely court comparison with the best American Cars—it invites competition for all-around efficiency under any and all conditions with the best cars made anywhere in the world.

The sixty-miles-an-hour guarantee, as we have said is merely incidental to its perfection in every other point.

We would suggest that your investigation be made as early as possible. Even the increased capacity of this great factory will not entirely meet this year's phenomenal demands.

HONORABLE MENTION

SCHEBLER CARBURETORS

STANDARD OF THE WORLD

NATIONAL MOTOR VEHICLE CO.

CABLE ADDRESS "NATIONOMET" INDIANAPOLIS — A.B.C. CODE

Indianapolis, Ind. Nov. 30, 1906.

Mr. F. H. Wheeler,
C I T Y.

Dear Sir:--

The National motor car was equipped with one of your Schebler carbureters during its World's Record travels at the Indianapolis Fair Grounds Track November 16 and 17. During the entire 24 hours continuous running the carbureter never once faltered, but gave a perfect mixture at all engine speeds regardless of day or night temperature. We cannot find words of sufficient praise with which to express our appreciation of its magnificent performance.

Yours very truly,
NATIONAL MOTOR VEHICLE CO.,
Earl H. Martin

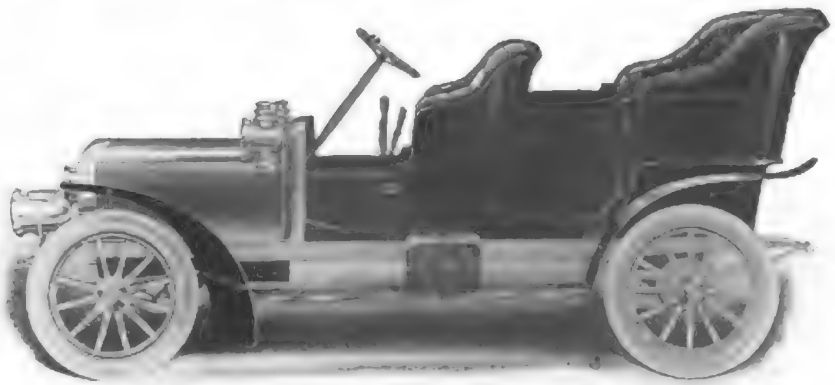
Aerocar

The Car of to-day, to-morrow and the years to come,
—Built by practical men.—



Here is the **one** motor car driven by a reliable, test-proven air-cooled motor.

The vital factor in every motor car is the motor.

All Automobile authorities—people who have had most experience—concede that many improvements are necessary in water cooled motors—too many mechanical complications, too much weight, too many troubles.

The same authorities agree that in the reliable, success-proven air-cooled motor lies the solution of most all motor car troubles.

The **Aerocar** has such an air-cooled motor. It has taken eight years of continual efforts, experimenting, testing, proving and many thousands of dollars to produce this reliable air-cooled motor, but the results sought have been secured, and they are well worth all the time, labor, and money expended.

The air-cooled motor of the **Aerocar** is of wonderful efficiency in power. Runs with the uniform smoothness and rhythm of an electric dynamo—under all climatic conditions, over all sorts of roads. Has strength of construction with simplicity of control, giving great durability of service, develops continuous higher power for weight, and gives greater speed than any other motor.

In the necessary, the vital qualities for satisfactory service, the air-cooled motor of the **Aerocar** is supreme—in a class by itself—the motor that "motes" when you want it to serve you.

The body of the **Aerocar** compares most favorably with any car either foreign or American. It embodies the best features of each, is graceful in line, is luxuriously roomy and comfortable; is finished and upholstered strictly up-to-date.

Aerocar 1906. 24 h. p. Four cylinders. Five passengers. 45 miles an hour. 104-inch wheel base. Shaft drive. Sliding gear transmission. Three speeds forward and reverse. Leather-faced cone clutch. Hollow steel dash. Four sight lubricator on dash. Tool box on running board. 34x4 tires. 9-inch road clearance. Weight 2,000 pounds. Fully equipped, ready for the road, including two large gas headlights, $2,800 f. o. b. Detroit.

Will be exhibited and demonstrated at the Automobile Shows in New York and Chicago.

The dealer who has the selling agency of the **Aerocar** will have a gold mine. Territory being rapidly taken up. If interested write us promptly.

INDIANAPOLIS DUNLOP TIRE

Open Steam Cured Fitted with Flap Wide Edges

¶ This tire is fitted with a flap, which protects the air tube from screw heads in the rim and from moisture, and does away with the necessity of fabric-covered tubes. The special edges and the flap constrict against the channel of the rim in such a way as to prevent creeping. It is entirely open steam-cured, which gives the tire exceptional strength. For full information apply to any of the following addresses:

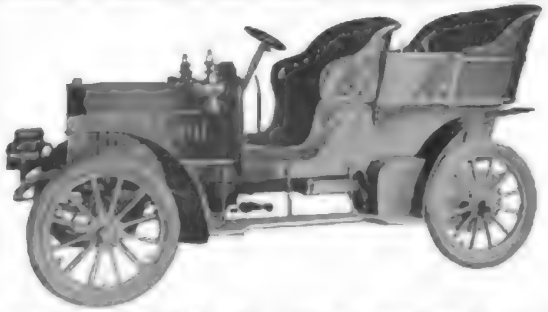
THE 1906 CRAWFORD TOURING CAR



FINEST CAR IN THE WORLD AT

$2000

A Perfect Car at a Popular Price

SPECIFICATIONS COMPLETE

MOTOR: Four-cylinder, upright, water-cooled, 4½ by 4½ individual cylinders. 24-28 Horsepower.
CRANK SHAFT: Four throw, bearing in five bronze bushings aggregating 14½ inches.
CRANK CASE: Removable without disturbing adjustments.
WHEEL BASE: 100 inches; tread 56 inches.
WHEELS: 34-inch, wood, artillery type, on large ball bearings.
TIRES: Optional; regular clincher or mechanically attached.
DRIVE: Double chain on generous-sized sprockets.
TRANSMISSION: Selective sliding gear set, three forward speeds, one lever control, ball bearings.
BEARINGS: Ball bearings throughout.
BRAKES: Two powerful brakes on rear hub, with set lever. Two band brakes operated by foot on cross shafts.
LUBRICATION: Force feed lubricator.
FRAME: Deep section pressed steel sides, with an angle iron sub frame brazed up to carry motor and transmission, which are connected by double universal joint.
CLUTCH: Of inverted type, made dust-proof by leather diaphragm and operated by foot lever.
IGNITION: Jump spark, with four coils on dash.
CONTROL: Throttle and spark.
SPEED: 36 miles, approximate maximum.
WEIGHT: 2100 lbs.
TANK CAPACITY: 14 gallons.
STEERING GEAR: Wheel and pinion.
AXLES: Large sized tubing.

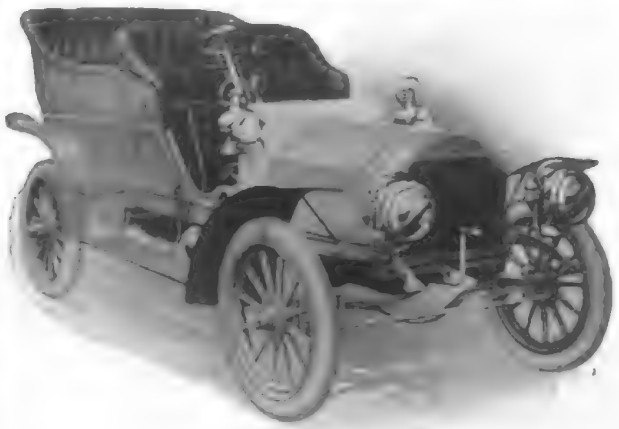
HAGERSTOWN, MD.



Again—"As good as it looks"

Stoddard-Dayton

MODEL D

Touring Car

has more than beauty-lines to recommend it.

But, if you will look at its picture above, you are bound to agree that it is just about the handsomest, trimmest, most luxuriously-inviting vehicle that four wheels ever carried.

Note the exquisite modeling of the body, the clean, symmetrical lines of the frame, the vigorous and altogether stunning effect of the entire car.

Note—you cannot see it in the cut, but in the car itself—the delicate pearl-gray of its finish (16 paintings to attain *that* lustre!) See how this Quaker garb is relieved by the effective contrast of rich tan upholstering. Other colors optional with purchaser.

And then remember that artistic appearance is the *least* of the Stoddard-Dayton's virtues.

It IS *"as good as it looks."*

Every Stoddard-Dayton car *must* perform, and proves its *ability* to perform, before it leaves our factory. This is done by exacting block tests for motor, and road tests for car before final finish is applied.

The Stoddard-Dayton Model D, 5-passenger touring car has a special type of 4½x5 in. 4-cylinder motor; water-cooled; frame of hot-rolled, high carbon, pressed steel; sliding gear transmission, three speeds and reverse—selective type, can be changed instantly from high to intermediate, or vice versa, at speed of 25 miles, up hill or down, without clashing or friction; practically noiseless; entire transmission on roller bearings; mechanical lubrication; 30-35 horse power. Proportion of power to weight, one horse power to every sixty pounds. $2,250. Immediate delivery.

Write for our 1906 catalogue. It's full of interest to every motorist. Sent *free* on request.

The Simplest Engine in the World

THE TWO-CYCLE ELMORE

When you understand that the two-cycle Elmore engine does away with 18 to 20 parts on each of the four cylinders; and absolutely eliminates all inlet and exhaust valves, with their attendant mechanism, you'll agree with us, won't you, that this is the simplest engine in the world?

Do we need to point out that this also reduces the cost of operation and upkeep to the minimum and makes the Elmore the most economical as well as the simplest of engines in the world?

From whatever standpoint you examine the two-cycle Elmore, equally impressive and sensational features present themselves. The four-cylinder car produces approximately as much power as would eight cylinders of the four-cycle type—produces it in a continuous and unbroken application that will carry the car **indefinitely on the high speed** under any and all road-conditions.

Again—it is the most successful self-starting engine in the world. Again—you can cut out one, two or three cylinders at will, both spark and gasoline. With one cylinder cut out the difference is imperceptible except in speed; with two out—barely noticeable. Do you see the economy of this?

Again—you can throttle the Elmore engine on the high speed down to **two** miles an hour. Again—the Elmore will take a 16 per cent grade on the high speed with approximately as much ease as it travels on the level road.

It starts with a smooth, gliding motion that is delightful; and dips down and over uneven spots with a minimum of jolt or jar.

The four-cylinder Elmore at $2,500.00 and the two-cylinder Elmore at $1,500.00 are two cars whose manifold exclusive features demand your most serious consideration. Learn all the wonders of the two-cycle type by getting in touch with the nearest Elmore agent or by writing for our new descriptive catalogue and books of information.

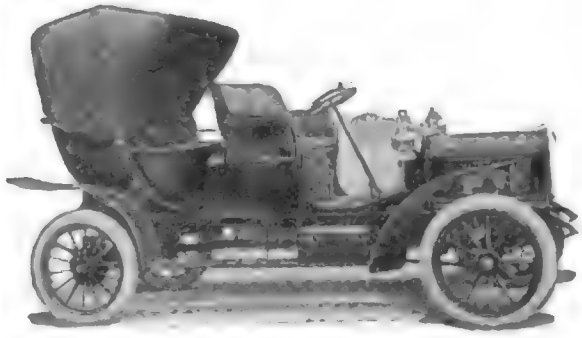
THE INCOMPARABLE

WHITE

THE CAR FOR SERVICE



THE REASON WHY

People often inquire, "Why is it that the longest tours, the hardest tours, the pioneer tours, the most interesting tours are made in White Steamers?" The answer is simple: because our standing has always been to design a car for extraordinary road conditions. That is why the White cars go ahead where other cars, designed only for ordinary road conditions, turn back. Another reason is that steam power, as utilized in the White car, possesses certain inherent advantages which cannot be realized through the use of other motive powers, no matter how highly developed the mechanism may be.

That readable publication, the White Bulletin, describes graphically some of the more notable tours of recent years, with maps and other data of interest to all tourists. If you have not seen the last three or four issues, it would be worth your while to send us a postal asking for them.

We will exhibit at the Armory show in New York.

WHITE SEWING MACHINE COMPANY

CLEVELAND, OHIO

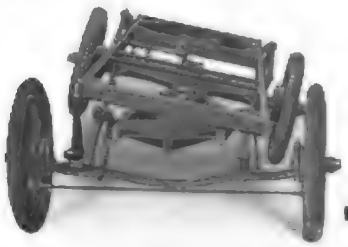
THE MARMON

"A Mechanical Masterpiece"



Can Your Car Do This?

This is a good question to ask the demonstrator before buying.

In most of our illustrations we have used a view showing a front wheel raised, tilting the lower frame, but leaving the body frame level.

This shows a rear wheel raised over a foot, tilting the body frame, but leaving the lower frame level.

All roads afford many parallels for this condition.

Observe that raising one wheel does not affect the other three wheels in the slightest. Observe that no matter what wheels are raised, no matter which frame is tilted, the power plant and rear axle are maintained in perfect alignment, doing full duty without strain or undue friction in any part.

Another point, it is not left to the springs and tires to bear the shocks entirely. The flexibility of the gear relieves them to a remarkable degree. Nor do the springs bear the driving strain, as this is direct from rear to front axle through radius rods.

Any Marmon owner knows, when he is speeding along over rough roads with an easy, gentle sway unknown in any other car, that the entire mechanism is equally at ease, conserved for a long and useful life.

The reason for this important elasticity lies in no mere combination of springs, but in the exclusive patented feature

Double Three-Point Suspension

Luxurious cast aluminum body on one frame, power plant on another frame, each frame suspended on three pivotal points. Eliminates the binding and twisting strains inevitable in the rigid suspension of all other cars; means simpler parts, fewer parts and less wear on all parts, tires included. A straight, rigid shaft drive without Cardan joints and an inner driving axle that bears no weight, deliver a greater percentage of the power of the motor to the wheels, than is possible in any other scheme of transmission.

The Marmon four-cylinder motor never overheats or "sticks," due to perfect air-cooling and an oiling system that is unlike any other and superior to any other the world over.

The Marmon is stylish, strikingly handsome, and very quiet. It is replete with distinctive features that appeal instantly and forcefully to all who seek a strictly high-grade car.

Write for Booklet No. 1 and become posted on a real Twentieth Century Automobile.

We shall demonstrate at the Armory Show, New York.

Automobile Knowledge

means

Money In Your Pocket

We are the only school that provides complete, practical, *money-earning* and *money-saving* training by mail in operating, repairing, constructing, and designing every kind of motor vehicle and motor boat.

We have special courses for *owners*, shop and factory *employees*, *chauffeurs*, *motor boat* and *motorcycle users*, and *others*.

There are only two ways of learning anything. One is slowly and tediously to gain the experience yourself; the other (and better) way is to take advantage of the experience of others.

Though we offer you the long, hard-learned, thorough experience of experts who have done prominent work in the development of the new vehicle, we offer this experience in such form that to teach it to you will take only a few minutes and cost only a few cents each day—*the few minutes and the few cents that you ordinarily waste.*

Our instruction has been prepared and is conducted by well-known men, of long experience and proved ability both in automobile engineering and correspondence instruction. It is strongly endorsed by *prominent manufacturers*, *club* and *association officials*, *racing men*, *trade-paper editors*, and others whose standing in the automobile field lends authority to what they say.

In the automobile industry, the demand for competent men is so great that ability, no matter how acquired, is considered above "pull" and length of service. This makes it easy for an ambitious man to qualify quickly for good wages and prompt advancement.

For further information, send us your name on the accompanying coupon. This will cost you only a moment of time and a postage stamp, which will be well spent for interesting and convincing literature.

POPE-TOLEDO

Type XII. 35-40 Horse-Power. Price, $3500

THIS car is absolutely the FASTEST and most POWERFUL touring car ever built. Think of a STOCK car with regular gearing doing 76 miles an hour. Isn't this convincing that the power the POPE-TOLEDO motor develops is transmitted to the wheels? TYPE XII will carry seven people at 30 miles an hour, and its noiseless, smooth-running engine will be scarcely more exerted than when idling.

Car has 54 pounds of total weight per horse power, only 10 8-10 pounds engine weight per horse-power.

The wheel base is only 104 inches. Yet the car seats comfortably seven people, with room to spare.

Double Direct Outside Chain Drive, of course; and a TRANSMISSION made of specially treated steel of 225,000 pounds tensile strength, the strongest, most efficient, smoothest running transmission ever constructed.

BAKER ELECTRICS The ARISTOCRATS OF MOTORDOM

Imperials...Stanhopes...Surreys...Depot Carriages...Broughams

Our Depot Carriage is the acme of refined, quiet elegance. Its every appointment is correct. Its finish and upholstery are the best that money can buy and the most skillful labor execute **by hand.** Its mechanical construction is as nearly perfect as long experience in the manufacture of electric vehicles enables us to make it.

All **BAKER ELECTRICS** are extremely light in weight, yet made from such carefully selected materials, with the utmost care and attention to every detail that they are extremely efficient and durable.

The absolute simplicity of operation and ease of control adapts **BAKER VEHICLES** for the use of anyone and a skilled chauffeur is never necessary.

We desire agents in a few important cities not yet covered and will be pleased to correspond with all who care to arrange for the best and easiest selling line of vehicles in the market.

American Mercedes

IF YOU WANT A MERCEDES

Buy it Here and Save the Duty

All the speed, all the strength, all the lightness and all the beauty of the imported 1906 Mercedes are repeated in the 1906 American Mercedes.

Every working part in the one has its counterpart in the other. No test of endurance that can be applied to these two cars will bring out a difference between them. Every patent, every device, every method of construction used by the Daimler Motoren Gesellschaft in building the Mercedes is used by us in building the American Mercedes.

We have the sole ownership for the United States and Canada of all patents, designs and shop drawings of our parent company.

Through the rights granted us by our parent Company, the Daimler Motoren Gesellschaft, we have during the past year convinced the most prejudiced and skeptical buyers of foreign automobiles that the American Mercedes is the equal in every respect of its counterpart, the imported Mercedes.

There is only one difference — you save the duty.

The 1906 American Mercedes will be exhibited at the Automobile Show.

JOSEPH E. ROOT, M. D.
67 Pearl Street HARTFORD, CONN.

December 12, 1905.

Mr. Schull, Mgr. E. H. V. Co:

Dear Sir—I thought it might be of interest to you to know how my "Doctor's Stanhope" was progressing.

I am pleased to voluntarily state that it is way beyond my expectations, high as they were. You understand I'm a "greenhorn" at running a motor car, and it's pulled me every day in town and out—on my professional rounds—always brings me home—never has had to go to a garage or repair shop for adjustments, etc.—goes through the cold and snow (the latter with chains on) just the same. It continues to ride as easy and warm as a hack. My total running expenses for my first month, ending December 8th, were $8.86. Upwards of six hundred (600) miles were covered.

Thanking you for furnishing me such a competent, durable and elegant machine, I am, Yours, etc.,

JOSEPH E. ROOT, M. D.

HAYNES

HAS AN EXCLUSIVE TRANSMISSION

If an automobile weighing 2,750 pounds, plus the weight of five passengers, is dropped over a sheer embankment of 7 feet, the machinery will receive a shock of just the same severity as if suddenly checked by shifting from high speed gear at 30 miles per hour to middle speed gear at 15 miles per hour. In the latter case the engine must act as a brake, and the entire machine is severely strained.

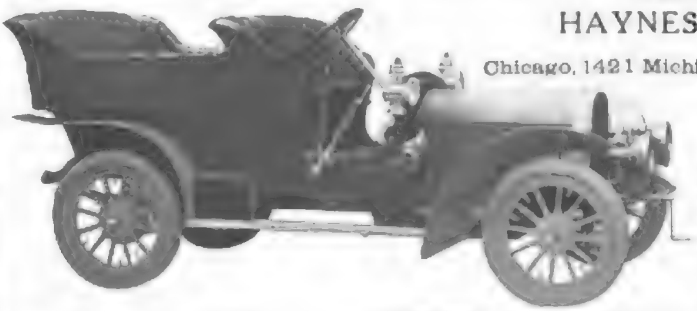
With the Haynes transmission, this cannot occur. A ratchet and pawl device permit the car to coast until the speed of the car and engine are relatively equal, when the pawls engage and the engines take up the load. While making the change in speed from high to middle or from high to low, the gears are running idle, permitting the operator to shift with perfect ease and without danger of burring or stripping the gears.

With all forms of transmission except the Haynes, the shock of sudden change of gears may be, and frequently is, thrown upon the machine, a thing impossible in the Haynes car and one of the reasons why Haynes cars are so long lived and cost so little for repairs and up-keep.

This is but one of the exclusive features of the Haynes. Others are its Roller-Bearing Engines, Master Clutch, Universal Joints that do away with wear on pins, Driving Sprocket and Roller Pinion, etc. There is perfect harmony throughout its entire mechanism, which makes its cost of operation, up-keep and maintenance extremely low.

It is perfectly finished in all respects. Only the best of materials are used. Body is of cast aluminum and wood, designed by a leading Parisian body maker. Hand-buffed leather and gray curled hair are used in upholstering. Other exclusive features are given in our new catalogue. For prompt attention address Desk 25.

"The Car the Repairman Seldom Sees"



HAYNES AUTOMOBILE COMPANY
KOKOMO, INDIANA
Chicago, 1421 Michigan Ave. New York, 1715 Broadway

MEMBERS A. L. A. M.

MODEL R—FOUR-CYLINDER TOURING CAR

Vertical roller-bearing engines. Cylinders cast separately, 5¼ x 6 inches, 50 H. P. An exclusive transmission that absolutely prevents stripping of gears. Positive cooling system. Individual and special lubrication. Master clutch has metal faces and takes hold without jerking. Shaft drive. Exclusive universal joints that prevent wear on pins. Sprocket and Roller Pinion and perfect Rear Axle, all exclusive. Roller-bearings throughout. 108-inch wheel base. 54-inch tonneau, seating five people. Four to sixty miles an hour on high gear. Weight, 2,750 pounds. Price, $3,500, f.o.b. Kokomo. Full equipment.

We believe that a very large portion of the tire-trouble suffered by motorists is due to their ignorance in regard to the care and proper manipulation necessary for the preservation of motor-tires.

We also believe that, with the proper encouragement and instruction from the manufacturer, the driver of a car can materially reduce his tire-expense, which is now so large an item in the cost of operation.

We have, therefore, decided to offer cash prizes to the amount of

$1000.00

for a ***Tire Economy Competition*** to continue throughout the year 1906.

Every owner or driver of a motor car is eligible to enter this contest.

The prizes will be awarded according to the tire expense per running mile. Contestants may enter at any time during the year, but must complete 2,500 miles before the close of the competition.

We will forward particulars of this competition and instructions for the care of tires on request.

STARTS from the seat with forward pressure on foot pedal.
BODY—Double side entrance, seats five comfortably.
COLOR—Optional.
WEIGHT—1,750 pounds.

BRAKES—In addition to two powerful expanding brakes on rear wheels that suffice to hold the car anywhere, the rear wheel brake drum, on either side, is fitted with internal cut ratchet teeth, that will positively hold the car on any hill, however steep. This is especially desirable in case of accident or should the motor stop for any cause, as it absolutely prevents car from running backwards.
CONTROL—Spark and throttle lever are arranged on top of steering wheel, but independent of the latter. The gear operating lever is arranged immediately below the wheel; the backward movement of this lever gives the slow speed forward, the forward movement the high speed. The reverse and brakes are operated by foot pedals.
INTERCHANGEABILITY—Every part that enters into the mechanism of the Duquesne is standard and interchangeable. This is a great convenience, especially regarding repairs, and we are in position to forward repair parts the day order is received—a little big thing.

PRICE, $2,000 with full equipment. Two ace ylene lamps, generator, oil side lamps, horn and tail lamp

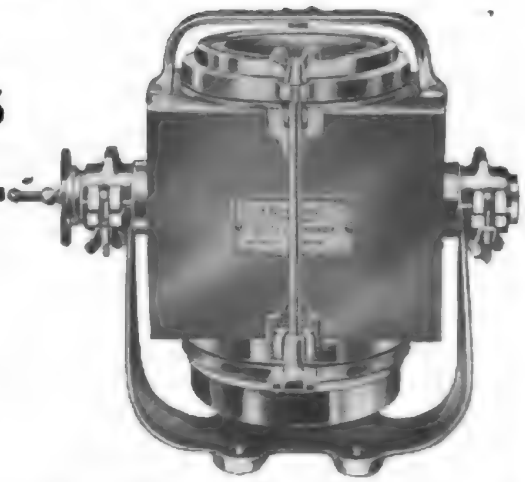
Make your own gas



The Neverout
TRADE MARK
Patent Invertible

Safety Gas Producer

is the only safe method for lighting motor-cars and boats.

Makes gas only as needed—at a cost of less than ½ cent per hour. No gas confined under pressure, no danger of explosion. Instantly lighted and extinguished.

No trouble, no dirt, no odor

A truly great invention that is as wonderful in its way as is

Neverout Mirror Lens Searchlight

the most powerful of all light projectors. Money back if not satisfactory. *Write for free booklet.*

Largest Searchlight Factory in the World

May It Prove a Year of Progress and of Satisfactory Results to All.

The Fisk Rubber Company . . . Chicopee Falls, Mass.

(Makers of the Fisk Mechanically Fastened Tires)

Digitized by Google

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

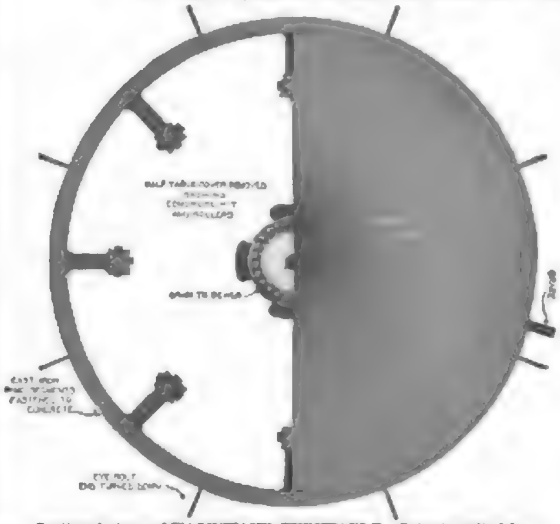
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

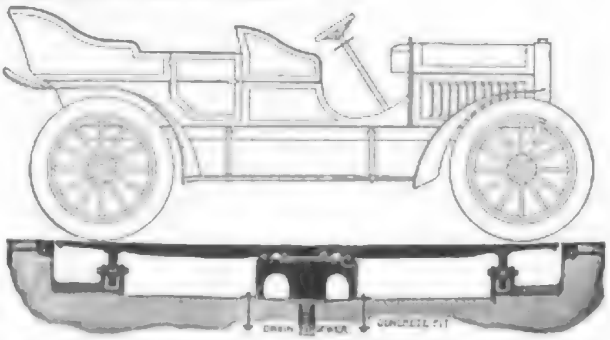
It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.





Sectional views of WASHSTAND-TURNTABLE. Patent applied for.

WHY IS IT

that, three times out of four, when an owner **names** the lamps on the car he advertises for sale, the name is

RUSHMORE?

It's because RUSHMORE Lamps Help to Sell the Car!

The Rushmore has a short focus lens mirror, ground in our own factory, and identical in everything but size with those prescribed by Uncle Sam for his battleships.

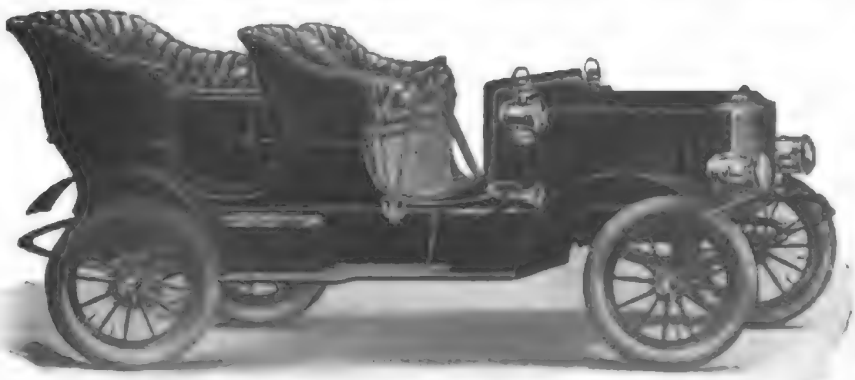
No other lamp compares with it in brilliancy and carrying power. Specify it on your new car.

1906 Models Ready for Delivery

THE LAMBERT

The Famous Friction Drive Car

It will pay you to investigate the Lambert for two reasons:
1st. Simplicity of Construction 2d. Cost of maintenance



NO COMPLICATED PARTS

We are booking orders on the following models:

Model 8. 34 H. P. Heavy Touring Car	$3,000
Model 7. 34 H. P. Touring Car	$2,000
Model 6. 18 H. P. Touring Car	$1,500
Model 5. 16 H. P. Touring Car	$1,200
Model 4. 16 H. P. Light Touring Car	$1,050
Model A. 16 H. P. Runabout	$900

Model 7. 34 H. P. Price, $2,000

A Gearless Transmission

This car has a 14 inch road clearance, capable of making 55 miles per hour, and has a detachable tonneau.

HERE IT IS

That "Trouble-Proof" Rushmore Generator

We haven't room to tell you about all its unique points of merit, but you can't afford to miss these three:

FIRST: The shaking carbide basket 1, hung by opposite corners and jarred constantly while the car is moving by the weight 4, hung on spring 3. This insures the instant separation of the lime dust from the carbide, and prevents the local overheating, caking of lime, and production of tarry compounds, with which you are probably familiar in other generators.

SECOND: The regulating chamber 8, separated from the water tank 5 by a false bottom, through which the water passes by the shut-off valve 9 and tube 6. To reach the carbide, the water must overflow the short central standpipe 10, and when the gas reaches normal pressure it forces part of the water back through tube 6 to the tank, uncovering the top of standpipe 10. No water can thereafter reach the carbide save through a reduction in the gas pressure, and the action is perfectly automatic, requiring no hand regulation.

THIRD: The safety vent pipe 12, ordinarily not needed, but useful in case of any accidental accumulation of gas when valve 9 is closed.

Every one of these features is essential to a perfectly automatic portable generator. Every one of them is broadly covered by Rushmore patents and cannot be imitated.

Our catalog tells other good points. Write for it.

Insurance against freezing troubles

The best way to protect yourself against the danger of the water freezing in the circulating system of your car, and the trouble and inconvenience which it brings on, is to use

No-Mor Auto-Freeze

One charge of this solution does the work for all winter and you don't need to be afraid of zero weather or even 10 degrees below.

No-Mor Auto-Freeze not only saves you the money that it costs to heat your barn, but prevents the bursting of water pipes and saves you the dollars it would take to make the necessary repairs.

It is cheaper to buy **No-Mor Auto-Freeze** than to take any risk. Your mind will be entirely at ease and you won't need to give another thought to your circulating system.

No-Mor Auto-Freeze is already dissolved, won't clog the circulating system and contains nothing to corrode the metal or injure the rubber.

75 cents a gallon, at dealers, or f. o. b. Cleveland, Ohio. Sold only in 5 and 10-gallon cans

Chemist's Report

THE GENERAL LABORATORY CO.
Chemists
185 Gardner St. Cleveland, Ohio

"We have examined and tested No-Mor Auto-Freeze and find that it will not corrode brass, aluminum, copper, galvanized iron or solder, and that it will remain clear at 10 degrees below zero Fahrenheit. Another good feature of the product of this formula is that it will not crystallize out, hence no danger of clogging the circulating system."

Good thing for dealers

No-Mor Auto-Freeze is right in your line, and is an easy seller. Write for terms and full particulars.

This AUTO TIRE is both DURABLE and LIVELY

When you buy an *ordinary* Auto Tire, you have to decide a difficult question.

Is it best to get a hard, inflexible tire, which will rack your bones and soon put your car out of business, but which will *last a season or more*

Or—

To get a soft, resilient, easy riding tire, which will go to pieces in a short time because it won't stand the wear and tear of the road?

Momentous question.

And either way you answer it—you lose.

Because if you decide on the *hard* tire, it means breakdowns on the road, and consequent liberal use of a farmer's team. It means constant repairs to your engine, a car always in the shop. Your aching joints are thrown in for good measure.

And if you select the *soft* tire, it means punctures, tire explosions and tire troubles generally. And you have to buy new tires every little while.

It's Money—Money—Money, either way.

You'll envy Rockefeller before you get through.

Now you can *dodge* this momentous question if you will.

Because the Goodyear Detachable Auto Tire has all the GOOD points of both the *hard* and the *soft* tire with the bad features of neither.

It's easy for anyone to understand WHY this is true. Read carefully, and see for yourself.

First, look at the section of the Goodyear Tire in the center column. Notice the crescent shaped portion in solid black where the wear of the road comes. That's dense, firm rubber, as tough as rawhide—practically no wear out to it. It's what the *hard* tire is made from.

Now right underneath this is the remainder of the outer tube (shown in grey) which is made from pure para rubber, as resilient and springy as it is possible for rubber to be. It's the same as the seldom-used *soft* tire.

These two different kinds of rubber—the dense, tough composition, to take the wear, and the soft, elastic rubber, to make you ride easy—are made into one solid piece by a special process. You can't skin the two kinds of rubber apart with a knife. Try it if you doubt.

The dense rubber and the soft rubber together make a tire that's almost as durable as a *solid* tire, a tire difficult to puncture yet one which is as *resilient* as a man could reasonably ask.

Our "Good News Book" tells more about the good points of this trouble-saving tire. You ought to get it now, for the Goodyear Detachable Auto Tire with Universal Rim will be "the only tire" next season.

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

THE OSCAR LEAR AUTOMOBILE CO.
Automobiles
Corner Fourth and Gay Streets

Columbus, Ohio, September 5, 1905.

The Steel Ball Co., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6-day endurance and economy run at Long Branch. In a run of 3,202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of all this we fully realize and its help in getting this record for our FRAYER-MILLER car. Yours truly,

THE OSCAR LEAR AUTOMOBILE CO.

Made in three sizes

GARFORD PARTS

A few Garford parts in a high grade car enhance its value. Liberal use of them maintain it. Just now we have none for sale. High grade car makers snapped up all we can make this season just as soon as they were offered—a plain tribute to the excellency of their design and material. Our productive capacity for 1907 will be so enlarged as to avoid the disappointment of fruitless inquiry.

MOTOR WAGON PARTS

We can, however, promptly execute orders for steering gears, brakes, sprockets, motor hangers and other parts for motor wagons. They are suitable for all classes of commercial power vehicles, from the lightest to the heaviest. They are not "freak" components of a wonder working vehicle. They enjoy the rare distinction of having been thoroughly tested for some years past in the most varied and severe kinds of commercial service. Circulars 2, 3, 5, 10 and 11 give information concerning them.

THE GARFORD COMPANY, Elyria, O.

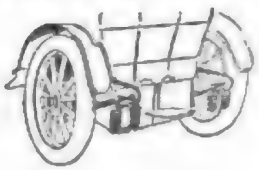
Sales Manager: HAYDEN EAMES, Cleveland, O.

Pinion and Section Type also supplied.

BUMPING THE BUMPS

in a Motor Car is bad enough in the summer time when the ground is soft, but when winter rolls around and the roads freeze up, you simply MUST do something to offset the jolts and jars of driving.

SUPPLEMENTARY SPIRAL SPRINGS



Absolutely do Absorb all Vibration

If Comfort Interests You, You Will Find Them

A NECESSITY

They act alike under heavy and light loads. They save your engine, your tires, your car and your back.

When you write for Catalogue, mention name and model of your car. Address

SUPPLEMENTARY SPIRAL SPRING CO.,

4527 Delmar Avenue :: :: ST. LOUIS, MO.

Swinehart Tires

One proof that our tire is **superior to any**, is the fact that dealers are pushing our tires although we do not allow them as great a commission on sales as they get on other tires; neither do they ever expect any revenue for repairs after our tires are applied.

We have hundreds of testimonials from users of **Swinehart tires** on sixty different types of cars, claiming that **Swinehart tires** do not injure their machinery. This proves either that our tires are superior to other solid tires or that there are plenty of substantially built cars now on the market.

PREST-O-LITE GAS TANK

No Waste. No Odor. No Attention. Tips Never Clog. Nothing to Freeze.

SIMPLE ENOUGH
When you want gas, turn it on. When you don't, —turn it off.

NEVER AFFECTED BY EXTREME COLD

In cold weather moisture collects in the tubes leading from the Generator to the Lamps, causing them frequently to freeze up; either entirely preventing gas from passing to the lamps or bursts the pipes.

The gas from the Prest-O-Lite Gas Tank contains nothing to freeze. It simply cannot freeze.

ALWAYS READY FOR SERVICE

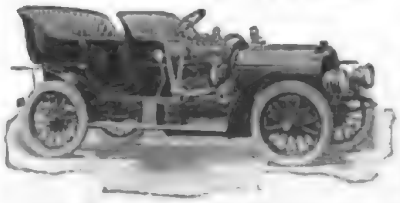
What Royal Tourist Owners are Writin'



"More pleased with Royal than any car I have ever owned. Have owned about 25, both foreign and American."

"Mine has run about 4000 miles this season, and has had absolutely no repairs."

"Since June 22d I have toured about 6000 miles and during this time I have never once stopped on the road to make a single repair or adjustment."

"The Royal Tourist which I purchased of you has run about 6000 miles, over hard country roads and sharp hills, and total cost of repairs will not exceed $8.00."

"I have run this car about 6000 miles and have given it some hard usage. The expense for repairs has been $3.25."

"Am delighted with my Royal. Have run it nearly 2000 miles and have had no repairs."

"We have been over 7500 miles at this date, without a repair or replacement of any kind or description, except to tires."

Ask any of our Agents to show you reproductions of letters from which these remarks were taken.

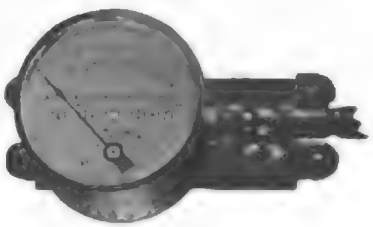
Every Automobilist's Automobile
should be equipped with a Jones Speedometer for the reason that it is recognized as the only *practical* speed indicating device.

The accuracy of the Jones Speedometer is attained by the mechanically perfect application of an absolutely unchangeable law. Its standard of perfection will never be equaled by devices based on theories. In the development of our Speedometer, we experimented with a large variety of devices, employing the principles of hydraulics, pneumatics, magnetism, electricity, etc., but after exhaustive tests discharged them, because found lacking on one essential or another.

Theoretical accuracy does not necessarily mean *practical* accuracy—nor does *initial* accuracy mean *permanent* accuracy.



JONES SPEEDOMETER
122 West 32d Street New York

READ MOTOR AGE ... $2.00 per Year

Digitized by Google

CRACKED CYLINDERS, GEARS, SHAFTS, Etc.

We repair by our Brazing System, making parts repaired stronger and tougher than they were originally. **Brazing is stronger, quicker, cheaper than patching.** In patching every hole drilled for bolts or rivets weakens the casting and the more a patched casting is used the looser it becomes. The metals used in brazing are stronger and tougher than cast iron, making the brazed part stronger than when new.

Cold weather does all kinds of fatal things to cylinders and other automobile parts. Write us for particulars, prices, etc.

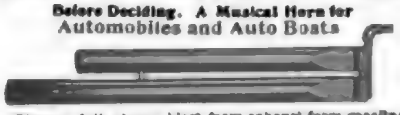
BY ALL MEANS HEAR
THE GABRIEL HORN
Before Deciding. A Musical Horn for Automobiles and Auto Boats



Blows a full, strong blast from exhaust from gasoline engine, or can be attached to steam, same as ordinary whistle; blows with less than one pound pressure.
Each horn is tuned to a musical key—no discordant screeching note—is easily blown, and is strong and durable.
Comes in three styles—two, three or four horns.
Write today for Catalogue, giving prices and full information.

There was a time when a regular and reliable ignition was a problem. This problem is solved today by the **HERZ TIMER**. We have made and sold over 70,000 of these instruments last year, to the most prominent manufacturers in this country, as well as in Europe, and are making now four distinctly new models for four of the leading manufacturers in America. The reason for this success: It's Tool Steel vs. Tool Steel, best Sheffield grade obtainable; **Sticking Vibrators** absolutely impossible; running packed with grease; built like a watch, tool maker's work throughout. We make 18 models and fit any make of motor. State make of your motor when ordering.

MOTOR AGE

THE car that has been consistently successful in the past can be depended upon to be even more successful in the future. Each successive model has added to the Packard record for endurance and reliability, and that unequaled smoothness of running. The latest model, the Packard "24," upon which will be concentrated every thought and every facility of the Packard factory during the coming season, has already proven itself to be the best thing we have ever turned out. On June 8th, the first car of this model made a run of three hundred miles from Detroit to Chicago in the total elapsed time of 12½ hours, the running time 11 hours, carrying from five to six passengers. After a night's rest in Chicago, the car made the return journey on the following day, June 9th. This severe test of six hundred miles was made without repairs or replacements, except to tires.

Price, (with standard equipment) $4,000 f. o. b. Detroit

The DeHaven Brothers

are twins

"Two peas in a pod" will have to content themselves with second prize.

Just how these brothers identify each other every morning is a puzzle to us.

During the time they are not busy being twins they operate a garage at 83-85-87 S. Center Ave., Chicago, and build automobiles for specially particular people.

(One of the fastest machines in Chicago was made by the DeHavens.)

One of these brothers told us the other day (we haven't the slightest idea which one it was) that Morgan & Wright tires have given a quality of service on the cars quartered with them that has been "head and shoulders" above that given by other brands.

And because this has been positively and repeatedly proven, several of their customers have swapped their tire troubles for Morgan & Wright tires.

There is no method of making friends equal to the method of making good.

THE most enjoyable days for touring of all the year are yet to come, but a perfect day is made miserable if the car you drive is unreliable. The Rambler is an ideal car for equipment.
Because of its simplicity every member of the family can run it.
There's only one lever to operate, giving two speeds forward, neutral and reverse.
The fact that one hand controls the Rambler makes it the car most suitable for reasonable speed, perfect cooling and reliability.

Call at any of our branches for a road demonstration and, at the same time, ask for a copy of the Rambler Magazine.

"Packard 24"

A CAR as good as the Packard could not be the result of one man's work or the creation of one man's brain. It is only possible by cumulative effort year after year, of the great organization of skilled specialists. It is like no other car. It can be measured by no other standard. It is a combination of perfect parts, every one of which reflects the price of the man who made it.

Price, (with runabout equipment) $4,000 f. o. b. Detroit

V. L. Emerson

is the General Manager of the
American Motor Car Co., Cincinnati

These people are comparatively new in the automobile manufacturing game, tho you would never guess it to see the kind of a car they put up.

We feel pretty dead sure that they are going to command a big business, for the simple reason that oaks can't help but evolve from acorns when the acorns are good ones.

Mr. Emerson believes in being sure he is right before he asks the public to buy his cars, which is a mighty good "acorn." For instance, here is a sample of his tire test :

"In August I put a new set of your 3-inch tires on my light speed car and went against some of the big ones at Coney Island, establishing a world's record for two miles from a standing start. I had to make better than fifty miles on the turns and above seventy miles on the straight, which is a very trying test on so light a tire. Usually one race of this kind uses up a set of cases, but in this instance your tires have been an exception, as I have covered more than four thousand miles with the same tires since I raced them, including twelve important races, in which I scored first eleven times and got second place once.

The outer casing of the rubber has worn down on my right wheels, but **there is not a cut or separation in the cases and I have not had them off the rims.**

It strikes us that that record ought to be tire guarantee enough for the patrons of the American Motor Car Co.

Rambler

Don't Stable Your Car Because The Snow Flies

Motoring on a keen, bright day when the air is clear and bracing, is one of the greatest pleasures of the year. But the car must be right, there must be no annoying stops for tinkering and adjustment when the fingers become cold and the temper hot.

Insure the pleasure of your ride by using a RAMBLER, the car of staunch dependability that you don't have to tinker with.

The car of power and simplicity that obeys your will and serves you all the time.

Our Catalogue or The Rambler Magazine will tell you how and why. Both are at your service.

Rambler

WINTER MOTORING while enjoyable, is severe upon both car and operator. ¶ The Model 15 RAMBLER, 35-40 horse-power, here shown, has power and stability to withstand the mechanical strain, while the simplicity of control and dependability of operation reduces the driver's cares to the minimum. ¶ It has a four-cylinder vertical motor, sliding gear transmission and double chain drive with many details that will interest you.

¶ Just your address — that's all.
